THOM. JOHNSON

TO THE RIGHT HONORABLE HIS SINGULAR GOOD LORD AND

MASTER, SIR WILLIAM CECIL KNIGHT, BARON OF
Burghley, Master of the Court of Wards and Liveries, Chancellor of the
Vniuersitie of Cambridge, Knight of the most noble Order of the Garter,
one of the Lords of her Maiesties most honorable Priuy Coun-
cell, and Lord high Treasurer of *England*.

Among the manifold creatures of God (right Honorable, and my singular good Lord) that haue all in all ages diuersly entertained many excellent wits, and drawne them to the contemplation of the diuine wisdom, none haue prouoked mens studies more, or satisfied their desires so much as Plants haue done, and that vpon iust and worthy causes: For if delight may prouoke mens labor, what greater delight is there than to behold the earth apparelled with plants, as with a robe of embroidered worke, set with Orient pearles,

and garnished with great diuersitie of rare and costly iewels? If this varietie and perfection of colours may affect the eye, it is such in herbs and floures, that no *Apelles*, no *Zeuxis* euer could by any art expresse the like: if odours or if taste may worke satisfaction, they are both so soueraigne in plants, and so comfortable, that no confesion of the Apothecaries can equall their excellent vertue. But these delights are in the outward senses: the principall delight is in the minde, singularly enriched with the knowledge of these visible things, setting forth to vs the inuisible wisdom and admirable workmanship of almighty God. The delight is great, but the vse greater, and ioyned often with necessity. In the first ages of the world they were the ordinatie meate of men, and haue continued euer since of necessarie vse both for meates to maintaine life, and for medicine to recouer health. The hidden vertue of them is such, that (as *Pliny* noteth) the very brute beasts haue found it out: and (which is another vse that he obserues) from thence the Dyarsooke the beginning of their Art.

*Pli. li. 8. ca. 27.
Ibid. li. 22. c. 2.*

Furthermore, the necessary vse of these fruits of the earth doth plainly appeare by the great charge and care of almost all men in planting and maintaining of gardens, not as ornaments onely, but as a necessarie prouision also to their houses. And here beside the fruit, to speake againe in a word of delight, gardens, especially such as your Honor hath, furnished with many rare Simples, do singularly delight, when in them a man doth behold a flourishing shew of Sommer beauties in the midst of Winters force, and a goodly spring of floures, when abroad a lease is not to be seene. Besides these and other causes, there are many examples of those that haue honored this science: for to passe by a multitude of the Philosophers, it may please your Honor to call to remembrance that which you know of some noble Princes, that haue ioyned this study with their most important mat-

ters

The Epistle Dedicatorie.

Plut. de Discr.
adul & amic.
Plin. lib. 25.
cap. 2.

ters of state : *Mithridates* the great was famous for his knowledge herein, as *Plutarch* noteth. *Euax* also King of Arabia, the happy garden of the world for principall Simples, wrot of this argument, as *Pliny* sheweth. *Diocletian* likewise, might haue had his praise, had he not drowned all his honour in the blood of his persecution. To conclude this point, the example of *Solomon* is before the rest, and greater, whose wisdom and knowledge was such, that hee was able to set out the nature of all plants from the highest Cedar to the lowest Mousse. But my very good Lord, that which sometime was the study of great Philosophers and mightie Princes, is now neglected, except it be of some few, whose spirit and wisdom hath carried them among other parts of wisdom and counsell, to a care and studie of speciall herbes, both for the furnishing of their gardens, and furtherance of their knowledge : among whom I may iustly affirme and publish your Honor to be one, being my selfe one of your seruants, and a long time witnesse thereof : for vnder your Lordship I haue serued, and that way employed my principall study and almost all my time, now by the space of twenty yeares. To the large and singular furniture of this noble Island I haue added from forreine places all the varietie of herbes and floures that I might any way obtaine, I haue laboured with the soile to make it fit for plants, and with the plants, that they might delight in the soile, that so they might liue and prosper vnder our clymat, as in their natieue and proper countrey : what my successe hath beene, and what my furniture is, I leaue to the report of them that haue seene your Lordships gardens, and the little plot of myne owne especiall care and husbandry. But because gardens are priuat, and many times finding an ignorant or a negligent successor, come soone to ruine, there be that haue sollicitied me, first by my pen, and after by the Presse to make my Labors common, and to free them from the danger whereinto a garden is subiect : wherein when I was ouercome, and had brought this History or report of the nature of Plants to a iust volume, and had made it (as the Reader may by comparison see) richer than former Herbals, I found it no question vnto whom I might dedicate my Labors; for considering your good Lordship, I found none of whose fauor and goodnesse I might sooner presume, seeing I haue found you euer my very good Lord and Master. Again, considering my duty and your Honors merits, to whom may I better recommend my Labors, than to him vnto whom I owe my selfe, and all that I am able in any seruice or deuotion to performe? Therefore vnder hope of your Honorable and accustomed fauor I present this Herball to your Lordships protection; and not as an exquisite Worke (for I know my meannesse) but as the greatest gift and chiefeft argument of duty that my labour and seruice can afford : whereof if there be no other fruit, yet this is of some vse, that I haue ministred Matter for Men of riper wits and deeper iudgements to polish, and to adde to my large additions where any thing is defectiue, that in time the Worke may be perfect. Thus I humbly take my leaue, beseeching God to grant you yet many dayes to liue to his glory, to the support of this State vnder her Maiestie our dread Soueraigne, and that with gret encrease of honor in this world, and all fulnesse of glory in the world to come.

Your Lordships most humble

and obedient Seruant,

JOHN GERARD.

LANCELOTVS BRVNIVS MEDICVS REGINEVS
IOHANNI GERARDO *Chirurgo peritissimo,*
& rei Herbariae callentissimo S. P. D.

VM singularum medicinae partium cognitio atque intelligentia libero homine digna censenda est; tum earum nulla vel antiquitate, vel dignitate, vel utilitate, vel denique iucunditate, cum stirpium cognitione iure comparari debet. Antiquissimam eam esse ex eo liquet, quod quum ceterae medicinae partes (sicut reliquae etiam artes) ab ipsis hominibus (prout eos dura pressit necessitas) primum excogitatae & inuentaе fuerunt: sola herbarum arborumque cognitio ante hominem formatum condita, eidemque mox creato ab ipso mundi archetecto donata videri potest. Cuius tanta apud antiqua secula existimatio ac dignitas erat, ut & ipsius inuentionem sapientissimo Deorum Apollini veteres

tribuerint, & reges celeberrimi in stirpium viribus indagandis studium laboremque suum consumere, summam sibi apud posteros laudi honorique futurum censuerint. Iam vero plantarum utilitas, atque etiam necessitas, adeo late patet, ut eius immensitatem nullius vel acutissimi hominis animus capere, nedum meus calamus exprimere queat. Stirpium enim complurimae nobis in cibos, alimentumque cedunt: innumeram aduersus morbos remedia suppeditant: ex alijs domos, naues, instrumenta tam bellica quam rustica fabricamus: aliquot etiam earum vestes nostris corporibus subministrant. In quibus singulis recensendis diutius persistere, hominis esset intemperanter abutentis & otio & literis. Quanta autem, & quam varias voluptates ex stirpium siue amoenitate oculis capiamus, siue fragrantia naribus hauriamus, sine summa inearum conditorem impietate inficiari non possumus. Adeo ut absque stirpium ope & subsidio vita nobis ne vitalis quidem haberi debeat.

Quum igitur res plantaria reliquis omnibus medicinae partibus antiquitate antecedar, dignitate, nulli cedat, utilitate insuper oblectationeque ceteras longe superet, quis futurus est, adeo, aut insensatus ut non exploratum habeat, aut ingratus, ut non ingenuè agnoscat, quanta vniuersis Anglis commoda, quantasque voluptates tuus mi Gerarde in stirpium inuestigatione & cultu labor indefessus, studium inexhaustum, immensisque sumptus hoc de stirpibus edito libro allaturi sunt. Maeste itaque ista tua virtute, istoque de republica bene merendi studio, & quod insigni tua cum laude ingressus es virtutis gloriaeque curriculum, eidem insiste animosè & gnauiter, neque à re plantaria promouenda prius desiste, quam eam à te ad umbilicum iam ferme productam ipse plenè absolvas atque perficias. Sic enim & tibi adhuc superstiti gloriam paries immortalem, & post obitum tantam tui nominis celebritatem relinques, ut tuarum laudum posteros nostros nulla vnquam captura sit obliuio. Bene vale. Ex Aula Reginea Westm. ipsis Cal. Decemb. 1597.

Quam Londinum appuli, in sinu gausus sum Gerarde amicissime, dum typogra-
pho formis excudenda Plantarum collectanea tua commissa vidi, de quibus
summas, nulla die perituras laudes Anglia tibi Rei herbariae familiam uni-
uersam, medicatricis artis partem, antiquissimum, iucundissimum & utilis-
simum studium, retere cupido, debet. Priscorum enim Theophrasti, Dio-
scoridis, Plinij, & Galeni scripta, passim toto orbe perulgata, tanquam
fontes; Neotericorum autem, seu rivulos, Brunfelsij, Fuchsj, Tragi, Ru-
ellij, Matthioli, Dodonæi, Turneri, Clusij, Dalecampij, Camerarij, Tabernæmontani,
Penæ, nostramque nouam methodum & ordinem, à Gramine & notioribus ad Triticea, generatim
& speciatim, materno idiomate, Anglica genti tuæ cultissima, Reipublica voluptabili commodo, re-
cludis; quò ipsa stimulata, herbarum delicias & hortorum suauissimum & amoenissimum cultum
amplectetur, maximorum Imperatorum, Regum & Heroum tam priscorum quam nuperorum ex-
emplo. Nec satis hoc tibi fuit; sed multo magis insuper præstitisti, quòd copiam multarum elegan-
tissimarum plantarum in Anglia sponte nascentium ab alijs hætenus prætermisissarum, historiam
descripsisti, magna hoc studio captorum utilitate & oblectamento: Singulas enim regiones pecu-
liares quasdam plantas, quas in alijs non facile reperias, gignere certum. Neque magni tibi fuit hæc
inspectione & è viuis Naturæ typis nosse; quippe qui diu herbas indigenas, inquilinas & peregrinas
cum nuperrimè solo erumpentes & pululantes; tum adultas, semineque prægnantes, hortulo tuo sub-
urbano aluisti & fouisti: Exactum enim cognoscendarum ex figura aut facie superficialia herbarum
studium generatim consistit (Dioscoride teste) in frequenti & assidua, temporis omnis, inspectio-
ne. Sed alia est interioris & substantialis formæ plantarum, quæ oculis cerni non potest, solers cogni-
tio; quam etiam, quantum potes percunctando, seniorum Græcorum Medicorum more, aperire cona-
ris. Solebant autem antiqui suorum Medicaminum experimenta, in Reipublica utilitatem, scrip-
tis tabellis dare, quibus apud Epheseos templi syluaticæ Diana parietes vestiebantur. Compertum eti-
am est Hippocratem discendi cupidum, permultis regionibus peragratis, idem præstitisse, & in me-
thodum commemorabiliorem restituisse & illustrasse. Melius enim est Reipublicæ quam nostris
commodus prospicere. Non est igitur quod huius inuidiosa procacis ætatis conuiciatores maledici Zoi-
li scripta tua obtrecent: dedisti enim gratis quòd potuisti, cetera doctioribus iudicijs relinquens;
exortiuus & exoticis incompertarum penè adhuc virium mangonizatis & lenocinijs allectis Florista-
rum floribus à Flora Dea meretrice nobili dictis, valetudini & utilitati potius consulens, quam vo-
luptati, valeri iussis. Nonnulli siquidem ex alijs libris herbarum transcriptores rapsodi; ignotis sibi
viris plantis ad medendum maximè necessarijs, assignant incertis, dubijs & suppositiis stirpibus
aut simplicibus facultates legitimi simplicis medicamenti, maximo errore & summa periclitatione
(vnum enim sæpe simplex compositionem ineptam reddit peruertit aut deprauat) quibus nec tutò
nec temere credendum; multoque etiam minus multis herbarum experimentis fallacibus, quibus eti-
am neque nisi notissimis morbis simplicibus, compositis & implicatis, eorundemque sensissimis symp-
tomatibus, utendum, ne inopportunus earum vsus sæpius venenum quam remedium sit. Summo enim
agrotantium dispendio & exercitatisimorum Medicorum tadio periclitatores procaces, contemptis
& neglectis artis institutionibus, Hippocratis & Galeni præceptis, per salutis discrimina & ho-
minum strages medentium tentamenta agunt. Omitto, breuitatis ergò, vulgi opifices, textores sellu-
larios, sordidissimos fabros, interpolatores, circulatores forenses & veteratores scutica dignos, qui
professionibus & mechanicis artibus suis fastiditis, scelerato insanæ lucro, se Medicos Theophra-
steos, quem vix vnquam summis labris degustarunt, profitentur. Non inueniunt Syluius in hu-
iusmodi hominis inuehit, dum ait, Quam quisque nouit artem, hanc exerceat vnam, atque ex-
colat, & totus in ea versetur, &c. Et sub finem præfationis rursus ait, Faxit Deus vt quisque
quam exercet Artem, pernoscat, & Medicus nihil eorum quæ ad morbos citò & tutò cu-
randos utilia vel necessaria esse consueuerunt, ignoret. Præualeat Medicus vbi Pharmacopœi
fides suspecta est, qui ipse simplicia & composita pernoscit; imò quam infamiae no-
tam imprudens inurit, dum ignarus horum simplicium medicamentorum, tanquam asinus
quidam ad omnia Pharmacopœi rogata, auribus motis, velut annuit: quid. quòd illi
sæpe etiam volens Pharmacopœus illudit. Absurdissimus est ac sæpè ridiculus qui me-
dicinam facit, harum rerum ignarus; & Pharmacopœo ignorantia suspectum meritò se
reddit. Plura si quis require apud Syluium, ibidem loci.

Medico

Medico quam plurima perscrutanda, ut satis superque ad artem medicatricem perdiscendam, annos paucos haudquaquam sufficere, testantur ipsius experientissimi & Diuini senis verba ubi inquit; Ego enim ad finem Medicinæ non perueni, etiam si iam senex sim. Et statim per initia Aphorismorum vitam breuem & artem longam pronunciant. Quomodo ergo tuto medebuntur multi larvati Medici aut Medicaſtri tam repente creati, nulla Medicina parte, Medicamentorumve facultatibus perspectis? Huiusmodi adulescentes, assentatores, dubitatores, rixatores, periclitatores & Gnathonicos parasistratos histrionibus qui in tragædijs introducuntur similes fecit Hippocrates. Quemadmodum enim illi (inquit) figuram quidem & habitum ac personam eorum quos referunt habent, illi ipsi autem vere non sunt: Sic & Medici fama quidem & nomine multi, re autem & opere valde pauci. Itaque cum paulo ante Medicinam omnium artium præclarissimam esse dixerit: Verum propter ignorantiam eorum qui eam exercent, & ob vulgi ruditatem, qui tales pro Medicis iudicat & habet, iam eo res deuenisse, ut omnium artium longe vilissima censeatur. At vero hoc peccatum ob hanc potissimum causam committi videtur; soli namque Medicinæ nulla pœna in rebus publicis statuta est, præterquam ignominia. Ne animam & famam lederit, aut illi insignis ignominia inureretur ob huiusmodi ardua & noxia discrimina, bonus ille & sincerus Dodonæus (quamvis multas herbas ex alijs & Fuchſio transcripserit, cuius methode usus est, quemque inchoauerat, ut ipsemet mihi retulit, vernacula Germanica inferiori lingua vertere). vulgatissimis, notissimis iisque paucis ex tot herbarum millibus, quinquagenis aut septuagenis herbis quibus utebatur, potius contentus fuit, quam innumeris sibi ignotis periclitari: melius enim omnino medicamento carere, abstinere, & naturæ committere, quam abuti. Utinam huius nostræ ætatis quamplures auso potiti, medicinam facitantes, eo studio, candore & voto mederentur: Illis id forsitan nequaquam euenerit, quod Philosophis (Hippocrate defuncto) discipulis suis inexpertis & parum adhuc exercitatis medendo, id est necando (ut memoria traditum est) contingit: quamobrem ars Medica Athenis, Roma & per uniuersam Græciam centum & septuaginta annis, interdicta et exul fuit. Merito igitur caute et tute agendum: Opiatis et Diagrediatis, Colocythide, Tithymalis, Esula, Lathyride, Mercurio, Stibio, & similibus molestissimis simplicibus cum cautione utendum: optimis ducibus & experientissimis senioribus præceptoribus adharendum, quorum sub vexillis fidesime & tutissime rara & præclara, ob barbariem fere extincta, patrum & auorum remedia, maximo et pristino artis ornamento et proximi utilitate renouantur, et in usum reuocantur, neglectis, spreis, et exclusis Empiricis verbosis, inuidiosis, suspensis, ambagiosis et exitiosis opinionibus, quibus Mundus immundus regitur et labitur; qui cum decipi velit, decipiatur: in cuius fallacias per apposite finxit et cecinit olim hos versiculos eruditissimus collega D. Iacobus Paradisus nobilis Gandanensis alludens ad nomen tanti versutissimi herois Nostradamus Salonensis Gallo-prouincia,

Epist. ad Democritum.

« Multi magis sunt videri quam esse.

Nostra-damus, cum verba damus, quia fallere nostrum;
Et cum verba damus, nil nisi Nostra-damus.

Vale. Londini ipsis Calendis Decemb. 1597.

In GERARDI Botanologian

φερώνυμον.

Vltimus ecce Gerardus : at edit an optimus herbas ?
Quid ni ? non notas sed dedit ille novas.

Ergo ne inuideas, videas cum nomen & omen

φερώνυμον, mirum est ardua quantagerit.

Οὗτος ὁ Gerardus, καὶ τὰς ἀνὰ τὰς ἡλίας :

Sic liber est promus, condus ut hortus erat.

Et γὰρ αὐτὸν καὶ τὸν καὶ τὸν καὶ τὸν :

τὸν γὰρ ἀπὸ τῆς ἀρχῆς ὁ Gerardus.

ANTONIVS HVNTONVS.

Medicinae candidatus.

Ad Iohannem Gerardum Chirurgum Herbari-
umq; peritissimum.

NVlla oculos hominum species magis allicit illa,
Quam praestante manu duxit generosus Apelles.
Nulla aures animosque magis facundia, quam quae
Se fusam loquitur Ciceronis ab ore diserti:

Hæc eadem hunc librum commendat causa, Gerarde,

Cui pro laude satis tali natum esse parente,

Artifices cui inter dexteras pro numine, nomen

Nobilius reliquis herbæ, plantæq; magistris.

Illi etenim Europæ succos, Asiæque liquores

Quæque arentes solo sitiens parit Africa, tractant :

Tu veterum inuentis noua consuis omnia, si qua

Indus uterque dedit nostram futura salutem,

Sive aliunde vehit nostras mercator ad oras,

Hoc ipso utilius. Quia quæ sunt credita scriptis,

Illa manu expertus medico, & bene diues ab horto

Explorata diu multumq; emittis in auras,

Quæ curent hominum languentia corpora, multi

Praestantesq; viri docuere fideliter artem.

Sed si sustuleris plantas, quem verba iuvabunt

Sic aniræ, sic fronte minax. In prælia miles

Profilis, at stricto cedit victoria ferro

Quæ tibi pro tanto cedit victoria ferro

Premia persoluet, Myrti lauriq; coronas ?

Istam nouit edax mercedem abolere vetustas.

At tibi pro studio impensisque laboribus istis,

Quæis hominum curas fertam tectamq; salutem,

Ille opifex rerum, custosq; authorq; salutis

Æterna statuit frontem redimire corona.

G. Lannaus Medicus.

In historiam plantarum, Io. Gerardi cinis & Chirurgi Londinensis,
M. Iacobi Ihonstonij Scoti Ballinerise Regij pagi portio-
narij Epigramma.

Define, quæ vastis pomaria montibus Atlas
Clauserat (Hesperij munera rara soli)

Auratis folijs auratos define ramos

Mirari, & ramis pendula poma suis.

Singula cum Domino periere, & Gorgone viso

In montis riguit viscera versus Atlas.

Alcinoi periit qui, cedat pensilis hortus,

Quem celebrat prisca temporis aura fugax :

Vna Gerardini species durabilis horti

Æterno famæ marmore sculpta manet.

Hic quicquid Zephyrus produxit, quicquid & Eurus,

Antiquus quicquid & novus orbis habet,

Intulit in patriam naturamq; exprimit arte :

Sic nullo cedit terra Britannia solo.

Quod

Quod magis est Graium & Latium concludit in vno
Margine, & Anglorum iam facit ore loqui :
Sic erit æternum hinc vt viuas, horte *Gerardi*,
Cultoris studio nobilitate tui.

*In Plantarum historiam, a solertissimo viro, Reiq; Herbaria peri-
tissimo, D. Iohanne Gerardo, Anglice editam
Epigramma.*

EGregiam certè laudem, decus immortale refertis
Tu, sociq; tui, magnum & memorabile nomen
(Illustris **DEVORAX**) raptoribus orbis **IBERIS**
Deiictis classe Anglorum; Tuque (Dicasta
Maxime **EGERTONE**) veterem superans Rhadamanthum,
HEROVM merito censendus in albo.
Nec laus vestra minor (sacrae pietatis alumni)
Qui mentes hominum diuina pascitis esca.
Ornatis Patriam cuncti, nomenq; Britannum
Augetis, vobisq; viam munitis ad astra.
Quin agite, in partem saltem permittite honoris
Phœbei veniant Vates, qui pellere gnari
Agmina morborum, humanæ insidiantia vitæ.
Huius & ingentes, serena fronte labores
ANGLO-DIOSCORIDIS, Patriæ, vestraq; saluti
Excipite exhaustos : paulum huc disuortite in **HORTOS**
Quos **CHORTEIA** colit, quos Flora exornat, & omnes
Naiades, & Dryades, Charites, Nymphæq; Britannæ.
Corporibus hic grata salus, animisq; voluptas.
Hic laxate animos : **HABITAVIT NVMEN IN HORTIS.**

Fran. Hering Med. D.

*Thomas Newtonus, Cestreshyrius, D. Io. Gerardo, ami-
co non vulgari, S.*

Post tot ab ingenuis conscripta volumina mystis,
Herbarum vires qui referare docent,
Tu tandem prodis Spartamq; hanc gnauiter ornas,
Dum reliquis palmam præripuisse studes.
Nec facis hoc, rutilo vt possis ditarier auro,
Nec tibi vt accrescat grandis acervus opum ;
Sed prodesse volens, vestitos gramine colles
Perlustras, & agros, frondiferumq; nemus.
Indeq; Pæonias (apis instar) colligis herbas,
Inq; tuum stirpes congeris aluicolum.
Mille tibi species plantarum, milleq; notæ;
Hortulus indicio est, quem colis ipse domi.
Pampineæ vites, redolens cedrus, innuba laurus,
Nota tibi, nota est pinguis oliua tibi.
Balsama, naryctis, rhododaphne, nardus, amomum,
Saluia, dictamnus, galbana nota tibi.
Quid multis ? radix, stirps, flos, cum cortice ramus,
Spicaq; cum siliquis est bene nota tibi.
Gratulor ergo tibi, cunctisq; (*Gerarde*) Britannis,
Namptwicoq; tuo gratulor, atq; meo.
Nam Cestreshyrij te ac me genuere parentes,
Tu meliore tamen sydere natus eras.
Maeste animo, pergasq; precor, ceptumq; laborem
Vrge etiam vltcrius. Viuitur ingenio.
Aurum habeant alij, gemmas, nitidosq; pyropos,
Plantas tu & flores scribe *Gerarde*. Vale.

Vere & ex animo tuus, Tho. Newton, Ilfordensis

To the well affected Reader and peruser of this
Booke, *St. Bredwell Physition*,
greeting.

Pen is the campe of glorie and honour for all men, saith the younger Pliny: not onely men of great birth and dignitie, or men of office endued with publique charge and titles, are seene therein, and haue the garland of praise and preferment waiting to crowne their merits, but euen the common souldier likewise: so as he, whose name and note was erst all obscure, may by egregiously acts of valour obtaine a place among the noble. The schoole of science keepeth semblable proportion: whose amplitude, as not alwaies, nor onely, men of great titles and degrees, labour to illustrate: so whosoever doth, may confidently account of, at the least, his name to be immortall. What is he then that will denie his voice of gracious commendation to the Authors of this Booke: to every one, no doubt, there is due a condigne measure. The first gatherers out of the Antients, and augmentors by their owne paines, haue already spread the odour of their good names, through all the Lands of learned habitations. D. Priest, for his translation of so much as Dodonzus, hath thereby left a tombe for his honorable sepulture. M. Gerard comming last, but not the least, hath many waies accommodated the whole worke vnto our English Nation: for this Historie of Plants, as it is richly replenished by those fine mens labours laied together, so yet could it full ill haue wanted that new accession he hath made vnto it. Many things hath he nourished in his garden, and obserued in our English fields, that neuer came into their penes to write of. Againe, the greatest number of these plants, hauing neuer been written of in the English tongue, would haue wanted names for the vulgar sort to call them by: in which defect he hath bin curiously carefull, touching both old and new names to make supply. And lest the Reader should too often languish with frustrate desire, to finde some plant he readeth, of rare vertue, he spareth not to tell (if himselfe haue seene it in England) in what wood, pasture or ditch the same may be seene and gathered. Which when I thinke of, and therewithall remember, with what cheerefull alacritie, and resolute attendance he hath many yeares tilled this ground, and now brought forth the fruit of it, whether I should more commend his great diligence to attaine this skill, or his large beneuolence in bestowing it on his countrie, I cannot easily determine. This booke-birth thus brought forth by Gerard, as it is in forme and disposition faire and comely, every species being referred to his likeliest genus, of whose stocke it came: so is it accomplished with surpassing varietie, vnto such spreading growth and strength of euery lim, as that it may seeme some heroicall Impe of illustrious race, able to draw the eies and expectation of euery man vnto it. Somewhat rare it will be here for a man to moue a question of this nature, and depart againe without some good satisfaction. Manifold will be the vse both to the Physition and others: for euery man delighteth in knowledge naturally, which (as Aristotle said) is in prosperitie an ornament, in aduersitie a refuge. But this booke aboue many others will sute with the most, because it both plenteously ministrerth knowledge, which is the food of the minde, and doth it also with a familiar and pleasing taste to euery capacitee. Now as this commoditie is communicated to all, and many shall receiue much fruit thereof, so I wish some may haue the minde to returne a benefit againe, that it might not be true in all that Iuuenall saith, Scire volunt omnes, mercedem solvere nemo: (i.) All desire to know, none to yeeld reward. Let men think, that the perfection of this knowledge is the high aduancement of the health of man: that perfection is not to be attained, but by strong indenor: neither can strong indenor be accomplished without free maintenance. This hath not he, who is forced to labour for his daily bread: but if hee, who from the short houres of his daily and necessarie trauell, stealing as it were some, for the publike behoofe, and setting at length those pecces together, can bring forth so comely a garment as this, meet to couer or put away the ignorance of many: what may be thought he would do, if publicke maintenance did free him from that priuate care, and vntie his thoughts to be wholly intent to the generall good. O Reader, if such men as this sticke not to rob themselves of such wealth as thou haste to enrich thee, with that substance thou wantest, detract not to share out of thine abundance to merit and encourage their paines: that so fluxible riches, and permanent sciences, may the one become a prop vnto the other. Although praise and reward ioined as companions to fruitfull endeours, are (in part) desired of all men, that vndertake losses, labours, or dangers for the publike behoofe: because they adde sinewes (as it were) vnto reason, and able her more and more to refine her selfe: yet doe they not imbrace that honour in respect of it selfe, nor in respect of those that conferred it vpon them, but

as hauing thereby an argument in themselves, that there is something in them worthy estimation
 among men : which then doubleth their diligence to deserue it more abundantly. Admirable and
 for the imitation of Princes, was that act of Alexander, who setting Aristotle to compile com- Plin. lib. 8.
cap. 16.
 mentaries of the bruit creatures, allowed him for the better performance thereof, certaine thou-
 sands of men, in all Asia and Greece, most skilfull obseruers of such things, to giue him informati-
 on touching all beasts, fishes, foules, serpents, and flies. What came of it? A booke written, where-
 in all learned men in all ages since do exercise themselves principally, for the knowledge of the crea-
 tures. Great is the number of those that of their owne priuate haue laboured in the same matter,
 from his age downe to our present time, which all do not in comparison satisfie vs. Whereas if in those
 ensuing ages there had risen still new Alexanders, there (certainely) would not haue wanted
 Aristotles to haue made the euidence of those things an hundred fold more cleered vnto vs, than
 now they be. Whereby you may perceiue the vnequall effects that follow those vsutable causes of
 publike and priuate maintenances vnto labours and studies. Now that I might not dispaire in this my
 exhortation, I see examples of this munificence in our age to giue me comfort : Ferdinand the Em- Gryllus in
orat. de pere-
gr. studij me-
dic.
 peror and Cosmus Medices Prince of Tuscane are herein registred for furthering this science of
 plants, in following of it themselves and becomming skilfull therein : which course of theirs could
 not be holden without the supporting and aduancing of such as were studious to excell in this kinde.
 Bellonius likewise (whom for honours cause I name) a man of high attempts in naturall science, Bellon. de
negl. stirp.
cul. prob. 9.
 greatly extollet his Kings liberalitie, which endued him with free leisure to follow the studie of
 plants, seconded also herein by Montmorencie the Constable, the Cardinals Castillon and Lor-
 raine, with Oliuerius the Chancellor, by whose meanes he was enabled to performe those his notable
 peregrinations in Italy, Africa and Asia : the sweet fruit whereof, as we haue receiued some taste by
 his obseruations, so we should plenteously haue been filled with them, if violent death by most accursed
 robbers had not cut him off. And as I finde these examples of comfort in forreine nations, so we are (I
 confesse) much to be thankfull to God, for the experience we haue of the like things at home. If
 (neuerthelesse) vnto that Physicke lecture lately so well erected, men who haue this worlds goods
 shall haue hearts also of that spirit, to adde some ingenious labourer in the skill of simples, they shall
 mightily augment and adorne the whole science of Physicke. But if to that likewise they ioine a
 third, namely the art of Chemicall preparation, that out of those good creatures which God hath
 giue n man for his health, pure substances may be procured for those that be sicke, (I feare not to say
 it, though I see how Momus scorneth) this present generation would purchasemore to the perfecti-
 on of Physicke, than all the generations past since Galens time haue done : that I say, nothing of this
 one fruit that would grow thereof, to wit, the discovering and abolishing of these pernicious impo-
 stures and sophistications, which mount promising Paracelsians euery where obtrude, through want
 of a true and constant light among vs to discerne them by. In which behalfe, remembering the Hipp. de Lege.
 mournfull speech of graue Hippocrates; The art of Physicke truly excelleth all arts, howbe-
 it, through the ignorance partly of those that exercise it, and partly of those that
 iudge rashly of Physitions, it is accounted of all arts the most inferiour: I say in like man-
 ner, the art of Chimiſtrie is in it selfe the most noble instrument of naturall knowledges, but through
 the ignorance & impiety, partly of those that most audaciously professe it without skill, and partly of
 them that impudently condemne that they know not, it is of all others most basely despised and scorn-
 fully rejected. A principall remedy to remoue such contumelious disgrace from these two pure vir-
 gins of one stocke and lineage, is this that I haue now insinuated, even by erecting the laboratory of
 an industrious Chimiſt, by the sweet garden of flourishing simples. The Physicke reader by their
 meanes shall not onely come furnished with authorities of the Ancients, and sensible probabilities
 for that he teacheth, but with reall demonstrations also in many things, which the reason of man
 without the light of the fornace would neuer haue reached vnto. I haue uttered my hearts desire,
 for promoting first the perfection of my profession, and next by necessary consequence, the
 healthie liues of men. If God open mens hearts to provide for the former, it cannot be
 but that the happy fruits shall be seene in the later. Let the ingenious
 learned iudge whether I haue reason on my side : the
 partiall addicted sect I shun, as men
 that neuer meane good to
 posteritie.

George

George Baker, one of her Maiesties chiefe Chirurgions in
ordinarie, and M. of the Chirurgions of the Citie
of London, to the Reader.

ARistotle, a Prince amongst the Philosophers, writing in his Metaphysicks of the nature of mankind, saith, that man is naturally inclined and desirous of science. The which sentence doth teach vs, that all creatures (being vertuously giuen) doe strue to attain to perfection, and draw neare in what they can to the Creator; and this knowledge is one of the principall parts which doth concerne the perfection of vnderstanding: for of the same doth follow, that all such are generally inclined to know the meanes by the which they may conserue their life, health, and reputation. And although it be necessarie for man to learne and know all sciences, yet neuerthelesse the knowledge of naturall philosophie ought to be preferred, as being the most necessarie; and moreouer it doth bring with it a singular pleasure and contentment. The first inuentor of this knowledge was *Chiron* the Centaure, of great renowne, sonne to *Saturne* and *Phillyre*: and others say that it was inuented of *Apollo*: & others of *Esculape* his son; esteeming that so excellent a science could neuer proceed but from the gods immortal, and that it was impossible for man to finde out the nature of Plants, if the great worker, which is God, had not first instructed and taught him. For, as *Pliny* saith, if any thinke that these things haue bin inuented by man, he is vngratefull for the workes of God. The first that we can learn of among the Greekes that haue diligently written of herbes, haue bin *Orpheus*, *Musaeus*, and *Hesiod*, hauing bin taught by the Egyptians: then *Pythagoras* of great renowne for his wisdom, which did write bookes of the nature of Plants, and did acknowledge to learne the same from *Apollo* and *Esculape*. *Democrite* also did compose bookes of Plants, hauing first trauelled ouer all Persia, Arabia, Ethiopia, and Egypt. Many other excellent spirits haue taken great pleasure in this science, which to accomplish haue hazarded their liues in passing many vnkowne regions, to learne the true knowledge of *Elleborus*, and other Medicaments: of which number were *Hippocrates*, *Crateua*, *Aristotle*, *Theophrast*, *Diocles Caristius*, *Pamphylus*, *Montius*, *Hierophile*, *Dioscorides*, *Galen*, *Pliny*, and many others, which I leaue to name, fearing to be too long. And if I may speake without partialitie of the Author of this book, his great paines, his no lesse expences in traouelling far and neere for the attaining of his skill haue bin extraordinarie. For he was neuer content with the knowledge of those simples which grow in those parts, but vpon his proper cost and charges hath had out of all parts of the world all the rare simples which by any means he could attaine vnto, not onely to haue them brought, but hath procured by his excellent knowledge to haue them growing in his garden, which as the time of the yeare doth serue may be seene: for there shall you see all manner of strange trees, herbes, roots, plants, floures, and other such rare things, that it would make a man wonder, how one of his degree, not hauing the purse of a number, could euer accomplish the same. I protest vpon my conscience, I do not think for the knowledge of Plants, that he is inferiour to any: for I did once see him tried with one of the best strangers that euer came into England, and was accounted in Paris the onely man, being recommended vnto me by that famous man Master Amb.

Pareus,

Pareus; and he being here was desirous to goe abroad with some of our Herbarists, for the which I was the meane to bring them together, and one whole day we spent therein, searching the rarest Simples: but when it came to the triall, my French man did not know one to his foure. What doth this man deserue that hath taken so much paines for his countrey, in setting out a booke, that to this day neuer any in what language soeuer did the like? First for correcting their faults in so many hundred places, being falsly named, mistaken the one for the other; and then the pictures of a great number of plants now newly cut. If this man had taken this paines in Italy and Germany, where *Matthiolus* did write, he should haue sped as well as he did: For (saith he) I had so great a desire euer to finish my Booke, that I neuer regarded any thing in respect of the publique good, not so much as to thinke how I should finish so great a charge, which I had neuer carried out, but that by Gods stirring vp of the renowned Emperour *Ferdinando* of famous memorie, and the excellent Princes had not helped mee with great sums of money, so that the Commonwealth may say, That this blessing doth rather proceed of them than from me. There haue been also other Princes of Almaine which haue bin liberal in the preferring of this Book, and the most excellent Elector of the Empire the Duke of Saxonie, which sent me by his Post much mony toward my charges: the liberalitie of the which and the magnificence toward me I cannot commend sufficiently. They which followed in their liberalitie were the excellent *Fredericke* Count Palatine of the Rhine, and the excellent *Ioachim* Marques of Brandenburg, which much supplied my wants: and the like did the reuerend Cardinall and Prince of Trent, and the Excellent Archbishop of Saltzperg, the Excellent Dukes of Bauare and Cleues, the duke of Megapolencis Prince of Vandalis, the State Republique of Noremberg, the liberalitie of whom ought to be celebrated for euer: and it doth much reioice me that I had the helpe and reward of Emperors, Kings, Electors of the Roman Empire, archdukes, Cardinalls, Bishops, Dukes and Princes, for it giveth more credit to our Labors than any thing that can be said. Thus far *Matthiolus* his owne writing of the liberalitie of Princes towards him. What age do we liue in here that wil suffer all vertue to go vnrewarded? Master *Gerard* hath taken more pains than euer *Matthiolus* did in his Commentaries, and hath corrected a number of faults that he passed ouer; and I dare affirme (in reuerence be it spoken to that Excellent man) that Master *Gerard* doth know a great number of Simples that were not knowne in his time: and yet I doubt whether he shall taste of the liberalitie of either Prince, Duke, Earle, Bishop, or publique Estate. Let a man excell neuer so much in any excellent knowledge, neuertheles many times he is not so much regarded as a Iester, a Boaster, a Quacksaluer or Mountebanke: for such kinde of men can flatter, dissemble, make of trifles great matters, in praising of this rare secret, or that excellent spirit, or this Elixer or Quintessence;

which when it shall come to the triall, nothing

shal be found but boasting words.

VALE.

To the courteous and well willing Readers.

Although my paines haue not been spent (courteous Reader) in the gracious discouerie of golden Mines, nor in the tracing after silver veins, whereby my native country might be enriched with such merchandise as it hath most in request and admiration; yet hath my labour (I trust) been otherwise profitably employed, in descrying of such a harmlesse treasure of herbes, trees, and plants, as the earth frankly without violence offereth vnto our most necessarie vses. Harmlesse I call them, because they were such delights as man in the perfectest state of his innocencie did erst inioy: and treasure I may well terme them, seeing both Kings and Princes haue esteemed them as Jewels; sith wise men haue made their whole life as a pilgrimage to attaine to the knowledge of them: by the which they haue gained the hearts of all, and opened the mouthes of many, in commendation of those rare vertues which are contained in these terrestriall creatures. I confesse blind Pluto is now adayes more sought after than quicke sighted Phœbus: and yet this dusty mettall, or excrement of the earth (which was first deeply buried least it should be an eye-sore to grieue the corrupt heart of man) by forcible entry made into the bowels of the earth, is rather snatched at of man to his owne destruction, than directly sent of God, to the comfort of this life. And yet behold in the compassing of this worldly drosse, what care, what cost, what aduentures, what mysticall proofes, and chymicall trials are set abroad; when as notwithstanding the chiefeest end is but vncertaine wealth. Contrariwise, in the expert knowledge of herbes, what pleasures still renewed with varietie? what small expence? what security? and yet what an apt and ordinary meane to condauct man to that most desired benefit of health? Which as I devoutly wish vnto my native country, and to the carefull nursing mother of the same; so hauing bent my labours to the benefiting of such as are studiously practised in the conseruation thereof, I thought it a chiefe point of my duty, thus out of my poore store to offer vp these my far fetched experiments, together with mine owne countries vnkowne treasure, combined in this compendious Herball (not vnprofitable though vnpolished) vnto your wise constructions and courteous considerations. The drift whereof is a ready introduction to that excellent art of Simpling, which is neither so base nor contemptible as perhaps the English name may seeme to intimate: but such it is, as altogether hath been a study for the wisest, an exercise for the noblest, a pastime for the best. From whence there spring floures not onely to adorne the garlands of the Muses, to decke the bosomes of the beautiful, to paint the gardens of the curious, to garnish the glorious crownes of Kings; but also such fruit as learned Dioscorides long trauelled for; and princely Mithridates reserued as precious in his owne closet: Mithridates I meane, better knowne by his soueraigne Mithridate, than by his sometime speaking two and twenty languages. But what this famous Prince did by tradition, Euax king of the Arabians did deliuer in a discourse written of the vertues of herbes, and dedicated it vnto the Emperor Nero. Euery Greene Herbarist can make mention of the herbe Lysimachia, whose vertues were found out by King Lysimachus, and his vertues no lesse eternised in the selfe same plant, than the name of Phydias, quaintly beaten into the shield of Pallas, or the first letters of Ajax or Hyacinthus (whether you please) registred in that beloued floure of Apollo. As for Artemisia, first called napew, whether the title thereof sprang from *Artemis*, Diana her selfe, or from the renowned Queene of Caria, which disclosed the vse thereof vnto posteritie, it suruineth as a monument to reuiue the memories of them both for euer. What should we speake of Gentiana, bearing still the cognisance of Gentius? or of diuers other herbes taking their denominations of their princely Inuentors? What should I say of those royall personages, Iuba, Attalus, Climenus, Achilles, Cyrus, Masynissa, Semyramis, Dioclesian? but onely thus, to bespeake their princely loues to Herbarisme, and their euerlasting honors (which neither old Plinius dead, nor yong Lipsius liuing will permit to die?) Crescent herbæ, crescetis amores: crescent herbæ, crescetis honores. But had this wonted facultie wanted the authorisement of such a royall companie, King Solomon, excellling all the rest for wisdom, of greater royaltie than they all (though the Lillies of the field out-braved him) he only (I say) might yeeld hereunto sufficient countenance and commendation, in that his lofty wisdom thought no scorne to stoupe vnto the lowly plants. I list not seeke the

common

To the Reader.

common colours of antiquitie, when notwithstanding the world can brag of no more antient Monument than Paradise and the garden of Eden: and the fruits of the earth may contend for seigniorie, seeing their mother was the first Creature that conceived, and they themselves the first fruit she brought forth. Talke of perfect happinesse or pleasure, and what place was so fit for that as the garden place where Adam was set to be the Herbarist? Whither did the Poets hunt for their sincere delights, but into the gardens of Alcinous, of Adonis, and the Orchards of Hesperides? Where did they dreame that Heauen should be, but in the pleasant garden of Elysium? Whither do all men walke for their honest recreation, but thither where the earth hath most beneficially painted her face with flourishing colours? And what season of the yeare more longed for than the Spring, whose gentle breath enticeth forth the kindly sweets, and makes them yeeld their fragrant smells? who would therefore looke dangerously vp at Planets, that might safely looke downe at Plants? And if true be the old proverbe, Quæ supra nos, nihil ad nos; I suppose this new saying cannot be false, Quæ infra nos, ea maximè ad nos. Easie therefore is this treasure to be gained, and yet pretious. The science is nobly supported by wise and Kingly Fauorites: the subiect thereof so necessary and delectable, that nothing can be confectioned either delicate for the taste, daintie for smell, pleasant for sight, wholesome for body, conseruative or restorative for health, but it borroweth the relish of an herbe, the saour of a floure, the colour of a lease, the iuice of a plant, or the decoction of a root. And such is the treasure that this my Treatise is furnished withall, wherein though myne Art be not able to counterwaile Nature in her liuely portraictures; yet haue I counterfeited likenes for life, shapes and shadowes for substance, being ready with the bad Painter to expaine the imperfections of my pensill with my pen, chusing rather to score vpon my pictures such rude marks as may describe my meaning, than to let the beholder to guesse at randome and misse. I haue here therefore set downe not onely the names of sundry Plants, but also their natures, their proportions and properties, their affects and effects, their increase and decrease, their flourishing and fading, their distinct varieties and seuerall qualities, as well of those which our owne Countrey yeeldeth, as of others which I haue fetched further, or drawne out by perusing diuers Herbals set forth in other languages, wherein none of my country-men hath to my knowledgetaken any paines, since that excellent Worke of Master Doctor Turner. After which time Master Lyte a Worshipfull Gentleman translated Dodonæus out of French into English: and since that, Doctor Priest, one of our London Colledge, hath (as I heard) translated the last Edition of Dodonæus, and meant to publish the same; but being preuented by death, his translation likewise perished. Lastly my selfe, one of the least among many, haue presumed to set forth vnto the view of the world, the first fruits of these myne owne Labours, which if they be such as may content the Reader, I shall thinke my selfe well rewarded, otherwise there is no man to be blamed but my selfe, being a worke I confesse for greater Clerkes to undertake: yet may my blunt attempt serue as a whetstone to set an edge vpon some sharper wits, by whom I wish this my course Discourse might be both fined and refined. Faults I confesse haue escaped, some by the Printers ouersight, some through defects in my selfe to performe so great a Worke, and some by meanes of the greatnesse of the Labour, and that I was constrained to seeke after my liuing, being void of friends to beare some part of the burthen. The rather therefore accept this at my hands (louing Countrey-men) as a token of my good will; and I trust that the best and well minded wil not rashly condemne me, although some thing haue passed worthy reprehension. But as for the slanderer or Enuious I passe not for them, but returne vpon themselves any thing they shall without cause either murmur in corners, or iangle in secret. Farewell.

From my House in Holborn within the Suburbs
of London, this first of December, 1597.

Thy sincere and vnfeigned Friend,

JOHN GERARD.

TO THE READER.

Courteous READER,

Here are many things which I thinke needfull to impart vnto thee, both concerning the knowledge of plants in generall, as also for the better explaining of some things pertinent to this present Historie, which I haue here set forth much amended and enlarged. For the generall differences, affections, &c. of Plants, I hold it not now so fitting nor necessarie for me to insist vpon them, neither doe I intend in any large discourse to set forth their many and great vses and vertues: giue me leaue onely to tell you, That God of his infinit goodnesse and bountie hath by the *medium* of Plants, bestowed almost all food, clothing, and medicine vpon man. And to this off-spring we also owe (for the most part) our houses, shipping, and infinite other things, though some of them *Proteus*-like haue run through diuers shapes, as this paper wereon I write, that first from seed became Flax, then after much vexation thred, then cloath, where it was cut and mangled to serue the Fashions of the time: but afterwards rejected and cast aside, yet vnwilling so to forsake the seruice of man for which God had created it, againe it comes (as I may terme it) to the Hammer, from whence it takes a more noble forme and aptitude to be employed to Sacred, Ciuill, Forreine and Domestick vses. I will not speake of the many and various objects of delight that these present to the senses, nor of sundry other things, which I could plentifully in this kinde deliuer: but rather acquaint you from what Fountaines this Knowledge may be drawne, by shewing what Authours haue deliuered to vs the Historie of Plants, and after what manner they haue done it; and this will be a meanes that many controuersies may be the more easily vnderstood by the lesse learned and judicious Reader.

Solomon.

He whose name we first finde vpon record (though doubtlesse some had treated therof before) that largely writ of Plants, was the wisest of men, euen King *Solomon*, who certainly would not haue medled with this subiect, if he in his wisdom had not knowne it worthy himselfe, and exceeding fitting: First for the honour of his Creator, whose gifts and blessings these are: Secondly for the good of his Subiects, whereof without doubt, he in this worke had a speciall regard in the curing of their diseases and infirmities. But this kingly worke being lost, I will not insist vpon it, but come to such as are yet extant, of which (following the course of antiquitie) that of *Theophrastus* first takes place.

Theophrastus.

Now *Theophrastus* succeeded *Aristotle* in the gouernement of the Schoole at Athens, about the 114 Olymp. which was some 322 yeares before Christ. He among many other things writ a Historie of Plants in ten bookes, and of the causes of them, eight bookes; of the former ten there are nine come to our times reasonable perfect, but there now remain but six of the eight of the causes of Plants. Some looking vpon the Catalogue of the bookes of *Theophrastus* his writing, set forth in his life, written by *Diogenes Laertius*, may wonder that they finde no mention of these bookes of Plants, amongst these he reckons vp, and indeed I thought it somewhat strange, and so much the more, because this his life is set forth by *Daniel Heinsius* before his * Edition of *Theophrastus*, and there also no mention neither in the Greeke nor Latine of those workes. Considering this, I thinking to haue said something therof, I found the doubt was long since cleared by the learned *Cassabone* in his notes vpon *Laertius*, where pag. 321. for *Περὶ φυτῶν ιστορίαι*, and *φυτῶν αἰτιολογία*, hee wishes you to reade *Περὶ φυτῶν ιστορίαι* and *αἰτιολογία*. Thus being certaine of the Authour, let mee say somewhat of the work, which though by the iniurie of time it hath suffered much, yet is it one of the chiefe pieces of Antiquitie, from whence the knowledge of Plants is

Lugd. Batav.
1613.

Excus. ab
Henr. Steph.
1593.

To the Reader.

to be drawne. *Theophrastus* as he followed *Aristotle* in the Schoole, so also in his manner of writing, for according as *Aristotle* hath deliuered his *Historia Animalium*, so hath hee set forth this of Plants, not by writing of each species in particular, but of their differences and nature, by their parts, affections, generations and life. Which how hard a thing it was, hee tells you in his second Chapter, and renders you this reason, *Because there is nothing common to all Plants, as the mouth and belly is to other living creatures, &c.* Now by this manner of writing you may learne the generall differences and affections of Plants, but cannot come to the particular knowledge of any without much labour: for you must goe to many places to gather vp the description of one Plant: neither doth hee (nor is it necessarie for any writing in this manner) make mention of any great number, and of many it may bee but once. His workes being in Greeke were translated into Latine by *Theodore Gaza*, who did them but *Graca fide*, for he omitted some things, otherwhiles rendred them contrary to the minde of the Author: but aboue all, he tooke to himselfe too much libertie in giuing of names in imitation of the Greeke, or of his owne inuention, when it had beene better by much for his Reader to haue had them in the Greeke, as when he renders *ἑλαττοίριον*, *Agitationum*, *ἰνδοπέμον* *Solaris*, &c. The learned *Iulius Scaliger* hath set forth *Animaduersiones* vpon these bookes, wherein he hath both much explained the minde of *Theophrastus*, and shewed the errours of *Gaza*. Some since his time haue promised to do something to this Author, as *Daniel Heinsius*, and *Spigelius*, but twentie yeares are past since, and I haue not yet heard of any thing done in this kinde by either of them. Thus much for *Theophrastus*.

Theoph. Hist. pl. l. 1. cap. 1.

Σημείον δὲ τὸ μὴ εἶναι ἐν ταῖς κοινῇς ἀνθρώπων καὶ ζώων ὅσας ἔχει τὸ σπέρμα καὶ τὸν πόρον.

Let me not passe ouer *Aristotle* in silence, though his bookes writ of this subiect were but two, and these according to the coniecture of *Iulius Scaliger* (who hath made a large and curious examination of them) haue either perished, or come to vs not as they were originally written by *Aristotle*, but as they haue been by some later man put into Greeke. Amongst other things *Scaliger* hath these concerning those two bookes: *Reor è textrina Theophrasti detracta fila quaedam, ijsq; clauos additos, tametsi neque aureos, neque purpureos. Quod si protinus autorem tibi dari vis ad Arabum diligentiam propius accedit.* And afterwards thus: *Attribuere viri docti, alius alijs, at quidem qui aliorum viderem nihil Planudem autorem facienti malim assentiri, extant enim illius alijs in libris similis vestigia semilatinietatis, &c.* Thus much for *Aristotle*, whom as you see I haue placed after his Scholler, because there is such doubt of these bookes carried about in his name, and for that *Scaliger* as you see thinks them rather taken out of *Theophrastus*, than written by his Master.

Aristotle

The next that orderly followes is *Pedacius Dioscorides Anazarbeus*, who liued (according to *Suidas*) in the time of *Cleopatra*, which was some few yeares before the birth of our Sauour. Now *Suidas* hath confounded * *Dioscorides Anazarbeus* with *Dioscorides Phacas*, but by some places in *Galen* you may see they were different men: for our Anazarbean *Dioscorides* was of the Empericke sect, but the other was a follower of *Herophylus* and of the Rationall sect. He writ not only of Plants, but *de tota materia medica*, to which studie hee was addicted euen from his childe-hood, which made him trauell much ground, and leade a militarie life, the better to accomplish his ends: and in this he attained to that perfection, that few or none since his time haue attained to, of the excellencie of his worke, which is as it were the foundation and ground-worke of all that hath been since deliuered in this nature. Heare what *Galen* one of the excellentest of Physicians, and one who spent no small time in this study, affirms: But, saith he, the Anazarbean *Dioscorides* in fve bookes hath written of the necessarie matter of medicine, not onely making mention of herbes, but also of trees, fruits, liquours and iuices, as also of all mineralls, and of the parts of living creatures: and in mine opinion he hath with the greatest perfection performed this worke of the matter of Medicine: for although many before him haue written well vpon this subiect, yet none haue writ so well of all. Now *Dioscorides* followes not the method of *Theophrastus*, but treats of each kinde of herbe in particular, first giuing the names, then the description, and then the place where they vsually grow, and lastly their vertues: Yet of some, which then were as frequently knowne with them, as Sage, Rosemary, an Ash or Oke tree are with vs, he hath omitted the descriptions, as not necessarie, as indeed at that time when they were so vulgarly knowne, they might seeme so to be: but now wee know the least of these, and haue no certaintie, but some probable coniectures do direct vs to the knowledge of them. He was not curious about his words nor method, but plainely and truly deliuered that whereof he had certaine and experimentall knowledge, concerning the description and nature of Plants. But the generall method he obserued you may finde set forth by *Bauhine* in his Edition of *Mathiolus*, immediatly after the preface of the first booke, whereto I refer the curious, being too long for me in this place to insist vpon. His

Dioscorides.

Διοσκορίδης Ἀναζαρβεὺς ἰατρὸς ὁ ἑστῆς ἐκείνης τῆς πόλεως ὁ ὀνομασθεὶς φάκας ἔκκ. Σκιδ.

De simpl. med. facult. lib. 6. proem.

ἡμετέριον ἔργον

To The Reader.

workes that haue come to vs are five bookes *de materia Medica*. One *de letalibus venenis, eorumq; praecautione et curatione*: another *de Cane rabido, deq; notis quae morsus ictusve animalium venenum relinquentium sequuntur*: a third *De eorum curatione*. These eight bookes within these two last centuries of yeares haue been translated out of Greeke into Latine, and commented vpon by diuers, as *Hermolaus Barbarus, Iohannes Ruellius, Marcellus Virgilius, &c.* But of these and the rest, as they offer themselves, I shall say somewhat hereafter. There is also another worke which goes vnder his name, and may well be his. It is *de facili parabilibus*, diuided into two bookes, translated and confirmed with the consent of other Greeke Physitions, by the great labour of *Iohn Moibane* a Physition of Aufpurge, who liued not to finish it, but left it to bee perfected and set forth by *Conrade Gesner*.

Pliny.

The next that takes place is the laborious *Caius Plinius secundus*, who liued in the time of *Vespasian*, and was suffocated by the sulphureous vapours that came from mount *Vesuvius*, falling at that time on fire, he through ouermuch curiositie to see and finde out the cause thereof approaching too nigh, and this was *Anno Domini, 79.* He read and writ exceeding much, though by the iniurie of time wee haue no more of his than 37. bookes *de Historia Mundi*. which also haue receiued such wounds, as haue tried the best skill of our Critickes, and yet in my opinion in some places require *medicas manus*. From the twelfth to the end of the twentieth seuenth of these bookes he treats of Plants, more from what he found written in other Authors, than from any certaine knowledge of his owne, in many places following the method and giuing the words of *Theophrastus*, and in other places those of *Dioscorides*, though he neuer make mention of the later of them: he also mentions, and no question followed many other Authors, whose writings haue long since perished. Sometimes he is pretty large, and otherwhiles so brieft, that scarce any thing can thence be gathered. From the seuenteenth vnto the twentieth seuenth he variously handles them, what method you may quickly see by his *Elenchus*, contained in his first book, but in the twenty seuenth hee handles those whereof hee had made no, or not sufficient mention, after an Alphabetical order, beginning with *Aethyopsis, Ageratum, Aloe, &c.* so going on to the rest.

Galen.
Paulus.
Aetius.

I must not passe ouer in silence, neither need I long insist vpon *Galen, Paulus Aegineta, and Aetius*, for they haue only alphabetically named Plants and other simple Medicines, briefly mentioning their temperature and faculties, without descriptions (some very few, and those brieft ones, excepted) and other things pertinent to their historie.

Macer.

The next that present themselves are two counterfeites, who abuse the World vnder feined titles, and their names haue much more antiquitie than the works themselves: the first goes vnder the title of *Emilius Macer* a famous Poet, of whom *Ouid* makes mention in these verses:

*Sape suas volucres legit mihi grandior aeo,
Quaq; nocet Serpens, quae inuat herba Macer.*

Pliny also makes mention of this *Macer*: hee in his Poems imitated *Nicander*, but this worke that now is carried about vnder his name, is written in a rude, and somewhat barbarous verse, far different from the stile of those times wherein *Macer* liued, and no way in the subiect imitating *Nicander*. It seemes to haue beene written about 400 or 500 yeares agoe.

Apuleius.

The other also is of an vnknowne Author, to whom the Printers haue giuen the title of *Apuleius Madaurensis*, and some haue been so absurdly bold of late, as to put it vnto the workes of *Apuleius*; yet the vncurious stile and method of the whole booke will conuince them of error, if there were no other argument. I haue seene some foure manuscripts of this Authour, and heard of a fifth, and all of them seeme to bee of good Antiquitie: the figures of them all for the most part haue some resemblance each of other: the first of these I saw some nine yeares agoe with that worthy louer and storer of Antiquities, *Sir Robert Cotton*: it was in a faire Saxon hand, and as I remember in the Saxon tongue; but what title it carried, I at that time was not curious to obserue. I saw also another after that, which seemed not to be of any small standing, but carelesly obserued not the title. But since I being informed by my friend Master *Goodyer* (as you may finde in the Chapter of Saxifrage of the Antients) that his Manuscript which was very antient, acknowledged no such Author as *Apuleius*, I beganne a little to examine some other Manuscripts, so I procured a very faire one of my much honored friend *Sr. Theod. Mayerne*: in the verie beginning of this is writ, *In hoc continentur libri quatuor medicinae Ypocratis, Platonis Apolienensis orbis de diuersis herbis; Sexti Papiri placiti ex Animalibus, &c.* A little after in

To the Reader.

in the same page at the beginning of a table which is of the vertues, are these words, *In primo libro sunt herbae descriptae, quas Apoliensis Plato descripsit, &c.* and thus also he is named in the title of the Epistle or Proeme; but at the end of the worke is *explicit liber Platonis de herbis masculinis, &c.* With this in all things agrees that of Mr. Goodyer, as he hath affirmed to me. Besides these, I found one with Mr. John Tradescant, which was written in a more ignorant and barbarous time, as one may coniecture by the title, which is thus at the very beginning. *In nomine domini incipit Herboraliū Apulei Platonis quod accepit a Scolapio, & Chirone Centauro magistro.* Then followes (as also in the former, and in the printed bookes) the tract ascribed to *Antonius Musa, de herba Betonica*: after that are these words, *Liber Medicinae Platonis herbaticus explicit.* By this it seemes the Author of this worke either was named, or else called himselfe *Plato*, a thing not without example in these times. This worke was first printed at Basill, 1528. amongst some other workes of Physicke, and one *Albanus Torinus* set it forth by the helpe of many Manuscripts, of whose imperfections he much complains, and I thinke not without cause: after this, *Gabriel Humelbergius* of Ravenspurg in Germany set it forth with a Comment vpon it, who also complains of the imperfections of his copies, and thinks the worke not perfect: indeed both the editions are faultie in many places: and by the help of these Manuscripts I haue seen they might be mended (if any thought it worth their labour) in some things, as I obserued in cursorily looking ouer them. One thing I much maruell at, which is, that I finde not this Author mentioned in any Writer of the middle times, as *Platanius*, *Bartholomaeus Angelus*, &c. Now I coniecture this worke was originally written in Greeke, for these reasons: first, because it hath the Greeke names in such plenty, and many of them proper, significant, and in the first place: Secondly some are onely named in Greeke, as *Hierobulbon*, *Artemisia Leptophyllos*, and *Artemisia tagantes*, *Batrachion*, *Gryas* (which I iudge rather Greeke than Latine) &c. Besides in both the written bookes in very many places amongst the names I finde this word *Omeos*, but diuersly written; for I coniecture the Greeke names were written in the Greeke character, and *ἰσοίως* amongst them; and then also when the rest of the worke was translated, which afterwards made the transcribers who vnderstood it not to write it variously, for in the one booke it is alwaies written *Amoeos*, and in the other *Omeos*, and somtimes *Omeos*, as in the Chapter of *Brittanica*, the one hath it thus, *Nomen herbae istius Brittanicae, Amoeos dicunt eam Damasinium, &c.* The other thus: *Nomen herbae Brittanicae, Omeos Damasinus, &c.* & in the chap. of *Althea* the one hath it thus: *Nomen huius herbae Althea Amoeos vocant hanc herbam Moloche, &c.* The other *Nomen herbae Ibisus omeos Moloce, &c.* If it be certaine which *Philip Ferrarius* affirms in his *Lexicon Geographicum*, that the citie Apoley is Constantinople, then haue I found *Apoliensis urbis*, of which I can finde no mention in any antient or moderne Geographer besides; and then it is more than probable that this was written in Greeke, and it may be thought differently translated, which occasions such diuersitie in the copies, as you shall finde in some places. Now I coniecture this worke was written about some 600. yeares agoe.

From these Antients haue sprung all, or the greatest part of the knowledge, that the middle or later times haue had of Plants; and all the controuersies that of late haue so stuffed the bookes of such as haue writ of this subiect, had their beginning by reason that the carelesnesse of the middle times were such, that they knew little but what they transcribed out of these Antients, neuer endeavouring to acquire any perfect knowledge of the things themselves: so that when as learning (after a long Winter) began to spring vp againe, men began to be somewhat more curious, and by the notes and descriptions in these antient Authors they haue laboured to restore this lost knowledge; making inquirie, first whether it were knowne by *Theophrastus*, *Dioscorides*, or any of the Antients, then by what name. But to returne to my Authors.

About *An. Dom. 1100.* or a little after, liued the Arabians *Auicen*, *Auerrhoes*, *Mesue*, *Rhasis*, *Serapio*; most of these writ but briefly of this subiect; neither haue we their workes in the Arabicke wherein they were written, but barbarously translated into Latine, and most part of these workes were by them taken out of the Greekes, especially *Dioscorides* and *Galen*; yet so as they added somewhat of their own, and otherwhiles confounded other things with those mentioned by the Greekes, because they did not well know the things whereof they writ. *Auicen*, *Auerrhoes*, and *Rhasis* alphabetically and briefly (following the method of *Galen*) giue the names, temperature, and vertues, of the chiefe simple medicines. But *Serapio* after a particular tract of the temperature and qualities of simple medicines in generall, comes to treat of them in particular, and therein followes chiefly *Dioscorides*, *Galen*, and *Paulus*, and diuers Arabians that went before him. This is the chiefe worke in this kinde of the Arabians, which haue come to vs; he himselfe tells vs his methode

To The Reader.

thod in his preface, which is (when he comes to particulars) first of medicines temperate, then of those that are hot and drie in the first degree; then those cold and drie in the same degree: after that, those hot and dry in the second degree, &c. and in each of these tracts he followes the order of the Arabicke Alphabet.

In or after the times of the Arabians vntill about the yeare 1400. There were diuers obscure and barbarous writers, who by sight knew little whereof they writ, but tooke out of the Greekes, Arabians, and one another, all that they writ, giuing commonly rude figures, seldome setting downe any descriptions: I will only name the chiefe of them that I haue seene, and as neare as I can guesse in that order that one of them succeeded another. For the particular times of their liuing is somewhat difficult to be found out. One of the ancientest of them seemes to be *Isidore*; then *Platearius* whose worke is Alphabetical and intituled *Circa instans*: the next *Mattheus Syluaticus*, who flourished about the yere 1319. his worke is called *Pandecta*: a little after him was *Bartholomaeus Anglus*, whose workes (as that of *Isidore*, and most of the rest of those times) treat of diuers other things besides Plants, as Beasts, Birds, Fishes, &c. His worke is called *De proprietatibus rerum*: the Authors name was *Bartholmew Glanvill*, who was descended of the Noble Family of the Earles of Suffolke; and he wrote this worke in *Edward* the thirds time, about the yeare of our Lord, 1397. After all these, and much like them is the *Hortus sanitatis* whose Author I know not. But to leaue these obscure men and their writings, let me reckon some of later time, who with much more learning and iudgement haue endeouored to illustrate this part of Physicke.

About some 200 yeare agoe learning againe beginning to flourish, diuers begunne to leaue and loath the confused and barbarous writings of the middle times, and to haue recourse to the Antients, from whence together with puritie of language, they might acquire a more certaine knowledge of the things treated of, which was wanting in the other. One of the first that tooke paines in this kinde was *Hermelaus Barbarus* Patriarch of Aquileia, who not onely translated *Dioscorides*, but writ a Commentarie vpon him in fve bookes, which he calls his *Corollarium*; in this worke hee hath shewed himselfe both iudicious and learned.

After him *Marcellus Virgilius* Secretarie to the State of Florence, a man of no lesse learning and iudgement than the former, set forth *Dioscorides* in Greeke and Latine with a Comment vpon him.

Much about their time also *John Ruellius* a French Physition, who flourished in the yere 1480, translated *Dioscorides* into Latine, whose translation hath been the most followed of all the rest. Moreouer he set forth a large worke, *De natura Stirpium*, diuided into three bookes, wherein he hath accurately gathered all things out of sundry writers, especially the Greekes and Latines; for first hauing (after the manner of *Theophrastus*) deliuered some common precepts and Aduertisements pertaining to the forme, life, generation, ordering, and other such accidents of plants; he then comes to the particular handling of each species.

Much about this time, the Germanes began to beautifie this so necessary part of Physicke; and amongst them *Otho Brunfelsius*, a Physition of good account, writ of plants, and was the first that gaue the liuely figures of them; but he treated not in all of aboue 288 Plants. He commonly obserues this method in his particular chapters: First the figure (yet he giues not the figures of all he writes of) then the Greeke, Latine, and Germane names; after that, the description and historie out of most former Authors; then the temperature and vertues, and lastly, the Authours names that had treated of them. His worke is in three parts or tomes, the first was printed in 1530. the second in 1531, and the third in 1536.

Next after him was *Hieronymus Tragus* a learned, ingenious, and honest writer, who set forth his workes in the German tongue, which were shortly after translated into Latine by *Danid Kiber*. He treats of most of the Plants commonly growing in Germany, & I can obserue no generall method he keepes, but his particular one is commonly this: hee first giues the figure with the Latine and high Dutch name; then commonly a good description; after that the names, then the temperature, and lastly the vertues, first inwardly, then outwardly vsed. He hath figured some 567, and described some 800. his figures are good, (and so are most of the rest that follow.) His workes were set forth in Latine, An. 1552.

In his time liued *Leonhartus Fuchs*, a German Physition, being also a learned and diligent writer, but he hath taken many of his descriptions as also vertues word for word out of the Antients, and to them hath put figures; his generall method is after the Greek Alphabet, and his particular one thus: First the names in Greeke and Latine, together oftentimes

To the Reader.

times with their Etymologies, as also the German and French names, then the kinds; after that the forme, the place, time, temperature, then the vertues: first out of the Antients, as *Dioscorides, Galen, Pliny, &c.* and sometimes from the late Writers, whom he doth not particularize, but expresses in generall *ex recentioribus*. His worke was set forth at Basil, 1542; in *Fol.* containing, 516 figures; also they were set forth in *Octavo*, the historie first, with all the figures by themselves together at the end with the Latine and high Dutch names.

About this time, and a little after, flourished *Conrade Gesner* also a German Physition, who set forth diuers things of this nature, but yet liued not to finish the great and general worke of Plants, which he for many yeres intended, and about which he had taken a great deale of paines, as may be gathered by his Epistles. He was a very learned, painfull, honest and iudicious writer, as may appeare by his many & great workes, wherof those of Plants were first a brieft Alphabeticall Historie of plants without figures, gathered out of *Dioscorides, Theophrastus, Pliny, &c.* with the vertues briefly, and for the most part taken out of *Paulus Aegineta*, with their names in Greek and French put in the margent: this was printed at Venice, 1541, in a small forme. He set forth a catalogue of Plants, in Latin, Greeke, high-Dutch and French, printed at Zurich, 1542. Also another tract *De Lunarijs & noctu lucentibus cum montis fracti, siue Pilati Lucernatum descriptione*, An. 1552. in quarto. He also set forth the foure Books of *Valerius Cordus* (who died in his time) and his *Sylua observationum* at Strausburgh, 1561. in *fol.* and to these he added a Catalogue of the Germane Gardens with an Appendix and *Corollarium* to *Cordus* his Historie. Also another treatise of his *De stirpium collectione*, was set forth at Zurich by *Wolphius*, An. 1587, in *Octavo*.

Conrade Gesner.

At the same time liued *Adam Lonicerus* a Physition of Frankford, whose naturall historie was there printed, An. 1551, and the first part thereof is of Plants; and foure yeres after he added another part thereto, treating also of Plants. I finde no generall method obserued by him, but his particular method vsually is this: first he giues the figure, then the names in Latine and Dutch, then the temperature, &c. as in *Tragus*, from whom & *Cordus*, he borrows the most part of his first tome, as he doth the 2. from *Matth. & Amat Lusitanus*.

Lonicerus.

In his time the Italian Physition *Petrus Andreas Matthiolus* set forth his Commentaries vpon *Dioscorides*, first in Italian with 957 large and very faire figures, and then afterwards in Latine at Venice, with the same figures, An. 1568. After this he set forth his Epitome in *Quarto*, with 921 smaller figures. Now these his Commentaries are very large; and he hath in them deliuered the historie of many Plants not mentioned by *Dioscorides*; but he is iustly reprehended by some, for that he euery where taxes and notes other Writers, when as he himselfe runs into many errours, and some of them wilfull ones, as when he giues figures framed by his owne fancie, as that of *Dracontium minus, Rhabarbarum, &c.* and falsified other some in part, the better to make them agree with *Dioscori*: his description, as when he pictures *Arbor Indæ* with prickles, and giues it for the true *Acatia*: and he oft-times giues bare figures without description of his owne, but saith, it is that described by *Dioscorides*, *Nullis reclamantibus notis*, for which the Authors of the *Aduersaria* much declaime against him. It had bin fit for him, or any one that takes such a worke in hand, to haue shewed by describing the plant he giues, and conferring it with the description of his Author, that there is not any one note wanting in the description, vertues, or other particulars which his Author sets downe; and if hee can shew that his is such, then will the contrary opinions of all others fall of themselves, and need no confutation.

P. And. Matthiolus.

Amatus Lusitanus also about the same time set forth Commentaries vpon *Dioscorides*, adding the names in diuers Languages but without figures, at Strausbourg, An. 1554. in *Quarto*: he dissented from *Matthiolus* in many things; whereupon *Matthiolus* writ an Apologie against him. He hath performed no great matter in his Enarrations vpon *Dioscorides*, but was an Author of the honestie of *Matthiolus*, for as the one deceiued the world with counterfeit figures, so the other by feined cures to strengthen his opinion, as *Crato* iudges of his *Curationes Medicinales* (another worke of his) which hee thinkes, *potius ficta, quam facta*.

Amatus Lusitanus.

Rembertus Dodonæus a Physition borne at Mechlin in Brabant, about this time begun to write of Plants. Hee first set forth a Historie in Dutch, which by *Clusius* was turned into French, with some additions, Anno Domini, 1560. And this was translated out of French into English by Master *Henry Lite*, and set forth with figures, Anno Dom. 1578. and diuers times since printed, but without Figures. In the yeare 1552, *Dodonæus* set forth in Latine his *Frugum Historia*, and within a while after his *Florum purgantium, & deleteriorum Historia*. Afterwards hee put them all together, his former, and those his later Workes, and diuided them into thirtie Bookes, and set them forth with 1305 figures, in *fol.* An. 1583. This edition was also translated into English, which became the foundation of

Remb. Dodon.

To the Reader.

of this present Worke, as I shall shew hereafter. It hath since beene printed in Latine, with the addition of some few new figures: and of late in Dutch, Anno 1618 with the addition of the same figures; and most of these in the *Exoticks* of *Clusius*, and great store of other additions. His generall method is this: first he diuides his Works into six Pemptades or fues: the fifth Pemptas or fue bookes of these containe Plants in an Alphabetically order, yet so as that other Plants that haue affinitie with them are comprehended with them, though they fall not into the order of the Alphabet. The second Pempt. containes *Flores Coronarij*, *Plantæ odoratæ & umbelliferæ*. The third is *De Radicibus, Purgantibus Herbis, convolvulis, deleterijs ac perniciosis Plantis, Filicibus, Muscis & Fungis*. The fourth is *De Frumentis, Leguminibus, palustribus & aquatilibus*. The fifth, *De Oleribus & Carduis*. The sixth, *de Fruticibus & Arboribus*. The particular method is the same vsed by our Author.

Peter Pena.
Matth. Lobel.

In the yeare 1570, Peter Pena and Matthias Lobel did here at London set forth a Worke, entituled *Stirpium Aduersaria noua*; the chiefe end and intention whereof being to find out the *Materia medica* of the Antients. The generall method is the same with that of our Author, which is, putting things together as they haue most resemblance one with another in externall forme, beginning with Grasses, Cornes, &c. They giue few figures, but sometimes refer you to *Fuchsius*, *Dodonæus*, and *Matthiolum*: but where the figure was not giuen by former Authors, then they commonly giue it; yet most part of these figures are very small and vnperfect, by reason (as I coniecture) they were taken from dried plants. In this Worke they insist little vpon the vertues of Plants, but succinctly handle controuersies, and giue their opinions of Plants, together with their descriptions and names, which sometimes are in all these languages, Greeke, Latine, French, high and low Dutch, and English: otherwhiles in but one or two of them. Some Writers for this Work call them *Doctissimi Angli*; yet neither of them were borne here, for Pena (as I take it) was a French man, and Lobel was borne at Ryssle in Flanders, yet liued most part of his later time in this Kingdome, and here also ended his dayes. In the yeare 1576 he set forth his Observations; and ioyned them with the *Aduersaria*, by them two to make one entire Worke: for in his Observations he giues most part of the figures and vertues belonging to those herbes formerly described onely in the *Aduersaria*; and to these also adds some new ones not mentioned in the former Worke. After which he set forth an Herball in Dutch, wherein he comprehended all those Plants that were in the two former Workes, and added diuers other to them, the Worke containing some 2116 figures; which were printed afterwards in a longish forme, with the Latine names, and references to the Latine and Dutch bookes. After all these, at London, Anno 1605, he againe set forth the *Aduersaria*, together with the second part thereof, wherein is contained some fourty figures, being most of them of Grasses and Floures; but the descriptions were of some 100 plants, varieties and all. To this he added a Treatise of Balsam (which also was set forth alone in Quarto, Anno 1598.) and the *Pharmacopœa* of *Rondeletius*, with Annotations vpon it. He intended another great Worke, whose title should haue beene *Stirpium Illustrationes*, but was prevented by death.

Carol. Clusius.

Some six yeares after the Edition of the *Aduersaria*, Anno 1576, that learned, diligent, and laborious Herbarist Carol. Clusius set forth his Spanish Observations, hauing to this purpose travelled ouer a great part of Spaine; and being afterwards called to the Imperiall Court by Maximilian the second, he viewed Austria and the adiacent prouinces, and set forth his there Observation, Anno 1583. He also translated out of Spanish the Works of *Garcias ab Orta* and *Christopher Acosta*, treating of the simple medicines of the East Indies, and *Nicolas Monardus*, who writ of those of the West Indies. After this he put into one body both his Spanish and Pannonicke Observations, with some other, and those he comprehends in six bookes, entituled *Rariorum Plantarum Historia*: whereto he also addes an Appendix, a treatise of Mushrooms, six Epistles treating of Plants, from *Honorius Bellus* an Italian Physitian liuing at Cydonia in Candy; as also the description of mount Baldus, being a Catalogue with the description and figures of some rare and not before written of Plants theregrowing, written by *Iohn Pona* an Apothecarie of Verona (This Description of Pona's was afterwards with some new descriptions and thirty six figures set forth alone in Quarto, An. 1608.) This first Volume of *Clusius* was printed in Antwerp, Anno 1601, in Folio: and in the yeare 1605 he also in Folio set forth in another volume six bookes of *Exoticks* containing various matter, as plants, or some particles of them, as Fruits, Woods, Barks, &c. as also the forenamed translations of *Garcias*, *Acosta*, and *Monardus*: Three Tracts besides of the same *Monardus*; the first, *De lapide Bezaar, & Herba Scorsoneræ*. The second, *De Ferro & eius facultatibus*. The third, *De Nive & eius commodis*.

Honor. Bellus.

Iohn Pona.

To the Reader.

To these he also added *Belonius* his Observations or Singularities, and a tract of the same Author, *De neglecta Stirpium cultura*, both formerly translated out of French into Latine by him. He was borne at Atrebas or Arras, the chiefe city of Artois, Anno 1526. and died at Leyden, Ann. 1609. After his death, by *Euerard Vorstius*, *Peter Paw*, or some others, were set forth some additions and emendations of his former Works, together with his funerall Oration made by *Vorstius*, his Epitaph, &c. in Quarto, Anno 1611, by the name of his *Cura Posteriores*.

In the yeare 1583, *Andreas Casalpinus* an Italian Physition, and Professour at Pisa, set forth an historie of Plants, comprehended in sixteene bookes: his Worke is without figures, and he oft times giues the Tuscan names for Latine; wherefore his worke is the more difficult to be vnderstood, vnlesse it be by such as haue been in Tuscanie, or else are already well exercised in this study. He commonly in his owne words diligently for the most part describes each Plant, and then makes enquirie whether they were knowne by the Antients. He seldome sets downe their faculties, vnlesse of some, to which former Writers haue put downe none. In the first booke he treats of Plants in generall, according as *Theophrastus* doth: but in the following bookes hee handles them in particular: he maketh the chiefe affinity of Plants to consist in the similitude of their seeds and seed vessels.

Ioachim Camerarius a Physition of Noremberg flourished about this time: Hee set forth the Epitome of *Matthiolus*, with some additions and accurate figures, in Quarto, at Frankfort, 1586: in the end of which Worke (as also in that set forth by *Matthiolus* himselfe) is *Iter Baldi*, or a journey from Verona to mount Baldus, written by *Francis Calceolarius* an Apothecarie of Verona. Another Worke of *Camerarius* was his *Hortus Medicus*, being an Alphabeticall enumeration of Plants, wherein is set forth many things concerning the names, ordering, vertues, &c. of Plants. To this he anexed *Hyracinia Saxo-noburgica* *Iohannis Thali*, or an alphabeticall Catalogue written by *Iohn Thalius*, of such Plants as grew in Harkwald a part of Germanie betweene Saxony and Durengen. This was printed also at Frankfort in Quarto, An. 1588.

In the yeare 1587 came forth the great Historie of Plants printed at Lyons, which is therefore vulgarly termed *Historia Lugdunensis*: it was begun by *Dalechampius*: but hee dying before the finishing thereof, one *Iohn Molinus* set it forth, but put not his name thereto. It was intended to comprehend all that had written before, and so it doth, but with a great deale of confusion; which occasioned *Bauhine* to write a treatise of the errors committed therein, in which he shewes there are about foure hundred figures twice or thrice ouer. The whole number of the figures in this Worke are 2686. This History is diuided into eighteene bookes, and the Plants in each booke are put together either by the places of their growings, as in Woods, copses, mountaines, waterie places, &c. or by their externall shape, as vmbelliferous, bulbous, &c. or by their qualities, as purging, poysonous, &c. Herein are many places of *Theophrastus* and other antient Writers explained. He commonly in each chapter giues the names, place, forme, vertue, as most other do. And at the end thereof there is an Appendix containing some Indian plants, for the most part out of *Acosta*; as also diuers Syrian and Egyptian plants described by *Reinold Rawolfe* a Physition of Ausburgh.

At this time, to wit Anno 1588, *Iacobus Theodorus Tabernamontanus* set forth an History of Plants in the Germane tongue, and some twelue yeares after his Figures being in all 2687, were set forth in a long forme, with the Latine and high-Dutch names put vnto them; and with these same Figures was this Worke of our Author formerly printed.

Prosper Alpinus a Physition of Padua in Italy, in the yeare 1592 set forth a Treatise of some Egyptian Plants, with large yet not very accurate figures: he there treats of some 46 plants, and at the end thereof is a Dialogue or Treatise of Balsam. Some six yeares agoe, Anno 1627, his Son set forth two bookes of his fathers, *De Plantis Exoticis*, with the figures cut in Brasse: this Worke containes some 136 Plants.

Fabius Columna a gentleman of Naples, of the house of *Columna* of Rome, An. 1592 set forth a Treatise called *Phytobasanos*, or an Examination of Plants; for therein he examines and asserts some plants to be such and such of the Antients: and in the end of this worke he giues also the historie of some not formerly described plants. Hee also set forth two other bookes, *De minus cognitis*, or of lesse knowne Plants: the first of which was printed at Rome, Anno 1606, and the other 1616. He in these works, which in all contain little about two hundred thirty six plants, shewes himselfe a man of an exquisit iudgment, and very learned and diligent, duely examining and weighing each circumstance in the writings of the Antients.

Casp. Bauhine.

Caspar Bauhine, a Physition and Professor of Basil, besides his Anatomical Works, set forth diuers of Plants. Anno 1596 he set forth his *Phytopinax*, or Index of Plants, wherein he follows the best method that any yet found: for according to *Lobels* method (which our Author followed) he begins with Grasses, Rushes, &c. but then he briefly giues the Etymologie of the name in Greeke and Latine, if any such be, and tells you who of the Antients writ thereof, and in what part of their Works: and lastly (which I chiefly commend him for) he giues the *Synonima's* or seuerall names of each plant giuen by each late Writer, and quoteth the pages. Now there is nothing more troubles such as newly enter into this study, than the diuersitie of names, which sometimes for the same plant are different in each Author; some of them not knowing that the plant they mention was formerly written of, name it as a new thing; others knowing it writ of, yet not approuing of the name. In this Worke he went but through some halfe of the historie of Plants. After this, Anno 1598, he set forth *Matthiolus* his Commentaries vpon *Dioscorides*, adding to them 330 Figures, and the descriptions of fifty new ones not formerly described by any; together with the *Synonima's* of all such as were described in the Worke. He also Anno 1613 set forth *Tabernamontanus* in Dutch, with some addition of historie and figures. In Anno 1620 he set forth the *Prodromus*, or fore-runner of his *Theatrum Botanicum*, wherein he giues a hundred and forty new figures, and describes some six hundred plants, the most not described by others. After this, Anno 1623, he set forth his *Pinax Theatri Botanici*, whose method is the same with his *Phytopinax*, but the quotations of the pages in the seuerall Authors are omitted. This is indeed the Index and summe of his great and generall Worke, which should containe about six thousand plants, and was a Worke of forty yeares: but he is dead some nine yeares agoe, and yet this his great worke is not in the Presse, that I can heare of.

Basil Bessler.

Basil Bessler an Apothecarie of Noremberg, Anno 1613 set forth the garden of the Bishop of Eystet in Bauaria, the figures being very large, and all curiously cut in brasfe, and printed vpon the largest paper: he onely giues the *Synonima's* and descriptions, and diuideth the worke first into foure parts, according to the foure seasons of the yeare; and then againe he subdiuides them, each into three, so that they agree with the moneths, putting in each Classis the plants that flourish at that time.

Aloys. Anguill.

These are the chiefe and greatest part of those that either in Greeke or Latine (whose Works haue come to our hands) haue deliuered to vs the history of Plants; yet there are some who haue vsed great diligence to helpe forward this knowledge, whose names I wil not passe ouer in silence. The first and antientest of these was *Aloysius Anguillara* a physition of Padua, and President of the publique Garden there: his opinions of some plants were set forth in Italian at Venice, 1561.

Melchior Guilandinus.

Melchior Guilandinus, who succeeded *Anguillara* in the garden at Padua, writ an Apologie against *Matthiolus*, some Epistles of plants, and a Commentarie vpon three Chapters of *Pliny*, De Papyro.

Fer. Imperato.

Ferantes Imperatus an Apothecary of Naples also set forth a Naturall Historie diuided into twenty eight bookes, printed at Naples Anno 1599. In this there is something of Plants: but I haue not yet seene the opinions of *Anguillara*, nor this Naturall Historie: yet you shall find frequent mention of both these in most of the forementioned Authors that writ in their time, or since, wherefore I could not omit them.

Will. Turner.

Let me now at last looke home, and see who we haue had that haue taken pains in this kinde. The first that I finde worthy of mention is *D^r. William Turner*, the first of whose works that I haue seene, was a little booke of the names of herbes, in Greeke, Latine, English, Dutch, and French, &c. printed at London Anno 1548. In the yeare 1551 he set forth his Herbal or Historie of Plants, where he giues the figures of *Fuchsius*, for the most part: he giues the Names in Latine, Greeke, Dutch, and French: he did not treat of many Plants; his method was according to the Latine alphabet. He was a man of good iudgment and learning, and wel performed what he tooke in hand.

Hen. Lyte.

After this, *Dodonæus* was translated into English by *M^r. Lyte*, as I formerly mentioned. And some yeares after, our Author set forth this Worke, whereof I will presently treat, hauing first made mention of a Worke set forth betweene that former Edition, and this I now present you withall.

Job. Parkinson.

M^r. Iohn Parkinson an Apothecarie of this city (yet liuing and labouring for the common good) in the yeare 1629 set forth a Worke by the name of *Paradisus terrestris*, wherein he giues the figures of all such plants as are preserued in gardens, for the beauty of their floures, for vse in meats or sauces; and also an Orchard of all trees bearing fruit, and such shrubs as for their raritie or beauty are kept in Orchards and gardens, with the ordering, planting,

To the Reader.

planting and preserving of all these. In this Worke he hath not superficially handled these things, but accurately descended to the very varieties in each species: wherefore I haue now and then referred my Reader addicted to these delights, to this worke especially in floures and fruits, wherein I was loth to spend too much time, especially seeing I could adde nothing to what he had done vpon that subiect before. He also there promised another worke, the which I thinke by this time is fit for the Presse.

Now am I at length come to this present Worke, whereof I know you will expect I should say somewhat; and I will not frustrate your expectation, but labour to satisfie you in all I may, beginning with the Author, then his worke, what it was, and lastly what it now is.

For the Author M^r. *John Gerard* I can say little, but what you also may gather out of this worke; which is, he was borne in the yeare 1545. in Cheshire, at Namptwich, from whence hee came to this city, and betooke himselfe to Surgerie, wherein his endeauours were such, as he therein attained to be a Master of that worthy profession: he liued some ten yeares after the publishing of this worke, and died about the yeare 1607. His chiefe commendation is, that he out of a propense good will to the publique aduancement of this knowledge, endeauoured to performe therein more than he could well accomplish; which was partly through want of sufficient learning, as (besides that which he himselfe faith of himselfe in the chapter of Water Docke) may be gathered by the translating of diuers places out of the *Aduersaria*; as this for one in the description of * *Aster Atticus*, *Caules pedales terni aut quaterni*: which is rendred, A stalke foure or fise foot long. He also by the same defect called burnt Barley, * *Hordeum distichon*; and diuided the titles of honour from the name of the person whereto they did belong, making two names thereof, beginning one clause with * *Iulius Alexandrinus* faith, &c. and the next with, *Casarius Archiater* faith. He also was very little conuersant in the writings of the Antients, neither, as it may seeme by diuers passages, could hee well distinguish betweene the antient and modernewriters: for he in one place faith, [* Neither by *Dioscorides*, *Fuchsius*, or any other antient writer once remembred.] Diuers such there are, which I had rather passe ouer in silence, than here set downe: neither should I willingly haue touched hereon, but that I haue met with some that haue too much admired him, as the only learned and iudicious writer. But let none blame him for these defects, seeing he was neither wanting in pains nor good will, to performe what he intended; and there are none so simple but know, that heauy burthens are with most paines vndergone by the weakest men: and although there were many faults in the worke, yet iudge well of the Author; for as a late writer well faith, *Falli & hallucinari humanum est, solitudinem querat oportet, qui vult cum perfectis viuere. Pensanda vitij bona cuiusque sunt, & qua maior pars ingenij stetit, ea iudicandum de homine est.*

John Gerard

See the former Edition in the places here mentioned. * pag. 391. p. 66. p. 147.

p. 118.

Cun. li. 3. ca. 3. de Rep. Heb.

Now let me acquaint you how this Worke was made vp. *Dodonæus* his *Pemptades* comming forth Anno 1583, were shortly after translated into English by D^r. *Priest* a physician of London, who died either immediately before or after the finishing of this translation. This I had first by the relation of one who knew D^r. *Priest* and M^r. *Gerard*: and it is apparant by the worke it selfe, which you shall finde to containe the *Pemptades* of *Dodonæus* translated, so that diuers chapters haue scarce a word more or lesse than what is in him. But I cannot commend my Author for endeauouring to hide this thing from vs, cauilling (though commonly vniustly) with *Dodonæus*, wheresoeuer he names him, making it a thing of heare-say, * that D^r. *Priest* translated *Dodonæus*: when in the Epistle of his friend M^r. *Bredwell*, prefixed before this worke, are these words: [The first gatherers out of the Antients, and augmenters by their owne paines, haue already spred the odour of their good names through all the lands of learned habitations: D^r. *Priest* for translating so much as *Dodonæus*, hath hereby left a tombe for his honorable sepulture. M^r. *Gerard* comming last, but not the least, hath many waies accommodated the whole worke vnto our English Nation, &c.] But that which may serue to cleare all doubts, if any can be in a thing so manifest, is a place in *Lobels* Annotations vpon *Rondeletius* his *Pharmacopeia*, where pag. 59. he findes fault with *Dodonæus*, for vsing barbarously the word *Seta* for *Sericum*: and with D^r. *Priest*, who (faith he) at the charges of M^r. *Norton* translated *Dodonæus*, and deceiued by this word *Seta*, committed an absurd error in translating it a bristle, when as it should haue been filke. This place so translated is to be seen in the chapter of the Skarlet Oke, at the letter F. And *Lobel* well knew that it was D^r. *Priest* that committed this error, and therefore blames not M^r. *Gerard*, to whom hee made shew of friendship, and who was yet liuing: but yet he couertly gaue vs to vnderstand, that the worke wherein that error was committed, was a translation of *Dodonæus*, and that made by

See his Epistle to the Reader

To the Reader.

D^r. Priest, and set forth by M^r. Norton. Now this translation became the ground-worke whereupon M^r. Gerard built vp this Worke: but that it might not appeare a translation, he changes the generall method of *Dodonaus*, into that of *Lobel*, and therein almost all ouer followes his *Icones* both in method and names, as you may plainly see in the *Grasses* and *Orchides*. To this translation he also added some plants out of *Clusius*, and other-some out of the *Aduersaria*, and some fourteene of his owne not before mentioned. Now to this historie figures were wanting, which also M^r. Norton procured from Frankfort, being the same wherewith the Works of *Tabernaemontanus* were printed in Dutch: but this fell crosse for my Author, who (as it seemes) hauing no great iudgement in them, frequently put one for another: and besides, there were many plants in those Authors which he followed, which were not in *Tabernaemontanus*, and diuers in him which they wanted, yet he put them all together, and one for another; and oft times by this meanes so confounded all, that none could possibly haue set them right, vnlesse they knew this occasion of these errors. By this meanes, and after this manner was the Worke of my Author made vp, which was printed at the charges of M^r. Norton, An. 1597.

Now it remaines I acquaint you with what I haue performed in this Edition, which is either by mending what was amisse, or by adding such as formerly were wanting: some places I helped by putting out, as the Kindes in the Chapter of Stonecrop, where there was but one mentioned. I haue also put out the Kindes in diuers places else where they were not very necessarie, by this meanes to get more roome for things more necessarie: as also diuers figures and descriptions which were put in two or three places, I haue put them out in all but one, yet so, as that I alwaies giue you notice where they were, and of what. Some words or passages are also put out here and there, which I thinke needlesse to mention. Sometimes I mended what was amisse or defectiue, by altering or adding one or more words, as you may frequently obserue if you compare the former edition with this, in some few chapters almost in any place. But I thinke I shall best satisfie you if I briefly specifie what is done in each particular, hauing first acquainted you with what my generall intention was: I determined, as wel as the shortnesse of my time would giue me leaue, to retaine and set forth whatsoeuer was formerly in the booke described, or figured without descriptions (some varieties that were not necessarie excepted) and to these I intended to adde whatsoeuer was figured by *Lobel*, *Dodonaus*, or *Clusius*, whose figures we made vse of; as also such plants as grow either wilde, or vsually in the gardens of this kingdome, which were not mentioned by any of the forenamed Authors; for I neither thought it fit nor requisite for me, ambitiously to aime at all that *Bauhine* in his *Pinax* reckons vp, or the *Exotickes* of *Prosper Alpinus* containe, not mentioned in the former. This was my generall intention. Now come I to particulars, and first of figures: I haue, as I said, made vse of those wherewith the Workes of *Dodonaus*, *Lobel*, and *Clusius* were formerly printed, which, though some of them be not so sightly, yet are they generally as truly exprest, and sometimes more. When figures not agreeable to the descriptions were formerly in any place, I giue you notice thereof with a marke of alteration before the title, as also in the end of the Chapter; and if they were not formerly in the booke, then I giue you them with a marke of addition. Such as were formerly figured in the booke, though put for other things, and so hauing no description therein, I haue caused to be new cut and put into their fit places, with descriptions to them, and only a marke of alteration. The next are the descriptions, which I haue in some places lightly amended, without giuing any notice thereof; but when it is much altered, then giue I you this marke † at the beginning thereof; but if it were such as that I could not helpe it but by writing a new one, then shall you finde it with this marke ‡ at the beginning and end thereof, as also whatsoeuer is added in the whole booke, either in description or otherwise. The next is the Place, which I haue seldome altered, yet in some places supplied, and in others I haue put doubts, & do suspect other some to be false, which because I had not yet viewed, I left as I found. The Time was a thing of no such moment, for any matter worth mentioning to be performed vpon, wherefore I will not insist vpon it. Names are of great importance, and in them I should haue been a little more curious if I had had more time, as you may see I at the first haue beene; but finding it a troublesome worke, I haue onely afterwards where I iudged it most needfull insisted vpon it: *Bauhinus* his *Pinax* may supply what you in this kinde finde wanting. In many places of this worke you shall finde large discourses and sometimes controuersies handled by our Authour in the names; these are for the most part out of *Dodonaus*, & some of them were so abbreviated, and by that meanes confounded, that I thought it not worth my paines to mend them, so I haue put them out in some few places, and referred you to the places in *Dodonaus* out of which

To the Reader.

which they were taken, as in the chapter of Alehoofe: it may be they are not so perfect as they should be in some very few other places, (for I could not compare all) but if you suspect any such thing, haue recourse to that Author, and you shall finde full satisfaction.

Now come I to the Temper and Vertues. These commonly were taken forth of the fore-mentioned Author, and here and there out of *Lobels* Obseruations, and *Camerarius* his *Hortus medicus*. To these he also added some few Receipts of his owne: these I haue not altered, but here and there shewed to which they did most properly belong; as also if I found them otherwise than they ought, I noted it; or if in vnfit places, I haue transferred them to the right place, and in diuers things whereof our Author hath bin silent, I haue supplied that defect.

For my additions I will here say nothing, but refer you to the immediate ensuing Catalogue, which will enforme you what is added onely in figure, or description, or in both, by which, and these two formerly mentioned marks, you may see what is much altered or added in the Work; for this marke † put either to figure, or before any clause, shews it to haue bin otherwise put before; or that clause whether it be in description, Place, Time, Names, or Vertues to be much altered. This other marke ‡ put to a figure shews it not to haue been formerly in the worke, but now added; and put in any other place it shewes all is added vntill you come to another of the same marks. But because it is sometimes omitted, I will therefore giue notice in the *Errata* where it should be put, in those places where I obserue either the former or later of them to be wanting.

Further, I must acquaint you how there were the descriptions of a few plants here and there put in vnfitting places, which made me describe them as new added, as *Saxifraga maior Matthioli*, *Persicaria siliquosa*, of which in the chapter of *Persicaria* there was an ill description, but a reasonable good one in the chapter of *Astrantia nigra*. *Papauer spinosum*, was figured and described amongst the *Cardui*; now all these (as I said) I added as new in the most fitting places: yet found them afterwards described, but put them out all, except the last, whose historie I still retaining, with a reference to the preceding figure and Historie. Note also, wherefoeuer my Author formerly mentioned *Clusius*, according to his Spanish or Pannonicke Obseruations, I haue made it, according to his Historie, which contains them both with additions.

Also I must certifie you, (because I know it is a thing that some will thinke strange, that the number of the pages in this booke do no more exceed that of the former, considering there is such a large accession of matter and figures) the cause hereof is, each page contains diuers lines more than the former, the lines themselves also being longer; and by the omission of descriptions and figures put twice or thrice ouer, and the Kindes, vnneccessarily put in some places, I gained as much as conueniently I could, beeing desirous that it might be bound together in one volume.

Thus haue I shewed what I haue performed in this Worke, entreating you to take this my Labor in good part; and if there be any defect therein (as needs there must in all humane works) ascribe it in part to my haste and many busineses, and in some places to the want of sufficient information, especially in Exoticke things; and in other some, to the little conuersation I formerly had with this Author, before such time as (ouercome by the importunitie of some friends, and the generall want of such a Worke) I tooke this taske vpon me. Furthermore I desire, that none would rashly censure me for that which I haue here done; but they that know in what time I did it, and who themselves are able to do as much as I haue here performed; for to such alone I shall giue free libertie, and will be as ready to yeeld further satisfaction if they desire it, concerning any thing I haue here asserted, as I shall be apt to neglect and scorne the censure of the Ignorant and Vnlearned, who I know are still forward to verifie our English prouerbe *

* A fooles bolt
is soone shot.

I must not in silence passe ouer those from whom I haue receiued any fauour or encouragement, whereby I might be the better enabled to performe this Taske. In the first place let me remember the onely Assistant I had in this Worke, which was Mr. *John Goodyer* of *Maple-Durham* in *Hampshire*, from whom I receiued many accurate descriptions, and some other obseruations concerning plants; the which (desirous to giue euery man his due) I haue caused to be so printed, as they may be distinguished from the rest: and thus you shall know them; in the beginning is the name of the plant in Latine in a line by it selfe, and at the end his name is inserted; so that the Reader may easily finde those things that I had from him, and I hope together with me will be thankfull to him, that he would so readily impart them for the further increase of this knowledge.

Mr. *George Bowles* of *Chiffelhurst* in *Kent* must not here be forgot, for by his trauels and industry I haue had knowledge of diuers plants, which were not thought nor formerly

knowne

13/6

A Catalogue of Additions.

BEcause the marks were not so carefully and right put to these Figures, which were not formerly in the booke, I haue thought good to giue you the names of all such as are added, either in figure or description, or both: together with the booke, chapter, and number or place they hold in each chapter. *F* stands for figure, *D* for Description, and where both are added, you shall finde both these letters; and where the letter *C* is put, the Historie of the whole Chapter is added.

THE FIRST BOOKE OF THE HISTORIE OF PLANTS:

*Containing Grasses, Rushes, Reeds, Corne, Flags, and Bulbous,
or Onion-rooted Plants.*

IN this Historie of Plants it would be tedious to vse by way of introduction, any curious discourse vpon the generall diuision of Plants, contained in Latine vnder *Arbor*, *Frutex*, *Suffrutex*, *Herba*: or to speake of the differing names of their seuerall parts, more in Latine than our vulgar tongue can well expresse. Or to go about to teach thee, or rather to beguile thee by the smell or taste, to guesse at the temperature of Plants: when as all and euery of these in their place shall haue their true face and note, whereby thou maist both know and vse them.

In three bookes therefore, as in three gardens, all our Plants are bestowed; sorted as neere as might be in kindred & neighbourhood.

The first booke hath Grasses, Rushes, Corne, Reeds, Flags, Bulbous or Onion-rooted Plants.

The second, most sorts of herbes vsed for meate, medicine, or sweet smelling.

The third hath Trees, Shrubs, Bushes, Fruit-bearing Plants, Rosins, Gummes, Roses, Heathes, Mosses, Mushrooms, Corall, and their seuerall kindes.

Each booke hath chapters, as for each herbe a bed: and euery Plant presents thee with the Latine and English name in the title, placed ouer the picture of the Plant.

Then follows the kindes, description, place, time, names, natures, and vertues, agreeing with the best receiued opinions.

Last of all thou hast a generall Index, as well in Latine as English, with a carefull supply likewise of an *Index bilinguis*, of barbarous names.

And thus hauing giuen thee a generall view of this garden, now with our friendly labours wee will accompany thee, and leade thee through a Grasse-plot, little or nothing of many Herbarists heretofore touched; and begin with the most common or best knowne Grasse, which is called in Latine, *Gramen pratense*: and then by little and little conduct thee through most pleasant gardens and other delightfull places, where any herbe or plant may be found fit for meate or medicine.

CHAP. I. Of Meadow-Grasse.

Here be sundry and infinite kindes of Grasses not mentioned by the Antients, either as vnnesseary to be set downe, or vnkowne to them: onely they make mention of some few, whose wants we meane to supply, in such as haue come to our knowledge, referring the rest to the curious searcher of Simples.

The Description.

Common Meadow Grasse hath very small tufts or roots, with thicke hairy threds depending vpon the highest turfe, matting and creeping on the ground with a most thicke and apparant shew of wheaten leaues, lifting vp long thinne ioynted and light stalks, a foot or a cubit high, growing small and sharpe at the top, with a loose eare hanging downward, like the tuft or top of the common Reed.

Small

2 Small meadow Grasse differeth from the former in varietie of the soile; for as the first kind groweth in meadows, so doth this small grasse clothe the hilly and more dry grounds vntilled, and barren by nature; a Grasse more fit for sheepe than for greater cattell. And because the kindes of Grasse do differ apparantly in root, tuft, stalke, leafe, sheath, ear, or crest, we may assure our selues that they are endowed with seuerall vertues, formed by the Creator for the vse of man, although they haue been by a common negligence hidden and vnknowne. And therefore in this our Labor we haue placed each of them in their seuerall bed, where the diligent searcher of Nature may, if so he please, place his learned obseruations.

1 *Gramen pratense.*
Meadow Grasse.

2 *Gramen pratense minus.*
Small Meadow-grasse.

¶ The Place.

Common Meadow-grasse groweth of it selfe vnset or vnswen, euery where, but the small meadow grasse for the most part groweth vpon dry and barren grounds, as partly wee haue touched in the description.

¶ The Time.

Concerning the time when Grasse springeth and seedeth, I suppose there is none so simple but knoweth it, and that it continueth all the whole yeare, seeding in Iune and Iuly. Neither needeth it any propagation or replanting by seed or otherwise; no not so much as the watery Grasses, but that they recouer themselves againe, although they haue bene drowned in water all the Winter long, as may appear in the wilde fennes in Lincolnshire and such like places.

¶ The Names.

Grasse is called in Greeke, *χλωρον*: in Latine, *Gramen*, as it is thought, à *gradiendo*, quod *geniculatus* internodijs serpat crebroque nouas spargat radices: for it groweth, goeth, or spreadeth it selfe vnset or vnswen, naturally ouer all fields or grounds, cloathing them with a faire and perfect greene. It is yearely mowed, in some places twice, and in some rare places thrice; then is it dried and withered by the heate of the Sunne, with often turning it; and then is it called *Fœnum*, nescio an à *fœnore* aut *fœtu*. In English, Hay: in French, *Le herbe du prair*.

¶ The Nature.

The roots and seeds of Grasse are of more vse in physicke than the herbe, and are accounted of all Writers moderately to open obstructions, and prouoke vrine.

¶ The Vertues.

The decoction of Grasse with the roots of Parsley drunke, helpeth the diffurie, and prouoketh A
vrine.

The roots of Grasse, according to *Galen*, doe glew and consolidate together new and bleeding B
wounds.

The iuyce of Grasse mixed with honey and the poudre of Sothernwood taken in drinke, killeth C
wormes in children; but if the childe be young, or tender of nature, it shall suffice to mixe the
iuyce of Grasse, and the gall of an Oxe or Bull together, and therewith anoint the childes belly,
and lay a clout wet therein vpon the nauell.

Fernelius saith, that grasse doth helpe the obstructions of the liuer, reines and kidnies and the D
inflammation of the raines called *Nephritis*.

Hay sodden in water till it be tender, and applied hot to the chaps of beasts that be chap-fal- E
len, through long standing in pound or stable without meate, is a present remedie.

CHAP. 2. Of Red Dwarf-grasse.

¶ The Description.

1 D Warfe Grasse is one of the least of Grasses. The root consists of many little bulbes,
couered with a reddish filme or skinne, with very many smal hairy and white strings:
the tuft or eare is of a reddish colour, and not much differing from the grasse called
Ischemon, though the eare be softer, broader, and more beautifull.

† 1 *Gramen minimum rubrum, sive*
Xerampelinum.
Red Dwarf-grasse.

2 *Gramen minimum album.*
White Dwarf-grasse.

† 2 This kinde of Grasse hath small hairy roots; the leaues are small and short, as also the
stalke, which on the top thereof beares a pannicle not much vnlike the small meadow Grasse, but
lesse: the colour thereof is sometimes white, and otherwhiles reddish; whence some haue given
two figures, which I thinking needlesse, haue onely retained the later, and for the former given the
figure of another Grasse, intended by our Author to be comprehended in this Chapter.

3 Small hard Grasse hath small roots compact of little strings or threds, from which come forth many sowerushy leaues of the length of an inch and a halfe: the tuft or eare is compact of many pannicles or very little eares, which to your feeling are very hard or harsh. This Grasse is vnpleasant, and no wholesome food for cattell.

4 Rush-grasse is a small plant some handfull high, hauing many small rushy leaues tough and pliant, as are the common Rushes: whereupon do grow small scaly or chaffie huskes, in stead of floures, like those of Rushes, but smaller. The root is threddy like the former. ‡ There is a varietie of this to be found in bogs, with the seeds bigger, and the leaues and whole plant lesser. ‡

3 *Gramen minus dariusculum.*
Small hard Grasse.

4 *Gramen junceum.*
Rush-grasse, or Toad-grasse.

¶ *The Place.*

The Dwarf-grasse doth grow on heathy rough and dry barren grounds in most places of England. ‡ That which I haue giuen you I haue not as yet obserued growing in any part of England. ‡

The white Dwarf-grasse is not so common as the former, yet doth it grow very plentifully among the Hop gardens in Essex and many other places.

Small Hard-grasse groweth in moist fresh marishes, and such like places.

Rush-grasse groweth in salt marishes neere vnto the sea, where the marishes haue bene overflowed with salt water. ‡ It also groweth in many wet woods, lanes, and such places, as in the lane going by Totenham Court towards Hampstead. The lesser varietie hereof growes on the bogges vpon Hampstead heath. ‡

¶ *The Time.*

These kindes of Grasses do grow, floure, and flourish when the common Meadow grasse doth.

¶ *The Names.*

It sufficeth what hath bene said of the names in the description, as well in English as Latine; onely that some haue deemed White Dwarf-grasse to be called *Xerampelinum*.

Rush-grasse hath been taken for *Holostemum Matthioli*.

¶ *The Names in particular.*

1 This I here giue you in the first place is the *Gramen minimum Xerampelinum* of Lobel: it is the *Gramen*

Gramen of *Matthiolus*, and *Gramen bulbosum* of *Daleschampsius*. Our Author did not vnderstand what *Xerampelinus* signified, when as he said the white Dwarf-grasse was so termed; for the word imports red, or murrey, such a colour as the withered leaues of Vines are of. 2. *Tabern* calls this, *Gramen paniculatum minus*. 3. *Lobel* calls this, *Exile Gramen durius*. 4. This by *Matthiolus* was called *Holostium*: by *Thalys*, *Gramen epigonatocaulon*: by *Tabernamontanus*, *Gra. Bufonium*, that is, Toad-grasse. ‡

¶ *The Nature and Vertues.*

These kindes of Grasses doe agree as it is thought with the common Meadow-grasse, in nature and vertues, notwithstanding they haue not beene vsed in physicke as yet, that I can reade of.

† The first figure was onely a varietie of the second, according to *Sauvins*; yet in my iudgement it was the same with the third, which is *Gramen minus durum*.

CHAP. 3. Of Corne-Grasse.

¶ *The Description.*

1 **C**orne-grasse hath many grassie leaues resembling those of Rie, or rather Otes, amongst the which commeth vp slender benty stalkes, kneed or ioynted like those of corne, whereupon groweth a faire tuft or pannicle not much vnlike to the feather-like tuft of common Reed, but rounder compact together like vnto Millet. The root is threddy like those of Otes.

1 *Gramen segetale.*
Corne-grasse.

2 *Gramen harundinaceum.*
Reed-grasse, or Bent.

2 Reed-grasse hath many thin grassie leaues like the former: the bushy top, with his long feather-like pannicles do resemble the common Reed, which is lightly shaken with the winde, branched vpon a long slender reeden stalke, kneed or ioynted like corne. The root is small and fibrous.

¶ *The Place and Time.*

These kindes of Grasses grow for the most part neere hedges, & in fallow fields in most places. Their time of springing, flourishing, and fading may be referred to the common Meadow-grasse.

The Names.

† The first is called in English, Corne-grasse. *Lobelius* calls this, *Segetum gramen panicula speciosa latiore*: others termeit *Gramen segetale*, for that it vsually groweth among corne; the which I haue not as yet seene.

The second is called in English, Reed-grasse: of *Lobelius* in Latine, *Gramen agrorum latiore, arundinacea, & comosa panicula*, for that his tuft or pannicles do resemble the Reed: and *Spica venti agrorum*, by reason of his feather-top, which is easily shaken with the wind. ‡ Some in English, much agreeable to the Latine name, call these, Windle-strawes. Now I take this last to be the Grasse with which we in London do vsually adorne our chimneys in Sommer time: and we commonly call the bundle of it handsomely made vp for our vse, by the name of Bents. ‡

¶ The Temperature and Vertues.

These Grasses are thought to agree with common Grasse, as well in temperature as vertues, although not vsed in physicke.

CHAP. 4. Of Millet Grasse.

1 *Gramen Miliaceum.*
Millet Grasse.

† 2 *Gramen majus aquaticum.*
Great Water-grasse.

¶ The Description.

1 **M**illet Grasse is but a slender Grasse, bearing a tuft or eare like vnto the common Meadow-grasse, but consisting of small seeds or chaffie heads like to *Milium*, or Millet, whereof it tooke the name. The stalke or leaues do resemble the Bent, wherewith country people do trimme their houses.

2 The great Water-grasse in root, leafe, tuft, and reeden stalke doth very well resemble the Grasse called in Latine, *Gramen fulcatum*, or *Pictum*; and by our English women, Lady-laces, because it is stript or furrowed with white and greene streakes like silke laces; but yet differs from that, that this Water grasse doth get vnto it selfe some new roots from the middle of the stalks and ioynts, which the other doth not. ‡ This is a large Grasse, hauing stalkes almost as thicke as ones little finger, with the leaues answerable vnto them, and a little rougish: the tuft is somewhat like a reed, but lesse, and whitish coloured. ‡

¶ The

¶ The Place, Names, Nature, and Vertues.

The former growes in medowes, and about hedges, and the later is to be found in most fenny and watery places, and haue their vertues and natures common with the other Grasses, for any thing that wee can finde in writing. The reason of their names may be gathered out of the description.

† This which I giue you in the second place is not of the same plant that was figured in the former edition; for that picture was of *Gramen aquaticum harundinaceum paniculatum* of Taber. which hath a running root and large specious pannicle like to a Reed, of a browne colour. But it is most apparant that our Authour meant this, and framed his description by looking vpon this figure, especially the later part thereof. The true figure of this was in the second place in the next Chapter.

CHAP. 5.

Of Darnell Grasse.

¶ The Description.

Darnell Grasse, or *Gramen Sorghinum*, as Lobel hath very properly termed it, hath a brownish stalke thicke and knotty, set with long sharpe leaues like vnto the common Dogs Grasse: at the top whereof groweth a tuft or eare of a grayish colour, somewhat like *Sorghum*, whereof it tooke his name.

1 *Gramen Sorghinum*.
Darnell Grasse.

2 *Gramen harundinaceum paniculatum*.
Wilde Reed.

2 Wilde Reed, or *Gramen harundinaceum paniculatum*, called also *Calamogrostis*, is far bigger than Couch grasse, or Dogs grasse, and in stalkes and leaues more rough, rugged, and cutting. It is bad food for cattell, though they want, or be very hungry; and deadly to Sheepe, because that, as the Husbandman saith, it is a cause of leanness in them, thirst, and consumption: it cutteth their

‡ 3 *Gramen arundinaceum minus.*
The lesser Reed-Grasse.

tongue, straitneth the gullet or throat, and draweth downe bloud into the stomacke or maw; whereof ensueth inflammation, and death for the most part. And not onely this *Calamogrostis* is hurtfull, but also all other kindes of shearing leaued reeds, flagges, sedge, or the like, which haue as it were edges, and cut on both sides like kniues as well mens fingers, as cattels mouthes. This herbe is in a meane between reed & grasse. The root is white, creeping downwards very deepe. The spike or eare is like vnto the reed, being soft and cottony, somewhat resembling Pannicke.

‡ 3 This in root, stalkes, and leaues is like to the last described, but that they are lesser. the top or head is a long single spike or eare, not feuered or parted into many eares like the top of the precedent, and by this and the magnitude it may chiefly be distinguished from it. This was in the twelfth place in the sixteenth chapter, vnder the title of *Gramen barundinaceum minus*: and the *Calamogrostis* but now described, was also there againe in the eleuenth place. ‡

¶ The Place.

The first growes in fields and orchards almost euery where; the other grow in fenny waterish places.

¶ The Names.

2 This in Lincolneshire is called Sheere-grasse, or Henne: in other parts of England, wild Reed: in Latine, *Calamogrostis*: out of the

Greeke, *καλαμὸς ἁγρίος*. As for their natures and vertues we doe not finde any great vse of them worth the setting downe.

† The figure that was in the second place was of *Gramen minus aquaticum*, being the second of the precedent Chapter. The true figure of this was page 21. vnder the title of *Gramen barundinaceum minus*. The third being there also, as I haue touched in the description.

CHAP. 6. Of Feather-top, Ferne, and Wood-grasse.

¶ The Description.

‡ 1 **T**His might fitly haue beene put to those mentioned in the foregoing chapter, but that our Author determined it for this, as may appeare by the mention made of it in the names, as also by the description hereof, framed from the figure we here giue you. ‡ This Grasse is garnished with chaffie and downie tufts, set vpon a long benty stalke of two cubits high or somewhat more, naked without any blades or leaues, for the most part. His root is tough and hard. ‡ The top is commonly of a red or murrey colour, and the leaues soft and downy. ‡

‡ 2 This, whose figure was formerly by our Author giuen for the last described, though verie much different from it, is a very pretty and elegant grasse: it in roots and leaues is not vnlike to the vsuall meadow Grasse; the stalke riseth to the height of a foot, and at the top thereof it beareth a beautifull pannicle, (whence the French and Spanish Nations call it *Amourettes*, that is, the Louely Grasse.) This head consists of many little eares, shaped much like those of the ordinarie Quaking Grasse, longer and flatter, being composed of more scales, so that each of them somewhat resembles the leafe of a small Ferne, whence I haue called it Ferne-Grasse. These tops when they are ripe are white, and are gathered where they grow naturally to beautifie garlands. ‡

‡ 3 Wood-grasse hath many small and threddy roots, compact together in manner of a tuft; from which spring immediately out of the earth many grassy leaues, among the which are sundrie benty

† 1 *Gramen tomentosum arundinaceum.*
Feather-top, or Woolly Reed-grasse;

2 *Gramen panniculatum elegans.*
Ferne-grasse.

3 *Gramen sylvaticum majus.*
The greater Wood-grasse.

benty stalkes, naked and without leaues or blades like the former, bearing at the top a soft spikie tuft or eare much like vnto a Fox-taile, of a brownish colour.

† 4 This in leaues, stalks, roots, manner and place of growing is like the last described: the onely difference betweene them is, That this hath much lesse, yet sharper or rougher eares or tufts. The figure and description of this was formerly giuen by our Author in the sixteenth chapter, and ninth place, vnder the title of *Gramen sylvaticum minus*. But because the difference between the last described and this is so small, we haue spared the figure, to make roome for others more different and note-worthy.

¶ The Time and Place.

1 This kinde of Grasse growes in fertil fields and pastures.

2 The second growes in diuers places of Spaine and France.

The other two grow in Woods.

¶ The Names.

1 *Lobelius* in Latine calls this *Gramen tomentosum & Acerosum*. Some haue taken it for the second kinde of *Calamagrostis*; but most commonly

it is called *Gramen plumosum*: and in English, a Bent, or Feather-top Grasse.

2 *Gramen panniculatum* is called by some *Heragrostis* in Greeke. *Lobel* calls this *Gramen panniculatum phalaroides*. And it is named in the *Hist. Lugd.* *Gramen filicium, seu polyanthos*: that is, Ferne, or many-floured Grasse. †

3 *Gramen syluaticum*, or as it pleaseth others, *Gramen nemorosum*, is called in our tongue, wood Grasse, or shadow Grasse.

CHAP. 7. Of great Fox-taile Grasse:

¶ The Description.

1 **T**He great Fox-taile Grasse hath many threddy roots like the common Meadow grasse; and the stalke riseth immediatly from the root, in fashion like vnto Barley, with two or three leaues or blades like Otes; but is nothing rough in handling, but soft and downie, and somewhat hoarie, bearing one eare or tuft on the top, and neuer more; fashioned like a Fox-taile, whereof it tooke his name. At the approch of Winter it dieth, and recouereth it selfe the next yeare by falling of his seed.

1 *Gramen Alopecuroides majus*
Great Fox-taile Grasse.

† 2 *Gramen Alopecuroides minus*
Small Fox-taile Grasse.

2 The lesser Fox-taile Grasse hath a tuffe and hard root compact of many small strings, yeelding a strawie stalke like the former, though somewhat lesser, with the like top or crest, but of a whitish colour.

3 Great bastard Fox-taile Grasse hath a strawie stalke or stemme, which riseth to the height of a cubit and an halfe, hauing a small root consisting of many fibres. His leafe is small and grassie, and hath on his top one tuft or spike, or eare of a hard chaffie substance, some three inches long, composed of longish seeds, each hauing a little beard or awne.

4 Small bastard Fox-taile Grasse doth resemble the former, sauing that this kinde doth not send

send forth such large stalkes and eares as the other, but smaller, and not so close packed together, neither hauing so long beards or awnes.

† 3 *Gramen Alopecurinum majus.*
Great bastard Fox-taile Grasfe.

4 *Gramen Alopecurinum minus.*
Small bastard Fox-taile Grasfe.

¶ The Place and Time.

These wilde bastard Fox-taile Grasses doe grow in the moist furrowes of fertile fields, towards the later end of Sommer.

¶ The Names.

† The first by *Lobel* and *Tabern.* is called *Gramen phalaroides.* The other *Lobel* calleth 2 *Gramen Alopecuroides.* 3. *minus.* 4. *minus alterum.*

CHAP. 8. Of Great Cats-taile Grasfe.

¶ The Description.

1 **G**reat Cats-taile Grasfe hath very small roots, compact of many small skins or threds, which may easily be taken from the whole root. The stalke riseth vp in the middest, and is somewhat like vnto wilde Barley, kneed and ioyned like corne, of a foot high or thereabout, bearing at the top a handsome round close compact eare resembling the Cats-taile.

2 The small Cats-taile grasfe is like vnto the other, differing chiefly in that it is lesfer than it. The root is thicke and cloued like those of Rush Onions, or Ciues, with many small strings or hairie threads annexed vnto it.

† 3 There is another that growes plentifully in many places about London, the which may fitly be referred to this Classis. The root thereof is a little bulbe, from whence ariseth a stalke some two foot or better high, set at each ioynnt with long grassie leaues: the spike or eare is commonly

Gramen Typhinum minus.
Small Cats-taile Grasse.

monly foure or five inches long, closely and handsomely made in the fashion of the precedent, which in the shape it doth very much resemble. ‡

¶ The Place and Time.

These kinds of Grasses do grow very well neere waterie places, as *Gramen Cyperoides* doth, and flourish at the same time that all the others doe.

‡ The latter may be found by the bridge entring into Chelsey field, as one goeth from Saint Iames to little Chelsey. ‡

¶ The Names.

The Latines borrow these names of the Greekes, and call it *Gramen Typhinum*, of *Typha*, a Cats taile: and it may in English as wel be called round Bent-grasse, as Cats-taile Grasse.

‡ The last described is by *Bauhine*, who first gaue the figure and description thereof in his *Prodomus*, pag. 10. called *Gramen Typhoides maximum spica longissima*; that is, The largest Foxe-taile Grasse with a very long eare. ‡

CHAP. 9. Of *Cyperus* Grasse.

1 *Gramen Cyperoides.*
Cyperus Grasse.

2 *Gramen Iuncum aquaticum.*
Rushy Water-Grasse.

¶ The Description.

1 **C**yperus Grasse hath roots somewhat like Cyperus, whereof it tooke his name: his leaues are long and large like vnto the common reed: the stalke doth grow to the height of a cubit in some places, vpon which groweth little scaly knobs or eares, spike fashion, somewhat like vnto Cats-taile, or Reed-mace, very chaffie, rough, and rugged.

2 Rushy Water-grasse hath his roots like the former, with many fibres or strings hanging at them; and creepeth along vpon the vppermost face of the earth, or rather mud, wherein it groweth, bearing at each ioynt one slenderbenty stalke, set with a few small grasse blades or leaues; bringing forth at the top in little hoods, small feather-like tufts or eares.

¶ The Place, Time, and Names.

They grow, as I haue insinuated, in myrie and muddy grounds, in the same season that others do. And concerning their names there hath been said enough in their titles.

CHAP. 10. Of Water-Grasse.

1 *Gramen aquaticum.*
Water-grasse.

2 *Gramen aquaticum spicatum.*
Spiked Water-grasse.

¶ The Description.

† 1 **W**ater-grasse, or as we terme it, Water Burre-grasse, hath a few long narrow slender and ioynted leaues: among which riseth vp a stalke of two foot high, bearing vpon his small and tender branches certaine little rough knobs, or brownish sharpe pointed seeds made vp into cornered heads: his root is small and threddy.

† The figure of this plant is not well exprest, for it should haue had the leaues made narrower, and ioynts exprest in them, like as you may see in the *Gramen junceum syluaticum*, which is the ninth in the sixteenth chapter; for that and this are so like, that I know no other difference betweene them, but that this hath leaues longer and narrower than that, and the heads smaller and whiter. There is a reasonable good figure of this in the *Historia Lugd. p. 1001.* vnder the name of *Arundo minima.* ‡

2 Spiked

2 Spiked Water-grasse hath long narrow leaues: the stalke is small, single, and naked, without leaues or blades, bearing along it the same toward the top an eare or spike made of certaine small buttons, resembling the buttonie floures of Sea Worme-wood. His root is thick & tough, full of fibres or threds.

¶ *The Place and Time.*

They differ not from the former kindes of Grasses in place and time: and their names are manifest.

¶ *The Nature and Vertues.*

Their nature and vertues are referred vnto Dogs Grasse, whereof we will speake hereafter.

CHAP. II. Of Flote-Grasse.

1 *Gramen fluuiatile.*
Flote-grasse.

2 *Gramen fluuiatile spicatum.*
Spiked Flote-grasse.

¶ *The Description.*

† 1 Flote-grasse hath a long and round root somewhat thicke, like vnto Dogs-grasse, set on euen ioynts with small strings or threds; from the which rise vp long and crooked stalkes, crossing, winding, and folding one within another with many flaggie leaues, which horses eat greedily of. At the top of these stalks, and somewhat lower, there come forth very many little eares of a whitish colour, composed of two ranks of little chaffie seeds set alternately, each of these small eares being almost an inch in length.

2 Spike Flote-Grasse, or spiked Flote-grasse beareth at the top of each slender creeping stalke one spiked eare and no more, and the other many, which maketh a difference betwixt them; otherwise they are one like the other. His root is compact, tufted, and made of many thrummie threds.

¶ *The Place.*

The first of these growes euery where in waters. The second is harder to be found.

¶ *The*

¶ The Names.

The first is called *Gramen fluviale*, and also *Gramen aquis innatans*: in English, Flote-grasse. *Tragus* calls it, *Gramen Anatum*, Ducks-grasse.

The second is called *Gramen fluviale spicatum*, and *fluviale album* by *Tabernamontanus*. Likewise in English it is called Flote-grasse, and Floter-grasse, because they swimme and flote in the water.

CHAP. 12. Of Kneed-Grasse.

¶ The Description.

1 **K**need-grasse hath straight and vpright strawie stalkes, with ioynts like to the straw of corne, and beareth small grasse leaues or blades spiked at the top like vnto Pannick, with a rough eare of a darke browne colour. His roots are hairy and threddy, and the ioynts of the straw are very large and conspicuous.

1 *Gramen geniculatum*,
Kneed-grasse.

2 *Gramen geniculatum aquaticum*,
Water Kneed-grasse.

2 Water Kneed-grasse hath many long and slender stemmes, ioynted with many knobby and gouty knees like vnto Reed, set with broad flaggy leaues somewhat sharpe pointed; bearing at the top a tuft or pannicle diuided into sundry small branches, of a dusky colour. His root is thred-
die like the other.

¶ The Place, Time, and Names.

These Grasses do grow in fertile moist medowes; not differing in time from others. And they are called *Geniculata*, because they haue large ioynts like as it were knees.

We haue nothing deliuered vs of their nature and properties.

CHAP. 13. Of Bearded Panicke Grasfe.

¶ The Description.

1 *Gramen Paniceum.*
Bearded Panick Grasfe.

1 Bearded Panicke grasfe hath broad and large leaues like barley, somewhat hoarie, or of an oner-worne russet colour. The stalkes haue two or three ioynts at the most, and many eares on the top, without order; vpon some stalkes more eares, on others fewer, much like vnto the eare of wilde Panicke, but that this hath many beards or awnes, which the other wants.

2 Small Pannicke Grasfe, as *Lobelius* writeth, in roots, leaues, ioynts, and stalkes is like the former, sauing that the eare is much lesse, consisting of fewer rowes of seed, contained in small chaffe blackish huskes. This, as the former, hath many eares vpon one stalke.

3 This small Pannicke Grasfe from a threddy root sendeth forth many little stalkes, whereof some are one handfull, other some little more than an inch high, and each of these stalkes on the top sustaines one single eare, in shape very like vnto the eare of wilde Pannicke, but about halfe the length. The stalkes of this are commonly crooked, and set with grassie leaues like to the rest of this kinde. The figure hereof was vnfitly placed by our Author in the sixteenth place in the eighth chapter, vnder the title of *Gramen Cyperoides spicatum*.

2 *Gramen paniceum paruum.*
Small Panicke Grasfe.

¶ The Place and Time.

The first of these two doth grow neere vnto mud walls, or such like places not manured, yet fertile or fruitfull,

The

The second groweth in shallow waterie plasches of pastures, and at the same timewith others.

† I haue not as yet obserued any of these three growing wilde. ‡

† 3 *Gramen Pannici effigie spica simplici.*
Single eared Pannicke Grasse.

¶ The Names and Vertues.

They are called Panicke Grasses, because they are like the Italian corne called Panicke.
Their nature and vertues are not knowne.

CHAP. 14. Of Hedge-hog Grasse.

† 1 *Gramen palustre Echinatum.*
Hedge-hog Grasse.

2 *Gramen exile Hirsutum.*
Hairy-grasse.

‡ 3 *Gramen Capitulis globosis.*
Round headed Silver-grasse.

¶ The Description.

1 **H** Edge-hog Grasse hath long stiffe flaggy leaues with diuers stalkes proceeding from a thicke spreading root; and at the top of euery stalke growe certaine round and pricking knobs fashioned like an hedge-hog.

† 2 The second is rough and hairie: his roots do spred and creep vnder the mud and myre as *Cyperus* doth; and at the top of the stalkes are certaine round soft heads, their colour being browne, intermixed with yellow, so that they looke prettily when as they are in their prime.

‡ 3 This Grasse (whose figure was formerly in the first place in this Chapter) hath a small and fibrous root, from which rise leaues like those of Wheat, but with some long white hairs vpon them like those of the last described: at the tops of the stalks (which are some foot or better high) there grow two or three round heads consisting of soft and white downie threds. These heads are said to shine in the night, and therefore they in Italy call it (according to *Cesalpini*) *Luciola, quia noctu lucet*.

4 To this I may adde another growing also in Italy, and first described by *Fabius Columna*. It hath small creeping ioyned

roots, out of which come small fibres, and leaues little and very narrow at the first, but those that are vpon the stalkes are as long againe, incompassing the stalks, as in Wheat, Dogs-grasse, and the like. These leaues are crested all along, and a little forked at the end: the straw or stalke is very slender, at the top whereof growes a sharpe prickly round head, much after the manner of the last described: each of the seed-vessels whereof this head consists ends in a prickly stalke hauing five or seuen points, whereof the vppermost that is in the middle is the longest. The seed that is contained in these prickly vessels is little and transparent, like in colour to that of Cow-wheat. The floures (as in others of this kinde) hang trembling vpon yellowish small threds. ‡

¶ The Place and Time.

† 1 2 They grow in watery meadows and fields, as you may see in Saint Georges fields and such like places.

3 4 Both these grow in diuers mountainous places of Italy; the later whereof floures in May.

¶ The Names.

The first is called Hedge-hog Grasse, and in Latine, *Gramen Echinatum*, by reason of those prickles which are like vnto a hedge-hog.

The second hairy Grasse is called *Gramen exile hirsutum Cyperoides*, because it is small and little, and rough or hairy like a Goat: and *Cyperoides*, because his roots do spring and creepe like the *Cyperus*.

‡ 3 This by *Anguillara* is thought to be *Combretum* of *Pliny*, it is *Gram. lucidum* of *Tabernaemontanus*; and *Gramen hirsutum capitulo globoso*, of *Bauhine*, *Pin. pag. 7.*

4 *Fabius Columna* calls this, *Gramen montanum Echinatum tribuloides capitatum*: and *Bauhine* nameth it, *Gramen spica subrotunda echinata*. Wee may call it in English, Round headed Caltrope Grasse.

¶ The Vertues.

3 The heade of this (which I haue thought good to call Silver-grasse) is very good to be applied to greene wounds, and effectuall to stay bleeding, *Cesalp.* ‡

† It is euident by the name and description, that our Author meant this which we here giue you in the first place; yet his figure was of another Grasse somewhat like the second, which figure and description you may finde here exprest in the third place.

CHAP. 15. Of Hairy Wood-Grasse.

¶ The Description.

1 **H**Airy Wood-grasse hath broad rough leaues somewhat like the precedent, but much longer, and they proceed from a threddy root, which is very thicke, and full of strings, as the common Grasse, with small stalkes rising vp from the same roots; but the top of these stalkes is divided into a number of little branches, and on the end of euery one of them standeth a little floure or huske like the top of *Allium Vrsinum*, or common Ramsons, wherein the seed is contained when the floure is fallen.

2 Cyperus Wood-grasse hath many sheary grassie leaues, proceeding from a root made of many hairy strings or threds: among which there riseth vp sundry straight and vpriight stalkes, on whose tops are certaine scaly and chaffie huskes, or rather spikie blackish eares, not much vnlike the catkins or tags which grow on Nut-trees, or Aller trees.

1 *Gramen hirsutum nemorosum.*
Hairy Wood-grasse.

2 *Gramen Cyperinum nemorosum.*
Cyperus Wood-grasse.

¶ The Place, Time, and Names.

These two grow in woods or shadowie places, and may in English be called Wood-grasses. Their time is common with the rest.

¶ Their Nature and Vertues.

There is nothing to be said of their nature and vertues, being as vnknowne as most of the former.

CHAP. 16. Of Sea Spike-Grasse.

¶ The Description.

† 1 Sea Spike-grasse hath many small hollow round leaues about six inches long, rising from a bushy threddy white fibrous root, which are very soft and smooth in handling. Among these leaues there doe spring vp many small rushy stalkes, alongst which are at the first diuers small flouring round buttons, the sides whereof falling away, the middle part growes into a longish seed-vessell standing vpright.

1 *Gramen marinum spicatum.*
Sea Spike-grasse.

2 *Gramen spicatum alterum.*
Salt marsh Spike grasse.

† 2 Salt-marsh Spike-grasse hath a woody tough thicke root with some small hairy threds fastned thereunto, out of which arise long and thicke leaues very like those of that Sea-grasse we vulgarly call Thrift. And amongst these leaues grow vp slender naked rushy stalkes which haue on one side small knobs or buttons of a greenish colour hanging on them.

3 The third hath many rushy leaues tough and hard, of a browne colour, well resembling Rushes: his root is compact of many small tough and long strings. His stalke is bare and naked of leaues vnto the top, on which it hath many small pretty chaffie buttons or heads.

4 The fourth is like the third, sauing that it is larger; the stalke also is thicker and taller than that of the former, bearing at the top such huskes as are in Rushes.

5 Great Cypresse Grasse hath diuers long three-square stalkes proceeding from a root compact of many long and tough strings or threds. The leaues are long and broad, like vnto the sedge called *Carex*. The spike or eare of it is like the head of Plantaine, and very prickly, and commonly of a yellowish Greene colour.

6 Small Cypresse Grasse is like vnto the other in root and leaues, sauing that it is smaller. His stalke is smooth and plaine, bearing at the top certaine tufts or pannicles, like to the last described in roughnesse and colour.

3 *Gramen junceum maritimum.*
Sea Rush-grasse.

4 *Gramen junceum maritimum.*
Marish Rush-grasse.

5 *Gramen palustre Cyperoides.*
Great Cypressse Grasse.

6 *Gramen Cyperoides parvum.*
Small Cypressse Grasse.

7 *Gramen aquaticum Cyperoides vulgatus.*
Water Cypresse Grasse.

9 *Gramen junceum sylvaticum.*
Wood Rushy-grasse.

† 8 *Gramen Cyperoides spicatum.* Spike Cypresse Grasse.

7 The first of these two kindes hath many crooked and crambing roots of a woody substance, very like vnto the right Cyperus, differing from it onely in smell, because the right Cyperus roots haue a fragrant smell, and these none at all. His leaues are long and broad, rough, sharp or cutting at the edges like sedge. His stalke is long, big, and three square, like to Cyperus, and on his top a chaffie vmbel or tuft like vnto the true Cyperus.

† 8 The second kinde hath many broad leaues like vnto those of Gillouers, but of a fresher Greene: amongst the which riseth vp a short stalke some handfull or two high, bearing at the top three or foure short eares of a reddish murrey colour, and these eares grow commonly together at the top of the stalk, and not one vnder another. There is also another lesser sort hereof, with leaues and roots like the former, but the stalke is commonly shorter, and it hath but one single eare at the top thereof. You haue the figures of both these exprest in the same table or piece. This kinde of Grasse is the *Gramen spicatum folijs Veronicae* of Lobel. †

9 This hath long tough and hairy strings growing deepe in the earth like a turfe, which make the root, from which rise many crooked tough and rushy stalks, hauing toward the top scaly and chaffie knobs or buttons. † This growes

growes some halfe yard high, with round brownish heads, and the leaues are ioynted as you see them expressed in the figure we here giue you. ‡

¶ The Place, Time, Names, Nature, and Vertues.

All the Grasses which we haue described in this chapter doe grow in marish and watery places neere to the sea, or other fenny grounds, or by muddy and myrie ditches, at the same time that the others do grow and flourish. Their names are easily gathered of the places they grow in, or by their Descriptions, and are of no vertue nor propertie in medicine, or any other necessarie vse as yet knowne.

† Formerly in the eighth place (but very vnfitly) was the figure of *Gramen panicis effigie spica simp.* being the third in the thirteenth chapter. The ninth also is restored to his due place, being the fourth in the sixth chapter. The two Reed-grasses that were in the eleventh and twelfth places are also before in the fifth Chapter.

CHAP. 17. Of Couch-Grasse, or Dogs-grasse.

1 *Gramen Caninum.*

Couch-grasse, or Dogs-grasse.

2 *Gramen Caninum nodosum.*

Knotty Dogs-grasse.

¶ The Description.

† 1 THE common or best knowne Dogs-grasse, or Couch-grasse hath long leaues of a whitish Greene colour: the stalke is a cubit and a halfe high, with ioynts or knees like wheaten straw, but these ioynts are couered with a little short down or wool-inesse. The plume or tuft is like the reed, but smaller and more chaffie, and of a grayish colour: it creepeth in the ground hither and thither with long white roots, ioynted at certaine distances, hauing a pleasant sweet taste, and are platted or wrapped one within another very intricately, inso-much as where it hapneth in gardens amongst pot-herbes, great labour must be taken before it can be destroyed, each piece being apt to grow, and euery way to dilate it selfe.

† 2 Knotty Dogs grasse is like vnto the former in stalke and leafe, but that they are of a deeper colour; also the spike or eare is greener, and about some two handfulls long, much in-shape resembling an Oate, yet far smaller, and is much more dispersed than the figure presents to you. The roots of this are somewhat knotty and tuberous, but that is chiefly about the Spring of the yeare, for afterwards they become lesse and lesse vntill the end of Summer. And these bulbes do grow confusedly together, not retaining any certaine shape or number.

¶ The Place.

1 The first growes in gardens and arable lands, as an infirmite or plague of the fields, nothing pleasing to Husbandmen; for after that the field is plowed, they are constrained to gather the roots together with harrowes and rakes; and being so gathered and laid vpon heapes, they set them on fire lest they should grow againe.

2 The second growes in plowed fields and such like places, but not euery where as the other. I haue found of these in great plenty, both growing, and plucked vp with harrowes, as before is rehearsed, in the fields next to S. James wall as ye go to Chelsey, and in the fields as ye go from the Tower-hill of London to Radcliffe.

¶ The Time.

These Grasses seldome come to shew their eare before Iuly.

¶ The Names.

It is called *Gramen Caninum*, or *Sanguinale*, and *Vniola*. The Countrey men of Brabant name it *Deen*: others, *Ledt grasse*: of the Grecians, *αγροστις*: of the Latines, by the common name, *Gramen*. It is of some named *αγροστις*: in English, Couch-grasse, Quitch-Grasse, and Dogs-grasse.

Gramen Caninum bulbosum, or *nodosum*, is called in English, Knobby, or Knotty Couch-grasse.

¶ The Nature.

The nature of Couch-grasse, especially the roots, agreeeth with the nature of common Grasse: although that Couch-grasse be an vnwelcome guest to fields and gardens, yet his physicke vertues do recompence those hurts; for it openeth the stoppings of the liuer and reines, without any manifest heate.

The learned Physitions of the Colledge and Societie of London do hold this bulbous Couch grasse in temperature agreeing with the common Couch-grasse, but in vertues more effectually.

¶ The Vertues.

- A Couch-grasse healeth greene wounds. The decoction of the root is good for the kidneys and bladder: it prouoketh vrine gently, and driueth forth grauell. *Dioscorides* and *Galen* do agree, that the root stamped and laid vpon greene wounds doth heale them speedily.
- B The decoction thereof serueth against griping paines of the belly, and difficultie of making water.
- C *Marcellus* an old Author maketh mention in his 26 chapter, That seuen and twenty knots of the herbe which is called *Gramen*, or Grasse, boiled in wine till halfe be consumed, pressed forth, strained, and giuen to drinke to him that is troubled with the strangurie, hath so great vertue, that after the Patient hath once begun to make water without paine, it may not be giuen any more. But it must be giuen with water onely to such as haue a Feuer. By which words it appeareth, That this knotted Grasse was taken for that which is properly called *Gramen*, or *Agrostis*; and hath bin also commended against the stone and diseases of the bladder.
- D The later Physitions doe vse the roots sometimes of this, and sometimes of the other indifferently.

CHAP. 18. Of Sea Dogs-Grasse.

¶ The Description.

1 THE Sea Dogs-grasse is very like vnto the other before named: his leaues are long and slender, and very thicke compact together, set vpon a knotty stalke spiked at the top like the former. Also the root crambleth and creepeth hither and thither vnder the earth, occupying much ground by reason of his great encrease of roots.

† This Grasse (whereof *Lobel* gaue the first figure and description, vnder the name of *Gramen geniculatum Caninum marinum*) I coniecture to be that which growes plentifully vpon the banks in the salt marishes by Dartford in Kent, and most other salt places by the sea; as also in many banks and orchards about London, and most other places farre from the sea. Now *Lobel's* figure being not good, and the description not extant in any of his Latine Workes; I cannot certainly affirme any thing. Yet I thinke it fit to giue you an exact description of that I do probably iudge to be it; and

and not onely so, but I iudge it to be the same Grasse that *Bauhine* in his *Prodromus* hath set forth, pag. 17. vnder the name of *Gramen latifolium spicatruticea compacta*. This is a very tall Grasse; for it sends forth a stalke commonly in good ground to the height of a yard and an halfe: the leaues are large, stiffe, and Greene, almost as big as those of white Wheat; the which it also very much resembles in the eare, which vsually is some handfull and an halfe long, little spokes standing by course with their flat sides towards the straw. About the beginning of Iuly it is hung with little

1 *Gramen Caninum marinum*.
Sea Dogs-grasse.

2 *Gramen Caninum marinum alterum*.
Sea Couch-grasse.

whitish yellow floures such as Wheat hath. The roots of this are like those of the first described. This sometimes varies in the largeness of the whole Plant, as also in the greatnesse, sparsednesse, and compactnesse of the eare. †

2 The second Sea Dogs-grasse is according vnto *Lobel* somewhat like the former: his roots are more spreading and longer, dispersing themselues vnder the ground farther than any of the rest. The leaues are like the former, thicke bushed at the top, with a cluster or bush of short thick leaues one folded within another. The stalke and tuft is of a middle kinde, betweene *Ischamon* and the common Couch-grasse.

¶ The Place, Time, Names, Nature, and Vertues.

They grow on the sea shore at the same time that others do, and are so called because they grow neere the sea side. Their nature and vertues are to be referred vnto Dogs-grasse.

CHAP. 19. Of vpright Dogs-Grasse.

¶ The Description.

1 Vpright Dogs-grasse, or Quich-grasse, by reason of his long spreading ioyned roots is like vnto the former, and hath at euery knot in the root sundry strings of hairie substance, shooting into the ground at euery ioint as it spreadeth: the stalks ly creeping, or rise but a little from the ground, and at their tops haue spokie pannieles farre smaller than the common

common Couch-grasse. By which notes of difference it may easily be discerned from the other kindes of Dogs-grasse.

1 *Gramen Caninum supinum.*
Vpright Dogs-grasse.

2 Ladies Laces hath leaues like vnto Millet in fashion, rough and sharpe pointed like to the Reed, with many white vaines or ribs, and siluer streakes running along through the midst of the leaues, fashioning the same like to laces or ribbons wouen of white and Greene filke, very beautiful and faire to behold: it groweth vnto the height of wilde Pannicke, with a spoky top not very much vnlike, but more compact, soft, white, and chaffie. The root is small and hairie, and white of colour like vnto the Meadow-grasse.

2 *Gramen striatum.*
Lady-lace Grasse.

¶ The Place.

1 Vpright Dogs-grasse groweth in dun-
ged grounds and fertile fields.

2 Lady-laces growes naturally in woody
and hilly places of Sauoy, and answers com-
mon Grasse in his time of seeding.

It is kept and maintained in our English
gardens, rather for pleasure than vertue, which
is yet knowne.

¶ The Names.

Lobelius calleth the later, *Gramen sulcatum*,
and *striatum*, or *Gramen pictum*: in English, the
Furrowed Grasse, the white Chamelion
Grasse, or streaked Grasse, and vsually of our
English women it is called Lady-laces, or
painted Grasse: in French, *Aiguillettes*
d'armes.

¶ The Nature and Vertues.

The vertues are referred vnto the Dogs-
grasses.

CHAP. 20. Of Dew-Grasse.

¶ The Description.

1 Dew-grasse hath very hard and tough roots long and fibrous: the stalkes are great, of three or foure cubits high, very rough and hairy, ioynted and kneed like the common Reed: the leaues are large and broad like vnto corne. The tuft or eare is diuided into sundry branches, chaffie, and of a purple colour; wherein is contained seed like *Milium*, wherewith the Germanes do make pottage and such like meat, as we in England do with Otemeale; and it is sent into Middleborough and other townes of the Low-countries, in great quantitie for the same purpose, as *Lobel* hath told me.

2 The second kinde of Dew-grasse or *Ischamon* is somewhat like the first kinde of Meadow-grasse, resembling one the other in leaues and stalkes, sauing that the crest or tuft is spred or stretched out abroad like a Cocks foot set downe vpon the ground, whereupon it was called *Galli crus*, by *Apuleius*. These tops are cleere and vpright, of a glistering purple colour, or rather violet; and it is diuided into foure or fve branches like the former Dew-grasse. The root consists of a great many small fibres.

3 To these may fitly be added another Grasse, which *Clusius* hath iudged to be the medicinall Grasse of the Antients: and *Lobel* referres it to the Dogs grasses, because it hath a root iointed thicke, and creeping like as the Dogs-grasses: the stalkes are some foot high, round, and of a purplish colour: but the top is very like to that of the last described, of a darke purple colour.

1 *Gramen Manna esculentum.*
Dew-grasse.

2 *Ischamon vulgare.*
Cocks-foot grasse.

¶ The Place and Time.

1 The first groweth naturally in Germanie, Bohemia, Italy, and in the territories of Gorizia and Carinthia, as *Matthiolus* reporteth.

2 The second groweth neere vnto rough bankes of fields, as I haue seene in the hilly bankes neere Greenhithe in Kent. It differeth not in time from those we haue spoken of.

¶ 3 This

- ‡ 3. *Gramen dactiloides radice repente.*
Cocks-foot Grasse with creeping roots.

- B As in the description I told you, this plant in his tuft or eare is diuided into sundry branches, some tuft into three, some foure, and some fve clouen parts like Cocks toes. *Apuleius* reporteth, If ye take that eare which is diuided onely into three parts, it wonderfully helpeth the running or dropping of the eyes, and those that begin to be bleare eyed, being bound about the necke, and so vsed for certaine dayes together, it turneth the humors away from the weake part.
- C ‡ Manna Grasse, or Rice-grasse is said to be very good to be put into pulteffes, to discusse hard swellings in womens breasts.
- D The Cocks-foot Dogs-grasse is very good in all cases, as the other Dogs-grasses are, and equally as effectuall. ‡

‡ 3 This groweth plentifully in most parts of Spaine and France; and it is probable, that this was the grasse that our Author found neere Greenhithe in Kent.

¶ The Names.

1 The Germanes call it *Himeldau*: That is to say, *Calis*; whereupon it was called *Gramen Manna*: it seemeth to be *Milij sylvestris spurium quoddam genus*, a certaine wilde or bastard kinde of Millet. *Leoniceus* and *Ruellius* name it *Capriola*, and *Sanguinaria*: some would haue it to be *Gramen aculeatum Plinij*, but because the description thereof is very short, nothing can be certainly affirmed. But they are far deceiued who thinke it be *Coronopus*, as some very learned haue set downe: but euery one in these dayes is able to controll that error. *Lobel* calleth it *Gramen Manna esculentum*, for that in Germany and other parts, as Bohemia and Italy, they vse to eate the same as a kind of bread-corne, and also make pottage therewith as wee do with Otemeale; for the which purpose it is there sowed as Corne, and sent into the Low-countries, and there sold by the pound. In English it may be called Manna-grasse, or Dew-grasse; but more fitly Rice-grasse.

2 This is iudged to be *Ischamon* of *Pliny*; and *Galli crus* of *Apuleius*.

¶ The Nature.

These Grasses are astringent and drying, in taste sweet like the common Dogs-grasse.

¶ The Vertues.

Apuleius saith, if a plaister be made of this Grasse, Hogs grease, and leuen of household bread, it cureth the biting of mad dogs.

‡ CHAP. 21. Of diuers *Cyperus* Grasses.

¶ The Description.

‡ 1 The first of these hath reasonable strong fibrous roots, from whence rise stiffe long and narrow leaues like those of other *Cyperus* Grasses: the stalkes also (as it is proper to all the plants of this kindred) are three square, bearing at their tops some three brownish eares soft and chaffie like the rest of this kinde, and standing vpright, and not hanging downe as some others do.

2 This hath pretty thicke creeping blacke roots, from whence arise three square stalkes set with leaues shorter, yet broader than those of the last described; and from the top of the stalke come forth three or foure foot-stalkes, whereupon doe hang longish rough scaly and yellowish heads.

3 The roots of this are blacke, without smell, and somewhat larger than those of the last described.

† 1 *Gramen Cyperoides angustifolium majus.*
Great narrow leaved Cyperus Grasse.

† 2 *Pseudocyperus.*
Bastard Cyperus.

† 3 *Cyperus longus inodorus sylvestris.*
Long Bastard Cyperus.

described: the 3 square stalke also is some two cubits high, bearing at the top dispersedly round scaly heads somewhat like those of the wood Rush-grasse: the leanes are somewhat sharpe and triangular like those of the other Cyperus.

4 This Cyperus hath creeping blacke roots, hauing here and there knotty tuberous heads for the most part, putting vp leaues like those of the last described, as also a stalke bearing at the top long chaffy eares like to some others of this kinde.

5 This Cyperus Grasse hath pretty thicke fibrous and blacke roots, from whence ariseth a stalke some cubit high, pretty stiffe, triangular, ioynted, set at each ioynt with a large greene leaf which at the bottome incompasses the stalke, which is omitted in the figure. At the top of the stalke, as in the true Cyperus, come forth two or three pretty large leaues, betweene which rise vp many small foot-stalkes very much branched, and bearing many blacke feeds somewhat like Millet or rushes.

¶ The Place and Time.

All these grow in ditches and waterie places,

places, and are to be found with their heads about the middle of Sommer, and some of them sooner.

¶ The Names.

The first of these by Lobel is called *Gramen palustre majus*.

2 This by Gesner, Lobel, and Dodonæus is called *Pseudocyperus*.

3 Lobel names this, *Cyperus longus inodorus sylvestris*.

4 He also calls this, *Cyperus aquaticus septentrionalis*.

5 This is the *Cyperus graminea miliacea* of Lobel and Pena: the *Iuncus latus* in the *Histor. Lugd.* pag. 988. and the *Pseudocyperus polycarpus* of Thalius.

† 4 *Cyperus rotundus inodorus sylvestris*.
Round Bastard Cyperus.

† 5 *Cyperus gramineus miliaceus*.
Millet Cyperus grasse.

¶ The Temper and Vertue.

None of these are made use of in physicke; but by their taste they seeme to be of a cold and astringent qualitie. †

† CHAP. 22. Of diuers other Grasses.

¶ The Description.

† 1 **T**his Ote or Hauer-grasse, described by Clusius, hath small creeping roots: the stalks are some cubit high, slender ioynted, and set with short narrow leaues: at the top of the stalke growes the eare, long, slender, and bending, composed of downy huskes containing a feed like to a naked Ote. The seed is ripe in Iuly. It growes in the mountainous and shadowie woods of Hungary, Austria, and Bohemia. Our Author mistaking himselfe in the figure, and as much in the title, gaue the figure of this for Burnt Barley, with this title, *Hordeum Distichon*. See the former edition, pag. 66.

2 I cannot omit this elegant Grasse, found by M. Goodyer vpon the wals of the antient city of Winchester, and not described as yet by any that I know of. It hath a fibrous and stringy root, from which arise leaues long and narrow, which growing old become round as those of *Spartum* or Mat-

Mat-weed : amongst these grassie leaues there growes vp a slender stalke some two foot long, scarce standing vpright, but oft times hanging down the head or top of the eare : it hath some two ioints; and at each of these a pretty grassy leafe. The eare is almost a foot in length, composed of many small and slender hairy tufts, which when they come to maturitie looke of a grayish or whitish colour, and do very well resemble a Capons taile; whence my friend, the first obseruer thereof, gaue it the title of *Gramen Alexandrinum*, or Capons-taile Grasse : by which name I receiued the seed thereof, which sowed, tooke root, and flourishes.

† 1 *Gra. montanum arvenaceum.*
Mountaine Hauer-grasse.

† 2 *Gramen murorum spica longissima.*
Capon-taile Grasse.

3 Next to this I thinke fit to place the *Gramen Cristatum*, or Cocks-combe grasse of *Bauhinus*. This Grasse hath for the root many white fibrous threds thicke packt together; the leaues are but short, about the bignesse of the ordinarie meadow grasse; the stalks are some cubit and halfe high, with some two or three knots a piece: the leaues of the stalke are some foure or fise inches long: the eare is small, longish, of a pale greene colour, somewhat bending, so that in some sort it resembles the combe of a Cocke, or the seed-vessell of that plant which is called *Caput Gallinaceum*. This is ordinarily to be found in most meadows about Mid-summer.

4 There is also commonly about the same time in our meadows to be found a Grasse growing to some cubit high, hauing a small stalke, at the top whereof there growes an eare some inch and an halfe, or two inches long, consisting as it were of two rankes of corne: it very much resembles Rie both in shape and colour, and in his short bearded awnes, wherefore it may very fitly be termed *Gramen secalinum*, or Rie-grasse. Yet is it not *Gramen spica secalina* which *Bauhine* describes in the fifty seuenth place, in his *Prodromus*, pag: 18. for that is much taller, and the eare much larger than this of my description.

5 In diuers places about hedges, in Iuly and August is to be found a fine large tall Grasse, which *Bauhine* (who also first described it) hath vnder the name of *Gramen spica Brizae majus*. This hath stalkes as tall as Rie, but not so thicke, neither are the leaues so broad: at the top of the stalk grow diuers pretty little flattish eares consisting of two rankes of chaffie huskes or seed-vessells, which haue yellowish little floures like to those of Wheat.

6 There is also commonly to be found about May or the beginning of Iune, in meadows and such

such places that grasse which in the *Historia Lugdun.* is set forth vnder the name of *Gramen Lanatum Dalechampij*: the stalkes and leaues are much like the common meadow grasse, but that they are more whitish and hairy; the head or panicle is also soft and woolly, and it is commonly of a gray, or else a murrie colour.

7 There is to be found in some bogs in Summer time about the end of Iuly a pretty rushie grasse some foote or better in height, the stalke is hard and rushie, hauing some three joints, at each whereof there comes forth a leafe as in other grasses, and out of the bosome of the two vppermost of these leaues comes out a slender stalke being some 2 or 3 inches high, and at the top thereof growes as in a little vmbel a pretty white chaffie floure; and at, or nigh to the top of the maine stalke there grow three or foure such floures clustering together vpon little short and slender foot stalkes: the leaues are but small, and some handfull or better long, the roote I did not obserue. This seemes to haue some affinitie with the *Gramen junceum aquaticum*, formerly described in the ninth chapter. I neuer found this but once, and that was in the companie of M. Thomas Smith, and M. James Clarke, Apothecaries of London; we riding into Windfore Forest vpon the search of rare plants, and we found this vpon a bogge neere the high way side at the corner of the great parke. I thinke it may very fitly be called *Gramen junceum leucanthemum*: White floured rush-grasse.

8 The last yeare at Margate in the Isle of Tenet, neere to the sea side and by the chalky cliffe I obserued a pretty litle grasse which from a small white fibrous roote sent vp a number of stalkes of an vnequall height; for the longest, which were those that lay partly spred vpon the ground, were some handfull high, the other that grew straight vp were not so much; and of this, one inch and halfe was taken vp in the spike or eare, which was no thicker than the rest of the stalke, and seemed nothing else but a plaine smooth stalke, vnlesse you looked vpon it earnestly, and then you might perceiue it to be like Darnell grasse: wherefore in the Iournall that I wrot of this Simpling voyage, I called it pag. 3. *Gramen paruum marinum spica Loliacea*. I iudge it to be the same that *Bauhine* in his *Prodromus*, pag. 19 hath set forth vnder the name of *Gramen Loliaceum minus spica simplici*. It may be called in English, Dwarfed Darnell Grasse.

9 The Darnell grasse that I compared the eare of this last described vnto, is not the *Gramen sorbiginum* (which our Author called Darnell-grasse) but another grasse growing in most places with stalkes about some span high, but they seldome stand vpright, the eare is made iust like that which hereafter chap. 58. is called *Lolium rubrum*, Red Darnell, of which I iudge this a variety, differing little therefrom but in smallnesse of growth.

10 Vpon Hampsted heath I haue often obserued a small grasse whose longest leaues are seldome aboue two or three inches high, and these leaues are very Greene, small, and perfectly round like the *Spartum Austriacum*, or Feather-grasse: I could neuer finde any stalke or eare vpon it: wherefore I haue brought it into the Garden to obserue it better. In the forementioned Iournall, pag. 33. you may finde it vnder the name of *Gramen Spartium capillaceo folio minimum*. It may be this is that grasse which *Bauhine* set forth in his *Prodromus*, pag. 11. vnder the title of *Gramen sparteum Monspeliacum capillaceo folio minimum*. I haue thought good in this place to explaine my meaning by these two names to such as are studious of plants, which may happen to light by chance (for they were not intended for publicke) vpon our Iournall, that they need not doubt of my meaning.

11 I must not passe ouer in silence two other Grasses, which for any thing that I know are strangers with vs, the one I haue seene with M. Parkinson, and it is set forth by *Bauhine*, pag. 30. of his *Prodromus*. The other by *Lobell* in the second part of his *Adversaria*, pag. 468. The first (which *Bauhine* fitly calls *Gramen alopecuriodes spica aspera*, and thinkes it to be *Gram. Echinatum Dalechampij*, described *Hist. Lugd.* pag. 432.) hath a fibrous and white root, from which arises a stiffe stalke diuided by many knots, or knees: the leaues are like to the other fox-taile grasses, but greener: the eare is rough, of some inch in length, and growes as it were vpon one side of the stalke: the eare at first is Greene, and shewes yellowish little flowers in August.

12 This other Grasse which *Lobell* in the quoted place figures and describes by the name of *Gramen Scoparium Ischami paniculis Gallicum*, hath rootes some cubit long, slender, and very stiffe, (for of these are made the head brushes which are vulgarly vsed) the straw is slender, and some cubit high, being heere and there ioynted like to other Grasses: the top hath foure or fise eares standing after the manner of Cocks foot Grasse, whereof it is a kinde. It growes naturally about Orleance, and may be called in English, Brush-grasse. ‡

CHAP. 23. Of Cotton Grasse.

¶ The description.

THis strange Cotton grasse, which *L'Obelius* hath comprehended vnder the kindes of Rushes; notwithstanding that it may passe with the Rushes, yet I finde in mine owne experience, that it doth rather resemble grasse than rushes, and may indifferently be taken for either, for that it doth participate of both. The stalke is small and rushy, garnished with many grassy leaues alongst the same, bearing at the top a bush or tuft of most pleasant downe or cotton like vnto the most fine and soft white silke. The root is very tough, small and threddy.

This Water Gladiole, or grassy Rush, of all others is the fairest and most pleasant to behold, and serueth very well for the decking and trimming vp of houses, because of the beauty and brauerie thereof: consisting of sundry small leaues, of a white colour mixed with carnation, growing at the top of a bare and naked stalke, five or six foot long, and sometime more. The leaues are long and flaggy, not much vnlike the common reed. The root is threddy, and not long.

1 *Gramen Tomentarium.*
Cotton Grasse.2 *Gladiolus palustris Cordi.*
Water Gladiole.

¶ The place and time.

1 Cotton grasse groweth vpon bogs and such like moorish places, and it is to be seene vpon the bogs on Hampsted heath. It groweth likewise in Highgate parke neere London.

2 Water Gladiole groweth in standing pooles, motes, and water ditches. I found it in great plenty being in company with a Worshipfull Gentleman Master *Robert Wilbraham*, at a Village fiftene miles from London called Bushey. It groweth likewise neere Redriffe by London, and many other places: the season answereth all others.

¶ The names.

1 *Gramen Tomentosum* is called likewise *Iuncus hombicinus*; of *Cordus*, *Linum pratense*, and *Gnaphalium Hieronymi Bockij*. In English Cotton grasse.

2 Water

2 Water Gladiole is called of *L' Obelius*, *Iuncus Cyperoides floridus paludosus*, Flowring Cy-
presse Rush : *Iuncus*, for that his stalke is like the rush : *Cyperoides*, because his leaues resemble
Cyperus : *Floridus*, because it hath on the top of euery stalke a fine vmbel or tuft of small flowers,
in fashion of the Lilly of Alexandria, the which it is very like, and therefore I had rather call it
Lilly grasfe.

The nature and vertues.

A *Cordus* saith, That *Iuncus bombicinus* sodden in wine, and so taken, helpeth the throwes and gri-
pings of the belly, that women haue in their childing.

There be also sundry kinds of Grasses wholly vknowne, or at the least not remembred of the
old Writers, whereof some few are touched in name onely by the late and new Writers : now
for as much as they haue onely named them, I will referre the better consideration of them to the
industrie and diligence of painefull searchers of nature, and prosecute my purposed labour, to
vnfold the diuers sorts and manifold kindes of *Cyperus*, Flags, and Rushes : and because that there
is added vnto many of the Grasses before mentioned, this difference, *Cyperoides*, that is to say,
resembling *Cyperus*, I thought it therefore expedient to ioine next vnto the history of grasses,
the discourse of *Cyperus*, and his kindes, which are as follow.

CHAP. 24.

Of English Galingale.

1 *Cyperus longus*.
English Galingale

2 *Cyperus rotundus vulgaris*.
Round Galingale.

The description.

English Galingale hath leaues like vnto the common Reed, but lesser and
shorter. His stalke is three square, two cubits high : vpon whose top stand
sundry branches, euery little branch bearing many small chaffy spikes.
The root is blacke and very long, creeping hither and thither, occupying
much ground by reason of his spreading : it is of a most sweet and plea-
sant smell when it is broken.

2 The common round *Cyperus* is like the former in leaues and tops, but the roots are here and there knotty and round, and not altogether so well smelling as the former.

† 3 There is also another *Cyperus* which growes in Syria and Ægypt, whose roots are round, blackish, and large, many hanging vpon one string, and hauing a quicke and aromaticke smell: the leaues and spokyn-tufts resemble the former.

4 There is said to be another kinde of this last described, which is lesser, and the roots are blacker, and it growes in Creet, now called Candy.

5 There is also another round *Cyperus* which growes about ditches and the bankes of Riuers whereas the salt water sometimes comes: the roots of this are hard and blacke without smell, many hanging sometimes vpon one string: the stalke and leaues are much like the former, but the heads vnlike, for they are rough and blackish, about the bignesse of a filbert, and hang some six or seuen at the top of the stalke. It floures in Iuly and August. †

¶ The place and time.

1 2 The first and second of these grow naturally in fenny grounds, yet will they prosper exceedingly in gardens, as experience hath taught vs.

3 4 The former of these growes naturally in Syria and Ægypt, the later in Candy.

5 This growes plentifully in the Marishes below Grauesend, in Shipecy, Tenet, and other places.

¶ The name in generall.

Cyperus is called in Greeke, *Κύρεος*, or *Κύμας*: of the Latines as well *Cypirus* as *Cyperus*: of some *Iuncus quadratus*: of Pliny *Iuncus Angulosus*, and *Triangularis*: of others *Aspalathum* and *Erysicpiron*: in French *Souchet*: in Dutch *Galgan*: in Spanish *Iunco odorosa*: By vs *Cyperus* and English Galangall.

† ¶ The names in particular.

1 This is called *Cyperus longus*, and *Cyperus longus Oederator*: in English, Common *Cyperus*, and English Galingall. 2 This is called *Cyperus rotundus vulgaris*, Round English Galangall. 3 *Cyperus rotundus Cyriacus*, or *Ægyptiacus*, Syrian or Ægyptian round *Cyperus*. 4 *Cyperus minor Creticus*, Candy round *Cyperus*. 5 *Cyperus rotundus inodorus Littoreus*, Round Salt-marsh *Cyperus*, or Galingale. †

¶ The nature.

Dioscorides saith, That *Cyperus* hath an heating qualitie. *Galen* saith, The roots are most effectual in medicine, and are of an heating and drying qualitie: and some doe reckon it to be hot and dry in the second degree.

¶ The vertues.

It maketh a most profitable drinke to breake and expell grauell, and helpeth the dropfie.

If it be boyled in wine, and drunke, it prouoketh vrine, driueth forth the stone, and bringeth downe the naturall sicknesse of women.

The same taken as aforesaid, is a remedie against the stinging and poyson of Serpents.

Fernelius saith, The root of *Cyperus* vsed in Baths helpeth the coldnesse and stopping of the matrix, and prouoketh the termes.

He writeth also, that it increaseth bloud by warming the body, and maketh good digestion; wonderfully refreshing the spirits, and exhilarating the minde, comforting the senses, and increasing their liuelinesse, restoring the colour decayed, and making a sweet breath.

The powder of *Cyperus* doth not onely dry vp all moist vlcers either of the mouth, priuy members, and fundament, but stayeth the humor and healeth them, though they be maligne and virulent, according to the iudgement of *Fernelius*.

5 *Cyperus rotundus littoreus*.
Round Salt-marsh *Cyperus*.

F

‡ CHAP. 25. Of Italian Trasi, or Spanish Galingale.

1 *Cyperus Esculentus sine Caule & flore.*
Italian Trasi, or Spanish Galingall,
without stalke and floure.

2 *Cyperus Esculentus, sine Trasi Italarum.*
Italian Trasi, or Spanish Galingall.

‡ 1 **T**he Italian Trasi, which is here termed Spanish Galingale, is a plant that hath many small roots, hanging at stringy fibers like as our ordinary Dropwort roots do, but they are of the bignesse of a little Medlar, and haue one end flat and as it were crowned like as a Medlar, and it hath also sundry streakes or lines, seeming to diuide it into seueral parts: it is of a brownish colour without, and white within; the taste thereof is sweet almost like a Chesnut. The leaues are very like those of the garden *Cyperus*, and neuer exceed a cubit in length. Stalkes, flowers, or seed it hath none, as *Iohn Pona* an Apothecary of Verona, who diligently obserued it nigh to that city whereas it naturally growes, affirmes; but he saith there growes with it much wild *Cyperus*, which as he judges hath giuen occasion of their error who giue it the stalkes and flowers of *Cyperus*, or English Galingale, as *Matthiolus* and others haue done. It is encreased by setting the roots first steeped in water, at the beginning of Nouember. I haue here giuen you the figure of it without the stalke, according to *Pona*, and with the stalke, according to *Matthiolus* and others.

¶ The names.

The Italian Trasi is called in Greeke by *Theophrastus* *Μελιτράριον*, *Hist. plant. 4. cap. 10.* as *Fabius Columna* hath proued at large: *Pliny* termes it *Anthaliū*: the later writers *Cyperus Esculentus*, and *Dulcichinum*: The Italians, *Trasi*, and *Dolzolini*, by which names in Italy they are cryed vp and downe the streets, as Oranges and Lemmons are here.

¶ The temper and vertues.

A The milke or creame of these Bulbous rootes being drunke, mundifies the brest and lungs; wherefore it is very good for such as are troubled with coughs. Now you must beat these roots, and macerate them in broth, and then presse out the creame through a linnen cloath, which by some late Writers is commended also to be vsed in venereous potions.

B The same creame is also good to be drunke against the heate and sharpnesse of the vrine, especially if you in making it do adde thereto the seeds of Pompions, Gourds, and Cucumbers. The Citizens of Verona eate them for dainties, but they are somewhat windy. ‡

‡ CHAP. 26. Of the true Galingale, the greater and the lesser.

‡ 1. *Galanga major.*
The greater Galingale.

‡ 2. *Galanga minor.*
The lesser Galingale.

The affinity of name and nature hath induced me in this place to insert these two, the bigger and the lesser Galingale; first therefore of the greater.

¶ The description.

1 The great Galingale, whose root onely is in vse, and brought to vs from Iava in the East Indies, hath flaggy leaues some two cubits high, like these of Cat-taile or Reed-mace: the root is thicke and knotty, resembling those of our ordinary flagges, but that they are of a more whitish colour on the inside, and not so large. Their tast is very hot and biting, and they are somewhat reddish on the outside.

2 The lesser growing in China, and commonly in shops called Galingale, without any addition, is a small root of a brownish red colour both within and without; the taste is hot and biting, the smell aromaticall, the leaues (if we may beleue *Garcias ab Horto*) are like those of Myrtles.

¶ The names.

1 The first is called by *Matthiolus*, *Lobell*, and others, *Galanga major*. Some thinke it to be the *Acorus* of the Ancients: and *Pena* and *Lobell* in their *Stirp. Aduers.* question whether it be not the *Acorus Galaticus* of *Dioscorides*. But howsoeuer, it is the *Acorus* of the shops, and by many vsed in *Mithridate* in stead of the true. The Indians call it *Lancuaz*.

2 The lesser is called *Galanga*, and *Galanga minor*, to distinguish it from the precedent. The Chinois call it *Lauandon*: the Indians *Lancuaz*: we in England terme it Galingale, without any addition.

¶ Their temper and vertue.

These roots are hot and dry in the third degree, but the lesser are somewhat the hotter.

They strengthen the stomacke, and mitigate the paines thereof arising from cold and flatulencies.

The smell, especially of the lesser, comforts the too cold braine; the substance thereof being chewed sweetens the breath. It is good also against the beating of the heart.

They are vsfull against the Collicke proceeding of flatulencies, and the flatulent affects of the wombe; they conduce to venery, and heate the too cold reines. To conclude, they are good against all cold diseases. ‡

‡ CHAP. 27. Of Turmericke.

This also challengeth the next place, as belonging to this Tribe, according to *Dioscorides*; yet the root, which onely is brought vs, and in vse, doth more on the outside resemble Ginger, but that it is yellower, and not so flat, but rounder. The inside thereof is of a Saffron colour, the taste hot and bitterish; it is said to haue leaues larger than those of Millet, and a leafie stalke. There is some varietie of these roots, for some are longer, and others rounder, and the later are the hotter, and they are brought ouer oft times together with Ginger.

¶ The place.

It growes naturally in the East-Indies about Calecut, as also at Goa.

¶ The names.

This without doubt is the *Cyperus Indicus* of *Dioscorides*, Lib. 1. Cap. 4. It is now vulgarly by

most Writers, and in shops, called by the name of *Terra merita*, and *Curcuma*: yet some terme it *Crocus Indicus*, and we in English call it *Turmericke*.

¶ *The temperature and vertues.*

- A This root is certainly hot in the third degree, and hath a qualitie to open obstructions, and it is vsed with good successe in medicines against the yellow laundise, and against the cold distempers of the liuer and spleene.

CHAP. 28. Of Zedoarie.

¶ **Z**edoarie is also a root growing naturally in the woods of Malavar about Calcut and Cananor in the Indies; the leaues thereof are larger than Ginger, and much like them; the root is also as large, but consisting of parts of different figures, some long and small, others round; their colour is white, and oft times brownish on the inside, and they haue many fibers comming out of them, but they are taken away together with the outward rinde before they come to vs. These roots haue a strong medicine-like smell, and somewhat an vngratefull taste.

¶ *Zerumbeth, siue Zedoaria rotunda.*
Round Zedoarie.

¶ *The names.*

Some call the long parts of these roots *Zedoaria*, and the round (whose figure we here giue you) *Zerumbeth*, and make them different, whenas indeed they are but parts of the same root, as *Lobell* and others haue well obserued. Some make *Zedoaria* and *Zerumbeth* different, as *Auicenna*: others confound them and make them one, as *Rhazes* and *Serapio*. Some thinke it to be *Αρωμα* of *Ægine-ta*: but that is not so; for he saith, *ἡ ἀρωμα ἔστιν ὁμοία τῷ κρόκῳ, ὁ δὲ κρόκος ἕτερος ὁμοίος τῷ κρόκῳ*; It is an Aromaticke, and therefore chiefly mixed in ointments: which is as much as if he should haue said, That it was put into ointments for the smells sake, which in this is no wayes gratefull, but rather the contrarie.

¶ *The temperature and vertues.*

- A It is hot and dry in the second degree; it discusses flatulencies, and fattens by a certaine hidden qualitie. It also dissipates and amends the vngratefull smell which Garlicke, Onions, or too much wine infect the breath withall, if it be eaten after them. It cures the bites and stings of venomous creatures, stops laskes, resolves the Abscesses of the wombe, stayes vomiting, helps the Collicke, as also the paine of the stomacke.
- B It kills all sorts of wormes, and is much vsed in Antidotes against the plague, and such like contagious diseases. ‡

CHAP. 29. Of Rushes.

¶ **I** Do not here intend to trouble you with an accurate distinction and enumeration of Rushes; for if I should, it would be tedious to you, laborious to me, and beneficiall to neither. Therefore I will onely describe and reckon vp the chiefe and more note-worthy of them, beginning with the most vsuall and common. ‡

¶ *The description.*

1 The roots of our common Rushes are long and hairy, spreading largely in the ground, from which, as from one entire tuft, proceed a great company of small rushes; so exceedingly well knowne, that I shall not need to spend much time about the description thereof.

2 There be sundry sorts of Rushes besides the former, whose pictures are not here exprest, and the rather, for that the generall description of Rushes, as also their common vse and seruice, are sufficient to leade vs to the knowledge of them. This great Water-Grasse or Bul-Rush, instead of leaues bringeth forth many strait twiggie shoots or springs, which be round, smooth, sharpe pointed, and without knots. Their tuft or flower breaketh forth a little beneath the top, vpon the one side of the Rush, growing vpon little short stems like Grape clusters, wherein is contained the seed after the fashion of a speares point. The roots be slender and full of strings. *Pliny*, and *Theophrastus* before him, affirme that the roots of the Rush do die every yeare, and that it groweth

it groweth againe of the seed. And they affirme likewise that the male is barren, and groweth againe of the yong shoots; yet I could neuer obserue any such thing.

‡ 3 There growes a Rush to the thicknes of a Reed, and to some two yards and an halfe, or three yards high, in diuers fenny grounds in this kingdome; it is very porous and light, and they vsually make mats, and bottom chaires therewith. The seeds are contained in reddish tufts, breaking out at the top thereof. The roots are large and ioynted, and it grows not vnlesse in waters. ‡

4 *Iuncus acutus*, or the sharpe Rush, is likewise common and well knowne; not much differing from *Iuncus levis*, but harder, rougher, and sharper pointed, fitter to straw houses and chambers than any of the rest; for the others are so soft and pithy, that they turne to dust and filth with much treading; where contrariwise this rush is so hard that it will last sound much longer.

‡ 5 There is also another pretty small kinde of Rush growing to some foot in heighth, hauing smooth stalkes which end in a head like to that of the ordinary Horse-taile. This rush hath also one little joynt towards the bottome thereof. It growes in watery places, but not so frequently as the former. ‡

1 *Iuncus levis*.

Common Rushes.

4 *Iuncus acutus*.

Sharpe Rush, or hard Rush.

3 *Iuncus aquaticus maximus*.

Great Water-Rush, or Bul-Rush.

¶ The place.

1 *Iuncus levis* groweth in fertile fields, and meadowes that are somewhat moist.

2 3 5 Grow in standing pooles, and by riuers sides in sundry places.

4 *Iuncus acutus* groweth vpon dry and barren grounds, especially neere the furrows of plowed land. I need not speake of their time of growing, they being so common as they are.

¶ The names.

The Rush is called in Greeke *ῥίζη*: in Latine *Iuncus*: in high Dutch *Binken*: in low Dutch *Biesen*: in Italian *Giunco*: in Spanish *Iunco*: in French *Ionc*: in English Rushes.

2 3 The Grecians haue called the Bull-Rush *ῥίζη βοῦν*. The greater are commonly in many places termed Bumbles.

1 *Iuncus levis* is that Rush which *Dioscorides* called *ῥίζη λευκή*.

4 *Iuncus acutus* is called in Greeke *ῥίζη σφοδρὰ*: In Dutch *Wseren Biesen*.

5 This is called by *Lobell*, *Iuncus aquaticus minor Capitulis Equiseti*: By *Daleschampsius*, *Iuncus clauatus*, or Club-Rush.

¶ The

¶ The nature and vertues.

- These Rushes are of a dry nature.
- A The seed of Rushes dried at the fire, and drunke with wine alayed with water, stayeth the laske and the ouermuch flowing of womens termes.
- B *Galen* yeeldeth this reason thereof, because that their temperature consisteth of an earthy essence, moderately cold and watery, and meanly hot, and therefore doth the more easily drie vp the lower parts, and by little and little send vp the cold humours to the head, whereby it prouoketh drowfinesse and desire to sleepe, but causeth the head-ache; whereof *Galen* yeeldeth the reason as before.
- C The tender leaues that be next the root make a conuenient ointment against the bitings of the Spider called *Phalangium*.
- D The seed of the Bull-Rush is most soporiferous, and therefore the greater care must be had in the administration thereof, lest in prouoking sleepe you induce a drowfinesse or dead sleepe.

CHAP. 30. Of Reeds.

¶ The kindes.

OF Reeds the Ancients haue set downe many sorts. *Theophrastus* hath brought them all first into two principall kindes, and those hath he diuided againe into moe sorts. The two principall are these, *Auletica*, or *Tibiales Arundines*, and *Arundo vallatoria*. Of these and the rest we will speake in their proper places.

1 *Arundo vallatoria*.
Common Reed.

2 *Arundo Cypria*.
Cypresse Canes.

¶ The description.

1 THE common Reed hath long strawie stalkes full of knotty joints or knees like vnto corne, whereupon do grow very long rough flaggy leaues. The tuft or spoky eare doth grow at the top of the stalkes, browne of colour, barren and without seed, and doth resemble a bush of feathers, which turneth into fine downe or cotton which is carried away with the winde. The root is thicke, long, and full of strings, dispersing themselves farre abroad, whereby

wherby it doth greatly increase. † *Baubinus* reports, That he receiued from D. *Cargill* a Scottish-man a Reed whose leaues were a cubit long, and two or three inches broad, with some nerues apparantly running alongst the leafe; these leaues at the top were diuided into two, three, or foure points or parts; as yet I haue not obserued it. *Bauhine* termes it *Arundo Anglica folijs in summitate dissectis*. †

1 The Cypresse Reed is a great Reed hauing stalkes exceeding long, sometimes twenty or thirty foot high, of a woody substance, set with very great leaues like those of Turkey wheate. It carrieth at the top the like downie tuft that the former doth.

3 *Arundo farcta*.

Stuffed Canes.

4 *Calamus sagittalis Lobelij*.

Small stuffed Reed.

5 *Nastos Clusij*.

Turky walking staues.

6 *Arundo scriptoria*.

Turky writing Reeds.

3 These Reeds *Lobelius* hath seene in the Low countries brought from Constantinople, where, as it is said, the people of that countrey haue procured them from the parts of the Adriaticke sea side where they do grow. They are full stufte with a spongy substance, so that there is no hollownesse in the same, as in Canes & other Reeds, except here and there certaine small pores or passages of the bignesse of a pinnes point, in manner such a pith as is to be found in the Bull-Rush, but more firme and solid.

4 The second differeth in smalnesse, and that it will winde open in fleakes, otherwise they are very like, and are vsed for darts, arrowes, and such like.

5 This great sort of Reeds or Canes hath no particular description to answer your expectation, for that as yet there is not any man which hath written thereof, especially of the manner of growing of them, either of his owne knowledge or report from others: so that it shall suffice that yee know that that great cane is vsed especially in Constantinople and thereabout, of aged and wealthy Citisens, and also Noblemen and such great personages, to make them walking staues of, caruing them at the top with sundry Scutchions, and pretty toyes of imagerie for the beautifying of them; and so they of the better sort do garnish them both with siluer and gold, as the figure doth most liuely set forth vnto you.

6 In like manner the smaller sort hath not as yet bene seene growing of any that haue bene curious in herbarisme, whereby they might set downe any certaintie thereof; onely it hath bene vsed in Constantinople and thereabout, euen to this day, to make writing pens withall, for the which it doth very fitly serue, as also to make pipes, and such like things of pleasure.

¶ The place.

The common Reed groweth in standing waters and in the edges and borders of riuers almost euery where: and the other being the angling Cane for Fishers groweth in Spaine and those hot Regions.

¶ The time.

They flourish and flower from April to the end of September, at what time they are cut down for the vse of man, as all do know.

¶ The names.

The common Reed is called *Arundo* and *Harundo vallatoria*: in French *Roscan*: in Dutch *Riet*: in Italian *Canne a far siepo*: of Diosc. *Phragmitis*: in English, Reed.

Arundo Cypria, or after *Lobelius*, *Arundo Donax*: in French *Canne*: in Spanish *Carra*: in Italian, *Calami a far Connochia*: In English, Pole reed, and Cane, or Canes.

¶ The nature.

Reeds are hot and dry in the second degree, as *Galen* saith.

¶ The vertues.

The roots of reed stamped smal draw forth thorns and splinters fixed in any part of mans body. A

The same stamped with vineger ease all luxations and members out of ioynt. B

And likewise stamped they heale hot and sharpe inflammations. The ashes of them mixed with vineger helpeth the scales and scurfe of the head, and helpeth the falling of the haire. C

The

D The great Reed or Cane is not vsed in physicke, but is esteemed to make flears for Weauers, sundry sorts of pipes, as also to light candles that stand before Images, and to make hedges and pales, as we do of laths and such like; and also to make certaine diuisions in ships to diuide the sweet oranges from the sowre, the pomecitron and lemmons likewise in sunder, and many other purposes.

CHAP. 31. Of Sugar Cane.

¶ The description.

S Vgar Cane is a pleasant and profitable Reed, hauing long stalkes seuen or eight foot high, ioyned or kneed like vnto the great Cane; the leaues come forth of euerie joynt on euery side of the stalke one, like vnto wings, long, narrow, and sharpe pointed. The Cane it selfe, or stalke is not hollow as other Canes or Reeds are, but full, and stuffed with a spongeous substance in taste exceeding sweet. The root is great and long, creeping along within the vpper crust of the earth, which is likewise sweet and pleasant, but lesse hard or woody than other Canes or Reeds; from the which there doth shoot forth many yong siens, which are cut away from the maine or mother plant, because they should not draw away the nourishment from the old stocke, and so get vnto themselues a little moisture, or else some substance not much worth, and cause the stocke to be barren, and themselues little the better; which shoots do serue for plants to set abroad for encrease.

¶ The place.

The Sugar Cane groweth in many parts of Europe at this day, as in Spaine, Portugal, Olbia, and in Prouence. It groweth also in Barbarie, generally almost euery where in the Canarie Islands, and in those of Madera, in the East and West Indies, and many other places. My selfe did plant some shoots thereof in my garden, and some in Flanders did the like: but the coldnesse of our clymate made an end of mine, and I thinke the Flemings will haue the like profit of their labour.

¶ The time.

This Cane is planted at any time of the yeare in those hot countries where it doth naturally grow, by reason they feare no frosts to hurt the yong shoots at their first planting.

¶ The names.

The Latines haue called this plant *Arundo Saccharina*, with this additament, *Indica*, because it was first knowne or brought from India. Of some it is called *Calamus Saccharatus*: in English Sugar Cane: in Dutch *Supickerriedt*.

¶ The nature and vertues.

The Sugar or iuice of this Reed is of a temperate qualitie; it drieth and cleanseth the stomacke, maketh smooth the roughnesse of the brest and lungs, cleareth the voice, and putteth away hoarsenesse, the cough, and all sourenesse and bitternesse, as *Isaac* saith in *Dictis*.

¶ The vse.

Of the iuyce of this Reed is made the most pleasant and profitable sweet, called Sugar, whereof is made infinite confections, confections, syrups, and such like, as also preserving and conseruing of sundry fruits, herbes, and flowers, as Roses, Violets, Rosemary flowers, and such like, which still retaine with them the name of Sugar, as Sugar Roset, Sugar violet, &c. The which to write of would require a peculiar volume, and not pertinent vnto this historie, for that it is not my purpose to make of my booke a Confectionarie, a Sugar Bakers furnace, a Gentlewomans preserving pan, nor yet an Apothecaries shop or Dispensatorie; but onely to touch the chiefe matter that I purposed to handle in the beginning, that is, the nature, properties, and descriptions of plants. Notwithstanding I thinke it not amisse to shew vnto you the ordering of these reeds when

Arundo Saccharina.
Sugar Cane.

when they be new gathered, as I receiued it from the mouth of an Indian my seruant: he saith, They cut them in small pieces, and put them into a trough made of one whole tree, wherein they put a great stone in manner of a mill-stone, whereunto they tie a horse, buffle, or some other beast which draweth it round: in which trough they put those pieces of Canes, and so crush and grind them as we do the barks of trees for Tanners, or apples for Cyder. But in some places they vse a great wheele, wherein slaues do tread and walke as dogs do in turning the spit: and some others do feed as it were the bottome of the said wheele, wherein are some sharpe or hard things which do cut and crush the Canes into powder. And some likewise haue found the inuention to turne the wheele with water workes, as we do our iron mills. The Canes being thus brought into dust or powder, they put them into great cauldrons with a little water, where they boyle vntill there be no more sweetnesse left in the crushed reeds. Then doe they straine them through mats and such like things, and put the liquor to boyle againe vnto the consistence of honey, which being cold is like vnto sand both in shew and handling, but somewhat softer; and so afterward it is carried into all parts of Europe, where it is by the Sugar Bakers artificially purged and refined to that whitenesse as we see.

CHAP. 32. Of Flowring Reed.

Arundo florida.
Flowring Reed.

¶ The description.

F^{lowring} Reed hath a thicke and fat stalke of foure or five foot high, great below neere the ground, and smaller toward the top, taper-wise: whereupon do grow very faire broad leaues ful of ribs or sinewes like vnto Plantaine, in shape representing the leaues of white Hellebor, or the great Gentian, but much broader and larger euery way: at the top of which stalkes do grow phantasticke flowers of a red or vermilion colour; which being faded, there follow round, rough, and prickly knobs, like those of *Sparganium*, or water-Burre, of a browne colour, and from the middle of those knobs three small leaues. The seed contained in those knobs is exceeding black, of a perfect roundnesse, of the bignesse of the smallest pease. The root is thicke, knobby, and tuberous, with certain small threds fixed thereto. † There is a variety of this, hauing floures of a yellow or Saffron colour, with red spots. †

¶ The place.

It groweth in Italy in the garden of Padua, and many other places of those hot regions. My selfe haue planted it in my garden diuers times, but it neuer came to flowring or seeding, for that it is very impatient to endure the injurie of our cold clymate. It is a native of the West Indies.

¶ The time.

It must be set or sown in the beginning of Aprill, in a pot with fine earth, or in a bed made with horse-dung, and some earth strawed thereon, in such manner as Cucumbers and Muske-Melons are.

¶ The names.

The name *Arundo Indica* is diuersly attributed to sundrie of the Reeds, but principally vnto this, called of *Lobelius*, *Cannacorus*: of others, *Arundo florida*, and *Harundo florida*: in English, the Flowring Reed.

¶ The nature and vertues.

There is not any thing set downe as touching the temperature and vertues of this ^{flowring} Reed, either of the Ancients, or of the new or later Writers.

CHAP. 33. Of Paper Reed.

Paper Reed hath many large flaggie leaues somewhat triangular and smooth, not much vnlike those of Catf-taile, rising immediatly from a tuft of roots compact of many strings, among st the which it shooteth vp two or three naked stalkes, square, and rising some six or seuen cubits high aboue the water; at the top whereof there stands a tuft or bundle of chaffie threds set in comely order, resembling a tuft of flowers, but barren and void of seed.

Papyrus Nilotica.
Paper Reed.

¶ *The place.*

This kinde of Reed growes in the Riuer about Babylon, and neere the city Alcaire, in the riuer Nilus, and such other places of those countries.

¶ *The time.*

The time of springing and flourishing answereth that of the common Reed.

¶ *The names.*

This kinde of Reed which I haue Englished Paper Reed, or Paper plant, is the same (as I do reade) that Paper was made of in Ægypt, before the inuention of paper made of linnen clouts was found out. It is thought by men of great learning and vnderstanding in the Scriptures, and set downe by them for truth, that this plant is the same Reed mentioned in the second chapter of *Exodus*; whereof was made that basket or cradle, which was dawbed within and without with slime of that countrey, called *Bitumen Iudæicum*, wherein *Moses* was put being committed to the water, when *Pharaoh* gaue commandement that all the male children of the Hebrewes should be drowned.

¶ *The nature, vertues, and vse.*

The roots of Paper Reed doe nourish, as may appeare by the people of Ægypt, which do vse to chew them in their mouthes, and swallow downe the iuice, finding therein great delight and comfort.

- A** The ashes burned asfwage and consume hard apostumes, tumors, and corrasie vlcers in any part of the body, but chiefly in the mouth.
- B** The burnt paper made hereof doth performe those effects more forcibly.
- C** The stalkes hereof haue a singular vse and priuiledge in opening the chanelles or hollow passages of a Fistula, being put therein; for they do swell as doth the pith of Elder, or a tent made of a sponge.
- D** The people about Nilus do vse to burne the leaues and stalkes, but especially the roots.
- E** The frailes wherein they put Raisins and Figs are sometimes made hereof; but generally with the herbe *Spartum*, described in the next Chapter.
- F**

CHAP. 34. Of Mat-Weed.

¶ *The kindes.*

There be diuers kindes of Mat-Weeds, as shall be declared in their seuerall descriptions.

¶ *The description.*

The herbe *Spartum*, as *Pliny* saith, groweth of it selfe, and sendeth forth from the root a multitude of slender rushie leaues of a cubit high, or higher, tough and pliable, of a whitish colour, which in time draweth narrow together, making the flat leafe to become round, as is the Rush. The stub or stalke thereof beareth at the top certaine feather-like tufts comming forth

forth of a sheath or huske, among the which chaffie huskes is contained the seed, long and chaffie. The root consisteth of many strings folding one within another, by meanes whereof it cometh to the forme of a turfe or hassocke.

1 *Spartum Plinij Clusio.*
Plinies Mat-Weed.

2 *Spartum alterum Plinij.*
Hooded Mat-Weed.

2 The second likewise *Pliny* describeth to haue a long stalke not much vnlike to Reed, but lesser, whereupon do grow many grassie leaues, rough and pliant, hard in handling as are the Rushes. A spokie chaffie tuft groweth at the top of the stalke, comming forth of a hood or finewie sheath, such as encloseth the flowers of Onions, Leekes, Narcissus, and such like, before they come to flowring, with seed and roots like the precedent.

3 English Mat-weed hath a rushie root, deeply creeping and growing in heapes of sand and grauell, from the which arise stiffe and sharpe pointed leaues a foot and a halfe long, of a whitish colour, very much resembling those of Camels hay. The stalke groweth to the height of a cubit or more, whereupon doth grow a spike $\ddagger$ or eare of some fine or six inches long, somewhat resembling Rie; it is the thickest of a finger in the midst, and smaller towards both the ends. The seed is browne, as small as Canarie seed, but round, and somewhat sharpe at the one end $\ddagger$. Of this plant neither Sheepe nor any other Cattle will taste or eate.

4 The other English Mat-Weed is like vnto the former, sauing that the roots of this are long, not vnlike to Dogs Grass, but do not thrust deepe into the ground, but creepe onely vnder the vpper crust of the earth. The tuft or eare is shorter, and more resembling the head of Canary feed than that of Rie.

$\ddagger$ 5 *Lobell* giues a figure of another smaller Rush, leaued *Spartum*, with small heads, but hee hath not described it in his Latine Workes, so that I can say nothing certainly of it.

6 To this kindred must be added the Feathered Grass, though not partaking with the former in place of growth. Now it hath many small leaues of a foote length round, green, and sharp pointed, not much in forme vnlike the first described Mat-weed, but much lesse: amongst these leaues rise vp many small stalkes not exceeding the height of the leaues, which beare a spike vnlike the forementioned Mat-weeds, hauing 3 or foure seeds ending in, or sending vp very fine white Feathers, resembling the smaller sort of feathers of the wings of the Bird of Paradise. The root consists of many small grassie fibres.

3 *Spartum Anglicanum.*
English Mat-Weed, or Helme.

4 *Spartum Anglicanum alterum.*
Small English Mat-Weed, or
Helme.

6 *Spartum Austriacum.*
Feather-Grasse.

¶ The place.

1 2 These two grow in diuers places of Spaine.

3 I being in company with M. Tho. Hicks, William Broad, and three other London Apothecaries besides, in August, 1632, to finde out rare plants in the Island of Tenet, found this bigger English one in great plenty, as soone as we came to the sea side, going betwene Margate and Sandwich.

4 5 These it may be grow also vpon our Coasts; howeuer they grow neere the sea side in diuers parts of the Low-Countries.

6 This elegant Plant *Clusius* first obserued to grow naturally in the mountaines nigh to the Bathes of Baden in Germany, and in diuers places of Austria and Hungarie. It is nourished for the beautie in fundrie of our English gardens.

¶ The time.

These beare their heads in the middle, and some in the later end of Sommer.

¶ The names.

1 This is called *Spartum primum Plinij*; that is, the first Mat-Weed described by *Pliny*: in Spaine they call it *Sparto*: the French in Prouence terme it *Olpho*.

2 This is *Spartum alterum Plinij*, *Plinie* his second Mat-Weed, or Hooded Mat-weed, it is called *Albardin* in Spaine.

3 This is *Spartum tertium* of *Clusius*, and *Gramen Spartum secundum Schenanthinum* of *Taber*. Our Author

gaue

gaue *Clusius* his figure for his first, and *Tabernamontanus* figure for the second *Spartum Anglicanum*; but I will thinke them both of one plant (though *Bauhine* distinguish them) vntill some shall make the contrary manifest. This the Dutch call *Palme*; and our English in Tenet, Helme. *Turner* calls it Sea-Bent.

4 This is *Spartum herba 4 Batavicum* of *Clusius*; *Gramen Spartum*, or *Iunci Spartum* of *Tabern.* and our Author gaue *Tabern.* figure in the 23 Chapter of this Booke vnder the title of *Iuncus marinus gramineus*; *Lobell* calls it *Spartum nostras alterum*.

5 *Lobell* calls this *Spartum nostras paruum*.

6 *Clusius* calls this *Spartum Austriacum*; *Daleschampsius*, *Gramen pinnatum*; we in England call it *Gramen plumosum*, or Feathered Grasse. ‡

¶ The temperature, vertues, and vse.

These kindes of grasse or rather rushie Reed haue no vse in physicke, but serue to make Mats, A and hangings for chambers, frailes, baskets, and such like. The people of the Countries where they grow do make beds of them, straw their houses and chambers in stead of Rushes, for which they do excell, as my selfe haue seene. *Turner* affirmeth, That they made hats of the English one in Northumberland in his time.

They do likewise in sundry places of the Islands of Madera, Canaria, Saint Thomas, and other B of the Islands in the tract vnto the West Indies, make of them their boots, shooes, Herd-mens Coats, fires, and lights. It is very hurtfull for cattell, as Sheere-grasse is.

The Feather-Grasse is worne by sundry Ladies and Gentlewomen in stead of a Feather, the which it exquisitely resembles.

CHAP. 35.

Of Camels Hay.

1 *Scœnanthum*
Camels Hay.

2 *Scœnanthum adulterinum*?
Bastard Camels Hay.

¶ The description.

1 C Amels Hay hath leaues very like vnto Mat-Weed or Helme; his roots are many, in quantitie meane, full of small haire or threds proceeding from the bigger Root deeply growing in the ground, hauing diuers long stalkes like *Cyperus* Grasse, set with

with some smaller leaues euen vnto the top, where do grow many small chaffie tufts or pannicles like vnto those of the wilde Oats; of a reasonable good smell and fauour, when they are broken, like vnto a Rose, with a certaine biting and nipping of the tongue.

† 2 Francis Penny, of famous memory, a good Physitian and skilfull Herbarist, gathered on the coast of the Mediterranean sea, between Aigues Mortes and Pescaire, this beautifull plant, whose roots are creeping, and stalkes and leaues resemble Squinanth. The flowers are soft, pappous, and thicke compact, and some five or six inches in length, like to Fox-taile; they in colour resemble white filke or siluer. Thus much Lobell. Our Author described this in the first place, Ch. 23. vnder *Iuncus Marinus Gramineus*, for so Lobell also calls it. †

¶ The place.

1 This growes in Africa, Nabathæa, and Arabia, and is a stranger in these Northerne Regions.

2 The place of the second is mentioned in the description.

¶ The time.

Their time answereth the other Reeds and Flags.

¶ The names.

1 Camels Hay is called in Greeke *ῥίζα ἰουγκίου*: in Latine, *Iuncus odoratus*, and *Scœnanthum*: in shops *Squinanthum*, that is, *Flos Iunci*: in French, *Pasteur de Chammeau*: in English, Camels Hay, and Squinanth.

2 This Lobell calls *Iuncus marinus gramineus*, and *Pseudosœnanthum*: We call it Bastard Squinanth, and Fox-taile Squinanth.

¶ The temper.

This plant is indifferently hot, and a little astringe.

¶ The vertues.

A Camels Hay prouoketh vrine, moueth the termes, and breaketh winde about the stomacke.
B It causeth aking and heauinesse of the head, Galen yeeldeth this reason thereof, because it heateth moderately, and bindeth with tenuitie of parts.

C According to *Dioscorides*, it dissolues, digests, and opens the passages of the veines.

D The floures or chaffie tufts are profitable in drinke for them that pisse bloud anywayes: It is giuen in medicines that are ministred to cure the paines and griefes of the guts, stomacke, lungs, liuer, and reines, the fulnesse, loathsomenesse, and other defects of the stomacke, the dropie, conuulsions, or shrinking of sinews, giuen in the quantitie of a dram, with a like quantitie of Pepper, for some few dayes.

E The same boyled in wine helpeth the inflammation of the matrix, if the woman do sit ouer the fume thereof, and bathe her selfe often with it also.

CHAP. 36. Of Burre-Reed.

¶ The description.

1 THE first of these plants hath long leaues, which are double edged, or sharpe on both sides, with a sharpe creft in the middle, in such manner raised vp that it seemeth to be triangle or three square. The stalkes grow among the leaues, and are two or three foot long, being diuided into many branches, garnished with many prickly huskes or knops of the bignesse of a nut. The root is full of hairy strings.

2 The great Water Burre differeth not in any thing from the first kind in roots or leaues, saue that the first hath his leaues rising immediately from the tuft or knop of the root; but this kinde hath a long stalke comming from the root, whereupon, a little aboue the root, the leaues shoot out round about the stalke successiuelly, some leaues still growing aboue others, euen to the top of the stalke, and from the top thereof downward by certaine distances. It is garnished with many round wharles, or rough coronets, hauing here and there among the said wharles one single short leafe of a pale greene colour.

¶ The place.

Both these are very common, and grow in moist medowes, and neere vnto water-courses. They plentifully grow in the fenny grounds of Lincolnshire, and such like places; in the ditches about S. George his fields, and in the ditch right against the place of execution, at the end of Southwark, called S. Thomas Waterings.

¶ The time.

They bring forth their burry bullets or seedy knots in August.

[Spar]

1 *Sparganium Ramosum.*
Branched Burre-Reed.2 *Sparganium latifolium.*
Great Water-Burre.

¶ The names.

These Plants of some are called *Sparganium*: *Theophrastus* in his fourth Booke and eighteenth Chapter calleth them *Butomus*: of some, *Platanaria*: I call them Burre-Reed: in the Arabian tongue they are called *Sa farhe Bamon*: in Italian *Sparganio*: of *Dodoneus*, *Carex*: Some call the first *Sparganium ramosum*, or Branched Burre-Reed. The second, *Sparganium non ramosum*, Not-branching Burre-Reed.

¶ The temperature.

They are cold and dry of complexion.

¶ The vertues.

Some write, that the knops or rough burrees of these plants boyled in wine, are good against the bitings of venomous beasts, if either it be drunke, or the wound washed therewith.

CHAP. 37. Of Cats Taile.

¶ The description.

Cats Taile hath long and flaggy leaues, full of a spongeous matter, or pith, among which leaues groweth vp a long smooth naked stalke, without knot, fashioned like a speare, of a firme or solid substance, hauing at the top a browne knop or eare, soft, thicke and smooth, seeming to be nothing else but a deale of flockes thicke set and thrust together, which being ripe turneth into a downe, and is carried away with the winde. The Roots be hard, thicke, and white, full of strings, and good to burne, where there is plenty thereof to be had.

¶ The place.

It groweth in pooles and such like standing waters, and sometimes in running streames.

I haue found a smaller kinde hereof growing in the ditches and marshie grounds in the Isle of Shepey, going from Sherland house to Feuertham.

¶ The time.

They floure and beare their mace or torch in Iuly and August.

Typha.
Cats Taile.

¶ The names.

They are called in Greeke *τύφη*: in Latine *Typha*: of some *Cestrum Morionis*: in French *Marteau Masses*: in Dutch, *Lischdoden*, and *Donsen*: In Italian *Mazza forda*: in Spanish *Behordo*, and *Iunco amacorodato*: In English, Cats Taile, and Reed-Mace. Of this Cats Taile *Aristophanes* maketh mention in his Comedy of Frogs, where he bringeth them forth one talking with another, being very glad that they had spent the whole day in skipping and leaping *inter Cyperum & Phleum*, among *Galingale* and Cats Taile. *Ouid* seemeth to name this plant *Scirpus*; for he termeth the mats made of the leaues, Catf-taile Mats, as in his sixth Booke *Fastorum*,

*At Dominus, discedite, ait, plaustroque morantes
Sustulit, in plaustro scirpea matta fuit.*

¶ The nature.

It is cold and dry of complexion.

¶ The vertues.

The soft Downe stamped with swines grease well washed, healeth burnings or scaldings with fire or water.

Some practitioners by their experience haue found, That the Downe of the Cats taile beaten with the leaues of Betony, the roots of Gladiole, and the leaues of *Hippoglosson* into powder, and mixed with the yelks of egges hard foddren, and so eaten, is a most perfect medicine against the disease in children called in Greeke *Εντεριμία*, which is, when the gut called *Intestinum cecum* is fallen into the cods. This medicine must be ministred euery day fasting for the space of thirtie

dayes, the quantitie thereof to be ministred at one time is *℥. 3*. This being vsed as before is specified doth not onely helpe children and striplings, but growne men also, if in time of their cure they vse conuenient ligature or trussings, and fit consouiding plaisters vpon the grieved place, according to art appointed for that purpose in Chirurgerie.

- C This Downe in some places of the Isle of Elie, and the low countries adioyning thereto, is gathered and well sold to make mattresses of, for plowmen and poore people.
- D It hath beene also often proued to heale kided or humbled heeles (as they are termed) being applied to them, either before or after the skinne is broken.

CHAP. 38. Of Stitchwort.

¶ The description.

1 **S**itchwort, or as *Ruellius* termeth it *Holosteum*, is of two kindes, and hath round tender stalkes full of joints leaning toward the ground; at euery ioynt grow two leaues one against another. The flowers be white, consisting of many small leaues set in the manner of a starre. The roots are small, jointed, and threddy. The seed is contained in small heads somewhat long, and sharpe at the vpper end, and when it is ripe it is very small and browne.

2 The second is like the former in shape of leaues and flowers, which are set in forme of a starre; but the leaues are orderly placed, and in good proportion, by couples two together, being of a whitish colour. When the flowers be vaded then follow the seeds, which are inclosed in bullets like the seed of flax, but not so round. The chiues or threds in the middle of the floure are sometimes of a reddish, or of a blackish colour. † There are more differences of this plant, or rather varieties, as differing little but in the largenesse of the leaues, floures, or stalkes. †

¶ The place.

They grow in the borders of fields vpon banke sides and hedges, almost euery where.

¶ The time.

They flourish all the Sommer, especially in May and Iune.

¶ The

Gramen Leucanthemum.
Stitchwort.

¶ The names.

Some (as *Ruellius* for one) have thought this to be the plant which the Grecians call *ἄνιστος*: in Latine, *Tota ossa*: in English, All-Bones; whereof I see no reason, except it be by the figure *Antonomia*; as when we say in English, He is an honest man, our meaning is that he is a knave: for this is a tender herbe having no such bony substance. † *Dodonæus* questions, whether this plant be not *Cratægonon*; and he calls it *Gramen Leucanthemum*, or White-floured Grasse. The qualitie here noted with B. is by *Dioscorides* giuen to *Cratægonon*; but it is with his *ἰσχυρὸν καὶ σαρκοπικόν*, (that is) Some say or report so much: which phrase of speech hee often vseth when as he writes faculties by heare-say, and doubts himselfe of the truth of them. †

¶ The nature.

The seed of Stitchwort, as *Galen* writeth, is sharpe and biting to him that tasteth it, and to him that vseth it very like to Mill.

¶ The vertues.

They are wont to drinke it in Wine with the powder of Acornes, against the paine in the side, stitches, and such like. A

Diuers report, saith *Dioscorides*, That the Seed of B
Stitchwort being drunke causeth a woman to bring forth a man childe, if after the purgation of her Sicknesse, before she conceiue, she do drinke it fasting thrice in a day, halfe a dram at a time, in three ounces of water many dayes together.

CHAP. 39. Of Spiderwort.

¶ The description.

1 THE obscure description which *Dioscorides* and *Pliny* haue set downe for *Phalangium*, hath bred much contention among late Writers. This plant *Phalangium* hath leaues much like Couch Grasse, but they are somewhat thicker and fatter, and of a more whitish Greene colour. The stalkes grow to the height of a cubit. The top of the stalke is beset with small branches, garnished with many little white flowers, compact of six little leaues. The threds or thrums in the middle are whitish, mixed with a faire yellow, which being fallen, there follow blacke seeds, inclosed in small round knobs, which be three cornered. The roots are many, tough, and white of colour.

2 The second is like the first, but that his stalke is not branched as the first, and floureth a moneth before the other.

3 The third kinde of Spiderwort, which *Carolus Clusius* nameth *Asphodelus minor*, hath a root of many threddy strings, from the which immediately rise vp grasse leaues, narrow and sharpe pointed: among the which come forth diuers naked strait stalkes diuided towards the top into fundry branches, garnished on euery side with faire starre-like flowers, of colour white, with a purple veine diuiding each leafe in the middest: they haue also certaine chiues or threds in them. The seed followeth inclosed in three square heads like vnto the kindes of *Asphodils*.

† 4 This Spiderwort hath a root consisting of many thicke, long, and white fibers, not much vnlike the precedent, out of which it sends forth some fise or six Greene and firme leaues, somewhat hollowed in the middle, and mutually inuoluing each other at the root: amongst these there riseth vp a round Greene stalke, bearing at the top thereof some nine or ten floures, more or lesse; these consist of six leaues apiece, of colour white (the three innermost leaues are the broader, and more curled, and the three outmost are tipt with Greene at the tops.) The whole floure much
resembles

resembles a white Lilly, but much smaller. Three square heads, containing a dusky and vnequall seed, follow after the floure.

1 *Phalangium* ^{non} *Ramosum*.
Branched Spiderwort.

† 3 *Phalangium* *Cretæ*.
Candy Spiderwort.

2 *Phalangium* ~~non~~ *ramosum*.
Vnbranched Spiderwort.

‡ 4 *Phalangium* *Antiquorum*.
The true Spiderwort of the Ancients.

5 *Phalangium*

‡ 5 *Phalangium Virginianum* Trade-
scanti.
Tradescants Virginian Spider-
wort.

5 This plant in my iudgement cannot be fitlier ranked with any than these last described; therefore I haue here giuen him the fifth place, as the last comer. This plant hath many creeping stringy roots, which here and there put vp Greene leaues, in shape resembling those of the last described: amongst these there riseth vp a pretty stiffe stalke jointed, and hauing at each joint one leafe incompassing the stalke, and out of whose bosome oft times little branches arise: now the stalke at the top usually diuides it selfe into two leaues, much after the manner of *Cyperus*; between which there come forth many floures consisting of three pretty large leaues a piece, of colour deepe blew, with reddish chiues tipped with yellow standing in their middle. These fading (as usually they doe the same day they shew themselves) there succeed little heads couered with the three little leaues that sustained the floure. In these heads there is contained a long blackish seed.

¶ The place.

1. 2. 3. These grow only in gardens with vs, and that very rarely. 4 This growes naturally in some places of Sauoy. 5 This Virginian is in many of our English gardens, as with M. Parkinson, M. Tradescant, and others.

¶ The time.

1. 4. 5. These floure in Iune: the second about the beginning of May: and the third about August.

¶ The names.

The first is called *Phalangium ramosum*, Branched Spiderwort. 2 *Phalangium non ramosum*, Vnbranched Spiderwort. Cordus calls it *Liliago*. 3 This, Clusius calls *Aphodelus minor*: Lobell, *Phalangium Creta*, Candy Spiderwort. 4 This is thought to be the *Phalangium* of the Ancients, and that of *Matthiolus*: it is *Phalangium Allobrogicum* of Clusius, Sauoy Spiderwort. 5 This by M. Parkinson (who first hath in writing giuen the figure and description thereof) is aptly termed *Phalangium Ephemereum Virginianum*, Soone-fading Spiderwort of Virginia, or *Tradescants Spiderwort*, for that M. Iohn Tradescant first procured it from Virginia. Bauhine hath described it at the end of his *Pinax*, and very vnfitly termed it *Allium*, *sive Moly Virginianum*. ‡

¶ The nature.

Galen saith, *Phalangium* is of a drying qualitie, by reason of the tenuitie of parts.

¶ The vertues.

Dioscorides saith, That the leaues, seed, and floures, or any of them drunke in Wine, preuaileth A against the bitings of Scorpions, and against the stinging and biting of the Spider called *Phalangium*, and all other venomous beasts.

The roots tunned vp in new ale, and drunke for a moneth together, expelleth poyson, yea al- B though it haue vniuersally spred it selfe through the body.

CHAP. 40.

Of the Floure de-luce.

¶ The kindes.

T Here be many kindes of Iris or Floure de-luce, whereof some are tall and great, some little, small, and low; some smell exceeding sweet in the root, some haue no smell at all: some floures are sweet in smell, and some without; some of one colour, some of many colours mixed: vertues attributed to some, others not remembered: some haue tuberous or knobby roots, others bulbous or Onion roots, some haue leaues like flags, others like grasse or rushes.

¶ The

¶ The description.

1 **T**He common Floure de-luce hath long and large flaggy leaues like the blade of a sword, with two edges, amongst which spring vp smooth and plaine stalkes two foot long, bearing floures toward the top, compact of six leaues ioyned together, whereof three that stand vpright are bent inward one toward another; and in those leaues that hang downward there are certaine rough or hairie welts, growing or rising from the nether part of the leafe vpwrd, almost of a yellow colour. The roots be thicke, long, and knobby, with many hairy threds hanging thereat.

2 The water Floure de-luce, or Water flag, or Bastard *Acorns*, is like vnto the garden Floure de-luce in roots, leaues, and stalkes, but the leaues are much longer, sometimes of the height of foure cubits, and altogether narrower. The floure is of a perfect yellow colour, and the Root knobby like the other; but being cut, it seemeth to be of the colour of raw flesh.

Pseudoacorus lutea
1 *Iris vulgaris*
Floure de-luce.

vulgaris
2 *Iris palustris lutea*
Water-flags, or Floure de-luce.

¶ The place.

The Water Floure de-luce or yellow flag prospereth well in moist meadows, and in the borders and brinks of riuers, ponds, and standing lakes. And although it be a water plant of nature, yet being planted in gardens it prospereth well.

¶ The names.

Floure de-luce is called in Greeke *Athenais* and *Theophrastus* readen: as though they should say, *Consecratrix*; by which name it is also called of the Latines *Radix Marica*, or rather *Radix Naronica*, of the riuer Naron, by which the best and greatest store do grow. Whereupon *Nicander* in his Treacles commendeth it thus:

Iridem quam aluit Drilon, & Naronis ripa.

Which may thus be Englished:

Iris, which *Drilon* water feeds,

And *Narons* bankes with other weeds.

The Italians, *Giglio azzurro*: in Spanish, *Lilio Cardeno*: in French, *Flambe*: The Germanes, *Gilgen*, *Schwertel*: in Dutch, *Lisch*.

The second is called in Latine, *Iris palustris lutea*, *Pseudoacorus*, and *Acorns palustris*: in English, Water-

Water flags, Bastard Floure de-luce, or Water Floure de-luce: and in the North they call them Seggs.

¶ The nature.

1 The roots of the Floure de-luce being as yet fresh and Greene, and full of iuyce, are hot almost in the fourth degree. The dried roots are hot and dry in the third degree, burning the throat and mouth of such as taste them.

2 The bastard Floure de-luce his root is cold and dry in the third degree, and of an astringent or binding facultie.

¶ The vertues.

The root of the common Floure de-luce cleane washed, and stamped with a few drops of Rose water, and laid plaister-wise vpon the face of man or woman, doth in two dayes at the most take away the blacknesse or blewnesse of any stroke or bruse: so that if the skinne of the same woman or any other person be very tender and delicate, it shall be needfull that ye lay a piece of silke, sindall, or a piece of fine laune betweene the plaister and the skinne; for otherwise in such tender bodies it often causeth heate and inflammation.

The iuyce of the same doth not onely mightily and vehemently draw forth choler, but most especially watery humors, and is a speciall and singular purgation for them that haue the Dropsie, if it be drunke in whay or some other liquor that may somewhat temper and alay his heate.

The dry roots attenuate or make thinne thicke and tough humours, which are hardly and with difficultie purged away.

They are good in a loch or licking medicine for shortnesse of breath, an old cough, and all infirmities of the chest which rise hereupon.

They remedie those that haue euill spleenes, and those that are troubled with convulsions or cramps, biting of serpents, and the running of the reines, being drunke with vinegre, as saith Dioscorides; and drunke with wine it bringeth downe the monethly courses of women.

The decoction is good in womens baths, for it mollifieth and openeth the matrix.

Being boyled very soft, and laid to plaister-wise it mollifieth or softneth the kings euil, and old hard swellings.

† The roots of our ordinary flags are not (as before is deliuered) cold and dry in the third degree, nor yet in the second, as Dodonaus affirmes; but hot and dry, and that at the least in the second degree, as any that throughly tastes them will confesse. Neither are the faculties and vse (as some would perswade vs) to be neglected; for as Pena and Lobell affirme, though it haue no smell, nor great heat, yet by reason of other faculties it is much to be preferred before the *Galanga major*, or forreigne *Acorus* of shops, in many diseases; for it imparts more heate and strength to the stomacke and neighbouring parts than the other, which rather preyes vpon and dissipates the innate heate and implanted strength of those parts. It bindes, strengthens, and condenses: it is good in bloody fixes, and stayes the Courses. †

CHAP. 40. Of Floure de-luce of Florence.

¶ The description.

1 The Floure de-luce of Florence, whose roots in shops and generally euery where are called *Ireos*, or *Orice* (whereof sweet waters, sweet pouders, and such like are made) is altogether like vnto the common Floure de-luce, sauing that the flowers of the *Ireos* is of a white colour, and the roots exceeding sweet of smell, and the other of no smell at all.

2 The white Floure de-luce is like vnto the Florentine Floure de-luce in roots, flaggy leaues, and stalkes; but they differ in that, that this *Iris* hath his flower of a bleake white colour declining to yellownesse; and the roots haue not any smell at all; but the other is very sweet, as we haue said.

3 The great Floure de-luce of Dalmatia hath leaues much broader, thicker, and more closely compact together than any of the other, and set in order like wings or the fins of a Whale fish, Greene toward the top, and of a shining purple colour toward the bottome, euen to the ground: amongst which riseth vp a stalke of foure foot high, as my selfe did measure oft times in my garden: whereupon doth grow faire large floures of a light blew, or as we terme it, a watchet colour. The floures do smell exceeding sweet, much like the Orange floure. The seeds are contained in square cods, wherein are packed together many flat seeds like the former. The root hath no smell at all.

1 *Iris Florentina.*
Floure de-luce of Florence.

2 *Iris alba.*
White Floure de-luce.

3 *Iris Dalmatica major.*
Great Floure de-luce of Dalmatia.

4 *Iris Dalmatica minor.*
Small Dalmatian Iris.

6 *Iris Violacea.*
Violet Floure de-luce.

5 *Iris Biflora.*
Twice-flouring Floure de-luce.

7 *Iris Pannonica.*
Austrian Floure de-luce.

† 8 *Iris Camerarij.*
 Germane Floure de-luce.

deferueth. The three leaues that stand vpright do claspe or embrace one another, and are of a yellow colour. The leaues that looke downward, about the edges are of a pale colour, the middle part of white, mixed with a line of purple, and hath many small purple lines stripped ouer the said white floure, euen to the brim of the pale coloured edge. It smelleth like the Hawthorne floures being lightly smelled vnto.

8 The Germane Floure de-luce, which *Camerarius* hath set forth in his Booke named *Hortus Medicus*, hath great thicke and knobby roots: the stalke is thicke and full of iuyce: the leaues be very broad in respect of all the rest of the Floure de-luces. The floure groweth at the top of the stalke, consisting of six great leaues blew of colour, welted downe the middle, with white tending to yellow; at the bottome next the stalke it is white of colour, with some yellownesse fringed about the said white, as also about the brims or edges, which greatly setteth forth his beautie; the which *Ioachimus Camerarius*, the sonne of old *Camerarius* of Noremberg, had sent him out of Hungarie, and did communicate one of the plants thereof to *Clusius*; whose figure he hath most liuely set forth with this description, differing somewhat from that which *Ioachimus* himselfe did giue vnto me at his being in London. The leaues, saith he, are very large, twice so broad as any of the others. The stalke is single and smooth; the floure groweth at the top, of a most bright shining blew colour, the middle rib tending to whitenesse, the three vpper leaues somewhat yellowish. The root is likewise sweet as *Ireos*.

¶ The place.

These kindes of Floure de-luces do grow wilde in Dalmatia, Goritia, and Piedmont; notwithstanding our London gardens are very well stored with euery one of them.

¶ The time.

Their time of flourishing answereth the other Floure de-luces.

¶ The names.

The Dalmatian Floure de-luce is called in Greeke of *Athenaus* and *Theophrastes* *iris*: it is named also *iugris*, of the heauenly Bow or Rainbow: vpon the same occasion *δωμωγος*, or Admirable: for the Poets sometime do call the Rainbow *δωμωγος*: in Latine *Iris*, and in English Floure de-luce. Their feuerall titles do sufficiently distinguish them, whereby they may be knowne one from another.

¶ The

¶ The nature.

The nature of these Floure de-luces are answerable to those of the common kinde; that is to say, the dry roots are hot and dry in the latter end of the second degree.

¶ The vertues.

The iuyce of these Floure de-luces doth not onely mightily and vehemently draw forth choler, but most especially waterie humors, and is a singular good purgation for them that haue the Dropsie, if it be drunke in sweet wort or whay.

The same are good for them that haue euill spleenes, or that are troubled with cramps or convulsions, and for such as are bit with Serpents. It profiteth also much those that haue the Gonorrhea, or running of the reines, being drunke with Vineger, as Diosc. saith; and drunke with Wine they bring downe the monethly termes.

CHAP. 42.

Of Variable Floure de-luces.

1 *Iris lutea variegata.*
Variable Floure de-luce.

† 2 *Iris Chalcidonica.*
Turky Floure de-luce.

¶ The description.

1 That which is called the Floure de-luce of many colours loseth his leaues in Winter, and in the Spring time recouereth them anew. I am not able to expresse the sundrie colours and mixtures contained in this floure: it is mixed with purple, yellow, blacke, white, and a fringe or blacke thrum downe the middle of the lower leaues, of a whitish yellow, tipped or frized, and as it were a little raised vp; of a deep purple colour neere the ground.

2 The second kinde hath long and narrow leaues of a blackish greene, like the stinking Gladdon; among which rise vp stalkes two foot long, bearing at the top of euery stalke one floure compact of six great leaues: the three that stand vp right are confusedly and very strangely striped, mixed with white and a dusky blacke colour. The three leaues that hang downward are like a gaping hood, and are mixed in like manner, (but the white is nothing so bright as of the other) and are as it were shadowed ouer with a darke purple colour somewhat shining: so that according

According to my iudgement the whole floure is of the colour of a Ginny hen : a rare and beautifull floure to behold.

‡ 3 *Iris maritima Narbonensis*. The Sea Floure de-luce.

4 *Iris sylvestris Bizantina*.

Wilde Bizantine Floure de-luce.

5 *Chamaeiris Angustifolia*.
Narrow leaved Floure de-luce.

6 *Chamaeiris tenuifolia*.
Grasse Floure de-luce.

‡ 7 *Iris flore caruleo obsoleto*
polyanthos.
 Narrow-leaved many-floured
Iris.

‡ 8 *Chamaeiris nivea aut Candida.*
 White Dwarf Iris.

‡ 9 *Chamaeiris latifolia flore rubello.*
 Red flowered Dwarf Iris.

‡ 10 *Chamaeiris Lutea.*
Yellow Dwarf Iris.

‡ 11 *Chamaeiris variegata.*
Varigated Dwarf Iris.

‡ 3 The French, or rather Sea Floure de-luce (whereof there is also another of the same kinde altogether lesser) haue their roots without any sauour. In shew they differ little from the garden Floure de-luce, but that the leaues of these are altogether slenderer, and vnpleasant in smell, growing plentifully in the rough crags of the rocks vnder the Alpes, and neere vnto the sea side. The which *Pena* found in the grassie grauelly grounds of the sea coast neere to Montpellier. The learned Doctor *Assatius* a long time supposed it to be *Medium Diosc. Matthiolum* deceiued himselfe and others, in that he said, That the root of this plant hath the sent of the peach: but my selfe haue proued it to be without sauour at all. It yeeldeth his floures in Iune, which are of all the rest most like vnto the grassie Floure de-luce. The taste of his root is hot, bitter, and with much tenuitie of parts, as hath been found by physicall prooffe.

‡ 4 This *Iris Bizantina* hath long narrow leaues like those of the last described; very narrow, sharpe pointed, hauing no vngratefull smell; the stalks are some cubit and an halfe in length, and somtimes more; at the top they are diuided into 2 or 3 branches that haue 2 or 3 floures a piece, like in shape to the floures of the broad leaved variegated bulbous *Iris*; they haue also a good smell: the ends of the hanging-downe leaues are of a darke colour; the other parts of them are variegated with white, purple, or violet colour. The three other leaues that stand vp are of a deepe violet or purple colour. The root is blackish, slender, hard, knotty. ‡

5 Narrow leaved Floure de-luce hath an infinite number of grassie leaues much like vnto Reed, among which rise vp many stalkes: on the ends of the same spring forth two, sometimes three right sweet and pleasant floures, compact of nine leaues. Those three that hang downward are greater than the rest, of a purple colour, striped with white and yellow; but those three small leaues that appeare next, are of a purple colour without mixture: those three that stand vp right are of an horse-flesh colour, tipped with purple, and vnder each of these leaues appeare three small browne aglets like the tongue of a small bird.

6 The small grassie Floure de-luce differeth from the former in smalnesse and in thinnesse of leaues, and in that the stalkes are lower than the leaues, and the floures in shape and colour are like those of the stinking Gladdon, but much lesse.

‡ There are many other varieties of the broad leaved Floure de-luces besides these mentioned by our Authour; as also of the narrow leaved, which here wee doe not intend to insist vpon, but referre such as are desirous to trouble themselves with these nicities, to *Clusius* and others.

Not-

Notwithstanding I judge it not amisse to giue the figures and brieue descriptions of some more of the Dwarfse Floure de-luces, as also of one of the narrower leaved.

7 This therefore which we giue you in the seventh place is *Iris flore caruleo obsoleto*, &c. *Lobelij*. The leaues of this are small and long like those of the wild *Bizantine* Floure de-luce; the root (which is not very big) hath many strong threds or fibres comming out of it: the stalke (which is somewhat tall) diuides it selfe into two or three branches, whereon grow floures in shape like those of the other Floure de-luces, but their colour is of an ouer-worne blew, or Ash colour.

8 Many are the differences of the *Chamaeirides latifolia*, or Broad leaved Dwarfse Floure de-luces, but their principall distinction is in their floures; for some haue flowers of violet or purple colour, some of white, other some are variegated with yellow and purple, &c. Therefore I will onely name the colour, and giue you their figure, because their shapes differ little. This eighth therefore is *Chamaeiris nivea aut Candida*, White Dwarfse *Iris*: The ninth, *Chamaeiris latifolia flore rubello*, Red floured Dwarfse *Iris*: The tenth, *Chamaeiris lutea*, Yellow Dwarfse *Iris*: The eleuenth, *Chamaeiris variegata*, Variegated Dwarfse *Iris*. The leaues and stalkes of these plants are vsually about a foot high; the floures, for the bignesse of the plants, large, and they floure betimes, as in April. And thus much I thinke may suffice for the names and descriptions of these Dwarfse varieties of Floure de-luces. ‡

¶ The place.

These plants do grow in the gardens of London, amongst Herbarists and other Lovers of Plants.

¶ The nature.

They floure from the end of March to the beginning of May.

¶ The names.

The Turkey Floure de-luce is called in the Turkish tongue *Alaja Susiani*, with this additament from the Italians, *Fiore Belle pintate*; in English, Floure de-luce. The rest of the names haue bin touched in their titles and historie.

¶ Their nature and vertues.

The faculties and temperature of these rare and beautifull floures are referred to the other sorts of Floure de-luces, whereunto they do very well accord.

There is an excellent oyle made of the floures and roots of Floure de-luce, of each a like quantitie, called *Oleum Irinum*, made after the same manner that oyle of Roses, Lillies, and such like be made: which oyle profiteth much to strengthen the sinewes and joints, helpeth the cramp proceeding of repletion, and the disease called in Greeke *Peripneumonia*.

The floures of French Floure de-luce distilled with *Diatrion sandalon*, and Cinnamon, and the water drunke, preuaileth greatly against the Dropsie, as *Hollerius* and *Gesner* testifie.

CHAP. 43. Of stinking Gladdon.

¶ The description.

Stinking Gladdon hath long narrow leaues like *Iris*, but smaller, of a darke Greene colour, and being rubbed, of a stinking smell very lothsome. The stalkes are many in number, and round toward the top, out of which do grow floures like the Floure de-luce, of an ouer-worne blew colour, or rather purple, with some yellow and red streakes in the midst. After the floures be vaded there come great huskes or cods, wherein is contained a red berry or seed as bigge as a pease. The root is long, and threddy vnderneath.

¶ The place.

Gladdon groweth in many gardens: I haue scene it wilde in many places, as in woods and shadowie places neere the sea.

¶ The time.

The stinking Gladdon floureth in August, the seed whereof is ripe in September.

¶ The names.

Stinking Gladdon is called in Greeke *βίη*, by *Dioscorides*; and *εσχάρα* by *Theophrastus*, according to *Pena*: in Latine *Spatula fetida* among the Apothecaries: it is called also *Xyris*: in English, stinking Gladdon, and Spurgewort.

¶ The nature.

Gladdon is hot and dry in the third degree.

¶ The vertues.

Such is the facultie of the roots of all the Irides before named, that being pounding they proueke sneefing, and purge the head: generally all the kinds haue a heating & extenuating quality.

They

B *Xyris*
Stinking Gladdon.

They are effectually against the cough; they easily digest and consume the grosse humors which are hardly concocted: they purge choler and rough flegme: they procure sleepe, and helpe the gripings within the belly.

It helpeth the Kings Euill, and Buboës in the groine, as *Pliny* saith. If it be drunke in Wine it prouoketh the termes, and being put in Baths for women to sit ouer, it prouoketh the like effects most exquisitely. The root put in manner of a pessarie hastneth the birth. They couer with flesh bones that be bare, being vsed in plaisters. The roots boyled soft, and vsed plaisterwise, soften all old hard tumours, and the swellings of the throat called *Strume*, that is, the Kings Euill; and emplaistered with honey it draweth out broken bones.

The meale thereof healeth all the rifts of the fundament, and the infirmities thereof called *Condilomata*; and openeth Hemorrhoides. The iuice sniffed or drawne vp into the nose, prouoketh sneezing, and draweth downe by the nose great store of filthy excrements, which would fall into other parts by secret and hidden waies, and conueiances of the channels.

It profiteth being vsed in a pessarie, to prouoke the termes, and will cause abortion.

It preuaileth much against all euill affections of the brest and lungs, being taken in a little sweet wine, with some Spiknard; or in Whay with a little Masticke.

The Root of *Xyris* or Gladdon is of great force against wounds and fractures of the head; for it draweth out all thornes, stubs, prickles, and arrow-heads, without grieve; which qualitie it effecteth (as *Galen* saith) by reason of his tenuitie of parts, and of his attracting, drying, and digesting facultie, which chiefly consisteth in the seed or fruit, which mightily prouoketh vrine.

H The root giuen in Wine, called in physicke *Passum*, profiteth much against Conuulsions, Ruptures, the paine of the huckle bones, the strangury, and the flux of the belly. Where note, That whereas it is said that the potion aboue named stayeth the flux of the belly, hauing a purging qualitie; it must be vnderstood that it worketh in that manner as *Rhabarbarum* and *Asarum* do, in that they concoct and take away the cause of the laske; otherwise no doubt it moueth vnto the stoole, as *Rhenbarb*, *Asarum*, and the other Irides do. Hereof the Countrey people of Somersetshire haue good experience, who vse to drinke the decoction of this Root. Others do take the infusion thereof in ale or such like, wherewith they purge themselves; and that vnto very good purpose and effect.

I The seed thereof mightily purgeth by vrine, as *Galen* saith, and the country people haue found it true.

CHAP. 44. Of Ginger.

The description.

I **G**inger is most impatient of the coldnesse of these our Northerne Regions, as my selfe haue found by prooffe; for that there haue beene brought vnto me at seuerall times sundry plants thereof, fresh, Greene, and full of iuyce, as well from the West Indies, as from Barbary and other places; which haue sprouted and budded forth Greene leaues in my garden in the heate of Sommer, but as soone as it hath been but touched with the first sharp blast of Winter, it hath presently perished both blade and root. The true forme or picture hath not before this time beene set forth by any that hath written; but the World hath beene deceiued by a counterfeite figure, which the reuerend and learned Herbarist *Matthias Lobell* did set forth in his Observations. The forme whereof notwithstanding I haue here expressed, with the true and vndoubted

doubted picture also, which I received from *Lobelius* his owne hands at the impression hereof. The cause of whose former error, as also the meanes whereby he got the knowledge of the true Ginger, may appeare by his owne words sent vnto me in Latine, which I haue here inserted. His words are these :

How hard and vncertaine it is to describe in words the true proportion of Plants; (hauing no other guide than skilfull, but yet deceitfull formes of them, sent from friends, or other meanes) they best do know who haue deepliest waded in this sea of Simples. About thirty yeares past or more, an honest and expert Apothecarie *William Dries*, to satisfie my desire, sent me from Antwerpe to London the picture of Ginger, which he held to be truly and liuely drawne: I my selfe gaue him credit easily, because I was not ignorant, that there had bin often Ginger roots brought Greene, new, and full of iuice, from the Indies to Antwerpe; and further, that the same had budded and growne in the said *Dries* Garden. But not many yeares after, I perceiued that the picture which was sent me by my Friend was a counterfeit, and before that time had been drawne and set forth by an old Dutch Herbarist. Therefore not suffering this error any further to spread abroad, (which I discovered not many yeares past at Flushing in Zeeland, in the Garden of *William* of Nassau Prince of Orange, of famous memorie; through the means of a worthy person, if my memorie faile me not, called *Vander Mill*; at what time he opened, and loosed his first young buds and shoots about the end of Sommer, resembling in leaues, and stalkes of a foot high, the young and tender shoots of the common Reed, called *Harundo vallatoria*) I thought it conuenient to impart thus much vnto Master *Iohn Gerard*, an expert Herbarist, and Master of happy successe in Surgery; to the end he might let posteritie know thus much, in the painefull and long laboured trauels which now he hath in hand, to the great good and benefit of his Countrey. The plant it selfe brought me to Middleborough, and set in my Garden, perished through the hardnesse of the Winter.

Thus much haue I set downe, truly translated out of his owne words in Latine; though too fauourably by him done to the commendation of my meane skill.

1 *Zinziberis ficta* Icon.

The feigned figure of Ginger.

1 *Zinziberis verior* Icon.

The true figure of Ginger.

¶ The place.

Ginger groweth in Spaine, Barbary, in the Canary Islands, and the Azores. Our men which sacked Domingo in the Indies, digged it vp there in sundry places wilde.

¶ The

¶ The time.

Ginger flourisheth in the hot time of Sommer, and loseth his leaues in Winter.

¶ The names.

Ginger is called in Latine *Zinziber* and *Gingiber*: in Greeke, *zingiberis* and *zingiber*: In French, *Gingembre*.

¶ The nature.

Ginger heateth and drieth in the third degree.

¶ The vertues.

A Ginger, as *Dioscorides* reporteth, is right good with meate in fauces, or otherwise in conditures: for it is of an heating and digesting qualitie; it gently looseth the belly, and is profitable for the stomacke, and effectually opposeth it selfe against all darknesse of the sight; answering the qualities and effects of Pepper. It is to be considered, That candied, greene or condited Ginger is hot and moist in qualitie, prouoking Venerie: and being dried, it heateth and drieth in the third degree.

CHAP. 45. Of Aromaticall Reeds.

2 *Acorus verus officinis falsò Calamus,*
gumjulo.
The true *Acorus* with his floure.

Acorus verus sine julo.

The true *Acorus* without the floure.

¶ The description.

1 **T**His sweet-smelling Reed is of a darke dun colour, full of joints and knees, easie to be broken into small splinters, hollow, and full of a certaine pith cobweb-wise, somewhat gummy in eating, and hanging in the teeth, and of a sharpe bitter taste. It is of the thicknesse of the little finger, as *Lobelius* affirmeth of some which he had seene in Venice.

2 Bastard Calamus hath flaggy leaues like vnto the Water floure de-luce or flagge, but narrower, three foot long; of a fresh greene colour, and aromaticke smell, which they keepe a long time, although they be dried. Now the stalke which beares the floure or fruit is much like another

ther leafe, but onely from the fruit downwards, whereas it is somewhat thicker, and not so broad, but almost triangular. The floure is a long thing resembling the Catf-tailes which grow on Hafsels; it is about the thicknesse of an ordinarie Reed, some inch and halfe long, of a greenish yellow colour, curiously chequered, as if it were wrought with a needle with Greene and yellow filke intermixt †. I haue not as yet seene it beare his tuft in my garden, and haue read that it is barren, and by prooffe haue seene it so: yet for all that I beleue *Clusius*, who saith hee hath seene it beare his floure in that place where it doth grow naturally, although in England it is altogether barren. The root is sweet in smell, and bitter in taste, and like vnto the common Flagge, but smaller, and not so red.

3 *Calamus Aromaticus Antiquorum.*

The true Aromaticall Reed of the Antients.

† 3 I thinke it very fitting in this place to acquaint you with a Plant, which by the conjecture of the most learned (and that not without good reason) is iudged to be the true *Calamus* of the Ancients. *Clusius* giues vs the historie thereof in his Notes vpon *Garcias ab Horto*, lib. 1. ca. 32. in these words: When as (saith he) this Historie was to be the third time printed, I very opportunely came to the knowledge of the true *Calamus Aromaticus*; the which the learned *Bernard Paludanus* the Frisian, returning from Syria and Ægypt, freely bestowed vpon me, together with the fruit *Habhel*, and many other rare seeds, about the beginning of the yeare 1579. Now wee haue caused a figure to be exactly drawne by the fragments thereof (for that it seemes so exquisitely to accord with *Dioscorides* his description.) In myne opinion it is rather to be iudged an umbelliferous plant than a reedy; for it hath a straight stalke parted with many knots or ioynts, otherwise smooth, hollow within, and inuested on the inside with a slender filme like as a Reed, and it breaketh into shiuers or splinters, as *Dioscorides* hath written: it hath a smell sufficiently strong, and the taste is gratefull, yet bitter, and pertaking of some astringtion: The leaues, as by remaines of them might appeare, seeme by couples at euery ioynt to engirt the stalke: the root at the top is somewhat tuberous, and then ends in fibres. Twenty five yeares after *Paludanus* gaue me this *Calamus*, the learned *Anthony Coline* the Apothecarie (who lately translated into French these Commentaries the fourth time set forth, Anno 1593) sent me from Lyons pieces of the like Reed; certifying me withall, That he had made vse thereof in his Composition of Treacle. Now these pieces, though in forme they resembled those I had from *Paludanus*, yet had they a more bitter taste than his, nether did they partake of any astringtion; which peraduenture was to be attributed to the age of one of the two. Thus much *Clusius*. †

¶ The place.

The true *Calamus Aromaticus* groweth in Arabia, and likewise in Syria, especially in the moorish grounds betweene the foot of Libanus † and another little hill, not the mountaine Antilibanus, as some haue thought, in a small valley neere to a lake, whose plashes are dry in Sommer. *Pliny* 12. 22. †

Bastard or false *Calamus* growes naturally at the foot of a hill neere to Prusa a city of Bithynia, not far from a great lake. It prospereth exceeding well in my garden, but as yet it beareth neither floures nor stalke. It groweth also in Candia, as *Pliny* reporteth: in Galatia likewise, and in many other places.

¶ The time.

They lose their leaues in the beginning of Winter, and do recouer them againe in the Spring of the yeare. † In May this yeare 1632, I receiued from the Worshipfull Gentleman M. *Thomas Glynn* of Glynnhivon in Carnaruanshire, my very good friend, the pretty *Iulus*, or floure of this plant; which I could neuer see here about London, though it groweth with vs in many Gardens, and that in great plenty. †

¶ The names.

† The want of the true *Calamus* being supplied by *Acorus* as a *succedaneum*, was the cause (as *Pena* and *Lobell* probably coniecture) that of a substitute it tooke the prime place vpon it; and being as it were made a Vice-Roy, would needs be King. But the falsenesse of the title was discovered

uered by *Matthiolus*, and others, and so it is sent backe to its due place againe; though notwithstanding it yet in shops retaines the title of *Calamus*.

1 The figure that by our Author was giuen for this, is supposed, and that (as I thinke truly) to be but a counterfeit, of *Matthiolus* his inuention; who therein hath beene followed (according to the custome of the world) by diuers others. The description is of a small Reed called *Calamus odoratus Libani*, by *Lobell* in his Obseruations, and figured in his *Irones*, p. 54.

2 This is called *Αcorus* and *Αcoron* by the Greekes: by some, according to *Apuleius*, *Αcoron*; and in Latine it is called *Acorus* and *Acorum*; and in shops, as I haue formerly said, *Calamus Aromaticus*: for they vsually take *Galanga major*, (described by me, Chap. 26.) for *Acorus*. It may besides the former names be fitly called in English, The sweet Garden Flag.

3 This is iudged to be the *Κάλαμος αρωματικός* of *Dioscorides*; the *Κάλαμος δροσδής* of *Theophrastus*; that is, the true *Calamus Aromaticus* that should be used in Compositions. †

¶ The nature of the true *Acorus*, or our sweet garden Flag.

Dioscorides saith, the roots haue an heating facultie: *Galen* and *Pliny* do affirme, that they haue thin and subtil parts, both hot and dry.

¶ The vertues of the same.

- A The decoction of the root of *Calamus* drunke prouoketh vrine, helpeth the paine in the side, liuer, spleene, and brest; convulsions, gripings, and burstings; it easeth and helpeth the pissing by drops.
- B It is of great effect, being put in broth, or taken in fumes through a close stoole, to prouoke womens naturall accidents.
- C The iuyce strained with a little honey, taketh away the dimnes of the eyes, and helpeth much against poyson, the hardnesse of the spleene, and all infirmities of the blood.
- D The root boyled in wine, stamped and applied plaisterwise vnto the cods, doth wonderfully abate the swelling of the same, and helpeth all hardnesse and collections of humors.
- E The quantitie of two scruples and an halfe of the root drunke in foure ounces of Muskadel, helpeth them that be bruised with grievous beating, or falls.
- F The root is with good successe mixed in counterpoysons. In our age it is put into Eclegma's, that is, medicines for the lungs, and especially when the lungs and chest are opprest with raw and cold humors.

- G † The root of this preserved is very pleasant to the taste, and comfortable to the stomacke and heart; so that the Turks at Constantinople take it fasting in the morning, against the contagion of the corrupt aire. And the Tartars haue it in such esteeme, that they will not drinke Water (which is their vsuall drinke) vnlesse they haue first steeped some of this root therein. †

¶ The choice.

The best *Acorus*, as *Dioscorides* saith, is that which is substantiall, and well compact, white within, not rotten, full, and well smelling.

Pliny writeth, That those which grow in Candia are better than those of Pontus, and yet those of Candia worse than those of the Easterne countries, or those of England, although we haue no great quantitie thereof.

¶ The faculties of the true *Calamus* out of *Dioscorides*.

- H † It being taken in drinke moueth vrine; wherefore boyled with the roots of grasse or Smal-lage seeds, it helpeth such as are hydropick, nephritick, troubled with the strangurie, or bruised.
- I It moues the Courfes, either drunke or otherwise applied. Also the fume thereof taken by the mouth in a pipe, either alone or with dried Turpentine, helps coughs.
- K It is boyled also in baths for women, and decoctions for Glysters; and it enters into plaisters and perfumes for the smells sake. †

CHAP. 46. Of Corne.

Hus farre haue I discoursed vpon Grasses, Rushes, Spartum, Flags, and Floure deluces: my next labour is to set downe for your better instruction, the historie of Corne, and the kindes thereof, vnder the name of Graine; which the Latines call *Cerealium semina*, or Bread-corne; the Grecians, *σινος* and *σινονειον σιμιγδα*; of which wee purpose to discourse. There belong to the historie of Graine all such things as be made of Corne, as *Far*, *Condrus*, *Alica*, *Tragus*, *Amylum*, *Prisana*, *Polenta*, *Maça*, *Byne* or Malt, *Zythum*, and whatsoever are of that sort. There be also ioyned vnto them many seeds, which *Theophrastus* in his eighth booke placeth among the graines; as Miller, Sorgum, Panicke, Indian wheat, and such like. *Galen* in his first booke of the Faculties of nourishments, reckoneth

vp the diseases of Graine, as well those that come of the graine it selfe degenerating, or that are changed into some other kinde, and made worse through the fault of the weather, or of the soile; as also such as be cumbersome by growing among them, doe likewise fitly succeed the graines. And beginning with corne, we will first speake of Wheat, and describe it in the first place, because it is preferred before all other corne.

1 *Triticum spica mutica.*
White Wheate.

¶ The description.

THIS kinde of Wheate which *Lobelius*, distinguishing it by the eare, calleth *Spica Mutica*, is the most principal of all other, whose eares are altogether bare or naked, without awnes or chaffie beards. The stalke riseth from a threddy root, compact of many strings, joynted or kneed at sundry distances; from whence shoot forth grassie blades and leaues like vnto Rie, but broader. The plant is so well knowne to many, and so profitable to all, that the meanest and most ignorant need no larger description to know the same by.

2 The second kinde of Wheat, in root, stalkes, joints, and blades, is like the precedent, differing onely in eare, and number of graines, whereof this kinde doth abound, hauing an eare consisting of many ranks, which seemeth to make the eare double or square. The root and graine is like the other, but not bare and naked, but bristled or bearded, with many small and sharpe eiles or awnes, not vnlike to those of Barley.

3 Flat Wheat is like vnto the other kindes of Wheat in leaues, stalkes, and roots, but is bearded and bordered with rough and sharpe ailes, wherein consists the difference. † I know not what our Author means by this flat Wheat, but I conjecture it to be the long rough eared Wheat, which hath blewish eares when as it is ripe, in other things resembling the ordinary red wheat. †

4 The fourth kinde is like the last described, and thus differeth from it, in that, that this kind hath many

small ears comming forth of one great eare, & the beards hereof be shorter than of the former kind.

5 Bright wheate is like the second before described, and differeth from it in that, that this kind is foure square, somewhat bright and shining, the other not.

† I thinke it a very fit thing to adde in this place a rare obseruation, of the transmutation of one species into another, in plants; which though it haue beene obserued of ancient times, as by *Theophrastus*, de caus. plant. lib. 3. cap. 6. whereas amongst others hee mentioneth the change of

Zea mays & *Cespar*, Spelt into oates: and by *Virgill* in these verses;

Grandia saepe quibus mandauimus Hordea sulcis,

Infelix Lolium, & steriles dominantur avena.

That is;

In furrowes where great Barley we did sow,

Nothing but Darnel and poore Oats do grow;

yet none that I haue read haue obserued, that two seuerall graines, perfect in each respect, did grow at any time in one eare: the which I saw this yeare 1632, in an eare of white Wheat, which was found by my very good Friend Master *John Goodyer*, a man second to none in his industrie and searching of plants, nor in his iudgement or knowledge of them. This eare of wheat was as large and faire as most are, and about the middle thereof grew three or foure perfect Oats in all respects: which being hard to be found, I held very worthy of setting downe, for some reasons not to be insisted vpon in this place. †

¶ The place.

Wheat groweth almost in all the countries of the world that are inhabited and mannured, and requireth a fruitfull and fat soile, and rather Sunny and dry, than watery grounds and shadowie: for in a dry ground (as *Columella* reporteth) it groweth harder and better compact: in a moist and darke soile it degenerateth sometime to be of another kinde.

2 *Triticum aristis circumvallatum.*
Bearded Wheat, or Red-Wheat.

3 *Triticum Typhinum.*
Flat Wheat.

4 *Triticum multiplici spica.*
Double eared Wheat.

B The floure of wheat being boyled with honey and water, or with oyle and water, taketh away all inflammations, or hot swellings.

C The bran of Wheat boyled in strong Vineger, clenseth away scurfe and dry scales, and dissoluethe beginning of all hot swellings, if it be laid vnto them. And boyled with the decoction of Rue, it slaketh the swellings in womens breasts.

D The graines of white Wheat, as *Pliny* writeth in his two and twentieth booke, and seuenth chapter, being dried brown, but not burnt, and the poudre thereof mixed with white wine is good for watering eyes, if it be laid thereto.

E The dried poudre of red Wheat boyled with vineger, helpeth the shrinking of sinewes.

F The meale of Wheat mingled with the juice of Henbane, and plaisterwise applied, appeaseth inflam-

¶ The time.

They are most commonly sown in the fall of the leafe, or Autumne: somtime in the Spring.

¶ The names.

Wheat is called of the Grecians *τροιχον*: of the Latines, *Triticum*, and the white Wheate *Siligo*. *Triticum* doth generally signifie any kinde of Corne which is threshed out of the eares, and made clean by fanning or such ordinary meanes. The Germans call it *Weizen*: in low Dutch, *Terwe*: in Italian, *Grano*: the Spaniards, *Trigo*: the French men, *Bled*, or *Fourment*: in England we call the first, White-Wheat, and Flaxen Wheat. *Triticum Lucidum* is called Bright Wheat: Red Wheat is called in Kent, Duck-bill Wheate, and Normandy Wheat.

¶ The nature.

Wheat (saith *Galen*) is very much vsed of men, and with greatest profit. Those Wheats do nourish most which be hard, and haue their whole substance so closely compact as they can scarcely be bit asunder; for such doe nourish very much: and the contrary but little.

Wheat, as it is a medicine outwardly applied, is hot in the first degree, yet can it not manifestly either dry or moisten. It hath also a certaine clamminesse and stopping qualitie.

¶ The vertues.

Raw Wheat, saith *Dioscorides*, being eaten, breedeth wormes in the belly: being chewed and applied, it doth cure the biting of mad dogs.

5 *Triticum lucidum.*
Bright Wheat.

inflammations, as *Ignis sacer*, or Saint *Anthony's* Fire, and such like, staying the flux of humors to the ioynts, which the Grecians call *Rheumatismata*. Paste made of fine meale, such as Booke-binders vse, helpeth such as doe spit bloud, taken warme one spoonfull at once. The bran of wheat boiled in sharpe vinegar, and rubbed vpon them that be scurvie and mangie, easeth the party very much.

The leauen made of Wheat hath vertue to G
heate and draw outward, it resolueth, concocteth, and openeth all swellings, bunches, tumors, and felons, being mixed with salt.

The fine floure mixed with the yolke of an H
egge, honey, and a little saffron, doth draw and heale byles and such like sores, in children and in old people, very well and quickly. Take crums of wheaten bread one pound and an halfe, barley meale 3 ij. Fennigreeke and Lineseed of each an ounce, the leaues of Mallowes, Violets, Dwale, Sengreene, and Cotyledon, ana one handfull: boyle them in water and oyle vntill they be tender: then stampe them very small in a stone mortar, and adde thereto the yolks of three egges, oyle of Roses, and oyle of Violets, ana 3 ij. Incorporate them altogether, but if the inflammation grow to an Erysipelas, then adde thereto the juice of Nightshade, Plantaine, and Henbane, ana 3 ij. it easeth an Erysipelas, or Saint *Anthony's* fire, and all inflammations very speedily.

Slices of fine white bread laid to infuse or I
steepe in Rose water, and so applied vnto sore eyes which haue many hot humors falling into them, doth easily defend the humour, and cease the paine.

The oyle of wheat pressed forth betweene two plates of hot iron, healeth the chaps and chinks K
of the hands, feet, and fundament, which come of cold, making smooth the hands, face, or any other part of the body.

The same vsed as a Balsame doth excellently heale wounds, and being put among salues or vn- L
guents, it causeth them to worke more effectually, especially in old vlcers.

CHAP. 47. Of Rie.

¶ The description.

THE leafe of Rie when it first commeth vp, is somewhat reddish, afterward greene, as be the other graines. It groweth vp with many stalks, slenderer than those of wheat, and longer, with knees or ioynts by certaine distances like vnto Wheat: the eares are orderly framed vp in rankes, and compassed about with short beards, not sharpe but blunt, which when it floureth standeth vp right, and when it is filled vp with seed it leaneth and hangeth downward. The seed is long, blackish, slender, and naked, which easily falleth out of the huskes of it selfe. The roots be many, slender, and full of strings.

¶ The place.

Rie groweth very plentifully in the most places of Germany and Polonia, as appeareth by the great quantitie brought into England in times of dearth, and scarcitie of corne, as hapned in the year 1596, and at other times, when there was a generall want of corne, by reason of the abundance of raine that fell the year before; whereby great penurie ensued, as well of cattell and all other victuals, as of all manner of graine. It groweth likewise very wel in most places of England, especially towards the North.

Secale.
Rie.

¶ *The time.*

It is for the most part sown in Autumne, and sometimes in the Spring, which proueth to be a Graine more subiect to putrifaction than that which was sown in the fall of the leafe, by reason the Winter doth ouertake it before it can attaine to his perfect maturitie and ripenesse.

¶ *The names.*

Rie is called in high Dutch, **Rocken**: in Low-Dutch, **Rogge**: in Spanish, *Centeno*: in Italian, *Segala*: in French, *Seigle*: which soundeth after the old Latine name which in *Pliny* is *Secale* and *Farrago*, lib. 18. cap. 16.

¶ *The temperature.*

Rie as a medicine is hotter than wheat, and more forcible in heating, wasting, and consuming away that whereto it is applied. It is of a more clammy and obstructing nature than Wheat, and harder to digest; yet to rusticke bodies that can well digest it, it yeelds good nourishment.

¶ *The vertues.*

Bread, or the leauen of Rie, as the Belgian Physitians affirme vpon their practise, doth more forcibly digest, draw, ripen, and breake all Apostumes, Botches, and Byles, than the leuen of Wheat.

Rie Meale bound to the head in a Linnen Cloath, doth assuage the long continuing paines thereof.

CHAP. 48. Of Spelt Corne.

¶ *The description.*

Spelt is like to Wheat in stalkes and eare: it groweth vp with a multitude of stalks which are kneed and joynted higher than those of Barley: it bringeth forth a disordered eare, for the most part without beards. The cornes be wrapped in certaine dry huskes, from which they cannot easily be purged, and are joyned together by couples in two chaffie huskes, out of which when they be taken they are like vnto wheat cornes: it hath also many roots as wheat hath, whereof it is a kinde.

¶ *The place.*

It groweth in fat and fertile moist ground.

¶ *The time.*

It is altered and changed into Wheat it selfe, as degenerating from bad to better, contrary to all other that do alter or change; especially (as *Theophrastus* saith) if it be clenfed, and so sown, but that not forthwith, but in the third year.

¶ *The names.*

The Grecians haue called it *Zea* and *Zea*: the Latines *Spelta*: in the Germane tongue **Speltz**, and **Sinkel**: in low Dutch, **Spelte**: in French, *Espeautre*: of most Italians, *Pirra*, *Farra*: of the Tuscans, *Biada*: of the Millanois, *Alga*: in English, Spelt Corne. *Dioscorides* maketh mention of two kindes of Spelt: one of which he names *amla*, or single: another, *dicochos*, which brings forth two cornes ioyned together in a couple of huskes, as before in the description is mentioned. That Spelt which *Dioscorides* calls *Dicoccos*, is the same that *Theophr.* and *Galen* do name *Zea*. The most ancient Latines haue called *Zea* or *Spelta* by the name of *Far*, as *Dionysius Halicarnassensis* doth sufficiently testifie: The old Romans (saith he) did call sacred marriages by the word *farfareum*, because the

Zea sine Spelta.
Spelt Corne.

the Bride and Bridegroom did eate of that *Far* which the Grecians do call *Far*. The same thing *Asclepiades* affirmeth in *Galen*, in his ninth Booke according to the places affected, writing thus; *Far* *ris quod Zea appellant*: that is to say, *Far* which is called *Zea*, &c. And this *Far* is also named of the Latines, *Ador*, *Adoreum*, and *Semen adoreum*.

¶ *The temper.*

Spelt, as *Dioscorides* reporteth, nourisheth more than Barley. *Galen* writeth in his Bookes of the Faculties of simple Medicines, Spelt is in all his temperature in a meane betweene Wheat and Barley, and may in vertue be referred to the kindes of Barley and Wheat, being indifferent to them both.

¶ *The vertues.*

The floure or meale of Spelt corne boyled in A water with the poudre of red Saunders, and a little oyle of Roses and Lillies, vnto the forme of a Pul-
tesse, and applied hot, taketh away the swelling of the legs gotten by cold and long standing.

‡ Spelt (saith *Turner*) is common about Weisen- B
burgh in high Almanie, eight Dutch miles on this side Strausbourgh: and there all men vse it for wheat; for there groweth no wheat at all: yet I neuer saw fairer and pleasanter bread in any place in all my life, than I haue eaten there, made onely of this Spelt. The Corne is much lesse than Wheat, and somewhat shorter than Rie, but nothing so blacke. ‡

CHAP. 49.

Of Starch Corne.

Triticum Amyleum.
Starch Corne.

¶ *The description.*

THis other kind of *Spelta* or *Zea* is called of the Germane Herbarists *Amyleum Frumentum*, or Starch corne; and is a kinde of grain sown to that end, or a three moneths graine, and is very like vnto wheat in stalke and seed; but the eare thereof is set round about, and made vp with two ranks, with certaine beards, almost after the manner of Barley, and the seed is closed vp in chaffie huskes, and is sown in the Spring.

¶ *The place.*

Amil corne, or Starch corne is sown in Germanie, Polonia, Denmarke, and other those Easterne Regions, as well to feed their cattel and pul-
len with, as also to make starch; for the which purpose it doth very fitly serue.

¶ *The time.*

It is sown in Autumne, or the fall of the leafe, and oftentimes in the Spring; and for that cause hath beene called *Trimestre*, or three months grain: it bringeth his seed to tipenesse in the beginning of August, and is sown in the Low-Countries in the Spring of the year.

¶ *The names.*

Because the Germanes haue great vse of it to make starch with, they do call it *Amelcorn*: Wee
thinks

thinke good to name it in Latine *Amyleum frumentum* : in English it may be called Amelcorne, after the Germane word ; and may likewise be called Starch Corne. *Tragus* and *Fuchsius* tooke it to be *Triticum trimestre*, or three moneths wheat ; but it may rather be referred to the *Farra* : for *Columella* speaketh of a graine called *Far Halic astrum*, which is sown in the Spring ; and for that cause it is named *Trimestre*, or three moneths *Far*. If any be desirous to learne the making of Starch, let them reade *Dodonens* last edition, where they shall be fully taught ; my selfe not willing to spend time about so vaine a thing, and not pertinent to the story. It is vsed onely to feed cattell, pullen, and make starch, and is in nature somewhat like to wheat or Barley.

CHAP. 50. Of Barley.

¶ The description.

Barley hath an helme or straw which is shorter and more brittle than that of Wheat, and hath more joints ; the leaues are broader and rougher ; the eare is armed with long, rough, and prickly beards or ailes, and set about with sundry rankes, sometimes two, otherwhiles three, foure, or six at the most, according to *Theophrastus* ; but eight according to *Tragus*. The graine is included in a long chaffie huske : the roots be slender, and grow thicke together. Barley, as *Pliny* writeth, is of all graine the softest, and least subiect to casualtie, yeelding fruit very quickly and profitably.

1 *Hordeum Distichon*.
Common Barley.

2 *Hordeum Polystichum vernum*.
Beare Barley, or Barley Big.

1 The most vsuall Barley is that which hath but two rowes of Corne in the eare, each graine set iust opposite to other, and hauing his long awne at his end, is couered with a huske sticking close thereto.

2 This which commonly hath foure rowes of corne in the eare, and sometimes more, as wee haue formerly deliuered, is not so vsuall sown with vs ; the eare is commonly shorter than the former, but the graine very like ; so that none who knowes the former, but may easily know the later at the first sight.

¶ The place.

They are sown, as *Columella* teacheth, in loose and dry ground, and are well knowne all Europe through.

2 The second is sown commonly in some parts of Yorke shire and the Bishopricke of Durham.

¶ The names.

1 The first is called of the Grecians *κριθι*: in high Dutch, *Gersten*: in Low Dutch, *Gerst*: in Italian, *Orzo*: in Spanish, *Cenada*: in French, *Orge*: in English, Barley.

2 The second is called of the Grecians *πολυστυχον*, and also *ελαστυχον*: *Columella* calleth it *Galaticum*; and *Hippocrates*, *αργυραλις κριθι*: of our English Northerne people, Big, and Big Barley. *Crimmon* (saith *Galen* in his Commentaries vpon the second booke of *Hippocrates* his Prognosticks) is the grosser part of Barley meale being grossely ground. Malt is well knowne in England, insomuch that the word needeth no interpretation; notwithstanding because these Workes may chance into the hands of Strangers, that neuer heard of such a word, or such a thing, by reason it is not euerie where made; I thought good to lay downe a word of the making thereof. First, it is steeped in water vntill it swell; then is it taken from the water, and laid (as they terme it) in a Couch; that is, spread vpon an euen floore the thickest of some foot and an halfe; and thus is it kept vntill it Come, that is, vntill it send forth two or three little strings or fangs at the end of each Corne: then it is spread vsually twice a day, each day thinner than other, for some eight or ten daies space, vntill it be pretty dry, and then it is dried vp with the heate of the fire, and so vsed. It is called in high Dutch, *Maltz*: in low Dutch, *Mout*: in Latine of later time, *Maltum*: which name is borrowed of the Germanes. *Actius* a Greeke Physitian nameth Barley thus prepared, *βιν*, or *Bine*: The which Author affirmeth, That a plaister of the meale of Malt is profitably laid vpon the swellings of the Dropsie. *Zythum*, as *Diodorus Siculus* affirmeth, is not onely made in *Aegypt*, but also in *Galatia*. The aire is so cold (saith he, writing of *Galatia*) that the country bringeth forth neither wine nor oyle; and therefore men are compelled to make a compound drinke of Barley, which they call *Zythum*. *Dioscorides* nameth one kinde of Barley drinke *Zythum*; another, *Curmi*. *Simeon Zethi* a later Grecian calleth this kind of drinke by an Arabicke name, *قوي*: in English we call it Beere and Ale which is made of Barley Malt.

¶ The temperature.

Barley, as *Galen* writeth in his booke of the Faculties of nourishments, is not of the same temperature that Wheat is; for Wheat doth manifestly heate, but contrariwise what medicine or bread soeuer is made of Barley, is found to haue a certaine force to coole and drye in the first degree, according to *Galen* in his booke of the faculties of Simples. It hath also a little absterfiue or cleansing qualitie, and doth dry somewhat more than Beane meale.

¶ The vertues.

Barley, saith *Dioscorides*, doth cleanse, prouoke vrine, breedeth windinesse, and is an enemy to the stomacke. A

Barley meale boyled in an honied water with figges, taketh away inflammations: with Pitch, B
Rosin, and Pigeons dung, it softneth and ripeneth hard swellings.

With Melilot and Poppy seeds it taketh away the paine in the sides: it is a remedy against C
windinesse in the guts, being applied with Linseed, Foenugreeke, and Rue: with tarre, wax, oyle, and the vrine of a yong boy, it doth digest, soften, and ripe hard swellings in the throat, called the Kings Euill.

Boyled with wine, myrtles, the barke of the pomegranate, wilde pearces, and the leaues of bram- D
bles, it stoppeth the laske.

Further, it serueth for *Ptisana*, *Polenta*, *Maça*, Malt, ale, and Beere. The making whereof if any E
be desirous to learne, let them reade *Lobelius Aduersaria*, in the chapter of Barley. But I thinke our London Beere-Brewers would scorne to learne to make beere of either French or Dutch, much lesse of me that can say nothing therein of mine owne experience more than by the Writings of others. But I may deliuer vnto you a Confection made thereof (as *Columella* did concerning sweet wine sodden to the halfe) which is this; Boyle strong ale till it come to the thicknesse of hony, or the forme of an vnguent or salue, which applied to the paines of the sinewes and joints (as ha- uing the propertie to abate aches and paines) may for want of better remedies be vsed for old and new fores, if it be made after this manner.

Take strong ale two pound, one Oxe gall, and boyle them to one pound with a soft fire, conti- F
nually stirring it; adding thereto of Vineger one pound, of *Olibanum* one ounce, floures of Camo- mil and melilot of each $\frac{3}{4}$ i. Rue in fine powder $\frac{3}{4}$ s. a little hony, and a small quantitie of the powder of Comin seed; boyle them all together to the forme of an vnguent, and so apply it. There be sundry sorts of Confections made of Barley, as *Polenta*, *Ptisana*, made of water and husked or hulled barley, and such like. *Polenta* is the meate made of parched Barley, which the Grecians doe pro- perly

perly call *μαζα* *Maza* is made of parched Barley tempered with water, after *Hippocrates* and *Xenophon*: *Cyrus* hauing called his souldiers together, exhorteth them to drinke water wherein parched Barley hath beene steeped; calling it by the same name, *Maza*. *Hesychius* doth interpret *μαζα* to be Barley meale mixed with water and oyle.

Barley meale boyled in water with garden Nightshade, the leaues of garden Poppie, the powder of Fœnugreece and Linefeed, and a little Hogs greafe, is good against all hot and burning swellings, and preuaileth against the Dropsie, being applied vpon the belly.

CHAP. 51. Of Naked Barley.

Hordeum nudum.
Naked Barley.

¶ The description.

Hordeum nudum is called Zeopyrum, and *Triticum-Speltum*, because it is like to *Zea*, otherwise called *Spelta*, and is like to that which is called French Barley, whereof is made that noble drinke for sicke Folkes, called *Ptisana*. The plant is altogether like vnto Spelt, sauing that the eares are rounder, the eiles or beards rougher and longer, and the seed or graine naked without huskes, like to wheat, the which in it's yellowish colour it somewhat resembles.

¶ The place.

‡ It is sowne in sundry places of Germany, for the same vses as Barley is.

¶ The names.

It is called *Hordeum Nudum*, for that the Corne is without huske, and resembleth Barley. In Greeke it is called *ζιζυριον*, because it participateth in similitude and nature with *Zea*, that is, Spelt, and *Puros*, (that is) wheat. ‡

¶ The vertues.

This Barley boyled in water cooleth vnnaturall and hot burning choler. In vehement feuers you may adde thereto the seeds of white Poppie and Lettuse, not onely to coole, but also to pro- uoke sleepe.

A Against the shortnesse of the breath, and paines of the brest, may be added to all the foresaid, **B** figs, raisins of the Sunne, liquorice, and Annise seed.

C Being boyled in the Whay of Milke, with the leaues of Sorrell, Marigolds, and Scabious, it quencheth thirst, and cooleth the heate of the inflamed Liuer, being drunke first in the morning, and last to bedward.

Hordeum Spurium.
Wall Barley.

CHAP. 52.

Of Wall Barley.

¶ The description.

THis kinde of wilde Barley, called of the Latines *Hordeum Spurium*; is called of *Pliny*, *Holcus*; in English, Wall Barley, Way Barley, or after old English Writers, Way Bennet. It groweth vpon mud walls and stony places by the wayes sides; very well resembling Selfe-sowed Barley, yet the blades are rather like grasse than Barley. ‡ This groweth some foot and better in height, with grasse leaues, the eare is very like that of Rie, and the corne both in colour and shape absolutely resembles it; so that it cannot be fitlier named than by calling it wilde Rie, or Rie grasse. ‡

¶ The vertues.

This Bastard wilde Barley stamped and applied vnto places wanting haire, doth cause it to grow and come forth, whereupon in old time it was called *Ristida*. A

CHAP. 53. Of Saint Peters Corne.

1 *Briza monococcos*. S. Peters Corne.2 *Festuca Italica*. Hauer Grasse.

¶ The

¶ The description.

† 1 **B**Riza is a Corne whose leaues, stalkes, and eares are lesse than Spelt; the eare resembles our ordinary Barley, the corne growing in two rowes, with awnes at the top, and huskes vpon it not easily to be gotten off. In colour it much resembles barley; yet *Tragus* saith it is of a blackish red colour.

2 This *Ægilops* in leaues and stalkes resembles wheat or barley, and it growes some two handfuls high, hauing a little eare or two at the top of the stalke, wherein are inclosed two or three seeds a little smaller than Barley, hauing each of them his awne at his end. These seeds are wrapped in a crested filme or skinne, out of which the awnes put themselues forth.

Matthiolus saith, That he by his owne triall hath found this to be true, That as *Lolium*, which is our common Darnel, is certainly knowne to be a seed degenerate from wheat, being found for the most part among wheat, or where wheat hath been: so is *Festuca* a seed or grain degenerating from barley, and is found among Barley, or where barley hath beene.

¶ The place.

1 Briza is sown in some parts of Germany and France; and my memorie deceiues me if I haue not often times found many eares thereof amongst ordinarie barley, when as I liued in the further side of Lincolneshire, and they there called it Brant Barley.

2 This *Ægilops* growes commonly amongst their Barley in Italy and other hot countries. †

¶ The names.

1 *Briza Monococcus*, after *Lobelius*, is called by *Tabernamontanus*, *Zea Monococcus*: in English, Saint Peters Corne, or Brant Barley.

2 *Festuca* of Narbone in France is called *Alphat*: in Latine, *Ægilops Narbonensis*, according to the Greeke: in English, Hauer-grasse.

¶ The nature.

They are of qualitie somewhat sharpe, hauing facultie to digest.

¶ The vertues.

A The iuice of *Festuca* mixed with Barley meale dried, and at times of need moistned with Rose water, applied plaisterwise, healeth the disease called *Ægilops*, or Fistula in the corner of the eye: it mollifieth and disperseth hard lumps, and asswageth the swellings in the joynts.

CHAP. 54. Of Otes.

¶ The description.

1 **A***vena Vesca*, Common Otes, is called *Vesca*, à *Vescendo*, because it is vsed in many countries to make sundry sorts of bread; as in Lancashire, where it is their chiefe bread corne for Iannocks, Hauer cakes, Tharffe cakes, and those which are called generally Oten cakes; and for the most part they call the graine Hauer, whereof they do likewise make drink for want of Barley.

2 *Avena Nuda* is like vnto the common Otes; differing in that, that these naked Otes immediately as they be threshed, without helpe of a Mill become Otemeale fit for our vse. In consideration whereof in Northfolke and Southfolke they are called vnhusled and naked Otes. Some of those good house-wiues that delight not to haue any thing but from hand to mouth, according to our English prouerbe, may (whiles their pot doth seeth) go to the barne, and rub forth with their hands sufficient for that present time, not willing to prouide for to morrow, according as the Scripture speaketh, but let the next day bring with it.

¶ The nature.

Otes are dry and somewhat cold of temperature, as *Galen* saith.

¶ The vertues.

A Common Otes put into a linnen bag, with a little bay salt quilted handsomely for the same purpose, and made hot in a frying pan, and applied very hot, easeth the paine in the side called the stitch, or collicke in the belly.

B If Otes be boyled in water, and the hands or feet of such as haue the *Serpigo* or *Impetigo*, that is, certaine chaps, chinks, or rifts in the palmes of the hands or feet (a disease of great affinitie with the pocks) be holden ouer the fume or smoke thereof in some bowle or other vessell wherein the Otes are put, and the Patient couered with blankets to sweat, being first annointed with that ointment or vnction vsually applied *contra Morbum Gallicum*: it doth perfectly cure the same in fixe times so annointing and sweating.

Otemeale

Otemeale is good for to make a faire and wel coloured maid to looke like a cake of tallow, especially if she take next her stomacke a good draught of strong vinegar after it.

Otemeale vsed as a Cataplasme dries and moderately discusses, and that without biting; for it hath somewhat a coole temper, with some astringion, so that it is good against scourings.

1 *Auena Vesca.*
Common Otes,

2 *Auena Nuda.*
Naked Otes,

CHAP. 55. Of Wilde Otes.

The description.

1 **B**romos sterilis, called likewise *Auena fatua*, which the Italians do call by a very apt name *Vena vana*, and *Auena Cassa*, (in English, Barren Otes, or wilde Otes) hath like leaues and stalkes as our Common Otes; but the heads are rougher, sharpe, many little sharpe huskes making each eare.

† 2 There is also another kinde of *Bromos* or wilde Otes, which *Dodonæus* calleth *Festuca altera*, not differing from the former wilde Otes in stalkes and leaues, but the heads are thicker, and more compact, each particular eare (as I may terme it) consisting of two rowes of seed handsomely compact and ioyned together; being broader next the straw, and narrower as it comes to an end.

¶ The time and place.

† The first in Iuly and August may be found almost in euery hedge; the later is to be found in great plenty in most Ric.

¶ The names.

1 This is called in Greeke *εἰς μὲν στείρα*: in Latine, *Bromos sterilis* by *Lobell*: *Aegylops prima* by *Mathioli*: in English, Wilde-Otes, or Hedge-Otes.

2 *Lobell* calls this *Bromos sterilis altera*: *Dodonæus* termes it *Festuca altera*: in Brabant they call it *Draulich*: in English, Drauke.

1 *Bromos sterilis*.
Wilde Otes.

2 *Bromos altera*.
Drauke, or small wilde Otes.

¶ The nature and vertues.

- A 1 It hath a drying facultie (as *Dioscorides* saith.) Boile it in water together with the roots vntill two parts of three be consumed; then straine it out, and adde to the decoction a quantitie of honey equall thereto: so boile it vntill it acquire the thicknesse of thin honey. This medicine is good against the *Oxana* and filthy vlcers of the nose, dipping a linnen cloth therein, and putting it vp into the nostrils; some adde thereto Aloes finely poudred, and so vse it.
- B Also boiled in Wine with dried Rose leaues, it is good against a stinking breath. ‡

CHAP. 56. Of Bearded Wilde Otes.

¶ The description.

Æ *Gylops Bromoides Belgarum* is a Plant indifferently partaking of the nature of *Agilops* and *Bromos*. It is in shew like to the naked Otes. The seed is sharpe, hairy, and somewhat long, and of a reddish colour, inclosed in yellowish chaffie huskes like as Otes, and may be Englished, Crested or bearded Otes. I haue found it often among Barley and Rie in sundry grounds. This is likewise vnprofitable and hurtfull to Corne; whereof is no mention made by the Antients worthy the noting.

1 *Agilops*

† *Egilops Bromoides*.
Bearded Wilde Otes.

CHAP. 57. Of Burnt Corne.

¶ The description.

1 **H** *Ordeum vstam*, or *Vstilago Hordei*, is that burnt or blasted Barley which is altogether vnprofitable and good for nothing, an enemy ynto corne; for that in stead of an eare with corne, there is nothing else but blacke dust, which spoileth bread, or whatsoeuer is made thereof.

2 Burnt Otes, or *Vstilago Auenæ*, or *Auenacea*, is likewise an vnprofitable Plant, degenerating from Otes, as the other from Barley, Rie, and Wheat. It were in vaine to make a long haruest of such euill corne, considering it is not possessed with one good qualitie. And therefore thus much shall suffice for the description.

3 Burnt Rie hath no one good property in phisicke, appropriate either to man, birds, or beast, and is a hurtfull maladie to all corne where it groweth, hauing an eare in shape like to corne, but in stead of graine it doth yeeld a blacke powder or dust, which causeth bread to looke blacke, and to haue an euill taste: and that corne where it is, is called smootie corne, and the thing it selfe Burnt Corne, or blasted corne.

1 *Hordeum vstam*, siue *vsti-* 2 *Vstilago Auenacea*.
ago hordei. Burnt Barley. } Burnt Otes.

3 *Vstilago Secalina*.
Burnt Rie.

CHAP. 58. Of Darnell.

1 *Lolium album.*
White Darnell.2 *Lolium rubrum.*
Red Darnell.

¶ The description.

1 **A**mong the hurtfull weeds Darnell is the first. It bringeth forth leaues or stalkes like those of wheat or barley, yet rougher, with a long eare made vp of many little ones, euery particular one whereof containeth two or three graines lesser than those of wheat, scarcely any chaffe huske to couer them with; by reason whereof they are easily shaken out and scattered abroad.

2 Red Darnell is likewise an vnprofitable corne or grasse, hauing leaues like barley. The joints of the straw or stalke are sometimes of a reddish colour, bearing at the top a small and tender eare, flat, and much in forme resembling the former.

¶ The place.

They grow in fields among wheat and barley, of the corrupt and bad seed, as *Galen* saith, especially in a moist and dankish soile.

¶ The time.

They spring and flourish with the corne, and in August the seed is ripe.

¶ The names.

1 Darnell is called in Greeke, αἶψα: in the Arabian Tongue, *Zizania* and *Sceylen*: In French, *Turay*: in Italian, *Loglio*: in low Dutch, *Dolick*: in English, Darnell: of some, *Iuray*, and *Raye*: and of some of the Latines, *Triticum temulentum*.

2 Red Darnell is called in Greeke ρυῖς, or *Phoenix*, because of the crimson colour: in Latine, *Lolium Rubrum*, and *Lolium Murinum*: of some, *Hordeum Murinum*, and *Triticum Murinum*: in Dutch, *Muyse cozen*: in English, Red Darnell, or great Darnell Grasse.

¶ The temperature.

Darnell is hot in the third degree, and dry in the second. Red Darnell drieth without sharpnesse, as *Galen* saith.

¶ The

¶ The vertues.

The seed of Darnell, Pigeons dung, oile Oliue, and pouder of Linefeed, boiled to the forme of A
a plaister, consume wennes, hard lumpes, and such like excrescences in any part of the body.

The new bread wherein Darnel is, eaten hot, causeth drunkenesse: in like manner doth beere B
or ale wherein the seed is fallen, or put into the Malt.

Darnell taken with red wine stayeth the flux of the belly, and the ouermuch flowing of womens C
termes.

Dioscorides saith, That Darnell meale doth stay and keepe backe eating sores, Gangrenes, and D
putrified vlcers; and being boyled with Radish roots, salt, brimstone, and vineger, it cureth spread-
ding scabs, and dangerous tetters, called in Greeke, *λεπροειδης*, and leprous or naughty scurfe.

The seed of Darnell ginen in white or Rhenish wine, prouoketh the flowers or menses. E

A fume made thereof with parched barley meale, myrrh, saffron, and frankinsence, made in form F
of a pulstesse, and applied vpon the belly, helps conception, and causeth easie deliuerance of child-
bearing.

Red Darnell (as *Dioscorides* writeth), being drunke in sowre or harsh red Wine, stoppeth the G
laske, and the ouermuch flowing of the flowers or menses, and is a remedie for those that pisse in
bed.

¶ The danger.

Darnell hurteth the eyes, and maketh them dim, if it happen in corne either for bread or drinke:
which thing *Ouid* in his first booke *Fastorum* hath mentioned, in this verse:

Et careant lolijs oculos vitiantibus agri.

And hereupon it seemeth that the old prouerbe came, That such as are dimme sighted should be
said, *Loliovictitare.*

CHAP. 59. Of Rice.

Oryza.
Rice.

¶ The description.

Rice is like vnto Darnell in shew, as *Theophrastus* saith: it bringeth not forth an eare, like
corne, but a certaine mane or plume, as Mill,
or Millet, or rather like Panick. The leaues, as *Pliny*
writeth, are fat and full of substance, like to the
blades of leeks, but broader: but (if neither the soile
nor climate did alter the same) the plants of Rice
that did grow in my garden had leaues soft and gras-
sie like barley. The floure did not shew it selfe with
me, by reason of the iniurie of our vnseasonable yere
1596. *Theophrastus* concludeth, that it hath a floure
of a purple colour. But, saith my Author, Rice hath
leaues like vnto Dogs grasie or Barley, a small straw
or stem full of ioynts like corne: at the top where-
of groweth a bush or tuft farre vnlike to barley or
Darnell, garnished with round knobs like small
gooseberries, wherein the seed or graine is contain-
ed: euery such round knob hath one small rough
aile, taile, or beard like vnto barley hanging there-
at. *Aristobulus*, as *Strabo* reporteth, sheweth, That
Rice growes in water in *Bactria*, and neere *Babylon*,
and is two yards high, and hath many eares, and bring-
eth forth plenty of seed. It is reaped at the setting
of the seven starres, and purged as Spelt and Ote-
meale, or hulled as French Barley.

¶ The place.

It groweth in the territories of the *Bactrians*, in
Babylon, in *Susium*, and in the lower part of *Syria*.
It groweth in those dayes not onely in those countries before named, but also in the fortunate
Islands, and in *Spaine*, from whence it is brought vnto vs, purged and prepared as we see, after the
manner of French Barley. It prospereth best in fenny and waterish places.

¶ The time.

It is sown in the Spring in India, as *Eratoſthenes* witneſſeth, when it is moiſtned with Sommer ſhowers.

¶ The names.

The Grecians call it *ὀρυζα*, or as *Theophrastus* ſaith, *ορυζον*: the Latines keepe the Greeke word *Oryza*: in French it is called *Riz*: in the Germane tongue, *Riz*, and *Rys*: in Engliſh, Rice.

¶ The temperature and vertues.

Galen ſaith, That all men uſe to ſtay the belly with this graine, being boiled after the ſame manner that *Chondrus* is. In England we uſe to make with milke and Rice a certaine food or pottage, which doth both meanly binde the belly, and alſo nourish. Many other good kindes of food is made with this graine, as thoſe that are ſkilfull in cookerie can tell.

CHAP. 60. Of Millet.

Milium.

Mill, or Millet.

¶ The deſcription.

Milium riſeth vp with many hairy ſtalkeſ knotted or jointed like wheat. The leaues are long, and like the leaues of the Common Reed. It bringeth forth on the top of the ſtalke a ſpoky buſh or mane, called in Greeke *ὀβη*, like the plume or feather of the Pole reed, hanging downwards, of colour for the moſt part yellow or white; in which groweth the ſeed, ſmall, hard, and glistering, couered with a few thinne huſkes, out of which it eaſily falleth. The roots be many, and grow deep in the ground.

2 *Milium nigrum* is like vnto the former, ſauing that the eare or plume of this plant is more looſe and large, and the ſeed ſomewhat bigger, of a ſhining blacke colour.

¶ The place.

It loueth light and looſe mould, and proſpereth beſt in a moiſt and rainy time. And after *Columella*, it groweth in greateſt aboundance in Campania. I haue of it yearely in my garden.

¶ The time.

It is to be ſown in Aprill and May, and not before, for it ioyleth in warme weather.

¶ The names.

It is named of the Grecians, *μύλον*: of ſome, *μύλον*: and of *Hippocrates*, *Paſſale*, as *Hermolaus* ſaith: In Spaniſh, *Mijo*: in Italian, *Miglio*: in High-Dutch, *Mirz*: in French, *Millet*: in Low-Dutch, *Mirs*: in Engliſh, Mill, or Millet.

¶ The temper.

It is cold in the firſt degree, as *Galen* writeth, and dry in the third, or in the later end of the ſecond, and is of a thinne ſubſtance.

¶ The vertues.

- A The meale of Mill mixed with tarre is laid to the bitings of ſerpents, and all venomous beaſts.
- B There is a drinke made hereof bearing the name of *Sirupus Ambroſij*, or *Ambroſe* his ſyrup, which procureth ſweat, and quencheth thirſt, uſed in the city of Milan in Tertian agues. The receipt whereof *Henricus Ranſonius* in his booke of the gouernment of health ſetteth downe in this manner: Take (ſaith he) of vnhuſked Mill a ſufficient quantitie, boile it till it be broken; then take ſiue ounces of the hot decoction, and adde thereto two ounces of the beſt white wine, and ſo giue it hot vnto the patient, being well couered with clothes, and then he will ſweat throughly. This is likewiſe commended by *Iohannes Heurneus*, in his booke of Praſtiſe.
- C Millet parched, and ſo put hot into a linnen bag, and applied, helpes the griping paines of the belly, or any other paine occaſioned by cold.

CHAP. 61. Of Turkie Corne.

1 *Frumentum Asiaticum.*
Corne of Asia.2 *Frumentum Turcicum.*
Turkie Corne.

¶ The kinds.

OF Turkie cornes there be diuers sorts, notwithstanding of one stocke or kindred, consisting of sundry coloured graines, wherein the difference is easie to be discerned, and for the better explanation of the same, I haue set forth to your view certaine eares of different colours, in their full and perfect ripenesse, and such as they shew themselves to be when their skinne or filme doth open it selfe in the time of gathering.

The forme of the eares of Turkey Wheat.

3 *Frumenti Indici spica.*

Turkie wheat in the huske, as also naked or bare.

¶ The description.

- 1 Corne of Asia beareth a long great stem or stalke, couered with great leaues like the great Cane reed, but much broader, and of a darke brownish colour towards the bottom: at the top of the stalkes grow idle or barren tufts like the common Reed, sometimes of one colour, and sometimes of another. Those eares which are fruitfull do grow vpon the sides of the stalkes, among the leaues, which are thicke and great, so couered with skins or filmes, that a man cannot see them vntill ripenesse haue discovered them. The graine is of sundrie colours, sometimes red, and sometimes white, and yellow, as my selfe haue scene in myne owne garden, where it hath come to ripenesse.

5 *Fruentum Indicum rubrum.*
Red Turkey wheat.4 *Fruentum Indicum luteum.*
Yellow Turkey wheat.6 *Fruentum Indicum caruleum.*
Blew Turkey wheat.

- 2 The stalke of Turkey Wheat is like that of the Reed, full of spongie pith, set with many ioynts, fve or six foot high, bigge beneath, and now and then of a purple colour, and by little and little small above: the leaues are broad, long, set with vaines like those of the Reed. The eares on the top of the stalke be a spanne long, like vnto the feather top of the common Reed, diuided into many plumes hanging downward, empty and barren without seed, yet blooming as Rie doth. The floure is either white, yellow, or purple, that is to say, euen as the fruit will be. The Fruit is contained in very bigge eares, which grow out of the ioynts of the stalke, three or foure from one stalke, orderly placed one aboue another, couered with cotes or filmes like huskes and leaues, as if it were a certaine sheath; out of which do stand long and slender beards, soft and tender, like those laces that grow vpon Sauorie, but greater and longer, euery one fastned vpon his owne seed. The seeds are great, of the bignesse of common peason, cornered in that part whereby they are fastned to the eare, and in the outward part round: being of colour sometimes white, now and then yellow, purple, or red; of taste sweet and pleasant, very closely ioynd together in eight or tenne orders or ranks. This graine hath many roots, strong, and full of strings.

¶ The place.

These kindes of graine were first brought into Spaine, and then into other prouinces of Europe: not (as some suppose) out of Asia minor, which is the Turks Dominions, but out of America and the Islands adioyning, as out of Florida and Virginia, or Norembega, where they vse to sow or set it, and to make bread of it, where it groweth much higher than in other countries. It is planted in the gardens of these Northerne regions, where it commeth to ripenesse when the sommer falleth out to be faire and hot, as my selfe haue scene by prooffe in myne owne garden.

¶ The

¶ *The time.*

It is sown in these countries in March and Aprill, and the fruit is ripe in September.

¶ *The names.*

† Turkey wheat is called of some *Frumentum Turcicum*, and *Milium Indicum*, as also *Maiyum*, and *Mais*, or *Mays*. It in all probabilitie was vnkowne to the antient both Greeke and Latine Authors. In English it is called Turkey corne, and Turkey wheat. The Inhabitants of America and the Islands adioyning, as also of the East and West Indies, do call it *Mais*: the Virginians, *Pagatowr*.

¶ *The temperature and vertues.*

Turkey wheat doth nourish far lesse than either wheat, rie, barley, or otes. The bread which is made thereof is meanly white, without bran: it is hard and dry as Bisket is, and hath in it no clamminesse at all; for which cause it is of hard digestion, and yeeldeth to the body little or no nourishment, it slowly descendeth, and bindeth the belly, as that doth which is made of Mill or Pannick. We haue as yet no certaine prooffe or experience concerning the vertues of this kinde of Corne; although the barbarous Indians, which know no better, are constrained to make a vertue of necessitie, and thinke it a good food: whereas we may easily iudge, that it nourisheth but little, and is of hard and euill digestion, a more conuenient food for swine than for men.

CHAP. 62. Of Turkie Millet.

Sorghum.

Turky Millet.

¶ *The description.*

Turky Millet is a stranger in England. It hath many high stalkes, thicke, and jointed commonly with some nine ioynts, beset with many long and broad leaues like Turkey Wheat: at the top whereof groweth a great and large tuft or eare like the great Reed. The seed is round and sharpe pointed, of the bignesse of a Lentill, sometimes red, and now and then of a fuller blacke colour. It is fastned with a multitude of strong slender roots like vnto threds: the whole plant hath the forme of a Reed: the stalkes and eares when the seed is ripe are red.

¶ *The place.*

It ioyeth in a fat and moist ground: it groweth in Italy, Spaine, and other hot regions.

¶ *The time.*

This is one of the Sommer graines, and is ripe in Autumne.

¶ *The names.*

The Millanois and other people of Lombardy call it *Melegna*, and *Melega*: in Latine, *Melica*: in Hetruria, *Saggina*: in other places of Italy, *Sorgho*: in Portugal, *Milium Saburum*: in English, Turkey Mill, or Turkey Hirffe.

† This seemes to be the *Milium* which was brought into Italy out of India, in the reigne of the Emperour Nero: the which is described by *Pliny, lib. 18. cap. 7.* †

¶ *The temperature and vertues.*

The seed of Turkey Mill is like vnto Panicke in taste and temperature. The country People sometimes make bread hereof, but it is brittle, and of little nourishment, and for the most part it serueth to fatten hens and pigeons with.

CHAP. 63. Of Panick.

1 *Panicum Indicum*
Indian Panick.2 *Panicum Caruleum*. Blew Panicke.

¶ The kindes.

There be sundry sorts of Panicke, although of the Antients there haue beene set downe but two, that is to say, the wilde or field Panicke, and the garden or manured Panicke.

¶ The descrip^{tion}.

1 The Panick of India groweth vp like Millet, whose straw is knotty, or full of ioynts; the ears be round, and hanging downward, in which is contained a white or yellowish seed, like Canarie seed, or *Alpisti*.

2 Blew Panick hath a reddish stalke like to Sugar cane, as tall as a man, thicker than a finger, full of a fungous pith, of a pale colour: the stalkes be vpright and knotty; these that grow neere the root are of a purple colour: on the top of the stalk commeth forth a spike or eare like the water Cats Taile, but of a blew or purple colour. The Seed is like to naked Otes: The Roots are very small, in respect of the other parts of the plant.

3 *Panicum Americanum spica longissimo*.
West-Indian Panicke with a very long eare.

3 To

‡ 3 To these may be added another West-Indian Panicke, sent to *Clofius* from M. *James Ga-*
ret of London. The eare hereof was thicke, close, compact and made Taper-fashion, smaller at
the one end than at the other; the length thereof was more than a foot & halfe. The shape of the
seed is much like the last described, but that many of them together are contained in one hairie
huske, which is fastned to a very short stalke, as you may see represented apart by the side of the
figure ‡

4 *Panicum vulgare.*

Common or Germane Panicke.

5 *Panicum sylvestre.*

Wild Panicke.

4 Germane Panicke hath many hairy roots growing thicke together like vnto wheat, as is all
the rest of the plant, as well leaues or blades, as straw or stalke. The eare groweth at the top sin-
gle, not vnlike to Indian Panicke, but much lesser. The graines are contained in chaffie scales, red
declining to tawny.

5 The wilde Panicke groweth vp with long reeden stalkes, full of ioynts, set with long leaues
like those of *Sorghum*, or Indian Panicke: the tuft or feather-like top is like vnto the common
reed, or the eare of the grasse called *Ischemon*, or *Manna* grasse. The root is small and threddy.

¶ The place and time.

The kindes of Panick are sown in the Spring, and are ripe in the beginning of August. They
prosper best in hot and dry Regions, and wither for the most part with much watering, as doth Mil
and Turkey wheat: they quickly come to ripeness, and may be kept good a long time.

¶ The names.

Panick is called in Greeke *ῥυζα*, and *ῥυζιον*. *Diocles* the Physitian nameth it *Mel Frugum*: the Spa-
niards, *Paniço*: the Latines, *Panicum*, or *Pannicula*: in English, Indian Panicke, or Otemeale.

¶ The temperature.

Panicks nourish little, and are driers, as *Galen* saith.

¶ The vertues.

Panicke stoppeth the laske, as Millet doth, being boyled (as *Pliny* reporteth) in Goats milke, A
and drunke twice in a day. Outwardly in Pulstesses or otherwife, it dries and cooles.

Bread made of Panick nourisheth little, and is cold and dry, very brittle, hauing in it neither B
clamminesse nor fatnesse; and therefore it drieth a moist belly.

CHAP. 64. Of Canary seed, or Pety Panicke.

1 *Phalaris.*
Canarie seed.2 *Phalaris pratensis.*
Quaking grasse.

¶ The description.

1 **C**anarie seed, or Canarie grasse after some, hath many small hairy roots, from which arise small strawie stalkes ioyned like corne, whereupon do grow leaues like those of Barley, which the whole plant doth very well resemble. The small chaffie eare groweth at the top of the stalke, wherein is contained small seeds like those of Panicke, of a yellowish colour, and shining.

2 Shakers, or Quaking Grasse groweth to the height of halfe a foot, and sometimes higher, when it groweth in fertile meadowes. The stalke is very small and bent, set with many grasse leaues like the common meadow grasse, bearing at the top a bush or tuft of flat scaly pouches, like those of Shepherds purse, but thicker, of a browne colour, set vpon the most small and weake hairy foot stalkes that may be found, whereupon those small pouches do hang: by meanes of which small hairy strings, the knaps which are the floures do continually tremble and shake, in such sort that it is not possible with the most stedfast hand to hold it from shaking.

3 There is also another Grasse plant which may fitly be referred to these: the leaues and stalkes resemble the last described, but the heads are about the length and bredth of a small Hop, and handsomely compact of light scaly filmes much like thereto; whence some haue termed it *Gramen Lupuli glumis*. The colour of this pretty head when it commeth to ripeness is white. †

¶ The place.

1 Canarie seed groweth naturally in Spaine, and also in the Fortunate or Canary Islands, and doth grow in England or any other of these cold Regions, if it be sown therein.

2 Quaking

3 *Phalaris pratensis altera.*
Pearle Grasse.

2 Quaking *Phalaris* groweth in fertile pastures, and in dry meadowes.

3 This growes naturally in some parts of Spaine, and it is sown yearly in many of our London Gardens.

¶ The time.

1 3 These Canarie feeds are sown in May, and are ripe in August.

¶ The names.

1 Canarie seed, or Canarie corne is called of the Grecians, *Phalaris*: the Latines retaining the same name *Phalaris*: in the Islands of Canarie, *Alpisti*: in English, Canarie seed, and Canarie grasse.

2 *Phalaris pratensis* is called also *Gramen tremulum*: in Cheshire about Nantwich, Quakers and Shakers: in some places, Cow-quakes.

3 This by some is termed *Phalaris altera*: *Clusius* calleth it *Gramen Amourettes majus*: *Bauhine*, *Gramen tremulum maximum*: In English they call it Pearle-Grasse, and Garden-Quakers.

¶ The nature and vertues.

I finde not any thing set downe as touching the temperature of *Phalaris*, notwithstanding it is thought to be of the nature of Millet.

The iuyce and seed, as *Galen* saith, are thought to be profitably drunke against the paines of the bladder. Apothecaries for want of Millet doe vse the same with good successe in fomentations; for in dry fomentations it serueth in stead thereof, and is his *succedaneum*, or *quid pro quo*. We vse it in England also to feed the Canarie Birds.

Alopecurus.
Fox-taile.

CHAP. 65.

Of Fox-Taile.

¶ The description.

1 F^Ox-taile hath many grassie leaues or blades, rough and hairy, like vnto those of Barley, but lesse and shorter. The stalke is likewise soft and hairy; whereupon doth grow a small spike or eare, soft, and very downy, bristled with very small haire in shape, like vnto a Fox-taile, whereof it tooke his name, which dieth at the approach of Winter, and recouereth it selfe the next year by falling of his seed.

‡ There is one or two varieties of this Plant in the largeness and smalness of the eare.

2 Besides these forementioned strangers, there is also another which growes naturally in many watry Salt places of this kingdome, as in Kent by Dartford, in Essex, &c. The stalkes of this plant are grassy, and some two foot high, with leaues like Wheat or Dogs Grasse. The eare is very large, being commonly foure or five inches long, downy, soft like silke, and of a brownish colour. ‡

¶ The

¶ The place.

1 This kinde of Fox-taile Grasse groweth in England, onely in gardens.

¶ The time.

1 This springeth vp in May, of the seed that was scattered the yere before, and beareth his taile with his seed in Iune.

2 This beares his head in Iuly.

¶ The names.

1 There hath not beene more said of the antient or later writers, as touching the name, than is set downe, by which they called it in Greeke *Alopecuros*; that is in Latine, *Cauda vulpis*: in English, Fox-taile.

2 This by *Lobell* is called *Alopecuros altera maxima Anglica paludosa*; that is, The large English Marsh Fox-taile.

¶ The temperature and vertues.

I finde not any thing extant worthy the memorie, either of his nature or vertues.

CHAP. 66. Of Jobs Teares.

Lachrima Iob.
Jobs Teares.

¶ The description.

Jobs Teares hath many knotty stalks, proceeding from a tuft of threddy roots, two foot high, set with great broad leaues like vnto those of reed; amongst which leaues come forth many small branches like straw of corne: on the end whereof doth grow a gray shining seed or graine hard to breake, and like in shape to the seeds of Gromell, but greater, and of the same colour, whereof I hold it a kinde: euery of which grains are bored through the middest like a bead, and out of the hole commeth a small idle or barren chaffie care like vnto that of Darnell.

¶ The place.

It is brought from Italy and the countries adjoyning, into these countries, where it doth grow very well, but seldome commeth to ripenesse, yet my selfe had ripe seed thereof in my garden, the Sommer being very hot.

¶ The time.

It is sown early in the Spring, or else the winter will ouertake it before it come to ripenesse.

¶ The names.

Diuers haue thought it to be *Lithospermum* species, or a kinde of Gromell, which the seed doth very notably resemble, and doth not much differ from *Dioscorides* his Gromell. Some thinke it *Plinies Lithospermum*, and therefore it may verie aptly be called in Latine, *Arundo Lithospermum*, that is in English, Gromell reed, as *Gesner* saith. It is generally called *Lachrima Iob*, and *Lachrima*

Iobi: of some it is called *Diospiros*: in English it is called *Jobs Teares*, or *Jobs Drops*, for that euery graine resembleth the drop or teare that falleth from the eye.

¶ The nature and vertues.

There is no mention made of this herbe for the vse of physicke: onely in France and those places (where it is plentifully growing) they do make beads, bracelers, and chaines thereof, as we do with pomander and such like.

CHAP. 67. Of Buck-wheat.

Tragopyron.
Buckwheat, or Bucke.

¶ The description.

Buck-wheat may very well be placed among the kinds of graine or corne, for that oftentimes in time of necessitie bread is made thereof, mixed among other graine. It hath round fat stalkes somewhat crested, smooth and reddish, which is diuided in many armes or branches, whereupon do grow smooth and soft leaues in shape like those of Iuie or one of the Binde-weeds, not much vnlike Basil, whereof *Tabernamontanus* called it *Ocymum Cereale*. The floures be small, white, and clustred together in one or more tufts or umbels, slightly dasht ouer here & there with a flourish of light Carnation colour. The seeds are of a darke blackish colour, triangle, or three square like the seed of blacke Binde-weed, The root is small and threddy.

¶ The place.

It prospereth very wel in any ground, be it neuer so dry or barren, where it is commonly sown to serue as it were in stead of a dunging. It quickly commeth vp, and is very soone ripe: it is verie common in and about the *Namptwich* in Cheshire, where they sow it as well for food for their cattell, pullen, and such like, as to the vse aforesaid. It groweth likewise in Lancashire, and in some parts of our South country, about London in Middlesex, as also in Kent and Essex.

¶ The time.

This base kinde of graine is sown in Aprill and the beginning of May, and is ripe in the beginning of August.

¶ The names.

Buck-wheat is called of the high Almaines, *Heydencorn*: of the base Almaines, *Buckenweide*; that is to say, *Hirci triticum*, or Goats wheat: of some, *Fagi triticum*, Beech Wheat: In Greeke, *ῥυβρον*, by *Theophrastus*; and by late Writers, *ῥυβρον*: in Latine, *Fago triticum*, taken from the fashion of the seed or fruit of the Beech tree. It is called also *Fagopyrum*, and *Tragopyron*: In English, French wheat, Bullimong, and Buck-wheat: In French, *Dragee aux cheueaux*.

¶ The temper.

Buck-wheat nourisheth lesse than Wheat, Rie, Barley, or Otes; yet more than either Mill or Panicke.

¶ The vertues.

Bread made of the meale of Buck-wheat is of easie digestion, and speedily passeth through the belly, but yeeldeth little nourishment.

CHAP. 68. Of Cow Wheat.

1 *Melampyrum album*.
White Cow-wheat.

2 *Melampyrum purpureum*.
Purple Cow-wheat.

3 *Melampyrum caruleum*.
Blew Cow-wheat.

4 *Melampyrum luteum*.
Yellow Cow-wheat.

The description.

Melampyrum grows vpright, with a straight stalke, hauing other small stalkes coming from the same, of a foot long. The leaues are long and narrow, and of a darke colour. On the top of the branches grow bushy or spikie eares full of floures and small leaues mixed together, and much jagged, the whole eare resembling a Foxe-taile. This eare

care beginneth to floure below, and so vpward by little and little vnto the top: the small leaues before the opening of the floures, and likewise the buds of the floures, are white of colour. Then come vp broad husks, wherein are enclosed two seeds somewhat like wheat, but smaller and browner. The root is of a woody substance.

‡ 2 3 These two are like the former in stalkes and leaues, but different in the colour of their floures, the which in the one are purple, and in the other blew. *Clusius* calls these, as also the *Cratægonon* treated of in the next Chapter, by the names of *Parietaria sylvestres*. ‡

4 Of this kinde there is another called *Melampyrum luteum*, which groweth neere vnto the ground, with leaues not much vnlike Harts horne, among which riseth vp a small straw with an eare at the top like *Alopecuros*, the common Fox-taile, but of a yellow colour.

¶ The place.

1 The first groweth among corne, and in pasture grounds that be fruitfull: it groweth plentifully in the pastures about London.

The rest are strangers in England.

¶ The time.

They floure in Iune and Iuly.

¶ The names.

Melampyrum is called of some *Triticum vaccinium*: in English, Cow-wheat, and Horse-floure: in Greeke, *μυλόμενον*: The fourth is called *Melampyrum luteum*: in English, Yellow Cow-wheat.

¶ The danger.

The seed of Cow Wheat raiseth vp fumes, and is hot and dry of nature, which being taken in meats and drinks in the manner of Darnell, troubleth the braine, causing drunkenesse and headache.

CHAP. 69. Of Wilde Cow-Wheat.

1 *Cratægonon album*.

Wilde Cow-wheat.

¶ The description.

1 **T**He first kinde of wilde Cow-Wheat *Clusius* in his Pannonick history calls *Parietaria sylvestris*, or wilde Pellitorie: which name, according to his owne words, if it do not fitly answer the Plant, hee knoweth not what to call it, for that the Latines haue not giuen any name thereunto: yet because some haue so called it, he retaineth the same name. Notwithstanding he referreth it vnto the kindes of *Melampyrum*, or Cow-wheat, or vnto *Cratægonon*, the wilde Cow-wheat, which it doth very wel answer in diuers points. It hath an hairy foure square stalke, very tender, weake, and easie to breake, not able to stand vpright without the helpe of his neighbours that dwell about him, a foot high or more; whereupon do grow long thin leaues, sharp pointed, and oftentimes lightly snipt about the edges, of a darke purplish colour, sometimes greenish, set by couples one opposite against the other; among the which come forth two floures at one ioynt, long and hollow, somewhat gaping like the floures of a dead nettle, at the first of a pale yellow, and after of a bright golden colour; which do floure by degrees, first a few, and then more, by meanes whereof it is long in flourishing. Which being past, there succeed small cups or seed vessels, wherein is contained browne seed not vnlike to wheat. The whole plant is hairy, not differing from the plant Stichwort.

2 Red leaved wilde Cow-wheat is like vnto the former, sauing that the leaues be narrower, and the tuft of leaues more iagged. The stalkes and leaues are of a reddish horse-flesh colour. The

floures in forme are like the other, but in colour differing; for that the hollow part of the floure with the heele or spurre is of a purple colour, the rest of the floure yellow. The seed and vessels are like the precedent.

3 *Cratægonon Euphrosine.*
Eyebright Cow-wheat.

¶ The description.

3 This kinde of wilde Cow-wheat *Tabernamontanus* hath set forth vnder the title of *Odontites*: others haue taken it to be a kinde of *Euphrasia* or Eyebright, because it doth in some sort resemble it, especially in his floures. The stalks of this plant are small, woody, rough, and square. The leaues are indented about the edges, sharpe pointed, and in most points resembling the former Cow-wheat; so that of necessitie it must be of the same kinde, and not a kinde of Eyebright, as hath beene set downe by some.

¶ The place.

These wilde kindes of Cow-wheat doe grow commonly in fertile pastures, and bushy Copfes, or low woods, and among bushes vpon barren heaths and such like places.

The two first doe grow vpon Hampsted heath neere London, among the Iuniper bushes and bilberry bushes in all the parts of the said heath, and in euery part of England where I haue traueled.

¶ The time.

They floure from the beginning of May, to the end of August.

¶ The names.

1 The first is called of *Lobelius*, *Cratægonon*: and of *Tabernamontanus*, *Milium Syluaticum*, or Wood Millet, and *Alfine syluatica*, or Wood-Chickweed.

2 The second hath the same titles: in English, Wilde Cow-wheat.

3 The last is called by *Tabernamontanus*, *Odontites*: of *Dodonæus*, *Euphrasia altera*, and *Euphrosine*. *Hippocrates* called the wilde Cow-wheat, *Polycarpum*, and *Polycritum*.

¶ The nature and vertues.

There is not much set downe either of the nature or vertues of these plants: onely it is reported that the seeds do cause giddinesse and drunkenesse as Darnell doth.

The seed of *Cratægonon* made in fine powder, and giuen in broth or otherwise, mightily prouoketh Venerie.

Some write, that it will likewise cause women to bring forth male children.

† See the vertues attributed to *Cratægonon* by *Dioscorides* before, Chap. 38. B.

CHAP. 70. Of White Asphodill.

¶ The kindes.

Hauing finished the kindes of corne, it followeth to shew vnto you the sundry sorts of Asphodills, whereof some haue bulbous roots, other tuberous or knobby roots, some of yellow colour, and some of mixt colours: notwithstanding *Dioscorides* maketh mention but of one Asphodill, but *Pliny* setteth downe two; which *Dionysius* confirmeth, saying, That there is the male and female Asphodill. The latter age hath obserued many more besides the bulbed one, of which *Galen* maketh mention.

1 *Asphodelus*

1 *Asphodelus non ramosus.*
White Asphodill.2 *Asphodelus ramosus.*
Branched Asphodill.

¶ The description.

The white Asphodill hath many long and narrow leaues like those of leeks, sharpe pointed. The stalke is round, smooth, naked, and without leaues, two cubits high, garnished from the middle vpward with a number of floures starre-fashion, made of fve leaues apiece; the colour white, with some darke purple streakes drawne downe the backe-side. Within the floures be certaine small chiues. The floures being past, there spring vp little round heads, wherein are contained hard, blacke, and 3 square feeds like those of Buck-wheat or Staues-acre. The root is compact of many knobby roots growing out of one head, like those of the Peonie, full of iuyce, with a small bitternesse and binding taste.

2 Branched Asphodill agreeth well with the former description, sauing that this hath many branches or armes growing out of the stalke, whereon the floures do grow, and the other hath not any branch at all, wherein consisteth the difference.

3 Asphodill with the reddish floure groweth vp in roots, stalke, leafe, and manner of growing like the precedent, sauing that the floures of this be of a dark red color, & the others white, which setteth forth the difference, if there be any such difference, or any such plant at all: for I haue conferred with many most excellent men in the knowledge of plants, but none of them can giue mee certaine knowledge of any such, but tell me they haue heard it reported that such a one there is, and so haue I also; but certainly I cannot set downe any thing of this plant vntill I heare more certaintie: for as yet I giue no credit to my Authour, which for reuerence of his person I forbear to name.

4 The yellow Asphodill hath many roots growing out of one head, made of sundry tough, fat, and oleous yellow sprigs, or grosse strings, from the which rise vp many grassy leaues, thick and grosse, tending to squarenesse; among the which commeth vp a strong thicke stalke set with the like leaues euen to the floures, but lesse: vpon the which do grow starre-like yellow floures, otherwise like the white Asphodill.

3 *Asphodelus flore rubente.*
Red Asphodill.

4 *Asphodelus luteus.*
Yellow Asphodill.

5 *Asphodelus minimus.* Dwarf Asphodill.

¶ 5 Besides these there is an Asphodill which *Clusius* for the smalnesse calls *Asphodelus minimus*. The roots thereof are knotty and tuberous, resembling those of the formerly described, but lesse: from these arise five or six very narrow and long leaues; in the midst of which growes vp a stalk of the height of a foot, round and without branches, bearing at the top thereof a spoke of floures, consisting of six white leaues a piece, each of which hath a streake running alongst it, both on the inside and outside, like as the first described. It floures in the beginning of Iuly, when as the rest are past their floures. It loseth the leaues in Winter, and gets new ones againe in the beginning of Aprill. ‡

¶ The time and place.

They floure in May and Iune, beginning below, and so flourishing vpward: and they grow naturally in France, Italy, Spaine, and most of them in our London Gardens.

¶ The names.

Asphodill is called in Latine, *Asphodelus*, *Albucum*, *albucus*, and *Hastula Regia*: in Greeke, *Asphodelos*: in English, Asphodill, not Daffodil; for Daffodill is *Narcissus*, another plant differing from Asphodill. *Pliny* writeth, That the stalke with the floures is called *Anthericos*; and the root, that is to say, the bulbs *Asphodelus*.

Of this Asphodill *Hesiod* maketh mention in his Works, where he saith, that fooles know not how much good there is in the Mallow and in the Asphodill, because the roots of Asphodill are good to be eaten. Yet *Galen* doth not beleue that he meant of this Asphodill, but of that bulbed one, whereof we will make mention hereafter. And he himselfe testifieth, that the bulbes thereof are not to be eaten without very long seething; and therefore it is not like that *Hesiod* hath commended any such: for he seemeth to vnderstand by the Mallow and the Asphodil, such kinde of food as is easily prepared, and soone made ready.

¶ The nature.

These kindes of Asphodills be hot and dry almost in the third degree.

¶ The vertues.

After the opinion of *Dioscorides* and *Aetius*, the roots of Asphodill eaten, prouoke vrine and the termes effectually, especially being stamped and strained with wine, and drunke.

One dram thereof taken in wine in manner before rehearsed, helpeth the paine in the sides, ruptures, convulsions, and the old cough.

The roots boiled in dregs of wine cure foule eating vlcers, all inflammations of the dugges or stones, and easeth the felon, being put thereto as a pulstesse.

The iuyce of the root boyled in old sweet Wine, together with a little myrrh and saffron, maketh an excellent Collyrie profitable for the eyes.

Galen saith, the roots burnt to ashes, and mixed with the grease of a ducke, helpeth the Alopecia, and bringeth haire againe that was fallen by that disease.

The weight of a dram thereof taken with wine helpeth the drawing together of sinews, cramps, and burstings,

The like quantitie taken in broth prouoketh vomit, and helpeth those that are bitten with any venomous beasts.

The iuyce of the root cleanseth and taketh away the white morpew, if the face be annointed therewith; but first the place must be chafed and wel rubbed with a course linnen cloath.

CHAP. 71. Of the Kings Speare.

1 *Asphodelus luteus minor*. The Kings Speare.

2 *Asphodelus Lancastriae*. Lancashire Asphodill.

3 *Asphodelus*

‡ 3 *Asphodelus Lancastria verus.*
The true Lancashire Asphodil.

¶ The description.

1 The leaues of the Kings Speare are long, narrow, and chamfered or furrowed, of a blewish Greene colour. The stalk is round, of a cubit high. The floures which grow thereon from the middle to the top are very many, in shape like to the floures of the other; which being past, there come in place thereof little round heads or seed-vessels, wherein the seed is contained. The roots in like manner are very many, long, and slender, smaller than those of the other yellow sort. Vpon the sides whereof grow forth certaine strings, by which the plant it selfe is easily encreased and multiplied.

2 There is found in these dayes a certaine waterie or marish Asphodill like vnto this last described, in stalke and floures, without any difference at all. It bringeth forth leaues of a beautifull Greene somewhat chamfered, like to those of the Floure de-luce, or corne-flag, but narrower, not full a span long. The stalke is strait, a foot high, whereupon grow the floures, consisting of fixe small leaues: in the middle whereof come forth small yellow chiues or threds. The seed is very small, contained in long sharpe pointed cods. The root is long, ioynted, and creepeth as grasse doth, with many small strings.

‡ 3 Besides the last described (which our Author I feare mistaking, termed *Asphodelus Lancastria*) there is another water Asphodill, which growes in many rotten moorish grounds in this kingdome, and in Lancashire is vsed by women to die their haire of a yellowish colour, and therefore by them it is termed Maiden-haire, if we may beleue *Lobell.*) This plant hath leaues of

some two inches and an halfe, or three inches long, being somewhat broad at the bottome, and so sharper towards their ends. The stalke seldome attaines to the height of a foot, and it is smooth without any leaues thereon; the top thereof is adorned with pretty yellow star-like floures, whereto succeed longish little cods, vsually three, yet sometimes foure or fise square, and in these there is contained a small red seed. The root consists onely of a few small strings. ‡

¶ The place.

1 The small yellow Asphodill groweth not of it selfe wilde in these parts, notwithstanding we haue great plenty thereof in our London gardens.

2 The Lancashire Asphodill groweth in moist and marish places neere vnto the Towne of Lancaster, in the moorish grounds there, as also neere vnto Maudsley and Marton, two Villages not farre from thence; where it was found by a Worshipfull and learned Gentleman, a diligent searcher of simples, and feruent loue of plants, *M. Thomas Heskett*, who brought the plants thereof vnto me for the encrease of my garden.

I receiued some plants thereof likewise from Master *Thomas Edwards*, Apothecarie in Excester, learned and skilfull in his profession, as also in the knowledge of plants. He found this Asphodill at the foot of a hill in the West part of England, called Bagshot hill, neere vnto a village of the same name.

‡ This Asphodill figured and described out of *Dodoneus*, and called *Asphodelus Lancastria* by our Author, growes in an heath some two miles from Bruges in Flanders, and diuers other places of the Low-countries; but whether it grow in Lancashire or no, I can say nothing of certaintie: but I am certaine, that which I haue described in the third place growes in many places of the West of England; and this yeare 1632, my kinde friend *M. George Bowles* sent mee some plants thereof, which I keepe yet growing. *Lobell* also affirms this to be the Lancashire Asphodill.

¶ The time.

They floure in May and Iune: most of the leaues thereof remaine Greene in the Winter, if it be not extreme cold.

¶ The names.

Some of the later Herbarists thinke this yellow Asphodill to be *Iphyon* of *Theophrastus*, and others

others iudge it to be *EriZambac* of the Arabians. In Latine it is called *Asphodelus luteus*: of some it is called *Hastula Regia*. We haue Englished it, the Speare for a King, or small yellow Asphodill.

2 The Lancashire Asphodill is called in Latine, *Asphodelus Lancastria*; and may likewise be called *Asphodelus palustris*, or *Pseudoasphodelus luteus*, or the Bastard yellow Asphodill.

† 3 This is *Asphodelus minimus luteus palustris Scoticus & Lancastriensis*, of Lobell; and the *Pseudoasphodelus pumilio folijs Iridis*, of Clusius, as farre as I can iudge; although Bauhine distinguisheth them. †

¶ The temperature and vertues.

It is not yet found out what vse there is of any of them in nourishment or medicines.

CHAP. 72.

Of Onion Asphodill.

Asphodelus Bulbosus.
Onion Asphodill.

¶ The description.

THE bulbed Asphodill hath a round bulbus or Onion root, with some fibres hanging thereat; from the which come vp many grasie leaues, very well resembling the Leeke; among the which leaues there riseth vp a naked or smooth stem, garnished toward the top with many star-like floures, of a whitish Greene on the inside, and wholly Greene without, consisting of six little leaues sharpe pointed, with certaine chiues or threads in the middle. After the floure is past there succeedeth a small knop or head three square, wherein lieth the seed.

¶ The place.

It groweth in the gardens of Herbarists in London, and not elsewhere that I know of, for it is not very common.

¶ The time.

It floureth in Iune and Iuly, and somewhat after.

¶ The names.

The stalke and floures being like to those of the Asphodill before mentioned, do shew it to be *Asphodeli species*, or a kinde of Asphodill; for which cause also it seemeth to be that Asphodil of which Galen hath made mention in his second book of the Faculties of nourishments, in these words; The root of Asphodill is in a manner like to the root of Squill, or Sea Onion, as well in shape as bitternes. Notwithstanding, saith Galen, my selfe haue known certaine countrymen, who in time of famine could not with many boilings and steepings make it fit to be eaten. It is called of Dodonaus, *Asphodelus famina*, and *Asphodelus Bulbosus*, *Hyacintho-Asphodelus*, and *Asphodelus Hyacinthinus* by Lobell, and that rightly; for that the root is like the Hyacinth, and the floures like the Asphodill: and therefore as it doth participate of both kindes, so likewise doth the name: in English we may call it Bulbed Asphodill. Clusius calls it *Ornithogalum majus*, and that fitly.

¶ The nature.

The round rooted Asphodil, according to Galen, hath the same temperature and vertue that Aron, Arisarum, and Dracontium haue, namely an abstersiue and cleansing qualitie.

¶ The vertues.

The yong sprouts or springs thereof is a singular medicine against the yellow Iaudise, for that the root is of power to make thin and open.

Galen saith, that the ashes of this Bulbe mixed with oile or hens grease cureth the falling of the haire in an Alopecia or scalld head.

CHAP. 73. Of Yellow Lillies.

¶ The kindes.

BEcause we shall haue occasion hereafter to speake of certaine Cloued or Bulbed Lillies, wee will in this chapter entreat onely of another kinde not bulbed, which likewise is of two sorts, differing principally in their roots; for in floures they are Lillies, but in roots Asphodils, participating as it were of both, though neerer approaching vnto Asphodils than Lillies.

1 *Lilium non bulbosum.*
The yellow Lillie.

2 *Lilium non bulbosum Phæniceum.*
The Day-Lillie.

¶ The description.

1 **T**He yellow Lillie hath very long flaggie leaues, chamfered or channelled, hollow in the midst like a gutter; among the which riseth vp a naked or bare stalke, two cubits high, branched toward the top, with sundry brittle armes or branches, whereon do grow many goodly floures like vnto those of the common white Lillie in shape and proportion, of a shining yellow colour; which being past, there succeed three cornered huskes or cods, full of blacke shining seeds like those of the Peonie. The root consisteth of many knobs or tuberos clogs, proceeding from one head, like those of the white Asphodill or Peonie.

2 The Day-Lillie hath stalkes and leaues like the former. The floures be like the white Lillie in shape, of an Orange tawny colour: of which floures much might be said which I omit. But in briebe, this plant bringeth forth in the morning his bud, which at noone is full blowne, or spread abroad, and the same day in the euening it shuts it selfe, and in a short time after becomes as rotten and stinking as if it had bene trodden in a dunghill a moneth together, in foule and rainie weather: which is the cause that the seed seldome followes, as in the other of his kinde, not bringing forth any at all that I could euer obserue; according to the old prouerbe, Soone ripe, soone rotten. His roots are like the former.

¶ The

¶ The place.

These Lillies do grow in my garden, as also in the gardens of Herbarists, and louers of fine and rare plants; but not wilde in England, as in other countries.

¶ The time.

These Lillies do floure somewhat before the other Lillies, and the yellow Lillie the soonest.

¶ The names.

Diuers do call this kinde of Lillie, *Liliasphodelus*, *Liliago*, and also *Lilium*, but most commonly *Lilium non bulbosum*: In English, Liriconfancie, and yellow Lillie. The old Herbarists name it *Hemerocallis*: for they haue two kindes of *Hemerocallis*; the one a shrub or woody plant, as witnesseth *Theophrastus*, in his sixth booke of the historie of Plants. *Pliny* setteth downe the same shrub among those plants, the leaues whereof onely do serue for garlands.

The other *Hemerocallis* which they set downe, is a Floure which perisheth at night, and buddeth at the Sunne rising, according to *Athenaeus*; and therefore it is fitly called *himerocallis*; that is, Faire or beautifull for a day: and so we in English may rightly terme it the Day-Lillie, or Lillie for a day.

¶ The nature.

The nature is rather referred to the Asphodils than to Lillies.

¶ The vertues.

Dioscorides saith, That the root stamped with honey, and a mother pessarie made thereof with A wooll, and put vp, bringeth forth water and bloud.

The leaues stamped and applied do allay hot swellings in the dugges, after womens trauell in B childe-bearing, and likewise taketh away the inflammation of the eyes.

The roots and the leaues be laid with good successe vpon burnings and scaldings.

C

CHAP. 73. Of Bulbed Floure de-Luce.

¶ 1 *Iris Bulbosa Latifolia.*

Broad leaued Bulbous Floure de-luce;

¶ 2 *Iris Bulbosa Anglica.*

Onion Floure de-Luce.

¶ The

¶ The kinds.

Like as we haue set downe sundry sorts of Floure de-luces, with flaggy leaues, and tuberous or knobby roots, varying very notably in sundry respects, which we haue distinguished in their proper Chapters: it resteth that in like manner we set forth vnto your view certaine bulbous or Onion-rooted Floure de-luces, which in this place do offer themselves vnto our consideration, whereof there be also sundry sorts, sorted into one chapter as followeth.

3 *Iris Bulbosa flore vario.*

Changeable Floure de-luce.

4 *Iris Bulbosa versicolor Polyclonos.*

Many branched changeable Floure de-luce.

¶ The description.

¶ 1 **T**he first of these, whose figure here we giue you vnder the name of *Iris Bulbosa Latifolia*, hath leaues somewhat like those of the Day-Lillie, soft, and somewhat palish Greene, with the vnder sides somewhat whiter; amongst which there riseth vp a stalk bearing at the top thereof a Floure a little in shape different from the formerly described Floure de-luces. The colour thereof is blew; the number of the leaues whereof it consists, nine: three of these are little, and come out at the bottome of the Floure as soone as it is opened; three more are large, and being narrow at their bottome, become broader by little and little, vntill they come to turne downwards, whereas then they are shapen somewhat roundish or obtuse. In the midst of these there runnes vp a yellow variegated line to the place whereas they bend backe. The three other leaues are arched like as in other Floures of this kinde, and diuided at their vpper end, and containe in them three threads of a whitish blew colour.

This is called *Iris Bulbosa Latifolia*, by *Clusius*; and *Hyacinthus Poetarum Latifolius*, by *Lobell*.

It floures in Ianuarie and Februarie, whereas it growes naturally, as it doth in diuers places of Portugall and Spaine. It is a tender plant, and seldome thriues well in our gardens. ¶

2 Onion Floure de-luce hath long narrow blades or leaues, crested, chamfered, or streaked on the backe side as it were welted; below somewhat round, opening it selfe toward the top, yet remaining as it were halfe round, whereby it resembleth an hollow trough or gutter. In the bottome of the hollownesse it tendeth to whitenesse; and among these leaues do rise vp a stalke of a cubit high; at the top whereof groweth a faire blew Floure, not differing in shape from the com-

mon

mon Floure de-luce: the which being past, there come in the place thereof long thicke cods or seed-vessels, wherein is contained yellowish seed of the bignesse of a tare or fitch. The root is round like an Onion, couered ouer with certaine browne skinnies or filmes. Of this kind there are some five or six varieties, caused by the various colours of the Floures.

5 *Iris Bulbosa Flore luteo cum flore & semine.*

Yellow bulbed Floure de-luce in floure and seed.

3 Changeable Floure de-luce hath leaues, stalkes, and Roots like the former, but lesser. The Floure hath likewise the forme of the Floure de-luce, that is to say, it consisteth of sixe greater leaues, and three lesser; the greater leaues fold backward and hang downward, the lesser stand vpright; and in the middle of the leaues there riseth vp a yellow welt, white about the brimmes, and shadowed all ouer with a wash of thinne blew tending to a Watchet colour. Toward the stalke they are stripped ouer with a light purple colour, and likewise amongst the hollow places of those that stand vpright (which cannot be expressed in the figure) there is the same faire purple colour; the smell and sauour very sweet and pleasant. The root is Onion fashion, or bulbous like the other.

‡ 4 There is also another variegated Floure de-luce, much like this last described, in the colour of the Floure; but each plant produceth more branches and Floures, whence it is termed *Iris Bulbosa versicolor polyclonos*, Many-branched changeable Floure de-luce. ‡

5 Of which kinde or sort there is another in my Garden, which I receiued from my Brother *James Garret* Apothecarie, far more beautifull than the last described; the which is dasht ouer, in stead of the blew or watchet colour, with a most pleasant gold yellow colour, of smell exceeding sweet, with bulbed roots like those of the other sort.

6 It is reported, that there is in the garden of the Prince Elector the Lantgraue of Hessen, one of this sort or kinde, with white Floures, the which as yet I haue not seene.

‡ Besides these sorts mentioned by our Author, there are of the narrow leaued bulbous Floure de-luces, some twenty foure or more varieties, which in shape of roots, leaues, and Floures differ very little, or almost nothing at all; so that he which knows one of these may presently know the rest. Wherefore because it is a thing no more pertinent to a generall historie of Plants, to insist vpon these accidentall nicities, than for him that writes a historie of Beasts to describe all the colours, and their mixtures, in Horses, Dogs, and the like; I refer such as are desirous to informe them-

themselues of those varieties, to such as haue onely and purposely treated of Floures and their diuerfities, as *De-Bry*, *Swerts*, and our Countreyman *M. Parkinson*, who in his *Paradisus terrestris*, set forth in English, Anno 1629. hath iudiciously and exactly comprehended all that hath beene deliuered by others in this nature. ‡

‡ 6 *Iris Bulbosa flore cinereo.*

Ash-coloured Floure de-luce.

‡ 7 *Iris Bulbosa flore albido.*

Whitish Floure de-luce.

¶ The place.

The second of these bulbed Floure de-luces growes wilde, or of it selfe, in the corne fields of the West parts of England, as about Bathe and Wells, and those places adiacent: from whence they were first brought into London, where they be naturalised, and encrease in great plenty in our London gardens.

The other sorts do grow naturally in Spaine and Italy wilde, from whence we haue had Plants for our London gardens, whereof they do greatly abound.

¶ The time.

They floure in Iune and Iuly, and seldome after.

¶ The names.

The Bulbed Floure de-luce is called of *Lobelius*, *Iris Bulbosa*, and also *Hyacinthus flore Iridis*: of some, *Hyacinthus Poetarum*; and peradventure it is the same that *Apuleius* mentioneth in the one and twentieth Chapter, saying, That *Iris*, named among the old Writers *Hieris*, may also be called, and not vnproperly, *Hierobulbus*, or *Hieribulbus*: as though you should say, *Iris Bulbosa*, or Bulbed Ireos; vnlesse you would haue *hierobulbos*, called a greater or larger Bulbe: for it is certaine, that great and huge things were called of the Antients, *hier*, or *Sacra*: in English, Holy.

¶ The nature.

The nature of these Bulbed Floure de-luces are referred to the kindes of *Asphodils*.

¶ The vertues.

Take, saith *Apuleius*, of the herbe *Hierobulbus* fix ʒ. Goats suet as much, Oile of *Alcanna* one pound; mix them together, being first stamped in a stone mortar, it taketh away the paine of the Gout.

Moreouer, if a woman do vse to wash her face with the decoction of the root, mixed with the meale of *Lupines*, it forthwith cleanseth away the freckles & morphew, and such like deformities.

Chap.

CHAP. 75. Of Spanish Nut.

1 *Sisyrinchium majus*.
Spanish Nut.2 *Sisyrinchium minus*.
Small Spanish Nut.3 *Iris Tuberosa*. Veluet Floure de-luce.

¶ The description.

1 Spanish Nut hath small grassie leaues like those of the Starres of Bethlem, or *Ornithogalum*; among which riseth vp a small stalke of halfe a foot high, garnished with the like leaues, but shorter. The Floures grow at the top, of a skie colour, in shape resembling the Floure de-luce, or common *Iris*; but the leaues that turne downe are each of them marked with a yellowish spot; they fade quickly, and being past, there succeed small cods with seeds as small as those of Turneps. The root is round, composed of two bulbes, the one lying vpon the other as those of the Corne flag vsually do; and they are couered with a skinne or filme in shape like a Net. The Bulbe is sweet in taste, and may be eaten before any other bulbed Root.

2 There is set forth another of this kinde, somewhat lesser, with Floures that smell sweeter than the former.

3 Veluet Floure de-luce hath many long square leaues, spongeous or full of pith, trailing vpon the ground, in shape like to the leaues of Rushes: among which riseth vp a stalke of a foot high,

high, bearing at the top a Floure like the Floure de-luce. The lower leaues that turne downward are of a perfect blacke colour, soft and smooth as is blacke Velvet; the blacknesse is weltd about with greenish yellow, or as wee terme it a Goose-turd greene; of which colour the vppermost leaues do consist: which being past, there followeth a great knob or crested seed vessell of the bignesse of a mans thumbe, wherein is contained round white seed as bigge as the Fetch or tare. The root consisteth of many knobby bunches like fingers.

¶ The place.

These bastard Kindes of Floure de-luces are strangers in England, except it be among some few diligent Herbarists in London, who haue them in their gardens, where they increase exceedingly, especially the last described, which is said to grow wilde about Constantinople, Morea, and Greece: from whence it hath beene transported into Italy, where it hath beene taken for *Hermodaetylus*, and by some exprest or set forth in writing vnder the title *Hermodaetylus*; whereas in truth it hath no semblance at all with *Hermodaetylus*.

¶ The time.

The wilde or Bastard Floure de-luces do floure from May to the end of Iune.

¶ The names.

1 2 These bulbed bastard Floure de-luces, which we haue Englished Spanish Nuts, are called in Spaine, *Nozelhas*; that is, little Nuts: the lesser sort *Parua Nozelha*, and *Macuca*: wee take it to be that kinde of nourishing Bulbe which is named in Greeke, *μαυλίζιον*: of *Pliny*, *Sisyrinchium*.

‡ 3 Some, as *Vlysses Aldroandus*, would haue this to be *Louchitis Prior*, of *Dioscor.* *Matthiolus* makes it *Hermodaetylus verus*, or the true *Hermodaetylus*: *Dodonæus* and *Lobell* more fitly refer it to the Floure de-luces, and call it *Iris tuberosa*. ‡

¶ The nature and vertues.

Of these Kindes of Floure de-luces there hath beene little or nothing at all left in writing concerning their natures or vertues; only the Spanish nut is eaten at the tables of rich and delicious, nay vitious persons, in fallads or otherwise, to procure lust and lecherie.

CHAP. 76. Of Corne-Flagge.

1 *Gladiolus Narbonensis.*

French Corne-Flag, or Sword-Flag.

2 *Gladiolus Italicus.*

Italian Corne-Flag, or Sword-Flag.

‡ 4 *Gladi.*

‡ 4 *Gladiolus Lacustris.*
Water Sword-Flag.

¶ The description.

1 French Corne-Flagge hath small stiffe leaues, ribbed or chamfered with long nerues or sinewes running through the same, in shape like those of the small Floure deluce, or the blade of a sword, sharpe pointed, of an ouer-worne greene colour, among the which riseth vp a stiffe brittle stalke two cubits high, whereupon doe grow in comely order many faire purple Floures, gaping like those of Snapdragon, or not much differing from the Fox-Gloue, called in Latine *Digitalis*. After them come round knobbie seed-vessels, full of chaffie seed, very light, of a browne reddish colour. The root consisteth of two Bulbes, one set vpon the other; the vppermost whereof in the beginning of the Spring is lesser, and more full of iuice; the lower greater, but more loose and lithie, which a little while after perisheth.

2 Italian Corn-Flag hath long narrow leaues with many ribbes or nerues running through the same; the stalke is stiffe and brittle, whereupon do grow Floures orderly placed vpon one side of the stalke, whereas the precedent hath his floures placed on both the sides of the stalke, in shape and colour like the former, as are also the roots, but seldome seene one aboue another, as in the former.

3 There is a third sort of Corne-Flag which agreeth with the last described in euerie point, saving that the Floures of this are of a pale colour, as it were betweene white, and that which we call Maidens Blush.

‡ 4 This Water Sword-Flag, described by *Clusius* in his *Cur. Post.* hath leaues about a span long, thicke and hollow, with a partition in their middles, like as wee see in the cods of Stocke-Gillouers, and the like: their colour is greene, and taste sweet, so that they are an acceptable food to the wilde Ducks ducking downe to the bottome of the water; for they sometimes lie some ells vnder water: which notwithstanding is ouer-topt by the stalke, which springs vp from among these leaues, and beares Floures of colour white, larger than those of Stock-Gillouers, but in that hollow part that is next the stalke they are of a blewish colour, almost in shape resembling the Floures of the Corne-Flag, yet not absolutely like them. They consist of fve leaues, whereof the two vppermost are reflected towards the stalke; the three other being broader hang downewards. After the floures there follow round pointed vessels filled with red seed. It floures at the end of Iuly.

It was found in some places of West-Friseland, by *Iohn Dortman* a learned Apothecary of Groningen. It growes in waters which haue pure grauell at the bottome, and that bring forth no plant besides.

Clusius, and *Dortman* who sent it him, call it *Gladiolus Lacustris*, or *Stagnalis*. ‡

¶ The place.

These kindes of Corne-Flags grow in medowes, and in earable grounds among corne, in many places of Italy, as also in the parts of France bordering thereunto. Neither are the fields of Austria and Moravia without them, as *Cordus* writeth. We haue great plenty of them in our London Gardens, especially for the garnishing and decking them vp with their seemly Floures.

¶ The time.

They floure from May to the end of Iuly.

¶ The names.

Corne-Flag is called in Greeke *ξίφος*: in Latine, *Gladiolus*; and of some, *Ensis*: of others, *odorator*, and *Gladiolus Segetalis*. *Theophrastus* in his discourse of *Phasganum* maketh it the same with *xiphium*. *Valerius Cordus* calleth Corne-Flag *Victoralis femina*: others, *Victoralis rotunda*, in the Germane Tongue,

Tongue, **Seigwurtz**: yet we must make a difference betweene *Gladiolus* and *Victorialis longa*; for that is a kinde of Garlicke found vpon the highest Alpish mountaines, which is likewise called of the Germanes **Seigwurtz**. The Floures of Corne-Flag are called of the Italians, *Monacuccio*: in English, Corne-Flag, Corne-Sedge, Sword-Flag, Corne Gladin: in French, *Glais*.

¶ *The nature.*

The root of Corne-Flag, as *Galen* saith, is of force to draw, waste, or consume away, and dry, as also of a subtill and digesting qualitie.

¶ *The vertues.*

- A The root stamped with the poudre of Frankincense and wine, and applied, draweth forth splinters and thornes that sticke fast in the flesh.
- B Being stamped with the meale of Darnell and honied water, doth waste and make subtill hard lumps, nodes, and swellings, being emplaistred.
- C Some affirme, that the vpper root prouoketh bodily lust, and the lower causeth barrenesse.
- D The vpper root drunke in water is profitable against that kinde of bursting in children called *Enterocoele*.
- E The root of Corne-Flag stamped with hogs grease and wheaten meale, hath been found by late Practitioners in physicke and Surgerie, to be a certaine and approued remedie against the *Struma Scrophula*, and such like swellings in the throat.
- F The cods with the seed dried and beaten into poudre, and drunk in Goats milke or Asses milke, presently taketh away the paine of the Collicke.

CHAP. 77. Of Starry Hyacinths and their kindes.

1 *Hyacinthus stellatus Fuchsj.*
Starry Iacinth.

2 *Hyacinthus stellaris albicans.*
The white floured starry Iacinth.

¶ *The kindes.*

There be likewise bulbous or Onion rooted plants that do orderly succeed, whereof some are to be eaten, as Onions, Garlicke, Leekes, and Ciuies; notwithstanding I am first to entreat of

of those bulbed roots, whose faire and beautifull Floures are receiued for their grace and ornament in gardens and garlands: the first are the Hyacinths, whereof there is found at this day diuers sorts, differing very notably in many points, as shall be declared in their feuerall descriptions.

‡ 3 *Hyacinthus stellatus bifolius*.
Two-leaved starry Iacinth.

4 *Hyacinthus stellatus Lilifolius cum flore & semine*.
The Lilly leaved starry Iacinth in floure and seed.

‡ 6 *Hyacinthus stellaris Byzantinus*.
The starry Iacinth of Constantinople.

¶ The description.

THe first kinde of Iacynth hath three very fat thicke browne leaues, hollow like a little trough, very brittle, of the length of a finger : among which shoot vp fat, thick brownish stalkes, soft and very tender, and full of iuyce ; whereupon do grow many small blew Floures consisting of six little leaues spread abroad like a starre. The seed is contained in small round bullets, which are so ponderous or heauy that they lie trailing vpon the ground. The root is bulbous or Onion fashion, couered with brownish scales or filmes.

2 There is also a white floured one of this kinde.

3 There is found another of this kinde which seldome or neuer hath more than two leaues. The roots are bulbed like the other. The Floures be whitish, starre-fashion, tending to blewnesse, which I receiued of *Robinus* of Paris.

‡ 8 *Hyacinthus stellaris* Someri.
Somers starry Iacynth.

‡ 9 *Hyacinthus stellatus aestiuus maior*.
The greater starry Summer Iacynth.

4 This kinde of Hyacinth hath many broad leaues spread vpon the ground, like vnto those of Garden Lilly, but shorter. The stalkes do rise out of the middest thereof bare, naked, and very smooth, an handfull high ; at the top whereof do grow small blew floures starre-fashion, very like vnto the precedent. The root is thicke and full of iuyce, compact of many scaly cloues of a yellow colour.

‡ There are some tenne or eleuen varieties of starry Iacynths, besides these two mentioned by our Authour. They differ each from other either in the time of flourishing (some of them flourishing in the Spring, other some in Sommer) in their bignesse, or the colours of their floures. The leaues of most of them are much like to our ordinarie Iacynth, or Hare-bells, and lie spread vpon the ground. Their floures in shape resemble the last described, but are vsually more in number, and somewhat larger. The colour of most of them are blew or purple, one of them excepted, which is of an Ash colour, and is knowne by the name of *Somers* his Iacynth. I thinke it not amisse to giue you their vsuall names, together with some of their figures ; for so you may easily impose them truly vpon the things themselves whensoever you shall see them.

5 *Hyacinthus stellaris Byzantinus nigra radice, flore ceruleo.*

The blew starry Iacynth of Constantinople, with the blacke root.

6 *Hyacinthus stellatus Byzantinus major flore ceruleo.*

The greater blew starry Iacynth of Constantinople.

7 *Hyacinthus stellatus Byzantinus alter flore boraginis.*

The other blew starry Iacynth of Constantinople, with Floures somewhat resembling Borage.

8 *Hyacinthus stellaris aestivus, sine exoticus Someri flore cinereo.*

Ash coloured starry Iacynth, or Somers Iacynth.

beareth a great spoke of faire starry floures, which first begin to open themselves below, and so shew themselves by little and little to the top of the stalke. The usuall sort hereof hath blew or purple floures. There is also a sort hereof which hath flesh-coloured floures, and another with white Floures: This is called *Hyacinthus stellatus Peruanus*, The starry Iacynth of Peru.

10 *Hyacinthus stellatus aestivus minor.*

The lesser starry Summer Iacynth.

9 *Hyacinthus stellatus aestivus major.*

The greater starry Sommer Iacynth.

10 *Hyacinthus stellatus aestivus minor.*

The lesser starry Summer Iacynth.

11 *Hyacinthus stellaris Poreti flore ceruleo strijs purpureis.*

Porets starry Iacynth with blew Floures, hauing purple streakes alongst their middles.

12 *Hyacinthus Hispanicus stellaris flore saturè ceruleo.*

The Spanish starry Iacynth with deepe blew floures.

13 There is another starry Iacynth more large and beautifull than any of these before mentioned. The leaues are broad and not very long, spread vpon the ground, and in the midst of them there riseth vp a stalke which at the top

13 *Hyacinthus Peruanus.*

Hyacinth of Peru,

Those who are studious in varieties of Floures, and require larger descriptions of these, may haue recourse to the Workes of the learned *Carolus Clusius* in Latine, or to *M. Parkinsons* Worke in English, where they may haue full satisfaction. †

¶ The place.

The three first mentioned Plants grow in many places of Germany in woods and mountaines, as *Fuchsius* and *Gesner* do testifie: In Bohemia also vpon diuers bankes that are full of Herbes. In England

England we cherish most of these mentioned in this place, in our gardens, onely for the beauty of their floures.

¶ The time.

The three first begin to floure in the midst of Ianuarie, and bring forth their seed in May. The other floures in the Spring.

¶ The names.

1 The first of these Hyacinths is called *Hyacinthus stellatus*, or *Stellaris Fuchsj*, of the starre-like Floures: *Narcissus ceruleus* Bockij: of some, *Flos Martius stellatus*.

3 This by Lobell is thought to be *Hyacinthus Bisolius*, of Theophrastus: Tragus calls it *Narcissus ceruleus*: and Fuchsius, *Hyacinthus ceruleus minor mas*. Wee may call it in English, The small two leaved starrie Iacinch.

4 The Lilly Hyacinth is called *Hyacinthus Germanicus Liliflorus*, or Germane Hyacinth, taken from the countrey where it naturally groweth wilde.

¶ The vertues.

¶ The faculties of the starry Hyacinths are not written of by any. But the Lilly leaved Iacinch, (which growes naturally in a hill in Aquitaine called *Hos*, where the Herdmen call it *Sarabug*) is said by them to cause the heads of such cattell as feed thereon to swell exceedingly, and then kills them: which shewes it hath a maligne and poysonous qualitie. *Clus.* ¶

CHAP. 78. Of Autumne Hyacinths.

1 *Hyacinthus Autumnalis minor*.
Small Autumne Iacinch.

2 *Hyacinthus Autumnalis major*.
Great Autumne Iacinch.

¶ The description.

1 **A**utumne Iacinch is the least of all the Iacinths: it hath small narrow grassy leaues spread abroad vpon the ground; in the midst whereof springeth vp a small naked stalke an handfull high, set from the middle to the top with many small starre-like blew floures, hauing certaine small loose chiues in the middle. The seed is blacke contained in small huskes: the root is bulbous.

2 The

2 The great Winter Iacynth is like vnto the precedent, in leaues, stalkes, and floures, not differing in any one point but in greatnesse.

† 3 To these I thinke it not amisse to adde another small Hyacinth, more different from these last described in the time of the flourishing, than in shape. The root of it is little, small, white, longish, with a few fibres at the bottome; the leaues are small and long like the last described. The stalke, which is scarce an handfull high, is adorned at the top with three or foure starry floures of a blewish Ash colour, each floure consisting of six little leaues, with six chiues and their pointals, of a darke blew, and a pestill in the midst. It floures in Aprill. †

¶ The place.

† The greater Autumne Iacynth growes not wilde in England, but it is to be found in some gardens.

The first or lesser growes wilde in diuers places of England, as vpon a banke by the Thames side betweene Chelsey and London. †

¶ The time.

They floure in the end of August, and in September, and sometimes after.

¶ The names.

1 The first is called *Hyacinthus Autumnalis minor*, or the lesser Autumne Iacynth, and Winter Iacynth.

2 The second, *Hyacinthus Autumnalis major*, the great Autumne Iacynth, or Winter Iacynth.

3 This is called by Lobell, *Hyacinthus parvulus stellaris vernus*, The small starry Spring Iacynth.

CHAP. 79. Of the English Iacynth, or Hare-Bels.

1 *Hyacinthus Anglicus*.
English Hare-bels.

2 *Hyacinthus albus Anglicus*.
White English Hare-bels

¶ The description.

1 The blew Hare-bels or English Iacynth is very common throughout all England. It hath long narrow leaues leaning towards the ground, among the which spring vp naked

or

or bare stalkes loden with many hollow blew Floures, of a strong sweet smell, somewhat stuffing the head: after which come the coddies or round knobs, containing a great quantitie of small blacke shining seed. The root is bulbous, full of a slimy glewifh juyce, which wil serue to set feathers vpon arrowes in stead of glew, or to paste bookes with: whereof is made the best starch next vnto that of Wake-robin roots.

4 *Hyacinthus Orientalis caruleus.*
The blew Orientall Iacinth.

5 *Hyacinthus Orientalis Polyanthos.*
Many floured Orientall Iacinth.

2 The white English Iacinth is altogether like vnto the precedent, sauing that the leaues hereof are somewhat broader, the Floures more open, and very white of colour.

3 There is found wilde in many places of England, another sort, which hath Floures of a faire carnation colour, which maketh a difference from the other.

† There are also sundry other varieties of this sort, but I thinke it vnnessearie to insist vpon them, their difference is so little, consisting not in their shape, but in the colour of their Floures. †

The blew Hare-bels grow wilde in woods, copses, and in the borders of fields euery where thorow England.

The other two are not so common, yet do they grow in the woods by Colchester in Essex, in the fields and woods by South-fleet, neere vnto Graues-end in Kent, as also in a piece of ground by Canturbury called the Clapper, in the fields by Bathe, about the woods by Warrington in Lancashire, and other places.

¶ The time.

They floure from the beginning of May vnto the end of Iune.

¶ The names.

1 The first of our English Hyacinths is called *Hyacinthus Anglicus*, for that it is thought to grow more plentifully in England than elsewhere; of *Dodonæus*, *Hyacinthus non scriptus*, or the vn-written Iacinth.

2 The second, *Hyacinthus Belgicus candidus*, or the Low Countrey Hyacinth with white Floures.

† 3 This third is called *Hyacinthus Anglicus*, aut *Belgicus Flore incarnato*, Carnation Hare-bels.

† 6 *Hyacinthus*

‡ 6 *Hyacinthus Orientalis polyanthos alter.*
The other many-Floured Oriental Iacynth.

‡ 7 *Hyacinthus Orientalis purpureo rubens.*
Reddish purple Oriental Iacynth.

‡ 8 *Hyacinthus Orientalis albus.*
White Oriental Iacynth.

‡ 9 *Hyacinthus Brumalis.*
Winter Iacynth.

¶ The Description.

4 The Orientall Iacynth hath great leaues, thicke, fat, and full of juyce, deeply hollowed in the middle like a trough: from the middle of those leaues riseth vp a stalke two hands high, bare without leaues, very smooth, soft, and full of juice, loden toward the top with many faire blew Floures, hollow like a bell, greater than the English Iacynth, but otherwise like them. The root is great, bulbous, or Onion fashion, couered with many scaly reddish filmes or pillings, such as couer Onions.

5 The Iacynth with many Floures (for so doth the word *Polyanthos* import) hath very many large and broad leaues, short and very thicke, fat, or full of slimy juyce: from the middle whereof rise vp strong thicke grosse stalkes, bare and naked, set from the middle to the top with many blew or skie coloured Floures growing for the most part vpon one side of the stalke. The root is great, thicke, and full of slimy juyce.

‡ 10 *Hyacinthus Orientalis caule folioso*
Orientall Iacynth with leaues on the stalke.

‡ 11 *Hyacinthus Orientalis flore pleno*.
The double floured Oriental Iacynth.

‡ 6 There is another like the former in each respect, sauing that the floures are wholly white on the inside, and white also on the outside, but three of the out-leaues are of a pale whitish yellow. These floures smell sweet as the former, and the heads wherein the seeds are contained are of a lighter Greene colour. ‡

7 There is come vnto vs from beyond the seas diuers other sorts, whose figures are not extant with vs, of which there is one like vnto the first of these Oriental Iacynths, sauing that the floures thereof are purple coloured, whence it is termed *Hyacinthus purpureo rubeus*.

8 Likewise there is another called *Orientalis albus*, differing also from the others in colour of the floures, for that these are very white, and the others blew.

9 There is another called *Hyacinthus Brumalis*, or winter Iacynth: it is like the others in shape, but differeth in the time of flourishing.

‡ 10 There is another Hyacinth belonging rather to this place than any other, for that in root, leaues, floures, and seeds it resembles the first described Oriental Iacynth; but in one respect it differs not onely from them, but also from all other Iacynths: which is, it hath a leauie stalke, hauing sometimes one, and otherwhiles two narrow long leaues comming forth at the bottome of the

‡ 14 *Hyacinthus obsoleto flore Hispanicus major.*
The greater dusky flowered Spanish Iacynth.

‡ 15 *Hyacinthus minor Hispanicus.*
The lesser Spanish Iacynth.

‡ 16 *Hyacinthus Indicus tuberosus.*
The tuberous rooted Indian Iacynth.

the setting on of the floure. Whereupon *Clusius* calls it *Hyacinthus Orientalis caule folioso*: That is, the Oriental Hyacinth with leaues on the stalke.

¶ Of double flowered Oriental Hyacinths.

Of this kindred there are two or three more varieties, whereof I wil giue you the description of the most notable, and the names of the other two; which, with that I shall deliuer of this, may serue for sufficient description. The first of these (which *Clusius* calls *Hyacinthus Orientalis subvirescente flore*, or, the greenish flowered double Orientall Iacynth) hath leaues, roots, and feeds like vnto the formerly described Oriental Iacynth; but the floures (wherein the difference consists) are at the first, before they be open, Greene, and then on the out side next to the stalke of a whitish blew; and they consist of six leaues whose tips are whitish, yet retaining some manifest greens: then out of the midst of the floure comes forth another floure consisting of three leaues, whitish on their inner side, yet keeping the great veine or streake vpon the outer side, each floure having in the middle a few chiues with blackish pendants. It floures in Aprill.

12 This varietie of the last described is called *Hyacinthus Orientalis flore caruleo pleno*, The double blew Orientall Iacynth.

13 This, *Hyacinthus Orientalis candidissimus flore pleno*, The milke-white double Orientall Iacynth.

14 This, which *Clusius* calls *Hyacinthus obsoletior Hispanicus*, hath leaues somewhat narrower, and more flexible than the *Muscari*, with a white veine running alongst the inside of them: among these leaues there riseth vp a stalke of some foot high, bearing some fiftene or sixtene floures, more or lesse, in shape much like the ordinarie English, consisting of six leaues, three standing much out, and the other three little or nothing. These floures are of a very dusky colour, as it were mixt with purple, yellow, and Greene: they haue no smell. The seed, which is contained in triangular heads, is smooth, blacke, scaly, and round. It floures in Iune.

15 The lesser Spanish Hyacinth hath leaues like the Grape-floure, and small floures shaped like the Orientall Iacynth, some are of colour blew, and other some white. The seeds are contained in three cornered seed-vessels. I haue given the figure of the white and blew together, with their seed-vessels.

16 This Indian Iacynth with the tuberous root (saith *Clusius*) hath many long narrow sharpe pointed leaues spread vpon the ground, being somewhat like to those of Garlicke, and in the midst of these rise vp many round firme stalkes of some two cubits high, and oft times higher, sometimes exceeding the thicknesse of ones little finger; which is the reason that oftentimes, vnlesse they be borne vp by something, they lie along vpon the ground. These stalkes are at certaine spaces ingirt with leaues which end in sharpe points. The tops of these stalkes are adorned with many white floures, somewhat in shape resembling those of the Orientall Iacynth. The roots are knotty or tuberous, with diuers fibres comming out of them. ‡

¶ The place.

These kindes of Iacynths haue beene brought from beyond the Seas, some out of one countrey, and some out of others, especially from the East countries, whereof they tooke their names *Orientalis*.

¶ The time.

They floure from the end of Ianuarie vnto the end of Aprill.

¶ The nature.

The Hyacinths mentioned in this Chapter do lightly cleanse and binde; the seeds are dry in the third degree; but the roots are dry in the first degree, and cold in the second.

¶ The vertues.

- A The Root of Hyacinth boyled in Wine and drunke, stoppeth the belly, prouoketh vrine, and helpeth against the venomous bitings of the field Spider.
- B The seed is of the same vertue, and is of greater force in stopping the laske and bloody flux. Being drunke in wine it preuaileth against the falling sicknesse.
- C The roots, after the opinion of *Dioscorides*, being beaten and applied with white Wine, hinder or keepe backe the growth of haire.
- D ‡ The seed giuen with Southerne-wood in Wine is good against the Iaundice. ‡

CHAP. 80. Of Faire haired Iacynth.

¶ The Description.

1 **T**He Faire haired Iacynth hath long fat leaues, hollowed alongst the inside, trough fashion, as are most of the Hyacinths, of a darke Greene colour tending to rednesse. The stalke riseth out of the midst of the leaues, bare and naked, soft and full of slimie juyce, which are beset round about with many small floures of an ouerborne purple colour: The top of the spike consisteth of a number of faire shining purple floures, in manner of a tuft or bush of haire, whereof it tooke his name *Comosus*, or faire haired. The seed is contained in small bullets, of a shining blacke colour, as are most of those of the Hyacinths. The roots are bulbous or Onion fashion, full of slimy juyce, with some hairy threads fastned vnto their bottome.

2 White haired Iacynth differeth not from the precedent in roots, stalkes, leaues, or seed. The floures hereof are of a darke white colour, with some blacknesse in the hollow part of them, which setteth forth the difference.

3 Of this kinde I receiued another sort from Constantinople, resembling the first hairy Hyacinth very notably: but differeth in that, that this is altogether greater, as well in leaues, roots, and floures, as also is of greater beauty without all comparison.

1 *Hyacinthus comosus.*
Faire haired Iacynth.

2 *Hyacinthus comosus albus.*
White haired Iacynth.

3 *Hyacinthus comosus Bizantinus.*
Faire-haired Iacynth of Constantinople.

5 *Hyacinthus comosus ramosus elegantior.*
Faire curld-haired branched Iacynth.

‡ 4 There are two other more beautifull haired Iacincts nourished in the gardens of our prime Florists. The first of these hath roots and leaues resembling the last described: the stalke commonly riseth to the height of a foot, and it is diuided into many branches on euery side, which are small and threddy; and then at the end as it were of these threddy branches there come forth many smaller threds of a darke purple colour, and these spread and diuaricate themselues diuers wayes, much after the manner of the next described; yet the threds are neither of so pleasing a colour, neither so many in number, nor so finely curled. This is called *Hyacinthus comosus ramosus purpureus*, The faire haired branched Iacincth.

5 This is a most beautiful and elegant plant, and in his leaues and roots he differs little from the last described; but his stalke, which is as high as the former, is diuided into very many slender branches, which subdiuided into great plenty of curled threads variously spread abroad, make a very pleasant shew. The colour also is a light blew, and the floures vsually grow so, that they are most dilated at the bottome, and so straiten by little and little after the manner of a Pyramide. These floures keepe their beautie long, but are succeeded by no seeds that yet could be obserued. This by *Fabius Columna* (who first made mention hereof in writing) is called *Hyacinthus Sannesius paniculosa coma*: By others, *Hyacinthus comosus ramosus elegantior*, The faire curld-haire Iacincth. These floure in May. ‡

6 *Hyacinthus botryoides ceruleus*.
Blew Grape-floure.

7 *Hyacinthus botryoides ceruleus major*.
Great Grape-floure.

6 The small Grape floure hath many long fat and weake leaues trailing vpon the ground, hollow in the middle like a little trough, full of slimie iuyce like the other Iacincts; amongst which come forth thicke soft smooth and weake stalkes, leaning this way and that way, as not able to stand vpright by reason it is surcharged with very heavy floures on his top, consisting of many little bottle-like blew floures, closely thrust or packed together like a bunch of grapes, of a strong smell, yet not vnpleasant, somewhat resembling the sauour of the Orange. The root is round and bulbous, set about with infinite young cloues or roots, whereby it greatly increaseth.

7 The great Grape-floure is very like vnto the smaller of his kinde. The difference consisteth, in that this plant is altogether greater, but the leaues are not so long.

8 The sky-coloured Grape-floure hath a few leanes in respect of the other Grape-floures, the which are shorter, fuller of iuyce, stiffe and vpright, whereas the others traile vpon the ground.

The

The floures grow at the top, thrust or packt together like a bunch of Grapes, of a pleasant bright sky colour, euery little bottle-like floure set about the hollow entrance with small white spots not easie to be perceiued. The roots are like the former.

8 *Hyacinthus Botryoides ceruleus major.*
Great Grape-floure.

9 The white Grape-floure differeth not from the sky-coloured Iacynth, but in colour of the floure: for this Iacynth is of a pleasant white colour tending to yellownes, tipped about the hollow part with White, whiter than White it selfe; otherwise there is no difference.

¶ The Place.

These plants are kept in gardens for the beautie of their floures, wherewith our London gardens do abound.

¶ The Time.

They floure from Februarie to the end of May.

¶ The Names.

The Grape-floure is called *Hyacinthus Botryoides*, and *Hyacinthus Neoticorum Dodonæi*: of some, *Bulbus Esculentus*, *Hyacinthus sylvestris cordi*, *Hyacinthus exiguus Tragi*. Some iudge them to be *Bulbina*, of Pliny.

† The faire haired Iacynth described in the first place is the *Hyacinthus* of *Dioscorides* and the Antients. †

¶ The Nature and Vertues.

† The vertues set downe in the precedent Chapter properly belong to that kinde of *Hyacinth* which is described in the first place in this Chapter.

CHAP. 81. Of *Muscari*, or Musk'd Grape-floure.

¶ The Description.

1 Y Eellow *Muscari* hath five or six long leaues spread vpon the ground, thicke, fat, and full of slimie iuyce, turning and winding themselues crookedly this way & that way, hollowed alongst the middle like a trough, as are those of faire haired Iacynth, which at the first budding or springing vp are of a purplish colour; but being growne to perfection, become of a darke Greene colour: amongst the which leaues rise vp naked, thicke, and fat stalkes, infirme and weake in respect of the thicknesse and greatnesse thereof, lying also vpon the ground as do the leaues; set from the middle to the top on euery side with many yellow floures, euery one made like a small pitcher or little box, with a narrow mouth, exceeding sweet of smell like the fauor of muske, whereof it tooke the name *Muscari*. The seed is inclosed in puffed or blowne vp cods, confusedly made without order, of a fat and spongy substance, wherein is contained round blacke seed. The root is bulbous or onion fashion, whereunto are annexed certaine fat and thicke strings like those of Dogs grasse.

2 Ash-coloured *Muscari* or grape-floure, hath large and fat leaues like the precedent, not differing in any point, sauing that these leaues at their first springing vp are of a pale dusky colour like ashes. The floures are likewise sweet, but of a pale bleake colour, wherein consisteth the difference,

¶ The

1 *Muscari flavum.*

Yellow musked Grape-floure.

*Muscari caulis filiquis onustus.*

The stalke of Muscari hanged with the seed-vessels.

2 *Muscari Clusij.*

Ash-coloured Grape-floure.

¶ *The Place.*

These Plants came from beyond the Thracian Bosphorus, out of Asia, and from about Constantinople, and by the meanes of Friends haue been brought into these parts of Europe, whereof our London gardens are possessed.

¶ *The Time.*

They floure in March and Aprill, and sometimes after.

¶ *The Names.*

They are called generally *Muscari*: In the Turkey Tongue, *Muschoromi*, *Muscurimi*, *Tipcadi*, and *Dipcadi*, of their pleasant sweet smell: Of *Matthiolus*, *Bulbus Vomitorius*. These plants may be referred vnto the Iacinths, whereof vndoubtedly they be kindes.

¶ *The Nature and Vertues.*

There hath not as yet any thing beene touched concerning the nature or vertues of these Plants, onely they are kept and maintained in gardens for the pleasant smell of their floures, but not for their beauty, for that many stinking field floures do in beautie farre surpasse them. But it should seem that *Matthiolus* called them *Vomitorius*, in that he supposed they procure vomiting; which of other Authors hath not bin remembred.

Chap.

CHAP. 82. Of Woolly Bulbus.

Bulbus Eriophorus.
Woolly Iacinth.

¶ The Description.

There hath fallen out to be here inserted a bulbous plant consisting of many Bulbes, which hath passed currant amongst all our late Writers. The which I am to set forth to the view of our Nation, as others have done in sundry languages to theirs, as a kind of the Iacinths, which in roots and leaues it doth very wel resemble; called of the Grecians, *Eriophorus*: in Latine, *Laniferus*, because of his abundance of Wooll-resembling substance, wherewith the whole Plant is in every part full fraught, as well roots, leaues, as stalkes. The leaues are broad, thicke, fat full of iuyce, and of a spider-like web when they be broken. Among these leaues riseth vp a stalke two cubits high, much like vnto the stalke of Squilla or Sea-Onion; and from the middle to the top it is beset round about with many small starre-like blew floures without smell, very like to the floures of Asphodill; beginning to floure at the bottome, and so vpward by degrees, whereby it is long before it hath done flourishing: which floures the learned Physitian of Vienna, *Iohannes Aicholzius*, desired long to see; who brought it first from Constantinople, and planted it in his Garden, where he nourished it tenne yeares with great curiositie: which time being expired, thinking it to be a barren plant, he sent it to *Carolus Clusius*, with whom in some few yeres it did beare such floures as before described, but neuer since to this day. This painefull Herbarist would

gladly haue seene the seed that should succeed these floures; but they being of a nature quickly subiect to perish, decay, and fade, began presently to pine away, leauing onely a few chaffie and idle seed-vessels without fruit. My selfe hath beene possessed with this plant at the least twelue yeares, whereof I haue yearely great encrease of new roots, but I did neuer see any token of budding or flourishing to this day: notwithstanding I shall be content to suffer it in some base place or other of my garden, to stand as the cipher o at the end of the figures, to attend his time and leisure, as those men of famous memorie haue done. Of whose temperature and vertues there hath not any thing beene said, but kept in gardens to the end aforesaid.

CHAP. 83. Of two feigned Plants.

¶ The Description.

I Haue thought it conuenient to conclude this historie of the Hyacinths with these two bulbous Plants, receiued by tradition from others, though generally holden for feigned and adulterine. Their pictures I could willingly haue omitted in this historie, if the curious eye could elsewhere haue found them drawne and described in our English Tongue: but because I finde them in none, I will lay them downe here, to the end that it may serue for excuse to others who shall come after, which list not to describe them, being as I said condemned for feigned and adulterine, nakedly drawne onely. And the first of them is called *Bulbus testaceus*: by others, *Bulbus Bombicinus Commentitius*. The description consisteth of these points, viz. The floures (saith the Author) are no lesse strange than wonderfull. The leaues and roots are like to those of Hyacinths,

cinths, which hath caused it to occupie this place. The floures resemble the Daffodils or Narcissus. The whole plant consisteth of a woolly or flockie matter: which description with the Picture was sent vnto *Dodonaus* by *Iohannes Aicholzius*. It may be that *Aicholzius* receiued instructions from the Indies, of a plant called in Greeke *τελεόδιν*, which groweth in India, whereof *Theophrastus* and *Athenæus* do write in this manner, saying, The floure is like the *Narcissus*, consisting of a flockie or woolly substance, which by him seemeth to be the description of our bombast Iacinth.

1 *Bulbus Bombicinus Commentitius.*
False bumbaste Iacinth.

2 *Tigridis flos.*
The floure of Tygris.

2 The second feigned picture hath beene taken of the Discoverer and others of later time, to be a kinde of Dragons not scene of any that haue written thereof; which hath moued them to thinke it a feigned picture likewise; notwithstanding you shall receiue the description thereof as it hath come to my hands. The root (saith my Author) is bulbous or Onion fashion, outwardly blacke; from the which spring vp long leaues, sharpe pointed, narrow, and of a fresh Greene colour: in the midst of which leaues rise vp naked or bare stalkes, at the top whereof groweth a pleasant yellow floure, stained with many small red spots here and there confusedly cast abroad: and in the midst of the floure thrusteth forth a long red tongue or stile, which in time groweth to be the cod or seed-vessell, crooked or wreathed, wherein is the seed. The vertues and temperature are not to be spoken of, considering that we assuredly perswade our selues that there are no such plants, but meere fictions and deuices, as we terme them, to giue his friend a gudgeon.

‡ Though these two haue beene thought commentitious or feigned, yet *Bauhinus* seemeth to vindicate the latter, and *Iohn Theodore de Bry* in his *Florilegium* hath set it forth. He giues two Figures thereof, this which we here giue you being the one; but the other is farre more elegant, and better resembles a naturall plant. The leaues (as *Bauhine* saith) are like the sword-flag, the root like a lecke, the floures (according to *De Bries* Figure) grow sometimes two or three of a stalke: the floure consists of two leaues, and a long stile or pestill: each of these leaues is diuided into three parts, the vttermost being broad and large, and the innermost much narrower and sharper: the tongue or stile that comes forth of the midst of the floure is long, and at the end diuided into three crooked forked points. All that *De Bry* saith thereof is this; *Flos Tigridis rubet egregie circa medium tamen pallet, albusque est & maculatus; ex Mexico à Casparo Bauhino*. That is; *Flos Tigridis* is wondrous red, yet is it pale and whitish about the middle, and also spotted; it came from about Mexico, I had it from *Caspar Bauhine*. ‡

CHAP. 84. Of Daffodils.

¶ The Kindes.

Daffodill, or *Narcissus*, according to *Dioscorides*, is of two sorts: the floures of both are white, the one hauing in the middle a purple circle or coronet; the other with a yellow cup circle or coronet. Since whose time there hath been sundry others described, as shall be set forth in their proper places.

1 *Narcissus medio purpureus*.
Purple circled Daffodill.

¶ 4 *Narcissus medio croceus serotinus Polyanthos*.
The late many floured Daffodill with the Saffron-coloured middle.

¶ The Description.

1 **T**he first of the Daffodils is that with the purple crowne or circle, hauing small narrow leaues, thicke, fat, and full of slimie iuyce; among the which riseth vp a naked stalke, smooth and hollow, of a foot high, bearing at the top a faire milk-white floure growing forth of a hood or thinne filme, such as the floures of onions are wrapped in: in the midst of which floure is a round circle or small coronet of a yellowish colour, purfled or bordered about the edge of the said ring or circle with a pleasant purple colour; which beeing past, there followeth a thicke knob or button, wherein is contained blacke round seed. The root is white, bulbous or Onion fashion.

2 The second kinde of Daffodill agreeth with the precedent in euery respect, sauing that this Daffodill floureth in the beginning of Februarie, and the other not vntill Aprill, and is somewhat lesser. It is called *Narcissus medio purpureus praecox*; That is, Timely purple ringed Daffodill. The next may haue the addition *praecocior*, More timely: and the last in place, but first in time, *praecocissimus*, Most timely, or very early flourishing Daffodill.

‡ 5 *Narcissus medio-purpureus flore pleno.*
Double floured purple circled Daffodill.

6 *Narcissus minor serotinus.*
The late flowering small Daffodill.

7 *Narcissus medioluteus.*
Primrose Pearles, or the common white Daffodill.

8 *Narcissus medioluteus polyanthos.*
French Daffodill.

9 *Narcissus Pisanus*.
Italian Daffodill.

¶ 11 *Narcissus flore pleno albo*.
The other double white Daffodill.

10 *Narcissus albus multiplex*.
The double white Daffodill of Constantinople.

¶ 12 *Narcissus flore pleno, medio luteo*.
Double white Daffodil with the middle yellow.

3 The third kind of Daffodil with the purple ring or circle in the middle, hath many small narrow leaues, very flat, crookedly bending toward the top, among which riseth vp a slender bare stalke, at whose top doth grow a faire and pleasant floure, like vnto those before described, but lesser, and floureth sooner, wherein consisteth the difference.

‡ There is also another somewhat lesse, and flourishing somewhat earlier than the last described.

4 This in roots, leaues, and stalkes differeth very little from the last mentioned kindes; but it beares many floures vpon one stalke, the out-leaues being like the former, white, but the cup or ring in the middle of a saffron colour, with diuers yellow threds contained therein.

5 To these may be added another mentioned by *Clusius*, which differs from these onely in the floures; for this hath floures consisting of six large leaues fairely spread abroad, within which are other six leaues not so large as the former, and then many other little leaues mixed with threds comming forth of the middle. Now there are purple welts which runne betweene the first and second ranke of leaues, in the floure, and so in the rest. This floures in May; and it is *Narcissus pleno flore quintus*, of *Clusius*. ‡

‡ 13 *Narcissus flore pleno, medio versicolore.*
Double Daffodill with a diuers coloured middle.

14 *Narcissus totus albus.*
Milke white Daffodill.

6 This late flourishing Daffodill hath many fat thicke leaues, full of juice, among the which riseth vp a naked stalke, on the top whereof groweth a faire white floure, hauing in the middle a ring or yellow circle. The seed groweth in knobby seed vessels. The root is bulbous or Onion fashion. It floureth later than the others before described, that is to say, in Aprill and May.

7 The seuenth kinde of Daffodill is that sort of *Narcissus* or *Primerose* peerelesse that is most common in our countrey gardens, generally knowne euery where. It hath long fat and thicke leaues, full of a slimie juice; among which riseth vp a bare thicke stalke, hollow within and full of juice. The floure groweth at the top, of a yellowish white colour, with a yellow crowne or circle in the middle; and floureth in the moneth of Aprill, and sometimes sooner. The root is bulbous fashion.

8 The eighth Daffodill hath many broad and thicke leaues, fat and full of juice, hollow and spongy. The stalkes, floures, and roots are like the former, and differeth in that, that this plant bringeth

bringeth forth many floures vpon one stalk, and the other fewer, and not of so perfect a sweet smell, but more offensive and stuffing the head. It hath this addition, *Polyanthos*, that is, of many floures, wherein especially consisteth the difference.

9 The Italian Daffodill is very like the former, the which to distinguish in words, that they may be knowne one from another, is impossible. Their floures, leaues, and roots are like, sauing that the floures of this are sweeter and more in number.

15 *Narcissus Iuncifolius præcox.*

Rush Daffodill, or *Iunquilia*.

16 *Narcissus Iuncifolius serotinus.*

Late flowering Rush Daffodill.

10 The double white Daffodill of Constantinople was sent into England vnto the right honourable the Lord Treasurer, among other bulbed floures: whose roots when they were planted in our London gardens, did bring forth beautifull floures, very white and double, with some yellownesse mixed in the middle leaues, pleasant and sweet in smell, but since that time we neuer could by any industrie or manuring bring them vnto flourishing againe. So that it should appeare, when they were discharged of that birth or burthen which they had begotten in their owne country, and not finding that matter, soile, or clymate to beget more floures, they remaine euer since barren and fruitlesse. Besides, we found by experience, that those plants which in Autumne did shoot forth leaues, did bring forth no floures at all; and the others that appeared not vntill the Spring, did flourish and beare their floures. The stalks, leaues, and roots are like vnto the other kindes of Daffodils. It is called of the Turks, *Giusl Catamer late*; That is, *Narcissus* with double floures. Notwithstanding we haue receiued from beyond the seas, as well from the Low Countries, as also from France, another sort of greater beautie, which from yeare to yeare doth yeeld forth most pleasant double floures, and great encrease of roots, very like as well in stalkes as other parts of the plant, vnto the other sorts of Daffodils. It differeth onely in the floures, which are very double and thicke thrust together, as are the floures of our double Primrose, hauing in the middle of the floure some few chiues or welts of a bright purple colour, and the other mixed with yellow as aforesaid.

11 This also with double white floures, which *Clusius* sets forth in the sixth place, is of the same kinde with the last described; but it beares but one or two floures vpon a stalke, whereas the other hath many.

12 This, which is *Clusius* his *Narcissus flore pleno* 2. is in roots, leaues, and stalkes very like the

precedent, but the floures are composed of six large white out-leaves; but the middle is filled with many faire yellow lit tle leaues much like to the double yellow wall-floure. They smel sweet like as the last mentioned.

13 This differs from the last mentioned onely in that it is lesse, and that the middle of the floure within the yellow cup is filled with longish narrow little leaues, as it were crossing each other. Their colour is white, but mixed with some Greene on the outside, and yellow on the inside. ‡

14 The milke white Daffodill differeth not from the common white Daffodill, or Primrose peerelesse, in leaues, stalkes, roots, or floures, sauing that the floures of this plant hath not any other colour in the floure but white, whereas all the others are mixed with one colour or other.

‡ 17 *Narcissus juncifolius Roseoluteus.*
Rose or round floured *Iunquilia*.

‡ 18 *Narcissus juncifolius amplo calice.*
White *Iunquilia* with the large cup.

‡ 19 *Narcissus juncifolius reflexus flore albo.*
The white reflex *Iunquilia*.

15 The Rush Daffodill hath long, narrow, and thicke leaues, very smooth and flexible, almost round like Rushes, whereof it tooke his syrnyme *Iuncifolius* or Rushie. It springeth vp in the beginning of Ianuarie, at which time also the floures doe shoot forth their buds at the top of small rushy stalkes, sometimes two, and often more vpon one stalke, made of six small yellow leaues. The cup or crowne in the middle is likewise yellow, in shape resembling the other Daffodills, but smaller, and of a strong sweet smel. The root is bulbed, white within, and couered with a blacke skin or filme.

16 This Rush Daffodil is like vnto the precedent in each respect, sauing that it is altogether lesser, and longer before it come to flourishing. There is also a white floured one of this kinde.

‡ 17 There

‡ 17 There is also another Rush Daffodill or *Iunquilia*, with floures not sharpe pointed, but round with a little cup in the middle: the colour is yellow or else white. This is *Lobels Narcissus juncifolius flore rotunda circinatis roseo*.

18 There is also another *Iunquilia* whose leaues and stalkes are like those of the first described Rushy Daffodill, but the cup in the midst of the floure is much larger. The colour of the floure is commonly white. *Clusius* calls this *Narcissus x juncifolius amplo calice*.

19 There are three or foure reflex *Iunquilia's*, whose cups hang downe, and the fixe incompassing leaues turne vp or backe, whence they take their names. The floures of the first are yellow; those of the second all white, the cup of the third is yellow, and the reflex leaues white. The fourth hath a white cup, and yellow reflex leaues. This seemes to be *Lobels Narcissus montanus minimus coronatus*.

20 This is like to the ordinarie lesser *Iunquilia*, but that the floures are very double, consisting of many long and large leaues mixed together; the shorter leaues are obtuse, as if they were clipt off. They are wholly yellow. ‡

‡ 19 *Narcissus juncifolius reflexus minor*.
The lesser reflex *Iunquilia*.

‡ 20 *Narcissus juncifolius multiplex*.
The double *Iunquilia*.

21 The Persian Daffodill hath no stalke at all, but onely a small and tender foot stalke of an inch high, such as the Saffron floure hath: vpon which short and tender stalk doth stand a yellowish floure consisting of six small leaues; of which the three innermost are narrower than those on the out side. In the middle of the floure doth grow forth a long stile or pointall, set about with many small chiues or threds. The whole floure is of an vnpleasant smel, much like to Poppy. The leaues rise vp a little before the floure, long, smooth, and shining. The root is bulbed, thicke, and grosse, blackish on the out side, and pale within, with some threds hanging at the lower part.

22 The Autumne Daffodill bringeth forth long smooth, glittering leaues, of a deepe Greene colour: among which riseth vp a short stalke, bearing at the top one floure and no more, resembling the floure of Mead Saffron or common Saffron, consisting of six leaues of a bright shining yellow colour; in the middle whereof stand six threds or chiues, and also a pestell or clapper yellow likewise. The root is thicke and grosse like vnto the precedent.

‡ 23 To this last may be adioyned another which in shape somewhat resembles it. The leaues

leaves are smooth, Greene, growing straight vp, and almost a fingers breadth; among which riseth vp a stalke a little more than halfe a foot in height, at the top of which groweth forth a yellow floure not much vnlike that of the last described Autumne Narcisse: it consisteth of fixe leaues some inch and halfe in length, and some halfe inch broad, sharpe pointed, the three inner leaues being somewhat longer than the outer. There grow forth out of the middest of the floure three whitish chiues, tipt with yellow, and a pestell in the midst of them longer than any of them. The root consists of many coats, with fibres comming forth of the bottome thereof like others of this kinde. It floures in Februarie. ‡

21 *Narcissus Persicus.*
The Persian Daffodill.

22 *Narcissus Autumnalis major.*
The great Winter Daffodill.

24 Small Winter Daffodill hath a bulbous root, much like vnto the root of Rush Daffodil, but lesser: from the which riseth vp a naked stalke without leaues, on the top whereof groweth a small white floure with a yellow circle in the middle, sweet in smell, something stuffing the head as do the other Daffodils.

¶ The Place.

The Daffodils with purple coronets do grow wilde in sundry places of France, chiefly in Bourgondie, and in Suitzerland in meadows.

The Rush Daffodill groweth wilde in sundry places of Spaine, among grasse and other herbes. *Dioscorides* saith, That they be especially found vpon mountaines. *Theocritus* affirmeth the Daffodils to grow in meadows, in his nineteenth *Eidyl.* or twentieth, according to some editions: where he writeth, That the faire Ladie *Europa* entring with her Nymphs into the meadows, did gather the sweet smelling Daffodils; in these Verses:

And, here, &c.

Which we may English thus:

But when the Girles were come into
The meadows flourishing all in sight,
That Wench with these, this Wench with those
Trim floures, themselves did all delight:
She with the Narcisse good in sent,
And she with Hyacinths content.

But

But it is not greatly to our purpose particularly to seeke out their places of growing wilde, seeing that we haue them all and euery of them in our London gardens, in great abundance. The common white Daffodill groweth wilde in fields and sides of Woods in the West parts of England.

¶ *The Time.*

They floure for the most part in the Spring, that is, from the beginning of Februarie vnto the end of Aprill.

The Persian and Winter Daffodils do floure in September and October.

‡ 23 *Narcissus vernus praecior flauo flore.*
The timely Spring yellow Daffodill.

24 *Narcissus Autumnalis minor.*
Small Winter Daffodill.

¶ *The Names.*

Although their names be set forth in their seuerall titles, which may serue for their appellations and distinctions; notwithstanding it shall not be impertinent to adde a supply of names, as also the cause why they are so called.

The Persian Daffodill is called in the Sclauonian or Turkish tongue, *Zaremcada Persiana*, and *Zaremcatta*, as for the most part all other sorts of Daffodils are. Notwithstanding the double flowered Daffodill they name *Giul catamer lala*: Which name they generally giue vnto all double floures.

The common white Daffodil with the yellow circle they call *Serin Cade*, that is to say, the kings Chalice; and *Deue bohini*, which is to say, Camels necke, or as we do say of a thing with long spindle shennes, Long-shankes, vrging it from the long necke of the floure.

The Rush Daffodill is called of some *Ionquillas*, of the similitude the leaues haue with Rushes. Of *Dioscorides*, *Bulbus Vomitorius*, or Vomiting Bulbe, according to *Dodonaeus*.

Generally all the kindes are comprehended vnder this name *Narcissus*, called of the Grecians *Nayxar*: in Dutch, *Narcissen*: in Spanish, *Iennetten*: in English, Daffodilly, Daffodowndilly, and Primerose peerelesse.

Sophocles nameth them the garland of the infernal gods, because they that are departed and dulled with death, should worthily be crowned with a dulling floure.

Of the first and second Daffodill *Ouid* hath made mention in the third booke of his *Metamorphosis*,

phosis, where hee describeth the transformation of the faire boy *Narcissus* into a floure of his own name; saying,

*Nusquam corpus erat, croceum pro corpore florem
Inueniunt, folijs medium cingentibus albis.*

But as for body none remain'd; in stead whereof they found

A yellow floure, with milke white leaues ingirting of it round.

Pliny and *Plutarch* affirme, as partly hath been touched before, that their narcoticke quality was the very cause of the name *Narcissus*, that is, a qualitie causing sleepeinesse; which in Greekes is *νάρκη*: or of the fish *Torpedo*, called in Greeke *νάρκη*, which benummeth the hands of them that touch him, as being hurtfull to the sinewes; and bringeth dulnesse to the head, which properly belongeth to the *Narcisses*, whose sinell causeth drowinesse.

¶ *The Nature.*

The roots of *Narcissus* are hot and dry in the second degree.

¶ *The Vertues.*

A *Galen* saith, That the roots of *Narcissus* haue such wonderfull qualities in drying, that they con-found and glew together very great wounds, yea and such gashes or cuts as happen about the veins, sinewes, and tendons. They haue also a certaine cleansing and attracting facultie.

B The roots of *Narcissus* stamped with honey, and applied plaister-wise, helpeth them that are burned with fire, and ioyneth together sinewes that are cut in sunder.

C Being vsed in manner afore said, it helpeth the great wrenches of the ankles, the aches and pains of the ioynets.

D The same applied with hony and nettle seed helpeth Sun burning and the morpew.

E The same stamped with barrowes grease and leuen of rie bread, hastneth to maturation hard impostumes, which are not easily brought to ripenesse.

F Being stamped with the meale of Darnell and honey, it draweth forth thornes and stubs out of any part of the body.

G The root, by the experiment of *Apuleius*, stamped and strained, and giuen in drinke, helpeth the cough and collicke, and those that be entred into a ptiicke.

H The roots whether they be eaten or drunken, do moue vomit, and being mingled with Vineger and nettle seed, taketh away lentiles and spots in the face.

CHAP. 85. Of the Bastard Daffodill.

¶ *The Description.*

1 **T**He double yellow Daffodill hath small smooth narrow leaues, of a darke greene colour; among which riseth vp a naked hollow stalke of two hands high, bearing at the top a faire and beautifull yellow floure, of a pleasant sweet smell: it sheddeth his floure, but there followeth no seed at all, as it hapneth in many other double floures. The root is small, bulbous, or onion fashion, like vnto the other Daffodils, but much smaller.

2 The common yellow Daffodill or Daffodowndilly is so well knowne to all that it needeth no description.

3 We haue in our London gardens another sort of this common kind, which naturally groweth in Spaine, very like vnto our best knowne Daffodill in shape and proportion, but altogether fairer, greater, and lasteth longer before the floure doth fall or fade.

4 This hath leaues and roots like the last described, but somewhat lesse; the floure also is in shape not vnlike that of the precedent, but lesse, growing vpon a weake slender greene stalke, of some fingers length: the seed is contained in three cornered, yet almost round heads. The root is small, bulbous, and blacke on the outside.

5 This hath a longish bulbous root, somewhat blacke on the outside, from which rise vp leaues not so long nor broad as those of the last described: in the midst of these leaues springs vp a stalk, slender, and some halfe foot in height, at the top of which, forth of a whitish filme, breakes forth a floure like in shape to the common Daffodill, but lesse, and wholly white, with the brim of the cup weltd about. It floures in Aprill, and ripens the seeds in Iune.

¶ *The Place.*

The double yellow Daffodill I receiued from *Robinus* of Paris, which he procured by meanes of friends from Orleance and other parts of France.

1 *Pseudonarcissus luteus multiplex.*
Double yellow Daffodill.

2 *Pseudonarcissus Anglicus.*
Common yellow Daffodill.

3 *Pseudonarcissus Hispanicus.*
The Spanish yellow Daffodill.

4 *Pseudonarcissus minor Hispanicus.*
The lesser Spanish Daffodill.

‡ 5 *Pseudonarcissus albo flore.*
White Bastard Daffodill.

The yellow English Daffodill groweth almost euerie where through England. The yellow Spanish Daffodill doth likewise decke vp our London Gardens, where they increase infinitely.

¶ The time.

The double Daffodill sendeth forth his leaues in the beginning of Februarie, and his floures in April.

¶ The Names.

The first is called *Pseudonarcissus multiplex*, and *Narcissus luteus Polyanthos*: in English, the double yellow Daffodill, or *Narcissus*.

The common sort are called in Dutch, *Geel Spoorckel bloemen*: in English, yellow Daffodill, Daffodilly, and Daffodowndilly.

¶ The Temperature.

The temperature is referred vnto the kindes of *Narcissus*.

¶ The Vertues.

Touching the vertues hereof, it is found out by experiment of some of the later Physitians, that the decoction of the roots of this yellow Daffodill do purge by siege tough and flegmaticke humors, and also waterish, and is good for them that are full of raw humors, especially if there be added thereto a little anise seed and ginger, which will correct the churlish hardnesse of the working.

The distilled water of Daffodils doth cure the Palsie, if the Patient be bathed and rubbed with the sayd liquor by the fire. It hath beene proued by an especiall and trusty Friend of myne, a man learned, and a diligent searcher of nature, *M. Nicholas Belsom*, sometimes of Kings Colledge in Cambridge.

CHAP. 86. Of diuers other Daffodils or Narcisses.

‡ There are besides the forementioned sorts of Daffodils, sundry others, some of which may be referred to them; other some not. I do not intend an exact enumeration of them, it being a thing not so fitting for a historie of Plants, as for a Florilegie, or booke of floures. Now those that require all their figures, and more exact descriptions, may finde satisfaction in the late Worke of my kinde friend *M. John Parkinson*, which is intituled *Paradisus terrestris*: for in other Florilegies, as in that of *De Bry*, *Swertz*, &c. you haue barely the names and figures, but in this are both figures, and an exact historie or declaration of them. Therefore I in this place will but onely briefly describe and name some of the rarest that are preferred in our choice gardens, and a few others whereof yet they are not posselt.

¶ The Descriptions.

1 The first of these, which for the largenesse is called *Nonpareille*, hath long broad leaues and roots like the other Daffodils. The floure consists of six very large leaues of a pale yellow colour, with a very large cup, but not very long: this cup is yellower than the incompassing leaues, narrower also at the bottome than at the top, and vneuenly cut about the edges. This is called *Narcissus omnium maximus*, or *Nonpareille*; the figure well expresth the floure, but that it is somewhat too little. There is a varietie of this with the open leaues & cup both yellow, which makes the difference. There is also another *Nonpareille*, whose floures are all white, and the six leaues that stand spread abroad are vsually a little folded, or turned in at their ends.

2 Besides these former there are foure or fve double yellow Daffodils, which I cannot passe ouer in silence; the first is that, which is vulgarly amongst Florists knowne by the name of *Robines Narcisse*

Narcisse; and it may be was the same our Author in the precedent chapter mentions he received from *Robine*; but he giuing the figure of another, and a description not well fitting this, I can affirme nothing of certaintie. This double Narcisse of *Robine* growes with a stalke some foot in height, and the floure is very double, of a pale yellow colour, and it seemes commonly to diuide it selfe into some six partitions, the leaues of the floure lying one vpon another euen to the middle of the floure. This may be called *Narcissus pallidus multiplex Robini*, *Robines* double pale Narcisse.

† 1 *Narcissus omnium maximus.*
The Nonpareille Daffodill.

† 3 *Pseudonarcissus flore pleno.*
The double yellow Daffodill.

3 The next to this is that which from our Author, the first obseruer thereof, is vulgarly called *Gerrards* Narcisse: the leaues and root do not much differ from the ordinarie Daffodill; the stalk is scarce a foot high, bearing at the top thereof a floure very double; the fixe outmost leaues are of the same yellow colour as the ordinarie one is; those that are next are commonly as deepe as the tube or trunke of the single one, and amongst them are mixed also other paler coloured leaues, with some green stripes here & there among those leaues: these floures are somtimes all contained in a trunk like that of the single one, the fixe out-leaues excepted: other whiles this inclosure is broke, and then the floure stands faire open like as that of the last described. *Lobel* in the second part of his *Aduersaria* tells, That our Author Master *Gerrard* found this in Wiltshire, growing in the garden of a poore old woman, in which place formerly a Cunning man (as they vulgarly terme him) had dwelt.

This may be called in Latine, according to the English, *Narcissus multiplex Gerardi*, *Gerrards* double Narcisse.

The figure we here giue you is expressed somewhat too tall, and the floure is not altogether so double as it ought to be.

4 There are also two or three double yellow Daffodils yet remaining. The first of these is called *Wilmots* Narcisse, (from Master *Wilmot*, late of Bow) and this hath a very faire double & large yellow floure composed of deeper and paler yellow leaues orderly mixed.

The second (which is called *Tradescants* Narcisse, from Master *Iohn Tradescant* of South-Lambeth) is the largest and stateliest of all the rest; in the largenesse of the floures it exceeds *Wilmots*, which otherwise it much resembles; some of the leaues whereof the floure consists are sharp poin-

This

red, and these are of a paler colour; other some are much more obtuse, and these are of a deeper and fairer yellow.

This may be called *Narcissus Rosens* Tradescanti, *Tradescanti* Rose Daffodill.

The third M. *Parkinson* challengeth to himselfe; which is a floure to be respected, not so much for the beautie, as for the various compofure thereof, for some of the leaues are long and sharpe pointed, others obtuse and curled, a third sort long and narrow, and vsually some few hollow, and in shape resembling a horne; the vtmost leaues are commonly streaked, and of a yellowish green; the next to them fold themselves vp ronnd, and are vsually yellow, yet sometimes they are edged with Greene. There is a deepe yellow pestill diuided into three parts, vsually in the midst of this floure. It floures in the end of March. I vsually (before M. *Parkinson* set forth his Florilegie, or garden of floures) called this floure *Narcissus polimorphus*, by reason of its various shape and colour: but since I thinke it fitter to giue it to the Author, and terme it *Narcissus multiplex varius* Parkinsoni, *Parkinsons* various double Narcisse.

‡ 5 *Narcissus Iacobæus Indicus*.
The Indian or Iacobæan Narcisse.

‡ 6 *Narcissus juncifolius montanus minimus*.
The least Rush-leaued Mountaine Narcisse.

5 Now come I to treat of some more rarely to be found in our gardens, if at all. That which takes the first place is by *Clusius* called *Narcissus Iacobæus Indicus*, the Indian or Iacobæan Narcisse. The root hereof is much like to an ordinarie onion, the leaues are broad like the other Narcisses, the stalke is smooth, round, hollow, and without knots, at the top whereof, out of a certaine skinny huske comes forth a faire red floure like that of the floueing Indian reed, but that the leaues of this are somewhat larger, and it hath six chiues or threds in the middle thereof of the same colour as the floure, and they are adorned with brownish pendants; in the midst of these there stands a little farther out than the rest, a three forked stile, vnder which succeeds a triangular head, after the falling of the floure.

This giues his floure in Iune or Iuly.

6 This *Lobell* calls *Narcissus montanus juncifolius minimus*, The least Rush-leaued mountaine Narcisse. The leaues of this are like the *Iunquilia*; the stalke is short, the floure yellow, with the six winged leaues small and paler coloured, the cup open and large to the bignesse of the floure.

7 This

7 This also is much like the former; but the fix incompassing leaues are of a greenish faint yellow colour; the cup is indented, or vnequally curled about the edges, but yellow like the precedent. *Lobell* calls this *Narcissus montanus juncifolius flore fimbriato*, The mountaine Rush-leaued Narcisse with an indented or curled cup.

‡ 7 *Narcissus montanus juncifolius flore fimbriato*.

The mountaine Rush leaued Narcisse with an indented or curled cup.

‡ 8 *Narcissus omnium minimus montanus albus*.

The least mountaine white Narcisse.

8 The leaues of this are as small as the Autumne Iacinth, the stalke some handfull high, and the floure like the last described, but it is of a whitish colour. *Lobell* calls this last described, *Narcissus omnium minimus montanus albus*, The least mountaine white Narcisse. These three last vsually floure in Februarie. ‡

CHAP. 87. Of Tulipa, or the Dalmatian Cap.

¶ The Kindes.

Tulipa, or the Dalmatian Cap is a strange and forreine floure, one of the number of the bulb bed floures, whereof there be sundry sorts, some greater, some lesser, with which all studious and painefull Herbarists desire to be better acquainted, because of that excellent diuersitie of most braue floures which it beareth. Of this there be two chiefe and generall kinds, viz. *Praecox* and *Serotina*; the one doth beare his floures timely, the other later. To these two we will adde another sort called *Media*, flowering betweene both the others. And from these three sorts, as from their heads, all other kinds do proceed, which are almost infinite in number. Notwithstanding, my louing friend M. *James Garret*, a curious searcher of Simples, and learned Apothecary of London, hath vndertaken to finde out, if it were possible, the infinite sorts, by diligent sowing of their seeds, and by planting those of his owne propagation, and by others receiued from his Friends beyond

1 *Tulipa Bononiensis.*
Italian Tulipa.

2 *Tulipa Narbonensis.*
French Tulipa.

3 *Tulipa praecox tota lutea.*
Timely flowering Tulipa.

4 *Tulipa Coccinea serotina.*
Late flowering Tulipa.

5 *Tulipa*

5 *Tulipa media sanguinea albis oris.*
Apple bloome Tulipa.

7 *Tulipa bulbifera.*
Bulbous stalked Tulipa.

6 *Tulipa Candida suave rubemibis oris.*
Blush coloured Tulipa.

8 *Tulipa sanguinea luteo fundo.*
The bloud-red Tulip with a yellow bottome.

beyond the seas for the space of twenty yeares, not being yet able to attaine to the end of his trauell, for that each new yeare bringeth forth new plants of fundry colours, not before seene : all which to describe particularly were to roll *Sisiphus* stone, or number the sands. So that it shall suffice to speake of and describe a few, referring the rest to some that meane to write of *Tulipa* a particular volume.

‡ 9 *Tulipa purpurea*.
The purple Tulip.

‡ 10 *Tulipa rubra amethystina*.
The bright red Tulip.

¶ The Description.

1 **T**he *Tulipa* of Bolonia hath fat, thicke, and grosse leaues, hollow, furrowed or chanelled, bending a little backward, and as it were folded together : which at their first comming vp seeme to be of a reddish colour, and being thoroughly growne turne into a whitish Greene. In the midst of those leaues riseth vp a naked fat stalke a foot high, or something more, on the top whereof standeth one or two yellow floures, sometimes three or more, consisting of six small leaues, after a sort like to a deepe wide open cup, narrow aboue, and wide in the bottome. After it hath bene some few dayes floured, the points and brims of the floure turne backward, like a Dalmatian or Turkish cap, called *Tulipan*, *Tolepan*, *Turban*, and *Tursan*, whereof it tooke his name. The chiues or threads in the middle of the floures be sometimes yellow, otherwhiles blackish or purplish, but commonly of one ouer-worne colour or other, Nature seeming to play more with this floure than with any other that I do know. This floure is of a reasonable pleasant smell, and the other of his kinde haue little or no smell at all. The seed is flat, smooth, shining, and of a gristly substance. The root is bulbous, and very like to a common onion of Saint Omers.

2 The French *Tulipa* agreeth with the former, except in the blacke bottome which this hath in the middle of the floure, and is not so sweet of smell, which setteth forth the difference.

3 The yellow *Tulipa* that floureth timely hath thicke and grosse leaues full of iuyce, long, hollow, or gutter fashion, set about a tender stalke, at the top whereof doth grow a faire and pleasant shining yellow floure, consisting of six small leaues without smell. The root is bulbous or like an onion.

† 11 *Tulipa flore albo strijs pur-*
pureis.

The white Tulip with pur-
ple streakes.

† 12 *Tulipa flore albo oris dilute rubentibus.*

The white Tulip with light red edges.

† 13 *Tulipa flore pallido.* The straw-coloured Tulip.

† 14 *Tulipa flammea strijs flavescentibus.*

The flame coloured Tulip with yellowish streakes.

† 16 *Tulipa serotina polyclados major flo-*
flavo fundo nigro, Clusij.

Clusius his greater many branched Tulip
with a yellow floure, and blacke bot-
tome.

M 3

† 17 *Tulipa*

† 15 *Tulipa polyclonos minor serotina flore rubro vel flavo, Clusij.*
The lesser many-branched late Tulip of Clusius, with red, or
else yellow floures.

- ‡ 17 *Tulipa pumilio obscure rubens oris viridibus.*
The dwarfe Tulip with darke red floures edged with greene.
‡ 18 *Tulipa pumilio flore purpurascenti intus candido.*
The Dwarfe Tulip with a purplish floure, white within.

- ‡ 19 *Tulipa pumilio lutea.*
The yellow Dwarfe Tulip.

- ‡ 21 *Tulipa aurea oris rubentibus.*
The gold yellow with red edges.

- ‡ 20 *Tulipa Persica flore rubro, oris albidis elegans.*

The pretty Persian Tulip hauing a red floure with whitish edges.

4 The fourth kinde of Tulipa, that floureth later, hath leaues, stalks, and roots like vnto the precedent. The floures hereof be of a skarlet colour, weltd or bordered about the edges with red. The middle part is like vnto a hart tending to whitenesse, spotted in the same whitenes with red speckles or spots. The seed is contained in square cods, flat, tough, and sinewie.

‡ 22 *Tulipa miniata*.
The Vermilion Tulip.

‡ 23 *Tulipa albo & rubro striatus*.
The white and red striped Tulip.

5 The fift sort of Tulipa, which is neither of the timely ones, nor of the later flourishing sort, but one that buddeth forth his most beautifull floures betweene both. It agreeth with the last described Tulipa, in leaues, stalkes, roots, and seed, but differeth in floures. The floure consisteth of six small leaues ioyned together at the bottome: the middle of which leaues are of a pleasant bloody colour, the edges be bordered with white, and the bottome next vnto the stalke is likewise white; the whole floure resembling in colour the blossomes of an Apple tree.

6 The sixth hath leaues, roots, stalkes, and seed like vnto the former, but much greater in euery point. The floures hereof are white, dasht about the brimmes or edges with a red or blush colour. The middle part is stripped confusedly with the same mixture, wherein is the difference.

7 *Carolus Clusius* setteth forth in his Pannonicke historie a kinde of Tulipa that beareth faire red floures, blacke in the bottome, with a pestell in the middle of an ouer-worne greenish colour; of which sort there happeneth some to haue yellow floures, agreeing with the others before touched: but this bringeth forth encrease of root in the bosome of his lowest leafe next to the stalke, contrarie to all the other kindes of Tulipa.

8 *Lobelius* in his learned Obseruations hath set forth many other sorts; one he calleth *Tulipa Chalcedonica*, or the Turkey Tulipa, saying it is the least of the small kindes or Dwarf Tulipa's, whose floure is of a sanguine red colour, vpon a yellow ground, agreeing with the others in roote, leafe, and stalke.

9 He hath likewise set forth another; his floure is like the Lilly in proportion, but in colour of a fine purple.

10 We may also behold another sort altogether greater than any of the rest, whose floure is in colour like the stone called *Amethyst*, not vnlike to the floures of Peonie.

11 We haue likewise another of greater beauty, and very much desired of all, with white floures dasht on the backside, with a light wash of watchet colour.

12 There

‡ 24 *Tulipa luteo & rubro striatus.*
The red and yellow Fooles coat.

‡ 26 *Tulipa rubra oris pallidis.*
The red Tulip with pale edges.

‡ 25 *Tulipa flore coloris sulphurei.*
The sulphur-coloured Tulip.

12 There is another also in our London gardens, of a snow white colour; the edges slightly washt over with a little of that we call blush colour.

13 We have another like the former, saving that his floure is of a straw colour.

14 There is another to be seene with a floure mixed with streaks of red and yellow, resembling a flame of fire, wherupon we have called it Flam-bant.

There be likewise so many more differing so notably in colour of their floures, although in leaues, stalke, and roots for the most part one like another, that (as I said before) to speake of them severally would require a peculiar volume.

‡ Therefore not to trouble you any further, I have giuen you onely the figures and names of the notablest differences which are in shape; as, the dwarfe Tulipa's, and the branched ones, together with the colour of their floures, contained in their titles, that you need not far to seeke it. ‡

There be a sort greater than the rest, which in forme are like; the leaues whereof are thicke, long, broad, now and then somewhat folded in the edges; in the midst whereof doth rise vp a stalk a foot high, or something higher, vpon which standeth onely one floure bolt vp-right, consisting of six leaues, after a sort like to a deepe wide cup of this forme, viz. the bottome turned vpwards, with threads

threads or chiues in the middle, of the colour of Saffron. The colour of the floure is sometimes yellow, sometimes white, now and then as it were of a light purple, and many times red; and in this there is no small varieties of colours, for the edges of the leaues, and oftentimes the nailes or lower part of the leaues are now & then otherwise coloured than the leaues themselves, and many times there doth runne all along these streakes some other colours. They haue no smell at all that can be perceiued. The roots of these are likewise bulbed, or Onion fashion; euery of the which to set forth seuerally would trouble the writer, and wearie the Reader, so that, what hath bin said shall suffice touching the description of Tulipa's. ‡ True it is that our Author here affirms, The varieties of these floures are so infinite, that it would both tyre the Writer and Reader to recount them. Yet for that some are more in loue with floures than with Plants in generall, I haue thought good to direct them where they may finde somewhat more at large of this Plant: Let such therefore as desire further satisfaction herein haue recourse to the Florilegies of *De Bry*, *Swerts*, *Robin*, or to *M. Parkinson*, who hath not onely largely treated of the floures in particular, but also of the ordering of them. ‡

‡ 27 *Tulipa lutea serotina.*

The late-flouring yellow Tulip.

‡ 28 *Tulipa serotina lutea guttis sanguineis fundo nigro.*

The late Yellow with sanguine spots and a blacke bottome.

¶ The Place.

Tulipa groweth wilde in Thracia, Cappadocia, and Italy; in Bizantia about Constantinople, at Tripolis and Alepo in Syria. They are now common in all the gardens of such as affect floures, all ouer England.

¶ The Time.

They floure from the end of Februarie vnto the beginning of May, and somewhat after; although *Augerius Busbecquius* in his journey to Constantinople, saw between Hadrianople and Constantinople, great abundance of them in floure euery where, euen in the middle of Winter, in the moneth of Ianuarie, which that warme and temperate climate may seeme to performe.

¶ The

The Names.

The later Herbarists by a Turkish and strange name call it *Tulipa*, of the Dalmatian Cap called *Tulipa*, the forme whereof, the floure when it is open seemeth to represent.

It is called in English after the Turkish name *Tulipa*, or it may be called *Dalmatian Cap*, or the *Turkes Cap*. What name the antient Writers gaue it is not certainly knowne. A man might suspect it to be *ποτιδ*, if it were a Bulbe that might be eaten, and were of force to make milke cruddy; for *Theophrastus* reckoneth it among those Bulbes that may be eaten: and it is an herbe, as *Hesychius* saith, wherewith milke is crudded. *Conradus Gesnerus* and diuers others haue taken *Tulipa* to be that *Satyrium* which is fynamed *Erythronium*, because one kinde hath a red floure; or altogether a certaine kinde of *Satyrium*: with which it doth agree reasonable well, if in *Dioscorides* his description we may in stead of *λευκοστέριον*, reade *κρυσσοστέριον* or *λειβροστέριον*; for such mistakes are frequent in antient and moderne Authors, both in writing and printing. In the Turkey Tongue it is called *Café lalé*, *Canale lalé*, and likewise *Turban* and *Turfan*, of the Turks Cap so called, as before said of *Lobelius*.

‡ 29 *Tulipa Holias alba strijs & punctis sanguineis.*

The white Holias with sanguine spots and streakes.

‡ 30 *Tulipa media satyre purpurea fundo subcaeruleo.*

A middle Tulip of a deepe Purple colour with a blewish bottome.

‡ I do verily thinke that these are the *κροκω*, the Lillies of the field mentioned by our Sauour, *Mat. 6. 28, 29*. for he saith, That *Solomon* in all his royaltie was not arayed like one of these. The reasons that induce me to thinke thus are these: First, their shape; for their floures resemble Lillies, and in these places whereas our Sauour was conuerfant they grow wilde in the fields. Secondly, the infinite varietie of colour, which is to be found more in this than any other sort of floure: and thirdly, the wondrous beautie and mixtures of these floures. This is my opinion, and these my reasons, which any may either approue of or gainsay as he shall thinke good. ‡

¶ *The Temperature and Vertues.*

There hath not beene any thing set downe of the antient or later Writers as touching the Nature or Vertues of the *Tulipa*'s, but they are esteemed especially for the beauty of their floures.

‡ The

‡ The roots preferued with sugar, or otherwise dressed, may be eaten, and are no vnpleasant A nor any way offensive meat, but rather good and nourishing. ‡

CHAP. 88. Of Bulbous Violets.

¶ The Kindes.

Theophrastus hath mentioned one kinde of bulbous *Leucoion*, which *Gaza* translates *Viola alba*, or the white Violet. Of this *Viola Theophrasti*, or *Theophrastus* his Violet, we haue obserued three sorts, whereof some bring forth many floures and leaues, others fewer; some floure very early, and others later, as shall be declared.

1 *Leucoium bulbosum praeox minus.*
Timely flowering bulbous Violet.

‡ 2 *Leucoium bulbosum praeox Byzantinum.*
The Byzantine early bulbous Violet.

¶ The Description.

1 **T**he first of these bulbous Violets riseth out of the ground, with two small leaues flat and crested, of an ouerworne Greene colour, betweene the which riseth vp a small and tender stalke of two hands high; at the top whereof commeth forth of a skinny hood a small white floure of the bignesse of a Violet, compact of six leaues, three bigger, and three lesser, tipped at the points with a light Greene: the smaller are fashioned into the vulgar forme of a heart, and pretily edged about with Greene; the other three leaues are longer, and sharpe pointed. The whole floure hangeth downe his head, by reason of the weake foot stalke whereon it groweth. The root is small, white, and bulbous.

‡ 2 There are two varieties of this kind which differ little in shape, but the first hath a floure as bigge againe as the ordinarie one, and *Clusius* calls it *Leucoium bulbosum praeox Byzantinum*, The greater early Constantinopolitan bulbous Violet. The other is mentioned by *Lobel*, and differs onely in colour of floures; wherefore he calls it *Leucoium triphyllum flore caeruleo*, The blew floured bulbous Violet.

3. The

3 *Leucoium bulbosum serotinum.*
Late flowering bulbous Violet.

4 *Leucoium bulbosum majus polyanthemum.*
The many flowered great bulbous violet.

5 *Leucoium bulbosum Autumnale minimum.*
The least Autumnne bulbous Violet.

3 The third sort of bulbed Violets hath narrow leaues like those of the lecke, but lesser and smoother, not vnlike to the leaues of the bastard Daffodill. The stalks be slender and naked, two hands high, whereupon doe grow faire white floures, tipped with a yellowish Greene colour, with many small chiues or threds in the midst of the floure. The seed is contained in smal round buttons. The root is white and bulbous.

4 The great bulbed Violet is like vnto the third in stalke and leaues, yet greater and higher. It bringeth forth on euery stalke not one floure onely, but five or six, blowing or flowering one after another, altogether like the other floures in forme and bignesse.

5 This small bulbous plant may be annexed to the former, the root is small, compact of many coats: the leaues are also small, and the stalke an handfull high, at the top whereof there hang downe one or two small white floures consisting of six leaues a piece, much resembling the last described, but farre lesse. It floures in Autumnne.

6 Besides these, *Clusius* makes mention of a small one much like this, and it floures in the Spring, and the floures are somewhat reddish nigh the stalke, and smell sweet. *Clusius* calls this, *Leucoium bulbosum verum minimum*, The smallest Spring bulbous Violet. ‡

¶ The

¶ The Place.

These plants do grow wilde in Italy and the places adiacent. Notwithstanding our London gardens haue taken possession of most of them many yeares past.

¶ The Time.

The first floureth in the beginning of Ianuary, the second in September; and the third in May; the rest at their seasons mentioned in their descriptions.

¶ The Names.

† The first is called of *Theophrastus*, *Leucoion*; which *Gaza* renders *Viola alba*, and *Viola Bulbosa*, or Bulbed Violet. *Lobelius* hath from the colour and shape called it *Leuconarcissolirion*, and that very properly, considering how it doth as it were participate of two sundry plants, that is to say, the root of the *Narcissus*, the leaues of the small Lilly, and the white colour; taking the first part *Leuco*, of his whitenesse; *Narcisso*, of the likenesse the roots haue vnto *Narcissus*; and *Lirium*, of the leaues of Lillies, as aforesaid. In English we may call it the bulbous Violet; or after the Dutch name, **Somer lottkens**; that is, Sommer fooles, and **Druyskens**. Some call them also Snow drops. This name *Leucoion*, without his Epithite *Bulbosum*, is taken for the Wall-floure, and stock Gillofloure, by all moderne Writers.

¶ The Nature and Vertues.

Touching the faculties of these bulbous Violets we haue nothing to say, seeing that nothing is set downe hereof by the antient Writers, nor any thing obserued by the moderne, only they are maintained and cherished in gardens for the beautie and rarenesse of the floures, and sweetnesse of their smell.

CHAP. 89. Of Turkie or Ginny-ben Floure.

1 *Fritillaria*.

Checquered Daffodill.

2 *Fritillaria variegata*.

Changeable Checquered Daffodil.

¶ The Description.

THe Checquered Daffodill, or Ginny-hen Floure, hath small narrow grassie leaues; among which there riseth vp a stalke three hands high, hauing at the top one or two floures, and sometimes three, which consisteth of six small leaues checquered most strangely: wherein Nature, or rather the Creator of all things, hath kept a very wonderfull order, surpassing (as in all other things) the curiouslest painting that Art can set downe. One square is of a greenish yellow colour, the other purple, keeping the same order as well on the backside of the floure, as on the inside, although they are blackish in one square, and of a Violet colour in an other; insomuch that euery leafe seemeth to be the feather of a Ginny hen, whereof it tooke his name. The root is small, white, and of the bignesse of halfe a garden beane.

The second kinde of Checquered Daffodill is like vnto the former in each respect, sauing that this hath his floure dasht ouer with a light purple, and is somewhat greater than the other, wherein consisteth the difference.

‡ 3 *Fritillaria Aquitanica minor flore luteo obsoleto.*
The lesser darke yellow Fritillarie.

‡ 9 *Fritillaria alba pracox.*
The early white Fritillarie.

‡ There are sundry differences and varieties of this floure, taken from the colour, largenes, doublenesse, earliness and latenes of flourishing, as also from the many or few branches bearing floures. We will onely specifie their varieties by their names, seeing their forme differs little from those you haue here described.

4 *Fritillaria maxima ramosa purpurea.* The greatest branched purple checquered Daffodill.

5 *Fritillaria flore purpureo pleno.* The double purple floured checquered Daffodill.

6 *Fritillaria polyanthos flavoviridis.* The yellowish Greene many floured checquered Daffodill.

7 *Fritillaria lutea Someri.* Somers his yellow Checquered Daffodill.

8 *Fritillaria alba purpureo tessulata.* The white Fritillarie checquered with purple.

9 *Fritillaria alba pracox.* The early white Fritillarie or Checquered Daffodill.

10 *Fritillaria minor flore luteo obsoleto.* The lesser darke yellow Fritillarie.

11 *Fritillaria angustifolia lutea variegata paruo flore, & altera flore majore.* Narrow leaued yellow variegated Fritillarie with small floures; and another with a larger floure.

12 *Fritillaria minima pluribus floribus.* The least Fritillarie with many floures.

Fritillaria Hispanica umbellifera. The Spanish Fritillarie with the floures standing as it were in an vmbell. ‡

¶ The Names.

The Ginny hen floure is called of *Dodonæus*, *Flos Meleagris*: of *Lobelius*, *Lilio-narcissus variegata*, for that it hath the floure of a Lilly, and the root of *Narcissus*: it hath beene called *Fritillaria*, of the table or boord vpon which men play at Chesse, which square checkers the floure doth very much resemble; some thinking that it was named *Fritillus*: whereof there is no certaintie; for *Martialis* seemeth to call *Fritillus*, *Abacus*, or the Tables whereat men play at Dice, in the fifth Booke of his Epigrams, writing to *Galla*.

Iam tristis, nucibus puer relictis,

Clamose renocatur à magistro:

Et blando malè proditus Fritillo

Arcana modò raptus è popina

Adilem rogat vdius aleator. &c.

The sad Boy now his nuts cast by,
Call'd vnto Schole by Masters cry:
And the drunke Dicer now betray'd
By flattring Tables as he play'd,
Is from his secret tipling house drawne out,
Although the Officer he much besought. &c.

In English we may call it Turkey-hen or Ginny-hen Floure, and also Checquered Daffodill, and Fritillarie, according to the Latine.

¶ The Temperature and Vertues.

Of the facultie of these pleasant floures there is nothing set downe in the antient or later Writer, but are greatly esteemed for the beautifying of our gardens, and the bosoms of the beautifull.

CHAP. 90. Of true Saffron, and the wilde or Spring Saffrons.

Crocus florens & sine flore. Saffron with and without floure.

The Description.

Although I haue expresse two pictures of Saffrons, as you see, yet are you to vnderstand that these two do but set forth one kinde of plant, which could not so easily be perceiued by one picture as by two, because his floure doth first rise out of the ground nakedly in September, and his long smal grassy leaues shortly after the floure, neuer bearing floure and leafe at once. The which to expresse, I thought it conuenient to set downe two pictures before you, with this description, *viç.* The root is small, round, and bulbous. The floure consisteth of sixe small blew leaues tending to purple, hauing in the middle many small yellow strings or threds; among which are two, three, or more thicke fat chiues of a fierie colour somewhat reddish, of a strong smell when they be dried, which doth stuffe and trouble the head. The first picture setteth forth the Plant when it beareth floures, and the other expresseth nothing but leaues.

1 *Crocus vernus.*

Early flowering wilde Saffron.

2 *Crocus vernus minor.*

Small wilde Saffron.

¶ *The Place.*

Common, or the best knowne Saffron groweth plentifully in Cambridge-shire, Saffron-Walden, and other places thereabout, as come in the fields.

¶ *The Time.*

Saffron beginneth to floure in September, and presently after spring vp the leaues, and remaine greene all the Winter long.

¶ *The Names.*

Saffron is called in Greeke, *κρόκος*: in Latine, *Crocus*: in Mauritania, *Saffaran*: in Spanish, *Açafrón*: in English, Saffron: in the Arabicke tongue, *Zahafaran*.

¶ *The Temperature.*

Saffron is a little astringent or binding, but his hot qualitie doth so ouer-rule in it, that in the whole essence it is in the number of those herbes which are hot in the second degree, and drie in the first: therefore it also hath a certaine force to concoct, which is furthered by the small astringtion that is in it, as *Galen* saith.

¶ *The Vertues.*

A *Avicen* affirmeth that it causeth head-ache, and is hurtfull to the braine, which it cannot do by taking it now and then, but by too much vsing of it: for too much vsing of it cutteth off sleepe, through want whereof the head and senses are out of frame. But the moderate vse of it is good for the head, and maketh the senses more quicke and liuely, shaketh off heauy and drowfie sleepe, and maketh a man merry.

B Also Saffron strengthneth the heart, concocteth crude and raw humors of the chest, openeth the lungs, and remoueth obstructions.

It is

‡ 3 *Crocus vernus flore luteo.*
Yellow Spring Saffron.

‡ 4 *Crocus vernus flore albo.*
White Spring Saffron.

‡ 5 *Crocus vernus flore purpureo.*
Purple Spring Saffron.

‡ 6 *Crocus montanus Autumnalis.*
Autumne mountaine Saffron.

C It is also such a speciall remedie for those that haue consumption of the lungs, and are, as wee terme it, at deaths doore, and almost past breathing, that it bringeth breath again, and prolongeth life for certaine dayes, if ten, or twentie graines at the most be giuen with new or sweet Wine. For we haue found by often experience, that being taken in that sort, it presently and in a moment remoueth away difficultie of breathing, which most dangerously and suddenly hapneth.

D *Dioscorides* teacheth, That being giuen in the same sort it is also good against a surfet.

E It is commended against the stoppings of the liuer and gall, and against the yellow Iaudise: And hereupon *Dioscorides* writeth, That it maketh a man well coloured. It is put into all drinckes that are made to helpe the diseases of the intrailes, as the same Authour affirmeth, and into those especially which bring downe the floures, the birth, and the after burthen. It prouoketh vrine, stirreth fleshly lust, and is vsed in Cataplasmes and puluesses for the matrix and fundament, and also in plaisters and seare-cloaths which serue for old swellings and aches, and likewise for hot swellings that haue also in them S. Anthonies fire.

‡ 7 *Crocus montanus Autumnalis flore
majore albido ceruleo.*

Autumne mountaine Saffron with
a large whitish blew floure.

‡ 8 *Crocus Autumnalis flore albo.*
White Autumne Saffron.

F It is with good successe put into compositions for infirmities of the eares.

G The eyes being annointed with the same dissolued in milke, or fennell or rose water, are preferred from being hurt by the small pox and meafels, and are defended thereby from humours that would fall into them.

H The chiues steeped in water, serue to illumine or (as we say) limne pictures and imagerie, as also to colour sundry meats and confections. It is with good successe giuen to procure bodily lust. The confections called *Crocomagna*, *Oxycroceum*, and *Diacroceuma*, with diuers other emplaisters and electuaries cannot be made without this Saffron.

I The weight of tenne graines of Saffron, the kernels of Wall-nuts two ounces, Figges two ounces, Mithridate one dram, and a few sage leaues, stamped together with a sufficient quantitie of Pimpernell water, and made into a masse or lumpe, and kept in a glasse for your vse, and thereof twelue graines giuen in the morning fasting, preserueth from the Pestilence, and expelleth it from those that are infected.

- ‡ 9 *Crocus vernus angustifolius flore violaceo.*
Narrow leaved Spring Saffron
with a violet floure.

- ‡ 10 *Crocus vernus latifolius flore flavo
strijs violaceis.*
Broad leaved Spring Saffron with
a yellow floure & purple streaks.

- ‡ 11 *Crocus vernus latifolius striatus flore
duplici.*
Double floured streaked Spring
Saffron.

¶ The Kindes of Spring Saffron

OF wilde Saffrons there be sundry sorts, differing as well in the colour of the floures, as also in the time of their flou- ring. Of which, most of the figures shall be set forth vnto you.

¶ The Description of wilde Saffron.

1 THE first kind of wilde Saffron hath small short grassie leaues, furrowed or chanelled downie the midst with a white line or streake: among the leaues rise vp small floures in shape like vnto the common Saffron, but differing in colour; for this hath floures of mixt colours; that is to say, the ground of the floure is white, stripped vpon the backe with purple, and dasht ouer on the inside with a bright shining murrey colour; the other not. In the middle of the floures come forth many yellowish chiues, without any smel of saffron at all. The root is small, round, and covered with a browne skinne or filme like vnto the roots of common Saffron.

2 The second wilde Saffron in leaues, roots, and floures is like vnto the precedent, but altogether lesser, and the floures of this are of a purple violet colour.

3 We haue likewise in our London gardens another sort, like vnto the other wilde Saffrons in

- ‡ 12 *Crocus vernus latifolius flore purpureo.*
Broad leaved Spring Saffron
with the purple floure.

- ‡ 14 *Crocus vernus latifolius flore flavo-vario duplici.*
Broad leaved Spring Saffron with a
double floure yellow & streaked.

- ‡ 13 *Crocus vernus flore cinereo striato.*
Spring Saffron with an Ash-coloured streaked floure.

in euery point, sauing that this hath floures of a most perfect shining yellow colour, seeming a far off to be a hot glowing cole of fire, which maketh the difference.

4 There is found among Herbarists another sort, not differing from the others, sauing that this hath white floures, contrarie to all the rest.

5 Louers of Plants haue gotten into their gardens one sort hereof with purple or Violet coloured floures, in other respects like vnto the other.

6 Of these we haue another that floureth in the fall of the leafe, with floures like to the common Saffron, but destitute of those chiues which yeeld the colour, smell, or taste that the right manured Saffron hath.

‡ 7 And of this last kinde there is another with broader leaues, and the floure also is larger, with the leaues thereof not so sharpe pointed, but more round; the colour being at the first whitish, but afterwards intermixt with some blewnesse. ‡

8 There is also another of Autumne wild Saffrons with white floures, which sets forth the distinction.

Many sorts there are in our gardens besides those before specified, which I thought needlesse to entreat of, because their vse is not great. ‡ Therefore I will only giue the figures and names of some of the chiefe of them, and refer such as delight to see or please themselves with the varieties (for they are no specificke differences) of these plants, to the gardens and the bookes of Florists, who are onely the preseruers and admirers of these varieties, not sought after for any vse but delight. ‡

¶ *The Place.*

All these wilde Saffrons we haue growing in our London Gardens. Those which doe floure in Autumne do grow vpon certaine craggy rockes in Portugall, not far from the sea side. The other haue been sent ouer vnto vs, some out of Italy, and some out of Spaine, by the labour and diligence of that notable learned Herbarist *Carolus Clusius*; out of whose Obseruations, and partly by seeing them in our owne gardens, we haue set downe their descriptions.

That pleasant plant that bringeth forth yellow floures was sent vnto me from *Robinus* of Paris, that painfull and most curious seacher of Simples.

¶ *The Time.*

They floure for the most part in Ianuarie and Februarie; that of the mountain excepted, which floureth in September.

¶ *The Names.*

All these Saffrons are vnprofitable, and therefore they be truly said to be *Croci syluestres*, or wild Saffrons: in English, Spring Saffrons, and vernall Saffrons.

¶ *The Temperature and Vertues.*

Of the faculties of these we haue nothing to set downe, for that as yet there is no knowne vse of them in Physicke.

CHAP. 91. Of Meadow Saffron.

¶ *The Kindes.*

There be sundry sorts of Meadow Saffrons differing very notably as well in the colour of their floures, as also in stature and Countrey, from whence they had their being, as shall be declared.

1 *Colchicum Anglicum Purpureum.*
Purple English Meadow Saffron.

2 *Colchicum Anglicum album.*
White English Meadow Saffron.

¶ *The*

¶ The Description.

¹ **M**edow Saffron hath three or foure leaues rising immediately forth of the ground, long, broad, smooth, fat, much like to the leaues of the white Lilly in forme and smoothnesse: in the middle whereof spring vp three or foure thicke cods of the bignesse of a small Wall-nut, standing vpon short tender foot-stalkes three square, and opening themselves when they be ripe, full of seed something round, and of a blackish red colour: and when this seed is ripe, the leaues together with the stalkes doe fade and fall away. In September the floures bud forth, before any leaues appeare, standing vpon short tender and whitish stemmes, like in forme and colour to the floures of Saffron, hauing in the middle small chiues or threads of a pale yellow colour, altogether vnfit for meat or medicine. The root is round or bulbous, sharper at the one end than at the other, flat on the one side, hauing a deepe clift or furrow in the same flat side when it floureth, and not at any time else: it is couered with blackish coats or filmes, it sendeth downe vnto the lowest part certaine strings or threds. The root it selfe is full of a white substance, yeelding a iuyce like milke, whilest it is greene and newly digged out of the earth. It is in taste sweet, with a little bitternesse following, which draweth water out of the mouth.

³ *Colchicum Pannonicum florens & sine flore.*
Hungary mede Saffron with and without Floure.

² The second kinde of Mede Saffron is like the precedent, differing onely in the colour of the floures, for that this plant doth bring forth white leaues, which of some hath bene taken for the true *Hermodactylus*; but in so doing they haue committed the greater error.

³ These two figures expresse both but one and the selfe same plant, which is distinguished because it neuer beareth floures and leaues both at one time. So that the first figure sets it forth when it is in leaues and seed, and the other when it floureth; and therefore one description shall suffice for them both. In the Spring of the yeare it bringeth forth his leaues, thicke, fat, shining, and smooth, not vnlike the leaues of Lillies, which do continue greene vnto the end of Iune; at which time the leaues do wither away, but in the beginning of September there shooteth forth of the ground naked milke white floures without any greene leafe at all: but so soone as the Plant hath done bearing of floures, the root remaines in the ground, not sending forth any thing vntill Februarie in the yeare following.

‡ It beares plentifull store of reddish seed in loose triangular heads. The root hereof is bigger than that of the last described. ‡

† 4 The small meadow Saffron hath three or foure thicke fat leaues narrower than any of the rest. The floure appeareth in the fall of the leafe, in shape, colour, and manner of growing like the common mede Saffron, but of a more reddish purple colour, and altogether lesser. The leaues in this, contrarie to the nature of these plants, presently follow after the floure, and so continue all the Winter and Spring, euē vntill May or Iune. The root is bulbous, and not great; it is couered with many blackish red coats, and is white within.

‡ 5 This meadow Saffron hath roots and leaues like to those of the last described, but the leaues of the floure are longer and narrower, and the colour of them is white on the inside, greene on the middle of the backe part, and the rest thereof of a certaine flesh colour.

4 *Colchicum montanum minus Hispanicum cum flore & semine.*

Small Spanish meadow Saffron in floure and seed.

6 The meadow Saffron of Illyria hath a great thicke and bulbous root, full of substance: from which riseth vp a fat, thicke, and grosse stalke, set about from the lower part to the top by equall distances, with long, thicke, and grosse leaues, sharpe pointed, not vnlike to the leaues of leekes; among which leaues do grow yellowish floures like vnto the English meadow Saffron, but smaller.

7 The Assyrian meadow Saffron hath a bulbous root, made as it were of two pieces; from the middle cleft whereof riseth vp a soft and tender stalke set with faire broad leaues from the middle to the top: among which commeth forth one single floure like vnto the common meadow Saffron, or the white Anemone of *Matthiolus* description.

8 The mountaine wilde Saffron is a base and low plant, but in shape altogether like the common meadow Saffron, but much lesser. The floures are smaller, and of a yellow colour, which setteth forth the difference. ‡ The leaues and roots (as *Clusius* affirms) are more like to the *Narcissus*; and therefore he calls this *Narcissus Autumnalis minor*, The lesser Autumne *Narcisse*. ‡

‡ 9 This, whose figure we here giue you, is by *Clusius* called *Colchicum Byzantinum latifolium*, The broad leaued *Colchicum* of Constantinople. The leaues of this are not in forme and magnitude much vnlike to those of the white Hellebor, neither lesse neruous, yet more greene. It beares many floures in Autumne, so that there come sometimes twenty from one root. Their forme and colour are much like the ordinarie sort, but that these are larger, and haue thicker stalkes. They are

are of a lighter purple without, and of a deeper on the inside, and they are marked with certaine veines running alongst these leaues. The roots and seeds of this plant are thrice as large as those of the common kinde.

10 This hath roots and leaues like to the first described, but the floure is shorter, and growes vpon a shorter stalke, so that it rises but little aboue the earth: the three inner leaues are of a reddish purple; the three out leaues are either wholly white, or purplish on the middle in the inside, or streaked with faire purple veins, or spotted with such coloured spots: all the leaues of the floure are blunter and rounder than in the common kinde.

11 This in leaues, roots, manner and time of growing, as also in the colour of the floures, differs not from the first described, but the floures, as you may perceiue by the figure here expressed, are very double, and consist of many leaues.

‡ 5 *Colchicum montanum minus versicolore flore.*

The lesser mountaine Saffron with a various coloured floure.

6 *Colchicum Illyricum.*

Greeke medow Saffron.

12 This *Colchicum* differs little from the first ordinarie one, but that the floures are somewhat lesse, and the three out-leaues are somewhat bigger than the three inner leaues; the colour is a little deeper also than that of the common one; but that wherein the principall difference consists, is, That this floures twice in a yeare, to wit, in the Spring and Autumne: and hence *Clusius* hath called it *Colchicum biflorum*, Twice-flouring Mede Saffron.

13 This also in the shape of the root and leaues is not much different from the ordinary, but the leaues of the floure are longer and narrower, the colour also when they begin to open and shew themselves, is white, but shortly after they are changed into a light purple: each leafe of the floure hath a white thread tipt with yellow growing out of it, and in the middle stands a white three forked one longer than the rest. The floure growes vp between three or foure leaues narrower than those of the ordinarie one, and broader than those of the small Spanish kinde. *Clusius*, to whom we are beholden for this, as also for most of the rest, calls it *Colchicum vernum*, or Spring Mede-Saffron, because it then floures together with the Spring Saffrons and Dogs Tooth.

14 There are other Mede-Saffrons besides these I haue mentioned, but because they may be referred

7 *Colchicum Syriacum Alexandrinum.*
Assyrian Mede Saffron.

referred easily to some of these, for that their difference chiefly consists either in the doubleness or colour of the floures, whereof some are striped, some fraided, others variegated, I will not insist upon them, but referre such as desire their further acquaintance to look into the gardens of our Florists, as M. Parkinsons, M. Tuggies, &c. or else into the booke of floures set forth not long since by M. Parkinson, where they shall finde them largely treated of. Yet I cannot passe over in silence that curious *Colchicum* which is called by some, *Colchicum variegatum Chiense*. The floure thereof is very beautiful, consisting of six pretty broad and sharp pointed leaues, all curiously checkered ouer with deepe blew or purple, the rest of the floure being of a light whitish colour: the leaues, that rise vp in the Spring, are not very long, but somewhat broad and sharpe pointed; the root is like others of this kinde. I haue giuen you an exact and large figure of this, as I tooke it from the growing floure some three yeares agoe, it being at that time amongst her Majesties floures kept at Edgcombe in Surry, in the garden of my much honoured friend Sir John Tunstall, Gentleman Vsher vnto her Maiestie.

15 I giue you here in this place the true Hermodactill of the shops, which probably by all is adiudged to this Tribe, though none can certainly say what floures or leaues it beares: the Roots are onely brought to vs, and from what place I cannot tell; yet I coniecture from some part of Syria or the adiacent countries. Now how hard

it is to iudge of Plants by one part or particle, I shall shew you more at large when I come to treat of *Pistolochia*, wherefore I will say nothing thereof in this place. These roots, which wanting the maligne qualitie of *Colchicum*, either of their owne nature, or by driness, are commonly about the bignesse of a Chesnut, smooth, flattish, and sharpe at the one end, but somewhat full at the other, and on the one side there is a little channell or hollownesse, as is in the roots of Mede-Saffron where the stalke of the floure comes vp. Their colour is either white, browne, or blackish on the outside, and very white within, but those are the best that are white both without and within, and may easily be made into a fine white meale or powder. ‡

8 *Colchicum parvum montanum luteum.*
Yellow mountaine Saffron.

¶ The Place.

Meadow Saffron, or *Colchicum*, groweth in Messinia, and in the Isle of Colchis, whereof it tooke his name. The titles of the rest do set forth their native countries; notwithstanding our London gardens are possessed with the most part of them.

The two first do grow in England in great abundance, in fat and fertile meadows, as about Wilford and Bathe, as also in the meadows neere to a small village in the West part of England, called Shepton Mallet, in the meadows about Bristoll, in Kingstroppe meadow neere unto a Water-mill as you go from Northampton to Holmeby House, vpon the right hand of the way, and likewise in great plenty in Nobottle wood two miles from the said towne of Northampton, and many other places. ‡ The rest for the most part may be found in the gardens of the Florists among vs. ‡

‡ 9 *Colchicum latifolium*. Broad leaued Mede Saffron.‡ 10 *Colchicum versicolore flore*. Party-coloured Mede Saffron.

¶ The Time.

The leaues of all the kindes of Mede-Saffron do begin to shew themselves in Februarie; The seed is ripe in Iune. The leaues, stalkes, and seed do perish in Iuly, and their pleasant floures doe come forth of the ground in September.

¶ The Names.

Dioscorides calleth Meadow Saffron *Κολχικόν*: some, *Εφίμερον*: notwithstanding there is another *Ephemerum* which is not deadly. Diuers name it in Latine *Bulbus agrestis*, or wild Bulbe: in high Dutch it is called *Zeitloosen*: in low Dutch, *Tilteloosen*: in French, *Mort au Chien*. Some haue taken it to be the true *Hermodactyl*, yet falsely. Other some call it *Filius ante Patrem*, although there is a kinde of *Lyssmachia* or Loose-strife so called, because it first bringeth forth his long cods with seed, and then the floure after, or at the same time at the end of the said cod. But in this Mede-Saffron it is far otherwise, because it bringeth forth leaues in Februarie, seed in May, and floures in September, which is a thing cleane contrarie to all other plants whatsoever, for that they do first floure, and after seed; but this Saffron seedeth first, and foure moneths after brings forth floures: and therefore some haue thought this a fit name for it, *Filius ante Patrem*: and we accordingly may call

‡ 11 *Colchicum flore pleno.*
Double flowered Mede-Saffron.

‡ 12 *Colchicum biflorum.*
Twice-flowering Mede-Saffron.

‡ 13 *Colchicum vernal.*
Spring Mede-Saffron.

‡ 14 *Colchicum variegatum Chienfe.*
Checquered Mede Saffron of Chio.

‡ 15 *Hermodactyli Officinarum.*
The true Hermodactyls of the shops.

call it, The Sonne before the Father.

‡ Our Author in this chapter was of many mindes; for first, in the description of *Colchicum Anglicum*, being the second, hee reproveth such as make that white floured *Colchicum* the true Hermodactyl. Then in the description of the eighth he hath these words, which being omitted in that place I here set downe. *Of all these kindes (saith he) of Meadow Saffrons it hath not beene certainly knowne which hath been the true Hermodactyll; notwithstanding wee have certaine knowledge that the Illyrian Colchicum is the Physicall Hermodactyll.* Yet when he comes to speake of the names, after that out of *Dodonaeus* he had set downe the truth in these words; *But notwithstanding that Hermodactyll which we do use in compound medicines, differeth from this (to wit, Colchicum) in many notable points, for that the true Hermodactyll hath a bulbe or round root, which being dried continueth very white within, and without not wrinkled at all, but full and smooth, of a meane hardnesse;* and that he had out of the same Authour alledged the words of *Valerius Cordus* and *Auicenna*, (which are here omitted) he concludes contrarie to the truth, his first admonition, and second assertion, That the white Meadow Saffron which we have in the West part of England, growing especially about Shepton Mallet, is the Hermodactyll vsed in shops.

Those we have in shops seeme to be the Hermodactyls of *Paulus Aegineta*; yet not those of *Nicholaus* and *Actuarius*, which were cordial, and

increasers of sperme; the which the Authors of the *Adversaria*, pag. 55. thinke to be the *Behen album & rubrum* of the Arabians. And to these vnkowne ones are the vertues set downe by our Author in the third place vnder C, to be referred. ‡

¶ The Temperature.

Meadow Saffron is hot and dry in the second degree.

¶ The Vertues of Hermodactyls.

- A † The roots of Hermodactyls are of force to purge, and are properly giuen (saith *Paulus*) to those that haue the Gout, euen then when the humors are in flowing. And they are also hurtful to the stomacke.
- B The same stamped, and mixed with the whites of egges, barley meale, and crums of bread, and applied plaisterwise, ease the paine of the Gout, swellings and aches about the ioynts.
- C The same strengthneth, nourisheth, and maketh good iuyce, encreaseth sperme or naturall seed, and is also good to cleanse vlcers or rotten sores.

¶ The correction.

The powder of Ginger, long Pepper, Annise seed or Cumine seed, and a little Masticke, correcteth the churlish working of that Hermodactyll which is vsed in Shops. But those which haue eaten of the common meadow Saffron must drinke the milke of a cow, or else death presently ensueth.

¶ The Danger.

The roots of all the sorts of Mede Saffrons are very hurtfull to the stomacke, and being eaten they kill by choaking, as Mushromes do, according vnto *Dioscorides*; whereupon some haue called it *Colchicum strangulatorium*.

† That which was set forth by our Author in the fourth place, vnder the title of *Colchicum montanum minus*, was nothing but the former *Colchicum minus* expressed in seed. The ninth and tenth were the same with the first and second. The sixth and seventh, which are *Colchicum Illyricum* and *Syriacum* I haue left with their figures and historie, though they be suspected to be counterfeits; and *Cuscuta* probably gesses, that the latter is the Apennine Tulip, the Painter making the leaues of the floure too round, and those of the plant too broad and short. †

CHAP. 92. Of Starre of Bethlem.

¶ The Kindes.

There be sundry sorts of wilde field Onions called Starres of Bethlehem, differing in stature, taste, and smell, as shall be declared.

1 *Ornithogalum.*

Star of Bethlehem.

2 *Ornithogalum luteum, sine Cypa agraria.*

Yellow, or wilde Star of Bethlehem.

¶ The Description.

1 **O**ur common Starre of Bethlehem hath many narrow leaues, thicke, fat, full of iuyce, and of a very greene colour, with a white streake downe the middle of each leafe: among the which rise vp small naked stalkes, at the top whereof grow floures compact of six little leaues, stripped on the backside with lines of greene, the inside being milke-white. These floures open themselues at the rising of the Sunne, and shut againe at the Sun setting; whereupon this Plant hath beene called by some, *Bulbus Solsequius*. The floures being past, the seed doth follow inclosed in three cornered husks. The root is bulbous, white both within and without,

† 2 The second sort hath two or three grassy leaues proceeding from a clouen bulbous root. The stalke riseth vp in the middest naked, but toward the top there doe thrust forth more leaues like vnto the other, but smaller and shorter; among which leaues do step forth very small, weake, and tender foot-stalkes. The floures of this are on the backside of a pale yellow stripped with greene, on the inside of a bright shining yellow colour, with Saffron coloured threds in their middles. The seed is contained in triangular vessels.

† 3 This Star of Hungarie, contrarie to the custome of other plants of this kinde, sendeth forth before Winter five or six leaues spread vpon the ground, narrow, and of some fingers length, somewhat whitish greene, and much resembling the leaues of Gillofloures, but somewhat roughish. In Aprill the leaues beginning to decay, amongst them rises vp a stalke bearing at the top a

spoke of floures, which consisting of six leaues apiece shew themselves open in May; they in colour are like the first described, as also in the Greene streak on the lower side of each leafe. The seed is blacke, round, and contained in triangular heads. The root is bulbous, long, and white. †

‡ 4 This fourth, which is the *Ornithogalum Hispanicum minus* of *Clusius*, hath a little white root which sends forth leaues like the common one, but narrower, and destitute of the white line wherewith the other are marked. The stalke is some two handfulls high, bearing at the top thereof some seuen or eight floures growing each aboue other, yet so, as that they seeme to make an ymbell: each of these floures hath six leaues of a whitish blew colour, with so many white chiues or threds, and a little blewish ymbone in the midst. This floures in Aprill.

5 This fifth first sends vp one onely leafe two or three inches long, narrow, and of a whitish colour, and of an acide taste: nigh whereto riseth vp a small stalke some inch or two high, hauing one or two leaues thereon, betweene which come forth small star-floures, yellow within, and of a greenish purple without. The seed, which is reddish and small, is contained in triangular heads. The root is white, round, and couered with an Ash-coloured filme.

3 *Ornithogalum Pannonicum*.
Star of Hungary.

‡ 4 *Ornithogalum Hispanicum minus*.
The lesser Spanish Star-floure.

6 I thinke it not amisse, hereto to adde another small bulbous plant, which *Clusius* calls *Bulbus monophyllus*, The one leaued Bulbe. This from a small root sends forth one rush-leafe of some foot in length, which about two inches aboue the earth, being somewhat broader than in the other places, and guttered, sends forth a little stalke some three inches long, whose top is set with three little floures, each standing aboue other, about the bignesse here presented vnto your view in the figure: each of those consisteth of six very white leaues, and are not much vnlike the floures of the grasse of Parnassus, but yet without leaues to sustaine the floure, as it hath: six white threds tipt with yellow, and a three square head with a white pointall possesse the middest of the floure; the smell thereof is somewhat like that of the floures of the Haw-thorne. It floures in the midst of Iune.

7 Hauing done with these two small plants, I must acquaint you with three or foure larger, belonging also to this Classis. The first of these is that which *Dodoneus* calls *Ornithogalum majus*, and *Clusius*, *Ornithogalum Arabicum*: This by *Lobel* and some others is called *Lilium Alexandrinum*,
or

¶ 5 *Ornithogalum luteum parvum.*
Dwarfe yellow Star of Bethlehem.

¶ 6 *Bulbus unifolius.*
The one leaved Bulbe.

¶ 7 *Ornithogalum majus Arabicum.*
The great Arabicke Star-floure.

or the Lilly of Alexandria, as our Author calls it in the chapter of Cotton-grasse. This faire, but tender plant, hath broad Greene leaues comming from a large white flat bottomed root, amongst which riseth vp a stalke some cubit high, whose top is garnished with sundry pretty large floures made of sixe very white leaues, with a shining blackish head, ingirt with six white threds tipt with yellow. This floures in May.

8 This, which is commonly called *Ornithogalum spicatum*, hath large leaues and roots, and the stalke growes some cubit or more high, wher-on grow many starre-floures in shape and colour like those of the ordinarie, but larger, and they begin to floure below, and floure vpwards to the top. There is a larger sort of this *Spicatum*, whose floures are not streaked with Greene on their backes. There is also a lesser, differing from the first of these onely in bignesse.

9 This Neapolitan hath three or foure long leaues not much vnlike those of the Hyacinths, but narrower, the stalke is pretty thicke, some foot high, and hath vsually growing thereon some fve or six floures hanging one way, though their stalkes grow alternately out of each side of the maine stemme. These floures are composed of six leaues, being about an inch long, and some quarter of an inch broad, white within, and of an Ash-coloured Greene without, with white edges, the

the middle of the floure is possessed by another little floure, consisting also of six little leaues, ha-
uing in them six threads headed with yellow, and a white pointall. A blacke wrinkled seed is
contained in three cornered heads, which by reason of their bignesse weigh downe the stalke. This
floures in Aprill. ‡

‡ 8 *Ornithogalum spicatum*.
Spike fashioned Star-floure.

‡ 9 *Ornithogalum Neapolitanum*.
The Neapolitan Star-floure.

¶ The Place.

Stars of Bethlehem, or Star-floures, especially the first and second, grow in fundry places that
lie open to the aire, not onely in Germany and the Low-countries, but also in England, and in our
gardens very common. The yellow kinde *Lobell* found in Somersetshire in the corne fields. The
rest are strangers in England; yet we haue most of them, as the third, fourth, eighth, and ninth, in
some of our choice gardens.

¶ The Time.

These kindes of bulbed plants do floure from Aprill to the end of May.

¶ The Names.

Touching the names, *Dioscorides* calls it *ὄρνιθόγαλον*: *Pliny*, *Ornithogale*: in high Dutch it is called
Feldz wibel, *Ackerz wibel*: as you should say, *Cepa agraria*: in English, Stars of Bethlehem.

‡ The rest are named in their titles and history; but *Clusius* questions whether the *Bulbus uni-*
folius be not *Bulbine* of *Theophrastus*, 7. *hist.* 13. *Bauhinus* seemes to affirme the *Spicatum* to be
Moly of *Dioscorides* and *Theophrastus*, and *Epimedium* of *Pliny*.

¶ The Nature.

These are temperate in heate and drinesse.

¶ The Vertues.

A The vertues of most of them are vnkowne; yet *Hieronymus Tragus* writeth, That the root of the
Star of Bethlehem roasted in hot embers, and applied with honey in manner of a Cataplasme or
pultesse, healeth old eating vlcers, and softens and discusses hard tumors.

The roots, saith *Dioscorides*, are eaten both raw and boyled.

† That which was the second of our Author, vnder the title of *Cepa agraria*, and the third vnder *Ornithogalum luteum*, were figures of the same plant, but in the la-
ter, as *Bauhinus* obserues, the bottom leaues are omitted, because they fall away when as it is growne vp to floure. †

CHAP. 93. Of Onions.

¶ The Kindes.

There be, saith *Theophrastus*, diuers sorts of Onions, which haue their syr-names of the places where they grow: some also lesser, others greater; some be round, and diuers others long; but none wilde, as *Pliny* writeth.

1 *Cepa alba.*
White Onions.

3 *Cepa Hispanica oblonga.*
Longish Spanish Onions.

¶ The Description.

1 The Onion hath narrow leaues, and hollow within; the stalke is single, round, biggest in the middle, on the top whereof groweth a round head couered with a thinne skin or filme, which being broken, there appeare little white floures made vp in forme of a ball, and afterward blacke seed three cornered, wrapped in thinne white skinned. In stead of the root there is a bulbe or round head compact of many coats, which oftentimes becommeth great in manner of a Turnep, many times long like an egge. To be brieft, it is couered with very fine skinned for the most part of a whitish colour.

2 The red Onion differeth not from the former but in sharpnesse and rednesse of the roots, in other respects there is no difference at all.

3 There is also a Spanish kinde, whose root is longer than the other, but in other respects very little different.

4 There is also another small kinde of Onion, called by *Lobel*, *Ascalonitis Antiquorum*, or Scallions; this hath but small roots, growing many together: the leaues are like to Onions, but lesse. It seldome beares either stalke, floure, or seed. It is vsed to be eaten in sallads.

¶ The

¶ The Place.

The Onion requireth a fat ground well digged and duned, as *Palladius* saith. It is cherished euery where in kitchen gardens: it is now and then in beds sowne alone, and many times mixed with other herbes, as with Lettuce, Parseneps, and Carrets. *Palladius* liketh well that it should be sowne with Sauory, because, saith *Pliny*, it prospereth the better, and is more wholesome.

‡ 4 *Ascalonitides*.
Scallions.

Pallacana: and the other is the headed or common Onion, which the Germanes call *Onion zwibel*: the Italians, *Cipolla*: the Spaniards, *Cebolla*, *Ceba*, and *Cebola*.

¶ The Temperature.

All Onions are sharpe, and moue teares by the smell. They be hot and dry, as *Galen* saith, in the fourth degree, but not so extreme hot as Garlick. The iuyce is of a thin waterie and airy substance: the rest is of thicke parts.

¶ The Vertues.

- A The Onions do bite, attenuate, or make thinne, and cause drinesse: being boyled they doe lose their sharpenesse, especially if the water be twice or thrice changed, and yet for all that they doe not lose their attenuating qualitie.
- B they also breake winde, prouoke vrine, and be more soluble boyled than raw; and raw they nourish not at all, and but a little though they be boyled.
- C They be naught for those that are cholericke, but good for such as are replete with raw and flegmaticke humors; and for women that haue their termes stayed vpon a cold cause, by reason they open the passages that are stopped.
- D *Galen* writeth, That they prouoke the Hemorrhoides to bleed if they be laid vnto them, either by themselves, or stamped with vineger.
- E The iuyce of Onions sniffed vp into the nose, purgeth the head, and draweth forth raw flegmaticke humors.
- F Stamped with salt, rew, and honey, and so applied, they are good against the biting of a mad Dog.
- G Roasted in the embers, and applied, they ripen and breake cold Apostumes, Biles, and such like.

The

The iuyce of Onions mixed with the decoction of Penniriell, and annointed vpon the goutie member with a feather, or a cloath wet therein, and applied, easeth the same very much.

The iuyce annointed vpon a pild or bald head in the sunne, bringing againe the haire very speedily.

The iuyce taketh away the heate of scalding with water or oyle, as also burning with fire and gun-powder, as is set forth by a very skilfull Chirurgion named Master *William Clowes*, one of the Queens Chirurgions; and before him by *Ambrose Parey*, in his Treatise of wounds made by gun shot.

Onions sliced, and dipped in the iuyce of Sorrell, and giuen vnto the sicke of a tertian Ague, to eate, take away the fit in once or twice so taking them.

¶ *The Hurts.*

The Onion being eaten, yea though it be boyled, causeth head-ache, hurteth the eyes, and maketh a man dimme sighted, dulbeth the senses, ingendreth windinesse, and prouoketh ouermuch sleepe, especially being eaten raw.

CHAP. 94. Of Squils, or Sea-Onions.

¶ 1 *Scilla Hispanica vulgaris.* The common Spanish Squill.

The Description.

¶ 1 THE ordinarie Squill or sea Onion hath a pretty large root, composed of sundrie white coats filled with a certain viscous humiditie, and at the bottome thereof grow forth sundry white and thicke fibres. The leaues are like those of Lillies, broad, thicke, and very Greene, lying spred vpon the ground, and turned vp on the sides. The stalke groweth some cubit or more high, straight, naked without leaues, beautified at the top with many starre-fashioned floures, very like those of the bigger *Ornithogalum*. The seed is contained in chaffie three cornered seed-vessels, being it selfe also black, smooth, and chaffie. It floures in August and September, and the seed is ripe in October. The leaues spring vp in Nouember and December, after that the seed is ripe, and stalke decayed. ¶

2 The great Sea Onion, which *Clusius* hath set forth in his Spanish historie, hath very great and broad leaues, as *Dioscorides* saith, longer than those of the Lilly, but narrower. The bulbe or headed root is very great, consisting of many coats or scaly filmes of a reddish colour. The floure is sometimes yellow, sometimes purple, and sometimes of a light blew. ¶ *Clusius* saith it is like that of the former, I thinke he meanes both in shape and colour. ¶

3 The sea-Onion of Valentia, or rather the sea Daffodill, hath many long and fat leaues, and narrow like those of Narcissus, but smoother and weaker, lying vpon the ground; among which riseth vp a stalke a foot high, bare and naked, bearing at the top a tuft of white floures, in shape like vnto

vnto our common yellow Daffodil. The seed is inclosed in thicke knobby huskes, blacke, flat, and thicke, very soft, in shape like vnto the seeds of *Aristolochia longa*, or long Birth-wort. The root is great, white, long, and bulbous.

4 Red floured Sea Daffodill, or sea Onion, hath a great bulbe or root like to the precedent; the leaues long, fat, and sharpe pointed, the stalke bare and naked, bearing at the top sundry faire red floures in shape like to the last described.

2 *Pancratium Clusij.*

Great Squill, or Sea Onion.

3 *Pancratium Marinum.*

Sea Onion of Valentia.

5 The yellow floured sea Daffodill, or sea Onion, hath many thicke fat leaues like vnto the common Squill or sea Onion, among which riseth vp a tender straight stalke full of iuyce, bearing at the top many floures like the common yellow Daffodill. The seed and root is like the precedent.

¶ 6 To these may fitly be added that elegant plant which is knowne by the name of *Narcissus tertius* of *Matthiolus*, and may be called White Sea Daffodill. This plant hath large roots, as bigge sometimes as the ordinarie Squill; the leaues are like those of other Daffodils, but broader, rounder pointed, and not very long. The stalke is pretty thicke, being sometimes round, otherwhiles cornered, at the top whereof grow many large white floures: each floure is thus composed; it hath six long white leaues, in the midst growes forth a white pointall which is incompassed by a welt or cap diuided into six parts, which six are againe by threes diuided into eighteen iaggies or diuisions, a white thred tipt with greene, of an inch long, comming forth of the middle of each diuision. This floureth in the end of May. It is said to grow naturally about the sea coast of Illyria. ‡

¶ The Place.

The first is found in Spaine and Italy, not far from the sea side.

The second also neere vnto the sea, in Italy, Spaine, and Valentia. I haue had plants of them brought me from sundry parts of the Mediterranean sea side, as also from Constantinople, where it is numbred among the kindes of *Narcissus*.

The third groweth in the sands of the sea, in most places of the coast of Narbone, and about Montpellier.

The fourth groweth plentifully about the coasts of Tripolis and Aleppo, neere to the sea, and also in the salt marshes that are sandie and lie open to the aire.

¶ The

¶ The Time.

They floure from May to the end of Iuly, and their seed is ripe in the end of August.

¶ The Names.

The first is called of the Grecians, *scilla*; and of the Latines also *Scilla*: the Apothecaries name it *Squilla*: Diuers, *Cepamuris*: the Germanes, *Meer zwibel*: the Spaniards, *Cebolla albarrana*: the French-men, *Oignon de mer*: in English, Squill, and Sea Onion.

‡ The second is called *Pancratium*, and *Scilla rubra major*.

3, 4, 5. These are all figures of the same plant, but the least (which is the worst) is the figure of the *Aduersaria*, where it is called *Pancratium maritimum*: *Dodoneus* calls it *Narcissus marinus*: and *Clusius*, *Hemerocallis Valentina*; and it is iudged to be the *Hemerocallis* of *Theophrastus*, *Lib. 6. Hist. cap. 1*. The Spaniards call this *Amores mios*: the Turkes, *Con zambach*: the Italians, *Giglio marino*. These three (as I said) differ no otherwise than in the colour of their floures.

The sixth is *Narcissus tertius*, or *Constantinopolitanus*, of *Matthiolus*: *Clusius* calls it *Lilionarcissus Hemerocallidis facie*. ‡

4 *Pancratium floribus rubris*.

Red floured sea Daffodill.

‡ 6 *Narcissus tertius Matthioli*.

The white sea Daffodill.

¶ The Temperature.

The sea Onion is hot in the second degree, and cutteth very much, as *Galen* saith. It is best when it is taken baked or roasted, for so the vehemencie of it is taken away.

¶ The Vertues of Squills.

The root is to be couered with paste or clay, (as *Dioscorides* teacheth) and then put into an ouen to be baked, or else buried in hot embers till such time as it be thoroughly roasted: for not being so baked or roasted it is very hurtfull to the inner parts. A

It is likewise baked in an earthen pot close covered and set in an ouen. That is to be taken especially which is in the midst, which being cut in pieces must be boyled, but the water is still to be changed, till such time as it is neither bitter nor sharpe: then must the pieces be hanged on a thread, and dried in the shadow, so that no one piece touch another. ‡ Thus vsed it loseth most of the strength; therefore it is better to vse it lightly dried, without any other preparation. ‡ B

P

These

- C These slices of the Squill are vsed to make oyle, wine, or vineger of Squill. Of this vineger of Squill is made an Oxymel. The vse whereof is to cut thicke, tough, and clammy humors, as also to be vsed in vomits.
- D This Onion roasted or baked is mixed with potions and other medicines which prouoke vrine, and open the stoppings of the liuer and spleene, and is also put into treacles. It is giuen to those that haue the Dropsie, the yellow Iaudise, and to such as are tormented with the gripings of the belly, and is vsed in a licking medicine against an old rotten cough, and for shortnesse of breath.
- E One part of this Onion being mixed with eight parts of salt, and taken in the morning fasting to the quantitie of a spoonefull or two, looseth the belly.
- F The inner part of Squilla boyled with oyle and turpentine, is with great profit applied to the chaps or chil-blaines of the feet or heeles.
- G It driueth forth long and round wormes if it be giuen with honey and oyle.
- ‡ The *Pancratium marinum*, or *Hemerocallis Valentina* (saith *Clusius*) when as *Liued* with *Rondeletius*, at Montpellier, was called *Scilla*; and the Apothecaries thereof made the trochiscs for the composition of Treacle: afterwards it began to be called *Pancratium flore Lilij*. *Rondeletius* also was wont to tell this following story concerning the poysonous and maligne qualitie thereof. There were two Fishermen, whereof the one lent vnto the other (whom he hated) his knife, poysoned with the iuyce of this *Hemerocallis*, for to cut his meate withall; he suspecting no treachery cut his victuals therewith, and so eat them, the other abstaining therefrom, and saying that he had no stomacke. Some few dayes after, he that did eate the victuals died; which shewed the strong and deadly qualitie of this plant: which therefore (as *Clusius* saith) cannot be the *Scilla Epimenidia* of *Pliny*, which was eatable, and without malignitie ‡

CHAP. 95. Of Leekes.

1 *Porrum capitatum*.
Headed, or set Leeke.

‡ 2 *Porrum sectivum aut tonsile*.
Cut, or vnset Leeke.

¶ The Description.

THe leaues or the blades of the Leeke be long, somewhat broad, and very many, hauing a keele or crest in the backside, in smell and taste like to the Onion. The stalks, if the blades be not often cut, do in the second or third yeare grow vp round, bringing forth on the top floures made vp in a round head or ball as doth the Onion. The seeds are like. The bulbe or root is long and slender, especially of the vnset Leeke. That of the other Leeke is thicker and greater.

¶ 2 Most Writers distinguish the common Leeke into *Porrum capitatum & sectivum*; and Lobel giues these two figures wherewith we here present you. Now both these grow of the same seed, and they differ onely in culture; for that which is often cut for the vse of the kitchen is called *Sectivum*: the other, which is headed, is not cut, but spared, and remoued in Autumne. ‡

¶ The Place.

It requireth a meane earth, fat, well dunged and digged. It is very common euery where in other countries, as well as in England.

¶ The Time.

It may be sowne in March or Aprill, and it to be remoued in September or October.

¶ The Names.

The Grecians call it *μακρον*: the Latines, *Porrum*. The Emperour Nero had great pleasure in this root, and therefore he was called in scorne, *Porrophagus*. But *Palladius* in the masculine gender called it *Porrus*: the Germanes, *Lauch*: the Brabanders, *Porreue*: the Spaniards, *Puerro*: the French, *Porreau*: the English-men, Leeke, or Leekes.

¶ The Temperature.

The Leeke is hot and dry, and doth attenuate or make thinne as doth the Onion.

¶ The Vertues.

Being boyled it is lesse hurtfull, by reason that it loseth a great part of his sharpenesse: and yet being so vsed it yeeldeth no good iuyce. But being taken with cold herbes his too hot quality is tempered.

Being boyled and eaten with Ptisana or barley creame, it concocteth and bringeth vp raw humors that lie in the chest. Some affirme it to be good in a loch or licking medicine, to cleanse the pipes of the lungs.

The iuyce drunke with honey is profitable against the bitings of venomous beasts, and likewise the leaues stamped and laid thereupon.

The same iuyce, with vineger, frankincense, and milke, or oyle of roses, dropped into the eares, mitigateth their paine, and is good for the noyse in them.

Two drams of the seed, with the like weight of myrtill berries drunk, stop the spitting of bloud which hath continued a long time. The same ingredients put into Wine keepe it from souring, and being alreadie soure, amend the same, as diuers write. It cutteth and attenuateth grosse and rough humors.

¶ Lobel commends the following Loch as very effectually against phlegmatick Squinances, and other cold catarrhes which are like to cause suffocation. This is the description thereof; Take blanchd almonds three ounces, foure figges, soft *Bdellium* halfe an ounce, iuyce of Liquorice, two ounces, of sugar candy dissolued in a sufficient quantitie of iuyce of Leekes, and boyled in *Balneo* to the height of a Syrup, as much as shall be requisite to make the rest into the forme of an *Eclegma*. ‡

¶ The Hurts.

It heateth the body, ingendreth naughty bloud, causeth troublesome and terrible dreames, offendeth the eyes, dulleth the sight, hurteth those that are by nature hot and cholericke, and is noysome to the stomacke, and breedeth windinesse.

CHAP. 96.

Of Ciuies or Chiuies, and wilde Leekes.

¶ The Kindes.

THere be diuers kinds of Leekes, some wilde, and some of the garden, as shall be declared. Those called Ciuies haue beene taken of some for a kinde of wilde Onion: but all the Authors that I haue beene acquainted with, do accord that there is not any wild Onion.

1 *Schænoprason*.
Ciues or Chiues.

2 *Porrum vitigineum*.
French Leekes, or Vine Leekes.

3 *Ampeloprason siue porrum siluestre*.
Wilde Leeke.

¶ The Description.

1 **C**iues bring forth many leaues about a hand-full high, long, slender, round, like to little rushes; amongst which grow vp small and tender stalke, sending forth certaine knops with floures like those of the Onion, but much lesser. They haue many little bulbes or headed roots fastned together: out of which grow downe into the earth a great number of little strings, and it hath both the smell and taste of the Onion and Leek, as it were participating of both.

2 The Vine Leek or French Leek groweth vp with blades like those of Leekes: the stalke is a cubit high, on the top whereof standeth a round head or button, couered at the first with a thinne skinne, which being broken, the floures and seeds come forth like those of the Onion. The bulbe or headed root is round, hard, and sound, which is quickly multiplied by sending forth many bulbes.

3 The wilde Leek hath leaues much like vnto those of Crow-garlicke, but larger, and more acride. The floures and seeds also resemble those of the Crow-garlicke, the seeds being about the bignesse of cornes of wheat, with smal strings coming forth at their ends. ‡

¶ The

¶ The Time and Place.

1 Ciues are set in gardens, they flourish long, and continue many yeares, they suffer the cold of Winter. They are cut and polled often, as is the vnset Leeke.

2 The Vine-leeke groweth of it selfe in Vineyards, and neere vnto Vines in hot regions, where of it both tooke the name Vine-Leeke, and French Leeke. It beareth his greene leaues in Winter, and withereth away in the Sommer. It groweth in most gardens of England.

‡ Thus farre our Author describes and intimates to you a garden Leeke, much like the ordinarie in all respects, but somewhat larger. But the following names belong to the wilde Leeke, which here we giue you in the third place. ‡

¶ The Names.

Ciues are called in Greeke, *ῥαπανάκιον*, *Shanoprasum*: in Dutch, *Biesloack*, as though you should say, *Iuncum Porrum*; or Rush Leeke: in English, Ciues, Chiues, Ciuet and Sweth: in French, *Brelles*.

† 2 The Vine-leeke, or rather wild Leeke, is called in Greeke, *ῥαπανάκιον*, of the place where it naturally groweth: it may be called in Latine, *Porum Vitium*, or *Vitigineum Porrum*: in English, after the Greeke and Latine, Vine Leeke, or French Leeke.

¶ The Temperature.

Ciues are like in facultie vnto the Leeke, hot and dry. The Vine leeke heateth more than doth the other Leeke.

¶ The Vertues.

Ciues attenuate or make thinne, open, prouoke vrine, ingender hot and grosse vapours, and are hurtfull to the eyes and braine. They cause troublesome dreames, and worke all the effects that the Leeke doth. A

The Vine-leeke, or Ampeloprason, prouoketh vrine mightily, and bringeth downe the floures. B It cureth the bitings of venomous beasts, as *Dioscorides* writeth.

† The figure of *Ampeloprasum* was in the first place, in the Chapter next but one, by the name of *Allium sylvestre*.

CHAP. 97. Of Garlicke.

¶ The Description.

1 **T**He bulbe or head of Garlické is couered with most thinne skinnies or filmes of a very light white purple colour, consisting of many cloues seuered one from another, vnder which in the ground below groweth a tassell of threddy fibres: it hath long greene leaues like those of the Leeke, among which riseth vp a stalke at the end of the second or third yeare, whereupon doth grow a tuft of floures couered with a white skinne, in which, being broken when it is ripe, appeareth round blacke seeds.

‡ 2 There is also another Garlicke which growes wilde in some places of Germanie and France, which in shape much resembles the ordinarie, but the cloues of the roots are smaller and redder. The floure is also of a more duskie and darke colour than the ordinarie. ‡

¶ The Place and Times.

Garlick is seldome sowne of seed, but planted in gardens of the small cloues in Nouember and December, and sometimes in Februarie and March.

¶ The Names.

It is called in Latine, *Allium*: in Greeke, *ῥαπανάκιον*: The Apothecaries keepe the Latine name: the Germanes call it *Knoblauch*: the Low Dutch, *Look*: the Spaniards, *Aios*, *Alho*: the Italians, *Aglia*: the French, *Ail* or *Aux*: the Bohemians, *Cesnek*: the English, Garlicke, and poore mans Treacle.

¶ The Temperature.

Garlicke is very sharpe, hot, and dry, as *Galen* saith, in the fourth degree, and exulcerateth the skinne by raising blisters.

¶ The Vertues.

Being eaten, it heateth the body extremely, attenuateth and maketh thinne thicke and grosse humors; cutteth such as are tough and clammy, digesteth and consumeth them; also openeth obstructions, is an enemy to all cold poysons, and to the bitings of venomous beasts: and therefore *Galen* nameth it *Theriaca Rusticorum*, or the husbandmans Treacle. A

It yeeldeth to the body no nourishment at all; it ingendreth naughty and sharpe blood. There-fore B

fore such as are of a hot complexion must especially abstaine from it. But if it be boyled in water vntill such time as it hath lost his sharpenesse, it is the lesse forcible, and retaineth no longer his euill iuyce, as *Galen* saith.

- C It taketh away the roughnesse of the throat, it helpeth an old cough, it prouoketh vrine, it breake-
keth and consumeth winde, and is also a remedie for the Dropsie which proceedeth of a cold
cause.
- D It killeth wormes in the belly, and driueth them forth. The milke also wherein it hath beene
fodden is giuen to yong children with good successe against the wormes.

1 *Allium*.
Garlicke.

2 *Allium sylvestre rubentibus nucleis*.
Wilde Garlicke with red cloues.

- E It helpeth a very cold stomacke, and is a preseruatiue against the contagious and pestilent
aire.
- F The decoction of Garlick vsed for a bath to sit ouer, bringeth downe the floures and secondines
or after-burthen, as *Dioscorides* saith.
- G It taketh away the morpew, tetters, or ring-wormes, scabbed heads in children, dandraffe and
scurfe, tempered with honey, and the parts anointed therewith.
- H With Fig leaues and Cumin it is laid on against the bitings of the Mousse called in Greeke,
μύσκα: in English, a Shrew.

CHAP. 98. Of Crow-Garlicke and Ramsons.

¶ The Description.

The wilde Garlicke or Crow-garlicke hath small tough leaues like vnto rushes, smooth and hollow within; among which groweth vp a naked stalke, round, slipperie, hard and found: on the top whereof, after the floures be gone, grow little seeds made vp in a round cluster like small kernels, hauing the smell and taste of Garlick. In stead of a root there is a bulbe or round head without any cloues at all.

Ramsons do fend forth two or three broad longish leaues sharpe pointed, smooth, and of a light Greene colour. The stalke is a span high, smooth and slender, bearing at the top a cluster of white star-fashioned floures. In stead of a root it hath a long slender bulbe, which senderth downe a multitude of strings, and is couered with skinnies or thicke coats.

† 1 *Allium sylvestre.*
Crow Garlicke.

2 *Allium ursinum.*
Ramsons.

¶ The Time.

They spring vp in Aprill and May. Their seed is ripe in August.

¶ The Place.

The Crow Garlicke groweth in fertile pastures in all parts of England. I found it in great plenty in the fields called the Mantels, on the backside of Islington by London.

Ramsons grow in the Woods, and borders of fields vnder hedges, among the bushes. I found it in the next field vnto Boobies barne, vnder that hedge that bordereth vpon the lane; and also vpon the left hand, vnder an hedge adioyning to a lane that leaeth to Hampsted, both places neere London.

¶ The

¶ The Names.

Both of them bewilde Garlicke, and may be called in Latine, *Allina sylvestria*: in Greeke, *Onigrida sylvestris*: The first, by *Dodonaeus* and *Lobell* is called *Allium sylvestre tenuifolium*.

Ramsons are named of the later praetioners, *Allium Vrsinum*, or Beares Garlicke: *Allium latifolium*, and *Moly Hippocraticum*: in English, Ramsons, Ramfies, and Buckrams.

¶ The Nature.

The temperatures of these wilde Garlickes are referred vnto those of the gardens.

¶ The Vertues.

- A Wilde Garlicke, or Crow-Garlicke, as *Galen* saith, is stronger and of more force than the garden Garlicke.
- B The leaues of Ramsons be stamped and eaten of diuers in the Low-countries, with fish for a sauce, euen as we do eate greene-sauce made with sorrell.
- C The same leaues may very well be eaten in April and May with butter, of such as are of a strong constitution, and labouring men.
- D The distilled water drunke breaketh the stone, and driueth it forth, and prouoketh vrine.

CHAP. 99. Of Mountaine Garlicks.

1 *Scorodoprasum*.

Great mountaine Garlicke.

‡ 2 *Scorodoprasum primum* *Clusij*.

Clusius his great mountaine Garlicke.

¶ The Description.

1 2 **T**He great Mountaine Garlicke hath long and broad leaues like those of Leekes, but much greater and longer, embracing or clasping about a great thicke stalke, soft and full of iuyce, bigger than a mans finger, and bare toward the top; vpon which is set a great head bigger than a tennise ball, couered with a skinne after the manner of an Onion. The skinne when it commeth to perfection breaketh, and discovereth a great multitude of whitish floures; which being past, blacke seeds follow, inclosed in a three cornered huske. The root is bulbous, of the bignesse of a great Onion. The whole plant smelleth very strong like vnto Garlick,

Garlicke, and is in shew a Leeke, whereupon it was called *Scorodoprasum*, as if we should say, Garlicke Leeke; participating of the Leeke and Garlicke, or rather a degenerate Garlicke growne monstrous.

I cannot certainly determine what difference there may be betweene the plants expressed by the first figure, which is our Authors, and the second figure which is taken out of *Clusius*. Now the historie which *Clusius* gives vs to the second, the same is (out of him) giuen by our Author to the first: so that by this reason they are of one and the same plant. To the which opinion I rather incline, than affirme the contrarie with *Bauhine*, who distinguishing them, puts the first amongst the Leekes, vnder the name of *Porrum folio latissimo*: following *Tabernamentanus*, who first gaue this figure, vnder the name of *Porrum Syriacum*.

This plant is lesser in all the parts than the former; the root is set about with longer and slenderer bulbes wrapped in brownish skinnies; the floures and leaues are like, yet smaller than Garlicke.

† 3 *Scorodoprasum minus.*

The lesser lecke-leaued Garlicke.

† 4 *Ophioscoridon.*
Vipers Garlicke.

4 The third, which *Clusius* makes his second *Scorodoprasum*, hath stalkes some two cubits high, hauing many leaues like those of Leekes from the bottome of the stalke to the middle thereof; their smell is betweene that of Leekes and Garlicke; the rest of the stalke is naked, green, smooth, sustaining at the top a head composed of many bulbes, couered with a whitish skinne ending in a long greene point; which skinne by the growth of the bulbes being broken, they shew themselves, being first of a purplish, and afterwards of a whitish colour, amongst which are some floures. The top of the stalke at first twines it selfe, so that it in some sort represents a serpent; then by little it vntwines againe, and beares the head straight vp. The root consists of many cloues much like that of Garlicke. †

5 The broad leaued Mountaine Garlicke, or rather the Mountaine Ramsons, riseth vp with a stalke a cubit high, a finger thicke, yet very weake, full of a spongeous substance, neere to the bottome of a purplish colour, and greene aboue, bearing at the top a multitude of small whitish floures, somewhat gaping, star-fashion. The leaues are three or foure, broad ribbed like the leaues of great Gentian, resembling those of Ramsons, but greater. The root is great and long, couered with many scaly coats and hairy strings.

5 *Allium Alpinum latifolium, seu Victorialis.*
Broad leaved Mountaine Garlicke.

meanes they will recouer their sight. Those that worke in the mines in Germany affirme, That they find this root very powerfull in defending them from the assaults of impure spirits or diuels, which often in such places are troublesome vnto them. *Clus.* ‡

¶ *The Place.*

The great mountaine Garlicke growes about Constantinople, as saith *Clusius*. I receiued a plant of it from M. *Thomas Edwards*, Apothecary of Excester, who found it growing in the West parts of England.

Victoralis groweth in the mountaines of Germany, as saith *Carolus Clusius*, and is yet a stranger in England for any thing that I do know.

‡ ¶ *The Time.*

‡ Most of these plants floure in the months of Iune and Iuly.

¶ *The Names.*

Of the first and second I haue spoken already. The third is *Scorodoprassum minus* of *Lobell*. The fourth is *Allium sativum secundum* of *Dodoneus*, and *Scorodoprassum secundum* of *Clusius*. The fifth is *Allium anguinum* of *Matthiolus*; *Ophioscoridon* of *Lobell*, and *Victoralis* of *Clusius* and others, as also *Allium Alpinum*. The Germanes call it *Seig-wurtz*.

¶ *The Temper.*

They are of a middle temper between Leekes and Garlicke.

¶ *Their Vertues.*

Scorodoprassum, as it partakes of the temper, so also of the vertues of Leekes and Garlicke; that is, it attenuates grosse and tough matter, helps expectoration, &c.

Victoralis is like Garlicke in the operation thereof. Some (as *Camerarius* writeth) hang the root thereof about the necks of their cattell being false blinde, by what occasion soeuer it happen, and perswade themselves that by this

CHAP. 100. Of Moly, or the Sorcerers Garlicke.

¶ *The Description.*

1 **T**He first kinde of Moly hath for his root a little whitish bulbe somewhat long, not vnlike to the root of the vnset Leeke, which sendeth forth leaues like the blades of corne or grasse: among which doth rise vp a slender weake stalke, fat and full of iuyce, at the top whereof commeth forth of a skinny filme a bundle of milke-white floures, not vnlike to those of Ramsons. The whole plant hath the smell and taste of Garlicke, whereof no doubt it is a kinde.

2 Serpents Moly hath likewise a small bulbous root with some fibres fastned to the bottom, from which rise vp weake grassie leaues of a shining Greene colour, crookedly winding and turning themselves toward the point like the taile of a Serpent, whereof it tooke his name: the stalke is tough, thicke, and full of iuyce, at the top whereof standeth a cluster of small red bulbes, like vnto the smallest cloue of Garlicke, before they be pilled from their skinne. And among those bulbes there do thrust forth small and weake foot-stalkes, euery one bearing at the end one small white floure tending to a purple colour: which being past, the bulbes do fall downe vpon the ground, where they without helpe do take hold and root, and thereby greatly encrease, as also by the infinite bulbes that the root doth cast off: all the whole plant doth smell and taste of Garlick, whereof it is also a kinde.

3 *Homers* Moly hath very thicke leaues, broad toward the bottome, sharpe at the point, and hollowed

1 *Moly Dioscorideum.*
Dioscorides his Moly.

2 *Moly Serpentinum.*
Serpents Moly.

3 *Moly Homericum.*
Homers Moly.

hollowed like a trough or gutter, in the bosome of which leaues neere vnto the bottome commeth forth a certaine round bulbe or ball of a goose-turd Greene colour: which being ripe and set in the ground groweth and becommeth a faire plant such as is the mother. Among those leaues riseth vp a naked smooth thicke stalke, of two cubits high, as strong as a small walking staffe: at the top of the stalke standeth a bundle of faire whitish floures, dashed ouer with a wash of purple colour, smelling like the floures of Onions. When they be ripe there appeareth a blacke seed wrapped in a white skinne or huske. The root is great and bulbous, couered with a blackish skinne on the outside, and white within, and of the bignesse of a great Onion.

4 Indian Moly hath verythicke fat short leaues, and sharpe pointed, in the bosome wherof commeth forth a thicke knobby bulbe like that of *Homers Moly*. The stalke is also like the precedent, bearing at the top a cluster of scaly bulbes included in a large thinn skin or filme. The root is great, bulbous fashion, and full of iuyce.

5 *Caucason*, or withering Moly, hath a very great bulbous root, greater than that of *Homers Moly*, and fuller of a slimie iuyce; from which do arise three or foure great thicke and broad leaues withered alwaies at the point; wherein

wherein consisteth the difference betweene these leaues and those of *Homers Moly*, which are not so. In the middle of the leaues riseth vp a bunch of smooth greenish bulbes set vpon a tender foot-stalke, in shape and bignesse like to a great garden Worme, which being ripe and planted in the earth, do also grow vnto a faire plant like vnto their mother.

† These two last mentioned (according to *Bauhine*, and I thinke the truth) are but figures of one and the same plant; the later whereof is the better, and more agreeing to the growing of the plant.

6 To these may be fitly added two other Molyes: the first of these, which is the yellow Moly, hath roots whitish and round, commonly two of them growing together; the leaues which it sends forth are long and broad, and somewhat resemble those of the Tulip, and vsually are but two in number; betweene which rises vp a stalke some foot high, bearing at the top an vmbell of faire yellow star-like floures tipt on their lower sides with a little Greene. The whole plant smelleth of Garlicke.

4 *Moly Indicum*.
Indian Moly.

5 *Caucason*.
Withering Moly.

7 This little Moly hath a root about the bignesse of an Hasell nut, white, with some fibres hanging thereat; the stalke is of an handfull or little more in height, the top thereof is adorned with an vmbel of ten or twelue white floures, each of which consists of six leaues, not sharpe pointed, but turned round, and pretty large, considering the bignesse of the plant. This plant hath also vsually but two leaues, and those like those of Leekes, but far lesse. ‡

¶ *The Place.*

† These plants grow in the garden of *M. Iohn Parkinson* Apothecarie, and with *M. Iohn Tradescant* and some others, studious in the knowledge of plants.

¶ *The Time.*

They spring forth of the ground in Februarie, and bring forth their floures, fruit, and seed in the end of August.

¶ *The Names.*

† Some haue deriued the name *Moly* from these Greeke words, *Μολογις* *ῥιζος*: that is, to driue away diseases. It may probably be argued to belong to a certaine bulbous plant, and that a kind of

of Garlicke, by the words *μῶλυζα*, and *μῶλυξ*. The former, *Galen* in his *Lexicon* of some of the difficult words vsed by *Hippocrates*, thus expounds: *Σκέπτεσθαι ἀπὸ τοῦ πρὸς τῇ κεφαλῇ ἔχειν, ὅτι μὴ διαλυτὸν μῶλόν ἐστιν ἀλλ' ἓν ἐστὶν ὅλον. πρὸς δὲ τὸ μῶλυ.* That is, *Moliza* is a Garlicke hauing a simple or single head, and not to be parted or distinguished into cloues: some terme it *Moly*. *Erotianus* in his *Lexicon* expounds the later thus: *μῶλυξ* (saith hee) *Σκεπδὴ κεφαλὴ καλομένη, &c.* That is; *Molyx* is a head of Garlicke, round, and not to be parted into cloues. ‡

¶ The Names in particular.

‡ 1 This is called *Moly* by *Matthiolus*; *Moly Angustifolium* by *Dodoneus*; *Moly Dioscorideum* by *Lobel* and *Clusius*.

2 This, *Moly Serpentinum vocatum*, by *Lobel* and the Author of the *Hist. Lugd.*

3 This same is thought to be the *Moly* of *Theophrastus* and *Pliny*, by *Dodoneus*, *Clusius*, &c. and some also would haue it to be that of *Homer*, mentioned in his twentieth *Odyss*. *Lobel* calleth it *Moly Liliflorum*.

4 5 The fourth and fifth being one, are called *Caucason*, and *Moly Indicum* by *Lobel*, *Clusius*, and others.

6 This is *Moly Montanum latifolium flauo flore* of *Clusius*, and *Moly luteum* of *Lobel*, *Aduersar.*

par. 2.

7 This same is *Moly minus* of *Clusius*. ‡

‡ 6 *Moly latifolium flore flauo.*

Broad leaued Moly with the yellow floure.

‡ 7 *Moly minus flore albo.*

Dwarfe white floured Moly.

¶ The Temperature and Vertues.

These Molyes are very hot, approaching to the nature of Garlicke, and I doubt not but in time some excellent man or other will find out as many good vertues of them, as their stately and comely proportion should seeme to be possessed with. But for my part, I haue neither proued, nor heard of others, nor found in the writings of the Antients, any thing touching their faculties. Only *Dioscorides* reporteth, That they are of maruellous efficacie to bring downe the termes, if one of them be stamped with oyle of Floure de-luce according to art, and vsed in manner of a pessarie or mother suppositorie.

Q

CHAP.

‡ CHAP. 79. Of diuers other Molyes.

‡ BESIDES the Garlickes and Molyes formerly mentioned by our Author, and those I haue in this Edition added, there are diuers others, which, mentioned by *Clusius*, and belonging vnto this Tribe, I haue thought good in this place to set forth. Now for that they are more than conueniently could be added to the former chapters, (which are sufficiently large) I thought it not amisse to allot them a place by themselves.

‡ 1 *Moly Narcissinis folijs primum.*
The first Narcisse-leaued Moly.

‡ 2 *Moly Narcissinis folijs secundum.*
The second Narcisse-leaued Moly.

¶ The Description.

‡ 1 THIS, which in face nighest represents the Molyes described in the last Chapter, hath a root made of many scales, like as an Onion in the vpper part, but the lower part is knotty, and runnes in the ground like as *Solomons Seale*; the Onion-like part hath many fibres hinging thereat; the leaues are like those of the white Narcisse, very greene and shining, amongst which riseth vp a stalke of a cubit high, naked, firme, greene, and crested; at the top come forth many floures consisting of six purplish leaues, with as many chiues on their insides: after which follow three square heads, opening when they are ripe, and containing a round blacke seed.

‡ 2 This other being of the same kinde, and but a varietie of the former, hath softer and more Ash-coloured leaues, with the floures of a lighter colour. Both these floure at the end of Iune, or in Iuly.

‡ 3 This hath five or six leaues equally as broad as those of the last described, but not so long, being somewhat twined, greene, and shining. The stalke is some foot in length, smaller than that of the former, but not lesse stiffe, crested, and bearing in a round head many floures, in manner of growing and shape like those of the former, but of a more elegant purple colour. In seed and root it

‡ 3 *Moly Narcissinis folijs tertium.*
The third Narcisse-leaved Moly.

‡ 4 *Moly montanum latifolium* 1. *Clusij.*
The first broad leaved mountaine Moly.

‡ 5 *Moly montanum secundum Clusij.*
The second mountaine Moly.

it resembles the precedent. There is also a variety of this kinde, with leaues longer and narrower, neither so much twined, the stalks weaker, and floures much lighter coloured.

This floures later than the former, to wit, in July and August.

All these plants grow naturally in Leitenberg and other hills neere to Vienna in Austria, where they were first found and obserued by *Carolus Clusius*.

4 This hath a stalke some two cubits high, which euen to the middle is incompassed with leaues much longer and broader than those of Garlicke, and very like those of the Leeke: on the top of the smooth and rush-like stalke groweth a tuft consisting of many darke purple coloured bulbs growing close together, from amongst which come forth pretty long stalkes bearing light purple starre-fashioned floures, which are succeeded by three cornered seed-vessels. The root is bulbous, large, consisting of many cloues, and hauing many white fibres growing forth thereof. Moreouer, there grow out certain round bulbes about the root, almost like those which grow in the head, and being planted apart, they produce plants of the same kinde. This is *Allium*, *sine Moly montanum latifolium* 1. *Clusij*.

5 This hath a smooth round Greene stalke some cubit high, whereon doe grow most com-

monly three leaues narrower than those of the former, and as it were grassy. The top of the stalke sustaines a head wrapped in two lax filmes, each of them running out with a sharpe point like two hornes, which opening themselues, there appeare many small bulbes heaped together, amongst which are floures composed of six purplish little leaues, and fastned to long stalkes. The root is round and white, with many long white fibres hanging thereat. *Clusius* calls this, *Allium*, *sive Moly montanum secundum*. And this is *Lobels Ampeloprason proliferum*.

6 Like to the last described is this in height and shape of the stalke and leaues, as also in the forked or horned skinne inuoluing the head, which consisteth of many small bulbes of a reddish Greene colour, and ending in a long Greene point; amongst which, vpon long and slender stalkes hang downe floures like in forme and magnitude to the former, but of a whitish colour, with a darke purple streake alongst the middle, and vpon the edges of each leafe. The root is round and white, like that of the last described. This *Clusius* giues vnder the title of *Allium sive Moly montanum tertium*.

‡ 6 *Moly montanum* 3. *Clus.*
The third mountaine Moly.

‡ 7 *Moly montani quarti spec. 1. Clus.*
The fourth mountaine Moly; the first sort thereof.

7 This also hath three rushy leaues, with a round stalke of some cubit high, whose top is likewise adorned with a forked membrane, containing many pale coloured floures hanging vpon long stalkes, each floure consisting of six little leaues, with the like number of chiues, and a pestil in the midst. This tuft of floures cut off with the top of the stalke, and carried into a chamber, wil yeeld a pleasant smell (like that which is found in the floures in the earlier *Cyclamen*) but it will quickly decay. After these floures are past succeed three cornered heads containing a blacke small seed, not much vnlike Gillofloure seed. The root is round like the former, sometimes yeelding off-sets. This is *Alij montani 4. species 1. of Clusius*.

8 There is another kinde of this last described, which growes to almost the same height, and hath like leaues, and the head ingirt with the like skinny long pointed huskes; but the floures of this are of a very darke colour. The roots are like the former, with off-sets by their side. This is *Clusius*

Clusius his *Moly montani quarti species secunda*. The roots of the three last described smell of garlick, but the leaues haue rather an hearby or grasse-like smell.

The fifth and sixth of these grow naturally in the Styrian and Austrian Alpes. The seventh growes about Presburg in Hungarie, about Niclasburg in Morauia, but most abundantly about the Baths in Baden.

‡ 8 *Moly montani quarti species secunda*
Clusij.

The second kinde of the fourth
mountaine Moly.

‡ 9 *Moly montanum quintum Clusij*.

The fifth mountaine Moly.

9 This growes to the like height as the former, with a greene stalke, hauing few leaues there-upon, and naked at the top, where it carieth a round head consisting of many star-like small floures, of a faire purple colour, fastned to short stalkes, each floure being composed of fixe little leaues, with as many chiues, and a pestill in the middle. The root is bulbous and white, hauing sometimes his off-sets by his sides. The smell of it is like Garlick. This groweth also about Presburgh in Hungarie, and was there obserued by *Clusius* to beare his floure in May and Iune. He calleth this *Allium*, seu *Moly montanum quintum*. ‡

CHAP. 102.

Of White Lillies.

¶ The Kindes.

There be sundry sorts of Lillies, whereof some be wilde, or of the field; others tame, or of the garden; some white, others red; some of our owne countries growing, others from beyond the seas: and because of the variable sorts we will diuide them into chapters, beginning with the two white Lillies, which differ little but in the native place of growing.

¶ The Description.

1 The white Lillie hath long, smooth, and full bodied leaues, of a grassie or light Greene colour. The stalkes be two cubits high, and sometimes more, set or garnished with the like leaues, but growing smaller and smaller toward the top; and vpon them doe grow faire white floures strong of smell, narrow toward the foot of the stalke whereon they doe grow, wide or open in the mouth like a bell. In the middle part of them doe grow small tender pointals tipped with a dusty yellow colour, ribbed or chamfered on the backe side, consisting of six small leaues thicke and fat. The root is a bulbe made of scaly cloues, full of rough and clammy iuyce, wherewith the whole plant doth greatly abound.

2 The white Lilly of Constantinople hath very large and fat leaues like the former, but narrower and lesser. The stalke riseth vp to the height of three cubits, set and garnished with leaues also like the precedent, but much lesse. Which stalke oftentimes doth alter and degenerate from his naturall roundnesse to a flat forme, as it were a lath of wood furrowed or chanelled alongst the same, as it were ribs or welts. The floures grow at the top like the former, sauing that the leaues do turne themselues more backward like the Turkes cap, and beareth many more floures than our English white Lilly doth.

1 *Lilium album.*

The white Lilly.

**2** *Lilium album Bizantinum.*

The white Lilly of Constantinople.

¶ The Place.

Our English white Lilly groweth in most gardens of England. The other groweth naturally in Constantinople and the parts adiacent, from whence wee had plants for our English gardens, where they flourish as in their owne country.

¶ The Time.

The Lillies floure from May to the end of Iune.

¶ The Names.

The Lillie is called in Greeke *λilium*: in Latine, *Lilium*, and also *Rosa Iunonis*, or Iuno's Rose, because as it is reported it came vp of her milke that fell vpon the ground. For the Poets feigne, That *Hercules*, who *Iupiter* had by *Alcumena*, was put to Iuno's breasts whilest shee was asleepe; and after the sucking there fell away abundance of milke, and that one part was spilt in the heauens, and the other on the earth; and that of this sprang the Lilly, and of the other the circle in the heauens called

called *Lacteus Circulus*, or the milky way, or otherwise in English Watling street. Saint *Basill* in the explication of the 44. Psalme saith, That no floure so liuely sets forth the frailty of mans life as the Lilly. It is called in high Dutch, *Weiß Gilgen*: in low Dutch, *Witte Lilien*: in Italian, *Giglio*: in Spanish, *Lirio blanco*: in French, *Lys blanc*: in English, the white Lilly.

The other is called *Lilium album Bizantinum*, and also *Martagon album Bizantinum*: in English, the white Lilly of Constantinople: of the Turkes themselves, *Sultan Zambach*, with this addition, (that they might be the better knowne which kinde of Lilly they meant when they sent roots of them into these countries) *Fa fiora grandi Bianchi*; so that *Sultan Zambach fa fiora grandi Bianchi*, is as much to say as, Sultans great Lilly with white floures.

¶ The Nature.

The white Lilly is hot, and partly of a subtil substance. But if you regard the root, it is dry in the first degree, and hot in the second.

¶ The Vertues.

The root of the garden Lilly stamped with honey gleweth together sinewes that be cut in sunder. It consumeth or scoureth away the vlcers of the head called *Achores*, and likewise all scur-
uiness of the beard and face. A

The Root stamped with Vineger, the leaues of Henbane, or the meale of Barley, cureth the tumours and apostumes of the priuy members. It bringeth the haire againe vpon places which haue beene burned or scalded, if it be mingled with oyle or grease, and the place anointed there-
with. B

The same root rosted in the embers, and stamped with some leauen of Rie bread and Hogges grease, breaketh pestilentiall botches. It ripeneth Apostumes in the flankes, comming of venery and such like. C

The floures steeped in Oyle Oliue, and shifted two or three times during Sommer, and set in the Sunne in a strong glasse, is good to soften the hardnesse of sinewes, and the hardnesse of the matrix. D

Florentinus a writer of husbandry saith, That if the root be curiously opened, and therein be put some red, blew, or yellow colour that hath no causticke or burning qualitie, it will cause the floure to be of the same colour. E

Iulius Alexandrinus the Emperors Physitian saith, That the water thereof distilled and drunke causeth easie and speedy deliuerance, and expelleth the secondine or after-burthen in most speedy manner. F

He also saith, the leaues boyled in red Wine, and applied to old wounds or vlcers, doe much good, and forward the cure, according to the doctrine of *Galen* in his seuenth booke *de simpl. med. facultat.* G

The root of a white Lilly stamped and strained with wine, and giuen to drinke for two or three dayes together, expelleth the poyson of the pestilence, and causeth it to breake forth in blisters in the outward part of the skinne, according to the experience of a learned Gentleman *M. William Godorus*, Sergeant Surgeon to the Queenes Maiestie: who also hath cured many of the Dropsey with the iuyce thereof, tempered with Barley meale, and baked in cakes, and so eaten ordinarily for some moneth or six weekes together with meate, but no other bread during that time. H

CHAP. 103. Of Red Lillies.

¶ The Kindes.

There be likewise sundry sorts of Lillies, which we do comprehend vnder one generall name in English, Red Lillies, whereof some are of our owne countries growing, and others of beyond the seas, the which shall be distinguished severally in this chapter that followeth.

¶ The Description.

The gold-red Lilly groweth to the height of two, and sometimes three cubits, and often higher than those of the common white Lilly. The leaues be blacker and narrower, set very thicke about the stalke. The floures in the top be many, from ten to thirty floures, according to the age of the plant, and fertilitie of the soile, like in forme and greatnesse to those of the white Lilly, but of a red colour tending to a Saffron, sprinkled or poudred with many little blacke specks, like to rude vnperfect draughts of certaine letters. The roots be great bulbes, consisting of many cloues, as those of the white Lilly.

‡ 2 In stead of the Plantaine leaved red Lilly, described and figured in this second place by our Author out of *Tabernamontanus*, for that I iudge both the figure and description counterfeit, I haue omitted them, and here giue you the many-floured red Lilly in his stead. This hath a root like that of the last described, as also leaues and stalkes; the floure also in shape is like that of the former, but of a more light red colour, and in number of floures it exceedeth the precedent, for sometimes it beares sixty floures vpon one stalke. ‡

† 3 This red Lilly is like vnto the former, but not so tall; the leaues be fewer in number, broader, and downy towards the top of the stalke, where it beares some bulbes. The floures in shape be like the former, sauing that the colour hereof is more red, and thicke dasht with blacke specks. The root is scaly like the former.

4 There is another red Lilly which hath many leaues somewhat ribbed, broader than the last mentioned, but shorter, and not so many in number. The stalke groweth to the height of two cubits, and sometimes higher, whereupon do grow floures like the former: among the foot-stalks of which floures come forth certaine bulbes or cloued roots, browne of colour, tending vnto rednesse; which do fall in the end of August vpon the ground, taking root and growing in the same place, whereby it greatly encreaseth, for seldome or neuer it bringeth forth seed for his propagation.

1 *Lilium aureum*.
Gold-red Lilly.

† 2 *Lilium rubrum*.
The red Lilly.

5 There is another sort of red Lillie hauing a faire scaly or cloued root, yellow aboue, and browne toward the bottome; from which riseth vp a faire stiffe stalke crested or furrowed, of an ouer-worne browne colour, set from the lower part to the branches, whereon the floures doe grow with many leaues, confusedly placed without order. Among the branches close by the stem grow forth certaine cloues or roots of a reddish colour, like vnto the cloues of Garlicke before they are pilled; which being fallen vpon the ground at their time of ripenesse, do shoot forth certaine tender strings or roots that do take hold of the ground, whereby it greatly encreaseth. The floures are in shape like the other red Lillies, but of a darke Orange colour, resembling a flame of fire spotted with blacke spots.

‡ 6 This hath a much shorter stalke, being but a cubit or lesse in height, with leaues blackish

kish, and narrower than those afore going. The floures, as in the rest, grow out of the top of the stalke, and are of a purplish Saffron colour, with some blackish spots. The root in shape is like the precedent. ‡

¶ The Place.

These Lillies do grow wilde in the plowed fields of Italy and Languedocke, in the mountaines and vallies of Hetruria and those places adiacent. They are common in our English gardens, as also in Germany.

¶ The Time.

These red Lillies do floure commonly a little before the white Lillies, and sometimes together with them.

3 *Lilium cruentum latifolium.*
The fierie red Lilly.

‡ 4 *Lilium cruentum bulbiferum.*
Red bulbe-bearing Lilly.

¶ The Names.

‡ 1 The first of these is thought by some to be the *Bulbus cruentus* of Hippocrates; as also the *Lilium purpureum* of Dioscorides: Yet Matthiolus and some others would haue it his *Hemerocallis*. Dodonæus and Bapt. Porta thinke it the *Hyacinthus* and *Cosmosandalos* of the Poets, of which you shall finde more hereafter. It is the *Martagon Chymistarum* of Lobell, and the *Lilium aureum majus* of Tabernamontanus.

2 This is *Martagon Chymistarum alterum* of Lobell. 3 This is Clusius his *Martagon bulbiferum secundum*. 4 *Martagon bulbiferum primum* of Clusius. 5 This Dodonæus calls *Lilium purpureum tertium*, and it is *Martagon bulbiferum tertium* of Clusius. 6 This last Lobell and Dodonæus call *Lilium purpureum minus*.

I haue thought good here also to giue you that discourse touching the Poets Hyacinth, which being translated out of Dodonæus, was formerly vnfitly put into the chapter of Hyacinths; which therefore I there omitted, and haue here restored to his due place, as you may see by Dodonæus, *Pempt. 2. lib. 2. cap. 2.* ‡

† There is a Lilly which Ouid, *Metamorph. lib. 10.* calls *Hyacinthus*, of the boy *Hyacinthus*, of whose blood he feigneth that this floure sprang, when he perished as he was playing with *Apollo*, for

for whose sake, he saith, that *Apollo* did print certaine letters and notes of his mourning. These are his words :

*Ecce cruor, qui fusus humo signauerat herbas,
Desinit esse cruor, Tyrioque nitentior ostro
Flos oritur, formamque capit, quam Lilia, si non
Purpureus color his argenteus esset in illis.
Non satis hoc Phæbo est, (is enim fuit auctor honoris)
Ipse suos gemitus folijs inscribit, & ai ai,
Flos habet inscriptum, funestaque litera ducta est.*

Which lately were elegantly thus rendred in English by M. Sands :

Behold ! the blood which late the grasse had dy'de
Was now no blood : from thence a floure full blowne,
Far brighter than the Tyrian scarlet shone :
Which seem'd the same, or did resemble right
A Lilly, changing but the red to white.
Nor so contented, (for the Youth receiu'd
That grace from *Phæbus*) in the leaues he weau'd
The sad impression of his sighs, Ai, Ai,
They now in funerall characters display, &c.

‡ 5 *Lilium cruentum secundum caulem
bulbulis donatum.*

Red Lilly with bulbes growing alongst
the stalke.

‡ 6 *Lilium purpureum minus.*
The small red Lilly.

Theocritus also hath made mention of this *Hyacinth*, in *Bions* Epitaph, in the 19. *Eidyl*. which *Eidyl* by some is attributed to *Moschus*, and made his third. The words are these :

*Νῦν ὁ κινδὺς λαλεῖ τὰ σὰ γράμματα καὶ πλὴσι εἴ τι
Λάμβαν' οὐκ ἔτι πέλοισι.*

In English thus :

Now *Iacinth* speake thy letters, and once more
Imprint thy leaues with Ai, Ai, as before.

Likewise

Likewise *Virgill* hath written hereof in the third *Eclog* of his *Bucolicks*.

*Et me Phæbus amat, Phæbo sua semper apud me
Munera sunt, lauri & suauè rubens Hyacinthus.*

Phæbus loues me, his gifts I alwayes haue,
The e're greene Laurel, and the Iacynth braue.

In like manner also *Nemesianus* in his second *Eclog* of his *Bucolicks*.

*Te sine me, misero mihi Lilia nigra videntur,
Pallentesque Rosa, nec dulce rubens Hyacinthus:
At si tu venias, & candida Lilia fient
Purpureæque Rosa, & dulce rubens Hyacinthus.*

Without thee, Loue, the Lillies blacke do seeme;
The Roses pale, and Hyacinths I deeme
Not louely red. But if thou com'st to me,
Lillies are white, red Rose and Iacynth be.

The Hyacinths are said to be red which *Ouid* calleth purple; for the red colour is somtimes termed purple. Now it is thought this *Hyacinthus* is called *Ferrugineus*, for that it is red of a rusty iron colour: for as the putrifaction of brasse is named *Ærugo*; so the corruption of iron is called *Ferrugo*, which from the reddish colour is stiled also *Rubigo*. And certainly they are not a few that would haue *Color ferrugineus* to be so called from the rust which they thinke *Ferrugo*. Yet this opinion is not allowed of by all men; for some iudge, that *Color ferrugineus* is inclining to a blew, for that when the best iron is heated and wrought, when as it is cold againe it is of a colour neere vnto blew, which from *Ferrum* (or iron) is called *Ferrugineus*. These latter ground themselues vpon *Virgils* authoritie, who in the sixth of his *Æneidos* describeth *Charons* ferrugineous barge or boat, and presently calleth the same blew. His words are these:

Ipse ratem conto subigit velisque ministrat,

Et ferruginea subuectat corpora Cymba,

He thrusting with a po'e, and setting sailes at large,
Bodies transports in ferrugineous barge.

And then a little after he addes;

Cæruleam aduertit puppim, ripaque propinquat.

He then turnes in his blew Barge, and the shore
Approches nigh to.

And *Claudius* also, in his second booke of the carrying away of *Proserpina*, doth not a little confirme their opinions; who writeth, That the Violets are painted, *ferrugine dulci*, with a sweet iron colour.

Sanguineo splendore rosas, vaccinea nigro

Induit, & aulci violas ferrugine pingit.

He trimmes the Rose with bloody bright,
And Prime-tree berries blacke he makes,
And decks the Violet with a sweet
Darke iron colour which it takes.

But let vs returne to the proper names from which we haue digressed. Most of the later Herbarists do call this Plant *Hyacinthus Poeticus*, or the Poets Hyacinth. *Pausanias* in his second booke of his *Corinthiackes* hath made mention of *Hyacinthus* called of the Hermonians, *Comosandalos*, setting downe the ceremonies done by them on their festiuall dayes, in honour of the goddesse *Cythonia*. The Priests (saith he) and the Magistrates for that yeare being, doe leade the troupe of the pompe; the women and men follow after; the boyes solemnly leade forth the goddesse with a stately shew: they go in white vestures, with garlands on their heads made of a floure which the Inhabitants call *Comosandalos*, which is the blew or sky-coloured Hyacinth, hauing the marks and letters of mourning as aforesaid.

¶ The Nature.

The floure of the red Lilly (as *Galen* saith) is of a mixt temperature, partly of thinne, and partly of an earthly essence. The root and leaues do dry and cleanse, and moderately digest, or waste and consume away.

¶ The Vertues.

The leaues of the herbe applied are good against the stinging of Serpents.

The same boiled and tempered with vineger are good against burnings, and heale green wounds and Vicers. A
B

The root roasted in the embers, and pounded with oyle of Roses cureth burnings, and softneth hardness of the matrix. C

The

- D The same stamped with honey cureth the wounded sinewes and members out of ioynt. It takes away the morpheu, wrinkles, and deformitie of the face.
- E Stamped with Vineger, the leaues of Henbane, and wheat meale, it remoueth hot swellings of the stones, the yarde, and matrix.
- F The roots boyled in Wine (saith *Pliny*) causeth the cornes of the feet to fall away within few dayes, with remouing the medicine vntill it haue wrought his effect.
- G Being drunke in honied water, they driue out by siege vnprofitable bloud.

CHAP. 104.

Of Mountaine Lillies.

¶ The Description.

THe great mountaine Lilly hath a cloued bulbe or scaly root like to those of the Red Lilly, yellow of colour, very small in respect of the greatnesse of the plant: From the which riseth vp a stalke, sometimes two or three, according to the age of the plant; whereof the middle stalke commonly turneth from his roundnesse into a flat forme, as those of the white Lilly of Constantinople. Vpon these stalkes do grow faire leaues of a blackish Greene colour, in roundles and spaces as the leaues of Woodroffe, not vnlike to the leaues of white Lillie, but smaller at the top of the stalkes. The floures be in number infinite, or at the least hard to be counted, very thicke set or thrust together, of an ouerworne purple, spotted on the inside with many small specks of the colour of rusty iron. The whole floure doth turne it selfe backward at such time as the Sunne hath cast his beames vpon it, like vnto the Tulipa or Turkes Cap, as the Lilly or Martagon of Constantinople doth; from the middle whereof doe come forth tender pointalls with small dangling pendants hanging thereat, of the colour the floure is spotted with.

1 *Lilium montanum majus.*

The great mountaine Lilly.

2 *Lilium montanum minus.*

Small Mountaine Lilly.

2 The small mountaine Lilly is very like vnto the former in root, leafe, stalke, and floures: differing in these points; The whole plant is lesser, the stalke neuer leaueth his round forme, and beareth fewer floures.

‡ There are two or three more varieties of these plants mentioned by *Clusius*; the one of this lesser kinde, with floures on the outside of a flesh colour, and on the inside white, with blackish spots; as also another wholly white without spots. The third varietie is like the first, but differs in that the floures blow later, and smell sweet.

These plants grow in the woody mountaines of Styria and Hungarie, and also in such like places on the North of Francfort, vpon the *Moene*.

The small sort I haue had many yeares growing in my garden; but the greater I haue not had till of late, giuen me by my louing friend *M. James Garret* Apothecarie of London.

¶ The Time.

These Lillies of the mountaine floure at such time as the common white Lilly doth, and sometimes sooner.

¶ The Names.

The great mountaine Lilly is called of *Tabernamontanus*, *Lilium Saracenicum*, receiued by Master *Garret* aforesaid from Lisse in Flanders, by the name of *Martagon Imperiale*: of some, *Lilium Saracenicum mas*: It is *Hemerocallis flore rubello*, of *Lobel*.

The small mountaine Lilly is called in Latine, *Lilium montanum*, and *Lilium sylvestre*: of *Dodonaeus*, *Hemerocallis*: of others, *Martagon*: but neither truly; for that there is of either, other Plants properly called by the same names. In high Dutch it is called *Goldwurtz*, from the yellownesse of the roots: in low Dutch, *Lilikens van Caluarien*: in Spanish, *Lirio Amarillo*: in French, *Lys Sauvage*: in English, Mountaine Lilly.

¶ The Nature and Vertues.

There hath not beene any thing left in writing either of the nature or vertues of these plants: notwithstanding we may deeme, that God which gaue them such seemely and beautifull shape, hath not left them without their peculiar vertues; the finding out whereof we leaue to the learned and industrious Searcher of Nature.

CHAP. 105. Of the Red Lillie of Constantinople.

1 *Lilium Bizantinum*.

The red Lilly of Constantinople.

‡ 2 *Lilium Byzantinum flo. purpureo sanguineo*.

The Byzantine purplish sanguine-coloured Lilly.

¶ The Description.

THe red Lilly of Constantinople hath a yellow scaly or cloued Root like vnto the Mountaine Lilly, but greater: from the which ariseth vp a faire fat stalke a finger thicke, of a darke purplish colour toward the top; which sometimes doth turne from his naturall roundnesse into a flat forme, like as doth the great mountaine Lilly: vpon which stalk grow sundry faire and most beautifull floures, in shape like those of the mountaine Lilly, but of greater beauty, seeming as it were framed of red wax, tending to a red leade colour. From the middle of the floure commeth forth a tender pointall or pestell, and likewise many small chiues tipped with loose pendants. The floure is of a reasonable pleasant sauour. The leaues are confusedly set about the stalke like those of the white Lilly, but broader and shorter.

¶ 2 This hath a large Lilly-like root, from which ariseth a stalke some cubit or more in height, set confusedly with leaues like the precedent. The floures also resemble those of the last described, but vsually are more in number, and they are of a purplish sanguine colour.

¶ 3 *Lilium Byzantinum flo. dilute rubente.*

The light red Byzantine Lilly.

¶ 4 *Lilium Byzantinum minutum polyanthos.*

The Vermilion Byzantine many-floured Lilly.

3 This differs little from the last, but in the colour of the floures, which are of a lighter red colour than those of the first described. The leaues and stalkes also, as *Clusius* obserueth, are of a lighter Greene.

4 This may also more fitly be termed a varietie from the former, than otherwise: for according to *Clusius*, the difference is onely in this, that the floures grow equally from the top of the stalke, and the middle floure rises higher than any of the rest, and sometimes consists of twelue leaues as it were a twinne, as you may perceiue by the figure. ¶

¶ The Time.

They floure and flourish with the other Lillies.

¶ The

¶ The Names.

The Lilly of Constantinople is called likewise in England, Martagon of Constantinople: of Lobel, *Hemerocallis Chalcedonica*, and likewise *Lilium Bizantinum*: of the Turks it is called *Zufiniare*: of the Venetians, *Marocali*.

¶ The Nature and Vertues.

Of the nature or vertues there is not any thing as yet set down, but it is esteemed especially for the beautie and rarenesse of the floure; referring what may be gathered hereof to a further consideration.

† CHAP. 106.

Of the narrow leaved reflex Lillies.

¶ The Description.

† 1 The root of this is not much vnlike that of other Lillies; the stalke is some cubit high, or better; the leaues are many and narrow, and of a darker green than those of the ordinarie Lilly, the floures are reflex, like those treated of in the last chap. of a red or Vermilion colour. This floures in the end of May: wherefore *Clusius* calls it *Lilium rubrum præcox*, The early red Lilly.

† 1 *Lilium rubrum angustifolium*.

The red narrow leaved Lilly.

† 3 *Lilium mont. flore flauo punctato*.

The yellow mountaine Lilly with the spotted floure.

2 This Plant is much more beautifull than the last described; the roots are like those of Lillies, the stalke some cubit and an halfe in height, being thicke set with small grassie leaues. The floures grow out one about another, in shape and colour like those of the last described, but oft-

times are more in number, so that some one stalke hath borne some 48 floures. The root is much like the former.

‡ 4 *Lilium mont. flore flauo non punctato.*

The yellow Mountaine Lilly with the vnspotted floure.

3 This in roots is like those afore described; the stalke is some 2 cubits high, set confusedly with long narrow leaues, with three conspicuous nerues running alongst them. The floures are at first pale coloured, afterwards yellow, consisting of six leaues bended backe to their stalkes, & marked with blackish purple spots.

4 There is also another differing from the last described onely in that the floure is not spotted, as that of the former.

¶ *The Place.*

These Lillies are thought Natiues of the Pyrenean mountaines, and of late yeares are become Denizons in some of our English gardens.

¶ *The Time.*

The first (as I haue said) floures in the end of May: the rest in Iune.

¶ *The Names.*

1 This is called by *Clusius*, *Lilium rubrum pracox*.

2 *Clusius* names this, *Lilium rubrum pracox* 3. *angustifolium*. *Lobel* stiles it, *Hemerocallis Macedonica*, and *Martagon Pomponium*.

3 This is *Lilium flauo flore maculis distinctum* of *Clusius*, and *Lilium montanum flauo flo.* of *Lobel*.

4 This being a varietie of the last, is called by *Clusius*, *Lilium flauo flore maculis non distinctum*.

¶ *The Temper and Vertues.*

These in all likelihood cannot much differ from the temper and vertues of other Lillies, which in all their parts they so much resemble. ‡

CHAP. 107. Of the Persian Lilly.

¶ *The Description.*

THE Persian Lilly hath for his root a great white bulbe, differing in shape from the other Lillies, hauing one great bulbe firme or solid, full of iuyce, which commonly each yeare setteth off or encreaseth one other bulbe, and sometimes more, which the next yeare after is taken from the mother root, and so bringeth forth such floures as the old plant did. From this root riseth vp a fat thicke and straight stemme of two cubits high, whereupon is placed long narrow leaues of a greene colour, declining to blewnes as doth those of the woade. The floures grow alongst the naked part of the stalke like little bells, of an ouer-worne purple colour, hanging down their heads, euery one hauing his owne foot-stalke of two inches long, as also his pestell or clapper from the middle part of the floure; which being past and withered, there is not found any seed at all, as in other plants, but is increased onely in his root.

¶ *The Place.*

This Persian Lilly groweth naturally in Persia and those places adiacent, whereof it tooke his name, and is now (by the industrie of Trauellers into those countries, louers of Plants) made a Denizon in some few of our London gardens.

¶ *The*

¶ The Time.

This plant floureth from the beginning of May, to the end of Iune.

¶ The Names.

This Persian Lilly is called in Latine, *Lilium Persicum*, *Lilium Susianum*, *Pennacio Persiano*, and *Pannaco Persiano*, either by the Turks themselves, or by such as out of those parts brought them into England; but which of both is vncertaine. *Alphonsus Pancius*, Physition to the Duke of Ferrara, when as he sent the figure of this Plant vnto *Carolus Clusius*, added this title, *Pennacio Persiano è Pianta bellissima & è specie di Giglio o' Martagon, diuerso della corona Imperiale*: That is in English, This most elegant plant *Pennacio* of Persia is a kinde of Lilly or Martagon, differing from the floure called the Crowne Imperiall.

Lilium Persicum.
The Persian Lilly.

¶ The Nature and Vertues.

There is not any thing knowne of the nature or vertues of this Persian Lilly, esteemed as yet for his rarenesse and comely proportion; although (if I might be so bold with a stranger that hath vouchsafed to trauell so many hundreds of miles for our acquaintance) we haue in our English fields many scores of floures in beauty far excellling it.

CHAP. 108. Of the Crowne Imperiall.

¶ The Description.

THE Crowne Imperial hath for his root a thicke firme and solid bulbe, couered with a yellowish filme or skinne, from the which riseth vp a great thicke fat stalke two cubits high, in the bare and naked part of a darke ouerworne dusky purple colour. The leaues grow confusedly about the stalke like those of the white Lilly, but narrower: the floures grow at the top of the stalke, incompassing it round in forme of an Imperiall crowne, (whereof it tooke his name) hanging their heads

Corona Imperialis. The Crowne Imperiall.*Corona Imperialis cum semine.*
Crowne Imperiall with the seed.*Corona Imperialis duplici corona.*
The double Crowne Imperiall.

heads downward as it were bells : in colour it is yellowish ; or to giue you the true colour, which by words otherwise cannot be expressed, if you lay sap berries in steepe in faire water for the space of two houres, and mix a little Saffron with that infusion, and lay it vpon paper, it sheweth the perfect colour to limne or illumine the floure withall. The backside of the said floure is streaked with purplish lines, which doth greatly set forth the beauty thereof. In the bottome of each of these bells there is placed six drops of most cleere shining sweet water, in tast like sugar, resembling in shew faire Orient pearles ; the which drops if you take away, there do immediately appeare the like : notwithstanding if they may be suffered to stand still in the floure according to his owne nature, they wil neuer fall away, no not if you strike the plant vntill it be broken. Amongst these drops there standeth out a certaine pestell, as also sundry smal chiues tipped with small pendants like those of the Lilly : about the whole floures there growes a tuft of green leaues like those vpon the stalke, but smaller. After the floures be faded, there follow cods or seed-vessels six square, wherein

is contained flat seeds, tough and limmer, of the colour of Mace. The whole plant, as well roots as floures, do saour or smell very like a Fox. As the plant groweth old, so doth it wax rich, bringing forth a Crowne of floures amongst the vppermost Greene leaues, which some make a second kinde, although in truth they are but one and the selfe same, which in time is thought to grow to a triple crowne, which hapneth by the age of the root, and fertilitie of the soile, whose figure or tipe I haue thought good to adioyne with that picture also which in the time of his infancie it had.

¶ The Place.

This plant likewise hath been brought from Constantinople amongst other bulbous roots, and made Denizons in our London gardens, whereof I haue great plenty.

¶ The Time.

It floureth in Aprill, and sometimes in March, when as the weather is warme and pleasant. The seed is ripe in Iune.

¶ The Names.

This rare & strange Plant is called in Latine, *Corona Imperialis*, and *Lilium Byzantinum*: the Turks doe call it *Canale lale*, and *Tusai*. And as diuers haue sent into these parts of these roots at sundry times, so haue they likewise sent them by sundry names; some by the name *Tusai*; others, *Ton-sai*, and *Tuychiachi*, and likewise *Turfani* and *Turfanda*. † *Clusius*, and that not without good reason, iudgeth this to be the *Hemerocallis* of *Dioscorides*, mentioned *lib. 3. cap. 120.*

¶ The Nature and Vertues.

The vertue of this admirable plant is not yet knowne, neither his faculties or temperature in working.

† If this be the *Hemerocallis* of *Dioscorides*, you may finde the vertues thereof specified pag. 99. of this Worke; where in my iudgement they are not so fely placed as they might haue bene here: yet we at this day haue no knowledge of the physcall operation of either of those plants mentioned in that place, or of this treated of in this chapter.

CHAP. 109. Of Dogs Tooth.

¶ The Description.

1 **T**Here hath not long since bene found out a goodly bulbous rooted plant, and termed Satyrion, which was supposed to be the true Satyrion of *Dioscorides*, after that it was cherished, and the vertues thereof found out by the studious searchers of nature. Little difference hath bin found betwixt that plant of *Dioscorides* and this *Dens caninus*, except in the colour, which (as you know) doth commonly vary according to the diuersitie of places where they grow, as it falleth out in Squilla, Onions, and the other kindes of bulbous plants. It hath most commonly two leaues, very seldome three; which leafe in shape is very like to *Allium Vrsinum*, or Ramsons, though farre lesse. The leaues turne downe to the groundward; the stalke is tender and flexible like to *Cyclamen*, or Sow-bread, about an handfull high, bare and without leaues to the root. The proportion of the floure is like that of Saffron or the Lilly floure, full of streames of a purplish white colour. The root is bigge, and like vnto a date, with some fibres growing from it: vnto the said root is a small flat halfe round bulbe adioyning, like vnto *Gladiolus*, or Corn-flag.

2 The second kinde is farre greater and larger than the first, in bulbe, stalke, leaues, floure, and cod. It yeeldeth two leaues for the most part, which do close one within another, and at the first they doe hide the floure (for so long as it brings not out his floure) it seemes to haue but one leafe like the Tulipa's, and like the Lillies, though shorter, and for the most part broader; wherefore I haue placed it and his kindes next vnto the Lillies, before the kinds of *Orchis* or stones. The leaues which it beareth are spotted with many great spots of a darke purple colour, and narrow below, but by little and little toward the top wax broad, and after that grow to be sharpe pointed, in form somewhat neere Ramsons, but thicker and more oleous. When the leaues be wide opened the floure sheweth it selfe vpon his long weake naked stalke, bowing toward the earth-ward, which floure consisteth of six very long leaues of a fine delayed purple colour, which with the heat of the Sunne openeth it selfe, and bendeth his leaues backe againe after the manner of the *Cyclamen* floure, within which there are six purple chiues, and a white three forked stile or pestell. This floure is of no pleasant smell, but commendable for the beauty: when the floure is faded, there succeedeth a three square huske or head, wherein are the seeds, which are very like them of *Leucojum bulbosum praeox*; but longer, slenderer, and of a yellow colour. The root is long, thicker below than aboue, set with many white fibres, waxing very tender in the vpper part, hauing one or more off-sets, or young shoots, from which the stalke ariseth out of the ground (as hath been said) bringing forth two leaues, and not three, or onely one, saue when it will not floure.

3 The third kinde is in all things like the former, saue in the leaues, which are narrower, and in the colour of the floure, which is altogether white, or consisting of a colour mixt of purple and white. Wherefore sith there is no other difference, it shall suffice to haue said thus much for the description.

¶ The Place.

These three plants grow plentifully at the foot of certain hills in the greene and moist grounds of Germanie and Italy, in Styria not far from Gratz, as also in Modena and Bononia in Italy, and likewise in some of the choice gardens of this countrey.

¶ The Time.

They floure in Aprill, and sometimes sooner, as in the middle of March.

1 *Dens caninus.*
Dogs tooth.

2 *Dens caninus flore albo angustioribus folijs.*
White Dogs tooth.

¶ The Names.

This plant is called in Latine, *Dens caninus*; and some haue iudged it *Satyrion Erythronium*. *Matthiolus* calls it *Pseudohermodactylus*. The men of the countrey where it groweth call it **Schoft-wurts**; and the Physitians about Styria call it *Dentali*. The second may for distinctions sake be termed *Dens caninus flore albo, angustioribus folijs*; that is, Dogs tooth with the white floure and narrow leaues.

¶ The Nature.

These are of a very hot temperament, windie, and of an excrementitious nature, as may appeare by the vertues.

¶ The Vertues.

- A The Women that dwell about the place where these grew, and do grow, haue with great profit put the dried meale or poulder of it in their childrens pottage, against the wormes of the belly.
- B Being drunke with Wine it hath been proued maruellously to assuage the Collicke passion.
- C It strengthneth and nourisheth the body in great measure, and being drunke with water it cureth children of the falling sicknesse.

CHAP. 110. Of Dogs stones.

¶ The Kindes.

STones or Testicles, as *Dioscorides* saith, are of two sorts, one named *Cynosorchis*, or Dogs stones, the other *Orchis Serapias*, or Serapias his stones. But because there be many and sundry other sorts differing one from another, I see not how they may be contained vnder these two kinds onely: therefore I haue thought good to diuide them as followeth. The first kind we haue named *Cynosorchis*, or Dogs stones: the second, *Testiculus Morionis*, or Fooles stones: the third, *Tragorchis*, or Goats stones: the fourth, *Orchis Serapias*, or Serapia's stones: the fifth, *Testiculus odoratus*, or sweet smelling stones, or after *Cordus*, *Testiculus Pumilio*, or Dwarfes stones.

† 1 *Cynosorchis maior*.
Great Dogs stones.

† 2 *Cynosorchis maior altera*.
White Dogs stones.

¶ The Description.

Great Dogs stones hath foure, and sometimes five, great broad thicke leaues, somewhat like those of the garden Lilly, but smaller. The stalke riseth vp a foot or more in height; at the top whereof doth grow a thicke tuft of carnation or horse-flesh coloured floures, thick and close thrust together, made of many small floures spotted with purple spots, in shape like to an open hood or helmet. And from the hollow place there hangeth forth a certain ragged chiue or tassell, in shape like to the skinne of a Dog, or some such other foure footed beast. The roots be round like vnto the stones of a Dog, or two oliues, one hanging somewhat shorter than the other, whereof the highest or vppermost is the smaller, but fuller and harder. The lowermost is the greatest, lightest, and most wrinkled or shriveled, not good for any thing.

2 Whitish Dogs stones hath likewise smooth, long broad leaues, but lesser and narrower than those of the first kinde. The stalke is a span long, set with five or six leaues clasping or embracing the same round about. His spikie floure is short, thicke, bushy, compact of many small whitish purple

purple coloured floures, spotted on the inside with many small purple spots and little lines or streakes. The small floures are like an open hood or helmet, hauing hanging out of euery one as it were the body of a little man without a head, with armes stretched out, and thighes stradling abroad, after the same manner almost that the little boyes are wont to be pictured hanging out of Saturnes mouth. The roots be like the former.

3 Spotted Dogs stones bring forth narrow leaues, ribbed in some sort like vnto the leaues of narrow Plaintaine or Rib-wort, dasht with many blacke streakes and spots. The stalke is a cubit and more high: at the top whereof doth grow a tuft or eare of violet-coloured floures, mixed with a darke purple, but in the hollownesse thereof whitish, not of the same forme or shape that the others are of, but lesser, and as it were resembling somewhat the floures of Larkes-spur. The roots be like the former.

4 Marish Dogs stones haue many thicke blunt leaues next the root, thick streaked with lines or nerues like those of Plantaine. The floure is of a whitish red or carnation: the stalk and roots be like the former.

† 3 *Cynosorchis maculata*.
Spotted Dogs stones.

4 *Cynosorchis palustris*.
Marish Dogs stones.

‡ 5 This hath five or six little leaues, the stalke is some handfull or better in height, set about with somewhat lesse leaues: the tuft of floures at the top of the stalke are of a purple colour, small, with a white lip diuided into foure partitions hanging downe, which also is lightly spotted with purple; it hath a little spurre hanging downe on the hinder part of each floure. The seed is small, and contained in such twined heads as in other plants of this kinde. The roots are like the former, but much lesse. ‡

¶ The Place.

These kindes of Dogs stones do grow in moist and fertile medowes. The marish Dogs stones grow for the most part in moist and waterish woods, and also in marish grounds. ‡ The 5 growes in many hilly places of Austria and Germanie. ‡

¶ The Time.

They floure from the beginning of May to the midst of August.

¶ The

¶ The Names.

The first and second are of that kinde which *Dioscorides* calleth *Cynosorchos*; that is in English, Dogs stones, after the common or vulgar speech; the one the greater, the other the lesser.

- 1 This is *Cynosorchis prior* of *Dodonæus*; *Cynosorchis nostra major* of *Lobel*.
- 2 *Dodonæus* names this *Cynosorchis altera*. *Lobel*, *Cynosorchis majoris secunda species*.
- 3 This *Lobel* calls *Cynosorchis Delphinia*, &c. *Tabern.* *Cynosorchis maculata*.
- 4 *Dodonæus* calls this, *Cynosorchis tertia*: *Lobel*, *Cynosorchis major altera nostras*. *Tabernam.* *Cynosorchis major quarta*.
- 5 This is *Clusius* his *Orchis Pannonica quarta*.

¶ The Temperature.

These kinds of Dogs stones be of temperature hot and moist; but the greater or fuller stone seemeth to haue much superfluous windinesse, and therefore being drunke it stirreth vp fleshly lust.

The second, which is lesser, is quite contrarie in nature, tending to a hot and dry temperature; therefore his root is so far from mouing venerie, that contrariwise it staieth and keepeth it backe, as *Galen* teacheth.

He also affirmeth, that *Serapia's* stones are of a more dry facultie, and doe not so much preuaile to stirre vp the lust of the flesh.

¶ The Vertues.

Dioscorides writeth that it is reported, That if A men doe eate of the great full or fat roots of these kinds of Dogs stones, they cause them to beget male children; and if women eate of the lesser dry or barren root which is withered or shriveled, they shall bring forth females. These are some Doctors opinions onely.

It is further reported, That in *Theffalia* the B women giue the tender full root to be drunke in Goats milke, to moue bodily lust, and the dry to restraints the same.

¶ The Choice.

Our age vseth all the kinds of stones to stirre vp venery, and the Apothecaries mix any of them indifferently with compositions seruing for that purpose. But the best and most effectuell are these Dogs stones, as most haue deemed: yet both the bulbes or stones are not to be taken indifferently, but the harder and fuller, and that which containes most quantity of iuyce, for that which is wrinkled is lesse profitable, or not fit at all to be vsed in medicine. And the fuller root is not alwaies the greater, but often the lesser, especialy if the roots be gathered before the plant hath shed his floure, or when the stalke first commeth vp; for that which is fuller of iuyce is not the

greatest before the seed be perfectly ripe. For seeing that euery other yeare by course one stone or bulbewaxeth full, the other empty and perisheth, it cannot be that the harder and fuller of iuyce should be alwaies the greater; for at such time as the leaues come forth, the fuller then begins to encrease, and whilst the same by little & little encreaseth, the other doth decrease and wither till the seed be ripe: then the whole plant, together with the leaues and stalkes doth forthwith fall away and perish, and that which in the meane time encreased, remaineth still fresh and full vnto the next yeare.

† The figures of the first and second were transposed in the former Edition: the third was of the *Cynosorchis maritima*, following in the next chapter.

CHAP. III. Of Fooles Stones.

¶ The Description.

THe male Foole stones hath five, sometimes six long broad and smooth leaues, not vnlike to those of the Lilly, sauing that they are dasht and spotted in sundry places with blacke spots and streakes. The floures grow at the top, tuft or spike fashion, somewhat like the former, but thrust more thicke together, in shape like to a fooles hood, or cocks combe, wide open, or gaping before, and as it were crested aboue, with certaine eares standing vp by euery side, and a small taile or spur hanging downe, the backside declining to a violet colour, of a pleasant sauour or smell.

† 1 *Cynosorchis Morio mas.*
The male Foole stones.

2 *Cynosorchis Morio femina.*
The female Foole stones.

2 The Female Fooles stones haue also smooth narrow leaues, ribbed with nerues like those of Plantaine. The floures be likewise gaping, and like the former, as it were open hoods, with a little horne or heele hanging behinde euerie one of them, and small Greene leaues sorted or mixed among them, resembling cockes combes, with little eares, not standing straight vp, but lying flat vpon the hooded floure, in such sort, that they cannot at the sudden view be perceiued. The roots are a paire of small stones like the former. The floures of this sort doe varie infinitely in colour, according to the soile or countrey where they do grow: some bring forth their floures of a deepe violet colour, some as white as snow; some of a flesh colour, and some garnished with spots of diuers colours, which are not possible to be distinguished.

† 3 This hath narrow spotted leaues, with a stalke some foot or more high, at the top wherof groweth a tuft of purple floures in shape much like those of the last described, each floure consisting of a little hood, two small wings or side leaues; and a broad lippe or leafe hanging downe. ‡

¶ The

‡ 3 *Cynosorchis Morio minor.*
The lesser spotted Fooles stones.

† The first was of *Cynosorchis maculata*, being the third in the former chapter.

¶ The Place.

These kinds of Fooles stones do grow naturally to their best liking in pastures and fields that seldome or neuer are dunged or manured.

¶ The Time.

They floure in May and Iune. Their stones are to be gathered for medicine in September, as are those of the Dogs stones.

¶ The Names.

The first is called *Cynosorchis Morio*: of *Fuchs*. *Orchis mas angustifolia*: of *Apuleius*, *Satyrion*: and also it is the *Orchis Delphinia* of *Cornelius Gemma*.

‡ The second is *Cynosorchis morio fœmina* of *Lobel*: *Orchis angustifolia fœmin.* of *Fuchs*: *Testiculus Morionis fœmina* of *Dodoneus*.

3 This is *Cynosorchis minimis & secundum caulem, &c. maculosis folijs*, of *Lobel*. ‡

¶ The Temperature.

Fooles stones both male and female are hot and moist of nature.

¶ The Vertues.

These Fooles stones are thought to haue the vertues of Dogs stones, whereunto they are referred.

CHAP. 112. Of Goats Stones.

¶ The Description.

1 The greatest of the Goats stones bringeth forth broad leaues, ribbed in some sort like vnto the broad leaued Plantaine, but larger: the stalke groweth to the height of a cubit, set with such great leaues euen to the top of the stalke by equall distances. The tuft or bush of floures is small and flat open, with many tender strings or laces comming from the middle part of those small floures, crookedly tangling one with another, like to the small tendrels of the Vine, or rather the laces or strings that grow vpon the herbe Sauorie. The whole floure consisteth of a purple colour. The roots are like the rest of the Orchides, but greater.

2 The male Goats stones haue leaues like to those of the garden Lilly, with a stalke a foot long, wrapped about euen to the tuft of the floure with those his leaues. The floures which grow in this bush or tuft be very small, in forme like vnto a Lizard, because of the twisted or writhen tailes, and spotted heads. Euery of these small floures is at the first like a round close huske, of the bignesse of a pease, which when it openeth there commeth out of it a little long and tender spurre or taile, white toward the setting of it to the floure, the rest spotted with red dashes, hauing vpon each side a small thing adioyning vnto it, like to a little leg or foot; the rest of the said taile is twisted crookedly about, and hangeth downward. The whole plant hath a ranke or stinking smel or sauour like the smell of a Goat, whereof it tooke his name.

3 The female Goats stones haue leaues like the male kinde, sauing that they be much smaller, hauing many floures on the tuft resembling the flies that feed vpon flesh, or rather ticks. The stones or roots, as also the smell are like the former.

S

‡ 4 This

1 *Tragorchis maximus.*
The greatest Goat stones-

2 *Tragorchis mas.*
The male Goat stones.

3 *Tragorchis femina.*
The female Goats stones.

4 *Tragorchis minor Batavica.*
The small Goat stones of Holland.

† 4 This also because of the vnpleasant smell may fitly be referred to this Classis. The roots hereof are small, and from them arise a stalke some halfe a foot high, beset with three or foure narrow leaues: the tuft of floures which groweth on the top of this stalke is small, and the colour of them is red without, but somewhat paler within; each floure hanging downe a lippe parted in three. ‡

¶ The Place.

1. 2. 3. These kinds of Goats stones delight to grow in fat clay grounds, and seldome in any other soile to be found.

† 4 This growes vpon the sea banks in Holland, and also in some places neere vnto the Hage. ‡

¶ The Time.

They floure in May and Iune with the other kinds of Orchis.

¶ The Names.

† 1 Some haue named this kind of Goats stones in Greeke, *Satyrion*: in Latine, *Testiculus Hircinus*, and also *Orchis Saurodes*, or *Scincophora*, by reason that the floures resemble Lizards.

The second may be called *Tragorchis mas*, male Goats stones; and *Orchis Saurodes*, or *Scincophora*, as well as the former.

The third, *Tragorchis femina*, as also *Coriosmites*, and *Coriophora*, for that the floures in shape and their vngratefull smell resemble Ticks, called in Greeke *ripis*: ‡

¶ The Nature and Vertues.

The temperature and vertues of these are referred to the Fooles stones, notwithstanding they are seldome or neuer vsed in physick, in regard of the stinking and loathsome smell and sauer they are possessed with.

CHAP. 113.

Of Fox Stones:

† 1 *Orchis Hermaphroditica*.
Butter-fly Satyrion.

† 2 *Testiculus psycodes*.
Gnat Satyrion.

¶ The Kindes.

There be diuers kinds of Fox-stones, differing very much in shape of their leaues, as also in floures: some haue floures wherein is to be seene the shape of sundry sorts of liuing creatures; some the shape and proportion of flies, in other gnats, some humble bees, others like vnto honey Bees; some like Butter-flies, and others like Wasps that be dead; some yellow of colour, others white; some purple mixed with red, others of a browne ouer-worne colour: the which seuerally to distinguish, as well those here set downe, as also those that offer themselues dayly to our view and consideration, would require a particular volume; for there is not any plant which doth offer such varietie vnto vs as these kinds of Stones, except the Tulipa's, which go beyond all account: for that the most singular Simplest that euer was in these later ages, *Carolus Clusius* (who for his singular industrie and knowledge herein is worthy triple honour) hath spent at the least fife and thirty yeares, sowing the seeds of Tulipa's from yeare to yeare, and to this day he could neuer attaine to the end or certaintie of their seuerall kinds of colours. The greatest reason whereof that I can yeeld is this; that if you take the seeds of a Tulipa that bare white floures, and sow them in some pan or tub with earth, you shall receiue from that seed plants of infinite colours: contrariwise, if you sow the seeds of a plant that beareth floures of variable colours, the most of those plants will be nothing like the plant from whence the seed was taken. It shall be sufficient therefore to set downe most of the varieties, and comprehend them in this chapter.

¶ The Description.

Butter-fly Orchis, or Satyrion, beareth next the root two very broad leaues like those of the Lilly, seldome three: the floures be white of colour, resembling the shape of a Butter-fly: the stalke is a foot high; the root is two stones like the other kinds of stones or Cullions, but somewhat sharper pointed.

† 3 *Testiculus Vulpinus 2. sphagodes.*
Humble Bee Orchis.

Gnat

2 Waspe Satyrion commeth forth of the ground, bearing two, sometimes three leaues like the former, but much smaller. The stalke groweth to the height of an hand, whereon are placed very orderly small floures like in shape to Gnats, and of the same colour. The root is like the former.

† 4 *Testiculus Vulpinus major sphagodes.*
Waspe Orchis.

3 The

3 The Humble Bee Orchis hath a few small weake and short leaues, which grow scatteringly about the stalke: the floures grow at the top among the small leaues, resembling in shape the humble Bee. The root consisteth of two stones or bulbes, with some few threds annexed thereunto.

4 The Waspe Satyrion groweth out of the ground, hauing stalkes small and tender. The leaues are like the former, but somewhat greater, declining to a browne or darke colour. The floures be small, of the colour of a dry Oken leafe, in shape resembling the great Bee, called in English an Hornet or drone Bee. The root is like the other.

5 The leaues of Bee Satyrion are longer than the last before mentioned, narrower, turning themselues against the Sun as it were round. The stalke is round, tender, and very fragile. At the top grow the floures, resembling the shape of the dead carcase of a Bee. The stones or bulbes of the roots be smaller and rounder than the last described.

6 The Fly Satyrion is in his leaues like the other, sauing that they be not of so dark a colour: the floures be smaller and more plentifully growing about the stalke, in shape like vnto flies, of a greenish colour.

† 5 *Orchis Melittias.*
Bee Orchis.

† 6 *Orchis Myodes.*
Fly Satyrion.

7 Yellow Orchis riseth out of the ground with browne leaues, smaller than the last before mentioned: the stalk is tender and crooked. The floures grow at the top yellow of colour, in shape resembling the yellow flies bred in the dung of Kine after raine.

8 The small yellow Satyrion hath leaues spread vpon the ground, at the first comming vp; the slender stalke riseth vp in the midst, of halfe a hand high. The floures grow scatteringly toward the top, resembling the flies last before mentioned, darke or rusty of colour. The stones or bulbes are very round.

9 Birds Orchis hath many large ribbed leaues, spread vpon the ground like vnto those of Plantaine; among the which rise vp tender stalkes couered euen to the tuft of the floures with the like leaues, but lesser, in such sort that the stalkes cannot be seene for the leaues. The floures grow at the top, not so thicke set or thrust together as the others, purple of colour, like in shape vnto little Birds, with their wings spread abroad ready to fly. The roots be like the former.

10 Spotted Birds Satyrion hath leaues like vnto the former, sauing that they be dashed or spotted

spotted here and there with darke spots or streakes, hauing a stalke couered with the like leaues, so that the plants differ not in any point, except the blacke spots which this kinde is dasht with.

11 White Birds Satyrion hath leaues rising immediately forth of the ground like vnto the blades or leaues of Leekes, but shorter; among the which riseth vp a slender naked stalke two handfulls high; on the top whereof be white floures resembling the shape or forme of a small bird ready to fly, or a white Butter-fly with her wings spread abroad. The roots are round, and smaller than any of the former.

12 Souldiers Satyrion bringeth forth many broad large and ribbed leaues, spred vpon the ground like vnto those of the great plantaine: among the which riseth vp a fat stalke full of sap or iuyce, cloathed or wrapped in the like leaues euen to the tuft of floures, whereupon do grow little floures resembling a little man hauing a helmet vpon his head, his hands and legges cut off, white vpon the inside, spotted with many purple spots, and the backe part of the floure of a deeper colour tending to rednesse. The roots be greater than any of the other kindes of Satyrions.

† 7 *Orchis Myodes Lutea.*
Yellow Satyrion.

† 9 *Orchis Myodes minor.*
Small yellow Satyrion.

13 Souldiers Cullions hath many leaues spread vpon the ground, but lesser than the soldiers Satyrion, as is the whole plant. The backside of the floures are somewhat mixed with whitenesse, and sometimes are ash coloured: the inside of the floure is spotted with white likewise.

14 Spider Satyrion hath many thinne leaues like vnto those of the Lilly, scatteringly set vpon a weake and feeble stalk, whereupon doth grow small floures, resembling as well in shape as colour the body of a dead humble Bee, or rather of a Spider; and therefore I thinke Lobel, who was the Author of this name, would haue said *Arachnitis*, of *Arachne*, a Spider.

† 15 This by right should haue bene put next the Gnat Satyrion, described in the second place. It hath short, yet pretty broad leaues, and those commonly three in number, besides those small ones set vpon the stemme. The floures are small, and much like those of the second formerly described.

† 16 Our Author gaue you this figure in the fourteenth place, vnder the title of *Orchis Arachnitis*; but it is of the *Orchis 16. minor* of *Tabernam.* or *Orchis Angustifolia* of *Bauhinus*. This *Orchis* is of the kinde of the *Myodes*, or Fly Satyrions, but his leaues are farre longer and narrower than

† 9 *Orchis Ornithophora.*
Birds Satyrion.† 11 *Orchis Ornithophora candida.*
White Birds Orchis.† 10 *Orchis Ornithophora folio maculoso.*
Spotted Birds Orchis.† 12 *Orchis Strateumatis.*
Souldiers Satyrion.† 13 *Orchis*

than any of the rest of that kinde, and therein consists the onely and chiefeft difference. †

¶ The Place.

These kindes of Orchis grow for the most part in moist medowes and fertile pastures, as also in moist woods.

The Bee, the Fly, and the Butter-fly Satyrions do grow vpon barren chalkie hills and heathie grounds, vpon the hils adioyning to a village in Kent named Green-hithe, vpon long field downes by South-fleet, two miles from the same place, and in many other places of Kent: likewise in a field adioyning to a small groue of trees, halfe a mile from Saint Albons, at the South end thereof. They grow likewise at Hatfield neere S. Albons, by the relation of a learned Preacher there dwelling, M. Robert Abot, an excellent and diligent Herbarist.

† 13 *Orchis Strateumatica minor.*
Souldiers Cullions.

† 14 *Orchis Andrachnitis.*
Spider Satyrion.

That kinde which resembleth the white Butter-fly groweth vpon the declining of the hill at the North end of Hampsted heath, neere vnto a small cottage there in the way side, as yee go from London to Henden a village thereby. It groweth in the fields adioyning to the pound or pinnefold without the gate, at the Village called High-gate, neere London: and likewise in the wood belonging to a Worshipfull Gentleman of Kent named Master Sidley, of South-fleet; where doe grow likewise many other rare and daintie Simples, that are not to be found elsewhere in a great circuit.

¶ The Time.

They floure for the most part from May to the end of August, and some of them sooner.

¶ The Names.

These kindes of Orchis haue not bin much written of by the Antients, neither by the late writers to any purpose, so that it may content you for this time to receiue the names set down in their severall

seuerall titles, reseruing what else might be said as touching the Greeke, French, or Dutch names, or any generall definition vntill a further consideration.

‡ 15 *Orchis trifolia minor.*
Small Gnat Satyrion.

‡ 16 *Orchis angustifolia.*
Narrow leaued Satyrion.

¶ The Nature and Vertues.

The nature and vertues of these kindes of Orchis are referred vnto the others, namely to those of the Fox stones; notwithstanding there is no great vse of these in physicke, but they are chiefly regarded for the pleasant and beautifull floures, wherewith Nature hath seemed to play and disport her selfe.

† These Figures in this Chapter were formerly much misplaced: as thus; The second was of *Orchis Ornith. fol. macul.* being the tenth. The third was of *Trichomanes minor* of Tabern. being a varietie of *Cynorchis morio femina*. The fifth was of *Orchis Batrachitis*. The sixth, of *Orchis Melittias*. The seventh and eighth were onely transposed, or put the one for the other. The ninth was of the second, called formerly *Testiculus sphagodes*. The tenth was of the third, called *Testiculus vulpinus*. The eleuenth was of *Strateumatia*. The twelfth was of *Strateumatia minor*. The thirteenth was a varietie of the fourth. The fourteenth was of *Orchis angustifolia*, which we here give you in the sixteenth place.

CHAP. II4. Of Sweet Cullions.

¶ The Kindes.

There be sundry sorts of sweet smelling Testicles or Stones, whereof the first is most sweet and pleasant in smell, the others of lesse smell or sauour, differing in floure and roots. Some haue white floures, others yellow; some flesh coloured; some dasht vpon white with a little reddish wash: some haue two stones, others three, and some foure, wherein their difference consisteth.

¶ The Description.

The first kinde of Sweet stones is a small base and low plant in respect of all the rest: The leaues be small, narrow, and short, growing flat vpon the ground; amongst the which riseth vp a small weake and tender stalke of a finger long, whereupon doe grow
small

small white floures spike fashion, of a pleasant sweet smel. The roots are two small stones in shape like the other.

2 Triple Orchis hath commonly three, yet sometimes foure bulbes or tuberous roots, somewhat long, set with many small fibres or short threads; from the which roots rise immediately many flat and plaine leaues, ribbed with nerues alongst them like those of Plantaine: among the which come forth naked stalkes, small and tender, whereupon are placed certaine small white floures, trace fashion, not so sweet as the former in smell and sauour. † The top of the stalke whereon the floures do grow, is commonly as if it were twisted or writhen about. †

3 Frieseland Lady traces hath two small round stones or bulbes, of the bignesse of the pease that we call Rouncifalls; from the which rise vp a few hairy leaues, lesser than those of the triple stones, ribbed as the small leaved Plantaine: among the which commeth forth a small naked stalk, set round about with little yellow floures, not trace fashion as the former.

4 Liege Lady traces hath for his roots two greater stones, and two smaller; from the which come vp two and sometimes more leaues, furrowed or made hollow in the midst like to a trough, from the which riseth vp a slender naked stalke, set with such floures as the last described, sauing that they be of an ouerworne yellow colour.

1 *Testiculus odoratus.*
Lady Traces.

2 *Triorchis.*
Triple Lady Traces.

¶ The Place.

These kindes of Stones or Cullions do grow in dry pastures and heaths, and likewise vpon chalkie hills, the which I haue found growing plentifully in sundry places, as in the field by Islington, neere London, where there is a bowling place vnder a few old shrubby Okes. They grow likewise vpon the heath at Barne-elmes, neere vnto the head of a conduit that sendeth water to the house belonging to the late Sir *Francis Walsingham*. They grow in the field next vnto a Village called Thistleworth, as you go from Branford to her Maiesties house at Richmond; also vpon a common Heath by a Village neere London called Stepney, by the relation of a learned merchant of London, named M. *James Cole*, exceedingly well experienced in the knowledge of Simples.

The yellow kindes grow in barren pastures and borders of fields about Ouenden and Clare in Essex

Essex. Likewise neere vnto Muche Dunmow in Essex, where they were shewed me by a learned Gentleman Master *James Twights*, excellently well scene in the knowledge of plants.

‡ I receiued some roots of the second from my kinde friend M. *Thomas Wallis* of Westminster, the which he gathered at Dartford in Kent, vpon a piece of ground commonly called the Brimth: but I could not long get them to grow in a garden, neither do any of the other Satyrions loue to be pent vp in such straight bounds, ‡

3 *Orchis Friesalutea.*

Frieseland Lady-traces.

4 *Orchis Leodiensis.*

Liege Lady-traces.

¶ *The Time.*

These kindes of stones do floure from August to the end of September.

¶ *The Names.*

The first is called in Latine *Testiculus Odoratus*: in English, Sweet smelling Testicles or stones, not of the sweetnesse of the roots, but of the floures. It is called also *Orchis spiralis*, or *Autumnalis*, for that this (as also that which is set forth in the next place) hath the top of the stalke as it were twisted or twined spire fashion, and for that it commeth to flourishing in Autumne: of our English women they be called Lady-traces, but euery countrey hath a seuerall name; for some call them Sweet Ballocks, sweet Cods, sweet Cullions, and Stander-grasse. In Dutch, *Knabekraut*, and *Stondelkraut*: In French, *Satyrion*.

The second sort is called *Triorchis*, and also *Tetrorchis*: in English, Triple Lady-traces, or white Orchis.

The third is called *Orchis Friesa*: in English Frieseland Orchis.

The last of these kindes of Testicles or Stones is called of some in Latine, *Orchis Leodiensis*, and *Orchis Lutea*, as also *Basilica minor Serapias*, and *Triorchis Agineta*: In English, Yellow Lady-traces.

¶ *The Temperature.*

These kindes of sweet Cullions are of nature and temperature like the Dogs stones, although not vsed in Physicke in times past; notwithstanding later Writers haue attributed some vertues vnto them as followeth.

¶ *The Vertues.*

The full and sappy roots of Lady-traces eaten or boyled in milke, and drunke, prouoke venery, A nourish and strengthen the body, and be good for such as be fallen into a Consumption or Feuer Hectique.

CHAP. 115. Of Satyrion Royall.

¶ The Description.

1 **T**He male Satyrion royal hath large roots, knobbed, not bulbed as the others, but branched or cut into sundry sections like an hand, from the which come vp thick and fat stalkes set with large leaues like those of Lillies, but lesse; at the top whereof groweth a tuft of floures, spotted with a deepe purple colour.

1 *Palma Christi mas.*

The male Satyrion Royall.

2 *Palma Christi femina.*

The female Satyrion Royall.

2 The female Satyrion hath clouen or forked roots, with some fibres ioyned thereto. The leaues be like the former, but smaller and narrower, and confusedly dashed or spotted with black spots: from the which springeth vp a tender stalke, at the top whereof doth grow a tuft of purple floures, in fashion like vnto a Friers hood, changing or varying according to the soile and clymat, sometimes red, sometimes white, and sometimes light carnation or flesh colour.

¶ 3 This in roots and leaues is like the former, but that the leaues want the black spots, the stalke is but low, and the top thereof hath floures of a whitish colour, not spotted: they on the fore side resemble gaping hoods, with eares on each side, and a broad lip hanging down; the backe part ends in a broad obtuse spur. These floures smell like Elder blossomes. ‡

¶ The Place.

The royall Satyrions grow for the most part in moist and fenny grounds, medowes, and Woods that are very moist and shadowie. I haue found them in many places, especially in the midst of a wood in Kent called Swainescombe wood neere to Grauesend, by the village Swainescombe, and likewise in Hamsted wood foure miles from London.

¶ The Time.

They floure in May and Iune, but seldome later.

¶ The

‡ 3 *Orchis Palmata Pannonica* S. Clus.
The Austrian handed Satyrion.

¶ The Names.

† Royal Satyrion, or finger Orchis is called in Latine, *Palma Christi*; notwithstanding there is another herbe or plant called by the same name, which otherwise is called *Ricinus*. This plant is called likewise of some, *Satyrion Basilicum*, or *Satyrion regium*. Some would haue it to be *Buzeiden*, or *Buzidan Arabum*, but *Anicen* saith *Buzeiden* is a woody Indian medicine: and *Serapio* saith, *Buzeiden* be hard white roots like those of *Behen album*, and that it is an Indian drug: but contrariwise the roots of *Palma Christi* are nothing lesse than woody, so that it cannot be the same. *Matthiolus* would haue Satyrion royall to be the *Digiti Citrini* of *Anicen*; finding fault with the Monkes which set forth Commentaries vpon *Mesues* Compositions, for doubting and leauing it to the iudgement of the discret Reader. Yet do we better allow of the Monkes doubt, than of *Matthiolus* his assertion. For *Anicens* words be these; What is *Asabasafra*, or *Digiti Citrini*? and answering the doubt himselfe, he saith, It is in figure or shape like the palme of a mans hand, of a mixt colour betweene yellow and white, and it is hard, in which there is a little sweetnesse, and there is a Citrine sort dusty and without sweetnesse. *Rhasis* also in the last booke of his *Continent* calls these, *Digiti Crocei*, or Saffron fingers; and he saith it is a gumme or veine for Dyars.

Now these roots are nothing lesse than of a Saffron colour, and wholly vnfit for Dying. Wherefore without doubt these words of *Anicen* and *Rhasis*, in the eares of men of iudgment do confirme, That Satyrion Royall, or *Palma Christi*, are not those *Digiti Citrini*. The Germans call it *Creutblum*: the low Dutch, *Handekens crypt*: the French, *Satyrion royal*.

¶ The Temperature and Vertues.

The Roots of Satyrion royall are like to *Cynosorchis* or Dogs stones, both in fauour and taste, and therefore are thought by some to be of like faculties. Yet *Nicolaus Nicolus*, in the chapter of the cure of a Quartaine Ague, saith, That the roots of *Palma Christi* are of force to purge vpward and downward; and that a piece of the root as long as ones thumbe stamped and giuen with wine before the fit commeth, is a good remedie against old Quartaines after purgation: and reporteth, That one *Baliolus*, after he had endured 44 fits, was cured therewith.

† This facultie of purging and vomiting, which our Author out of *Dodonæus*, and he out of *Nicolus*, giue to the root of *Palma Christi*, I doubt is mistaken and put in the wrong place: for I iudge it to belong to the *Ricinus*, which also is called *Palma Christi*; for that *Nicolus* saith, a piece of root must be taken as long as ones thumbe; now the whole root of this plant is not so long. And besides, *Ricinus* is knowne to haue a vomitorie or purging facultie.

CHAP. 116. Of Serapia's Stones.

¶ The Kindes.

There be sundry sorts of Serapias stones, whereof some be male, others female; some great, and some of a smaller kinde; varying likewise in colour of the floures, whereof some be white, others purple; altering according to the soile or clymate, as the greatest part of bulbous roots do. Moreouer, some grow in marshie and fenny grounds, and some in fertile pastures, lying open to the Sun, varying likewise in the shape of their floures; retaining the forme of flies, Butter-flies, and Gnats, like those of the Fox stones.

T

¶ The

1 *Serapias Candido flore.*
White handed Orchis.

3 *Serapias palustris latifolia.*
Marsh Satyrion.

2 *Serapias minor, nitente flore.*
Red handed Orchis.

4 *Serapias palustris leptophylla.*
Fenny Satyrion.

† 5 *Serapias Montana.*
Mountaine Satyrion.

7 *Serapias Castrata.*
Gelded Satyrion.

† 6 *Serapias Gariophyllat a cum rad. & sem.*

Sweet-smelling Satyrion, with the root and seed exprest at large.

† 8 *Serapias*

¶ The Description.

1 **T**He white handed Orchis or Satyrion hath long and large leaues, spotted and dished with blacke spots, from the which doth rise vp a small fragile or brittle stalke of two hands high, hauing at the top a bush or spoky tuft of white floures, like in shape to those of *Palma Christi*, whereof this is a kinde. The root is thicke, fat, and full of iuyce, fashioned like the hand and fingers of a man, with some tough and fat strings fastned to the vpper part thereof.

2 Red handed Satyrion is a small low and base herbe, hauing a small tender stalke set with two or three small leaues, like vnto those of the Leeke, but shorter. The floure groweth at the top tuft fashion, of a glistering red colour, with a root fashioned like an hand, but lesser than the former.

3 Serapia's stones, or marish Satyrion hath a thicke knobby root, diuided into fingers like those of *Palma Christi*, whereof it is a kinde: from which rise thicke fat and spongy stalkes, set with broad leaues like those of Plantaine, but much longer, euen to the top of the tuft of floures; but the higher they rise toward the top the smaller they are. The floure consisteth of many small hooded floures somewhat whitish, spotted within with deepe purple spots; the backside of these little floures are Violet mixed with purple.

† 8 *Serapias Batrachites.*
Frog Satyrion.

† 9 *Serapias Batrachites altera.*
The other Frog Satyrion.

4 Fenny Satyrion (or Serapia's stones) differeth little from the former, sauing that the leaues are smaller, and somewhat spotted, and the tuft of floures hath not so many Greene leaues, nor so long, mixed with the floures, neither are they altogether of so darke or purplish a colour as the former. The roots are like those of the last described.

5 Mountaine Orchis or Satyrion hath thicke fat and knobby roots, the one of them for the most part being handed, and the other long. It growes like the former in stalkes, leaues, and floures, but is somewhat bigger, with the leaues smoother, and more shining.

6 Cloue Satyrion, or sweet smelling Orchis, hath flat and thicke roots diuided into fingers like

like those of *Palma Christi*, sauing that the fingers are longer, smaller, and more in number; from the which rise vp long and narrow leaues like those of Narcissus or Daffodill: among which cometh forth a small tender stalke, at the top whereof groweth a purple tuft compact of many small floures resembling Flies, but in sauour and smell like the Cloue, or Cloue Gillo-floure; but farre sweeter and pleasanter, as my selfe with many others can witnesse now liuing, that haue both seene and smelt them in my garden. ‡ After the floure is past, come many seed vessels filled with a small seed, and growing after the manner as you see them here at large expressed in a figure, together with the root also set forth at full. ‡

7 Gelded Satyrion hath leaues with nerues and sinewes like to those of Daffodill, set vpon a weake and tender stalke, with floures at the top white of colour, spotted within the floure, and in shapè they are like Gnats and little Flies. The stalke is gelded as it were, or the stones and hands cut off, leauing for the root two long legges or fingers, with many strings fastned vnto the top.

8 Frog Satyrion hath small flat leaues set vpon a slender weake stem; at the top whereof growes a tuft of floures compact of sundry small floures, which in shapè do resemble little frogges, whereof it tooke his name. The root is likewise gelded, onely reserued two small mishapen lumps with certaine fibres annexed thereto.

‡ 9 This also may fitly be added to the last described, the root shewing it to be of a kinde betweene the Serapia's and Orchis. It groweth to the height of the former, with short leaues engirting the stalke at their setting on. The floures on the top resemble a Frogge, with their long leaues; and if you looke vpon them in another posture, they will somewhat resemble little Flies: wherefore *Lobel* calls it as well *Myoides*, as *Batrachites*. ‡

¶ The Time.

These Plants flourish in the moneth of May and Iune, but seldome after, except some degenerate kinde, or that it hath had some impediment in the time when it should haue floured, as often hapneth.

¶ The Names.

We haue called these kindes, Serapia's stones, or Serapiades, especially for that sundry of them do bring forth floures resembling Flies and such like fruitfull and lasciuious insects, as taking their name from *Serapis* the god of the citisens of Alexandria in Ægypt, who had a most famous Temple at Canopus, where he was worshipped with all kinde of lasciuious wantonneffe, songs, and dances, as we may reade in *Strabo*, in his seuenteenth Booke. *Apuleius* confounds the Orchides and Sérapides, vnder the name of both the Satyrions; and withall saith it is called *Entaticos*, *Panion*, and of the Latines, *Testiculus Leporinus*. In English we may call them Satyrions, and finger Orchis, and Hares stones.

¶ The Nature and Vertues.

Serapia's stones are thought to be in nature, temperature, and Vertues, like vnto the Satyrion Royall; and although not so much vsed in physicke, yet doubtlesse they worke the effect of the other Stones.

† The fifth was the figure of *Satyrion trifolium* of *Tabern.* and is a kinde of *Testiculus pycodes*. 6. In this place formerly was the figure of the last before, to wit *Serapis montana*. 8. Here was the figure of *Orchis Myodes*, which should haue bene in the sixth place in the 101 Chapter of the former Edition, being the 113 of this.

CHAP. II 7.

Of Fenny Stones.

¶ The Description.

† 1 **T**His hath cleft or diuided roots like fingers, much like vnto the Roots of other *Palma Christi's*; whereof this is a kinde: from the which riseth vp a stalke of a foot high, set here and there with very faire Lilly-like leaues, of colour red, the which do clip or embrace the stalkes almost round about, like the leaues of Thorow-wax. At the

top of the stalke groweth a faire bush of very red floures, among the which floures do grow many small sharpe pointed leaues. The seed I could neuer obserue, being a thing like dust that flieth in the winde.

2 The other Marish handed Satyrion differeth little from the precedent, but in the leaues and floures, for that the leaues are smaller and narrower, and the floures are faire white, gaping wide open; in the hollownesse whereof appeare certaine things obscurely hidden, resembling little helmets, which setteth forth the difference.

† 1 *Serapias Dracontias palustris*.
Marish Dragon Satyrion.

† 2 *Serapias palustris leptophylla altera*.
The other Marish handed Satyrion.

3 This third handed Satyrion hath roots fashioned like an hand, with some strings fastned to the vpper part of them; from which riseth vp a faire stiffe stalke armed with large leaues, very notably dasht with blackish spots, clipping or embracing the stalke round about: at the top of the stalke standeth a faire tuft of purple floures, with many Greene leaues mingled amongst the same, which maketh the bush or tuft much greater. The seed is nothing else but as it were dust like the other of his kinde: † and it is contained in such twined vessels as you see exprest apart by the side of the figure; which vessels are not peculiar to this, but common to most part of the other Satyrions. †

4 The creeping rooted Orchis or Satyrion without testicles, hath many long roots dispersing themselves, or creeping far abroad in the ground, contrarie to all the rest of the Orchides: which Roots are of the bignesse of strawes, in substance like those of Sopewort; from the which immediately doth rise foure or fve broad smooth leaues like vnto the small Plantaine, from the which shooteth vp a small and tender stalke, at the top whereof groweth a pleasant spikie eare of a whitish colour, spotted on the inside with little speckes of a bloudie colour. The seed also is very small.

† 5 This from handed roots like others of this kinde sends vp a large stalke, sometimes attaining to the height of two cubits; the leaues are much like to those of the marish Satyrions; the floures are of an elegant purple, with little hoods like the top of an helmet (whence *Gemma* termed

3 *Palma Christi palustris.*
The third handed marish Satyrion.

4 *Palma Christi, radice repente.*
Creeping Satyrion.

5 *Palma Christi maxima.*
The greatest handed Satyrion.

termed the plant, *Cynosorch. conopsea*; and from the height he called it *Macrocanlos*.) These floures smel sweet, and are succeeded by seeds like those of the rest of this kindred.

It delights to grow in grounds of an indifferent temper, not too moist nor too dry. It floures from mid-May to mid-June. ‡

The Place.

They grow in marish and fenny grounds, and in shadowie woods that are very moist.

The fourth was found by a learned Preacher called Master *Robert Abbot*, of Bishops Hatfield, in a boggy groue where a Conduit head doth stand, that sendeth water to the Queenes house in the same towne.

‡ It growes also plentifully in Hampshire, within a mile of a market Towne called Peters-field, in a moist meadow named Wood-mead, neere the path leading from Peters-field, towards Beryton. ‡

¶ *The Time.*

They floure and flourish about May and June.

‡ ¶ *The Names.*

‡ ¶ This is *Cynosorchis Dracuntias* of Lobell and Gemma.

2 This

- 2 This is *Cynosorchis palustris altera Leptaphylla*, of Lobell; *Testiculus Galericultus*, of Tabernaemontanus.
- 3 Lobell and Gemma terme this, *Cynosorchis palustris altera Lophodes, vel nephelodes*.
- 4 This is *Orchis minor radice repente*, of Camerarius.
- 5 This by Lobell and Gemma is called *Cynosorchis macrocaulos, sine Conopsea*.

¶ The Temperature and Vertues.

There is little vse of these in physicke; onely they are referred vnto the handed Satyrions, whereof they are kindes: notwithstanding *Dalecampius* hath written in his great Volume, that the Marish Orchis is of greater force than any of the Dogs stones in procuring of lust.

Camerarius of Noremberg, who was the first that described this kinde of creeping Orchis, hath set it forth with a bare description onely; and I am likewise constrained to do the like, because as yet I haue had no triall thereof.

† The first of these was the third in the former Chapter; in lieu whereof I giue you the *Dracunculus* of Lobel, whose figure was here in the second place.

CHAP. 118. Of Birds nest.

1 *Satyrion abortinum, sine Nidus anis.*
Birds nest.

¶ The Description.

1 **B**irds Nest hath many tangling roots platted or crossed one ouer another very intricately, which resembleth a Crowes nest made of stickes; from which riseth vp a thicke soft grosse stalk of a browne colour, set with small short leaues of the colour of a dry Oken leafe that hath lien vnder the tree all the winter long. On the top of the stalke groweth a spikie eare or tuft of floures, in shape like vnto Maimed Satyrion, whereof doubtlesse it is a kinde. The whole plant, as well stickes, leaues, and floures, are of a parched browne colour.

† I receiued out of Hampshire from my often remembred friend Master *Goodyer* this following description of a *Nidus anis* found by him the twenty ninth of Iune, 1621.

¶ *Nidus avis flore & caule violaceo purpureo colore; an Pseudoleimodoron Clus. Hist. Rar. plant. pag. 270.*

This riseth vp with a stalke about nine inches high, with a few smal narrow sharpe pointed short skinny leaues, set without order, very little or nothing at all wrapping or inclosing the stalke; hauing a spike of floures like those of *Orobanche*, without tiales or leaues growing amongst them: which fallen, there succeed small seed-vessels. The lower part of the stalke within the ground is not round like *Orobanche*, but slender or long, and of a yellowish white colour, with many small brittle roots growing vnderneath confusedly, wrapt or folded together like those of the common *Nidus anis*. The whole plant as it appeareth aboue ground, both stalkes, leaues, and floures, is of a violet or deepe purple colour. This I found wilde in the border of a field called Marborne, neere Habridge in Haliborne, a mile from a towne called Alton in Hampshire, being the land of one *William Balden*. In this place also groweth wilde the thistle called *Coronilla fratum*. *Ioh. Goodyer.*

¶ The Place.

This bastard or vnkindely Satyrion is very seldome seene in these Southerly parts of England.

It

It is reported, That it groweth in the North parts of England, neere vnto a village called Knaefborough. I found it growing in the middle of a Wood in Kent two miles from Grauesend, neere vnto a worshipfull Gentlemans house called Master *William Swan*, of Howcke Greene. The wood belongeth to one Master *John Sidley* : which plant I did neuer see elsewhere ; and because it is very rare, I am the more willing to giue you all the markes in the wood for the better finding it, because it doth grow but in one piece of the Wood : that is to say, The ground is couered all ouer in the same place neere about it with the herbe *Sanycle*, and also with the kinde of *Orchis* called *Hermaphroditica*, or Butter-fly *Satyriion*.

¶ *The Time.*

It floureth and flourisheth in Iune and August. The dusty or mealy seed (if it may be called seed) falleth in the end of August ; but in my iudgement it is an vnprofitable or barren dust, and not any seed at all.

¶ *The Names.*

It is called *Satyrium abortivum* : of some, *Nidus avis* : in French *Nid d'oiseau* : in English, Birds nest, or Goose-nest : in Low-Dutch, *Uogels nest* : in High-Dutch, *Argen Dzehen*,

¶ *The Temperature and Vertues.*

It is not vsed in Physicke that I can finde in any authoritie either of the antient or later Writers, but is esteemed as a degenerate kinde of *Orchis*, and therefore not vsed.

THE

It is reported, that it grows in the North part of England, where it is called *Woad*.
I found it growing in the middle of a field, about two miles from *Gloucester*,
into a woad-plant, which is called *Woad*. It is a low, leafy plant, with
belonging to the *Woad* family, and is very common in the fields.
I am the more willing to give you all the more, in the woad for the first finding it,
cause it is both a new and an old plant. *Woad* is also called *Woad*, and is
in the same place, and also with the kind of *Woad* called
the *Woad* of *Barren* *Straw*.

It is found in the North part of England, where it is called *Woad*.

THE SECOND BOOKE OF THE HISTORIE OF PLANTS:

*Containing the description, place, time, names, nature, and
vertues of all sorts of Herbes for meate, medicine,
or sweet smelling vse, &c.*

WE haue in our first booke sufficiently described the Grasses, Rushes, Flags, Corne, and bulbous rooted Plants, which for the most part are such as with their braue and gallant floures decke and beautifie Gardens, and feed rather the eyes than the belly. Now there remaine certaine other bulbes, whereof the most (though not all) serue for food: of which we will also discourse in the first place in this booke, diuiding them in such sort, that those of one kinde shall be separated from another. † In handling these and such as next succeed them, we shall treat of diuers, yea the most part of those Herbes that the Greekes call by a generall name *Αρχον*: and the Latines, *Olera*: and we in English, Sallet-herbes. When we haue past ouer these, we shall speake of other plants, as they shall haue resemblance each to other in their externall forme. †

CHAP. I. Of Turneps.

¶ The Kindes.

THEre be sundry sorts of Turneps; some wilde; some of the garden; some with round roots globe fashion; other ouall or peare fashion, and another sort longish or somewhat like a Radish: and of all these there are sundry varieties, some being great, and some of a smaller sort:

¶ The Description.

1 **T**He Turnep hath long rough and greene leaues, cut or snipt about the edges with deepe gashes. The stalke diuideth it selfe into sundry branches or armes, bearing at the top small floures of a yellow colour, and sometimes of a light purple: which being past, there do succeed long cods full of small blackish seed like rape seed. The root is round like a bowle, and sometimes a little stretched out in length, growing very shallow in the ground, and often shewing it selfe aboue the face of the earth.

† 2 This is like the precedent in each respect, but that the root is not made so globous or bowle-fashioned as the former, but slenderer, and much longer, as you may perceiue by the figure wee here giue you. †

3 The small Turnep is like vnto the first described, sauing that it is lesse. The root is much sweeter in taste, as my selfe hath often proued.

4 There is another sort of small Turnep said to haue red roots; † and there are other-some whose roots are yellow both within and without; some also are greene on the outside, and other-some blackish. †

¶ The Place.

The Turnep prospereth wel in a light, loose, and fat earth, and so loose, as *Petrus Crescentinus* saith, that

that it may be turned almost into dust. It groweth in fields and diuers vineyards or Hop gardens in most places of England.

The small Turnep groweth by Hackney, in a sandy ground; and those that are brought to Cheape-side market from that Village are the best that euer I tasted.

¶ The Time.

Turneps are sowne in the spring, as also in the end of August. They floure and seed the second yeare after they are sown: for those which floure the same yeare that they are sown are a degenerate kinde, called in Cheshire about the Namptwiche, Mad neeps, of their euill qualitie in causing frensie and giddinesse of the braine for a season.

1 *Rapum majus.*
Great Turnep.

2 *Rapum radice oblonga.*
Longish rooted Turnep.

¶ The Names.

The Turnep is called in Latine, *Rapum*: in Greeke, ραβαν: the name commonly vsed in shops and euery where is *Rapa*. The Lacedemonians call it ραση: the Boetians, ραβαν, as *Athenaus* reporteth: in high Dutch, *Ruben*: in low Dutch, *Rapen*: in French, *Naueau rond*: in Spanish, *Nabo*: in English, Turnep, and Rape.

¶ The Temperature and Vertues.

- A The bulbous or knobbed root, which is properly called *Rapum* or Turnep, and hath giuen the name to the plant, is many times eaten raw, especially of the poore people in Wales, but most commonly boiled. The raw root is windy, and engendreth grosse and cold bloud; the boyled doth coole lesse, and so little, that it cannot be perceiued to coole at all, yet it is moist and windy.
- B It auaieth not a little after what manner it is prepared; for being boyled in water, or in a certaine broth, it is more moist, and sooner descendeth, and maketh the body more soluble; but being roasted or baked it drieth, and ingendreth lesse winde, and yet it is not altogether without winde. But howsoeuer they be dressed, they yeeld more plenty of nourishment than those that are eaten raw: they do increase milke in womens breasts, and naturall seed, and prouoke vrine.
- C The decoction of Turneps is good against the cough and hoarsenesse of the voice, being drunke in the euening with a little sugar, or a quantitie of clarified honey.
- D *Dioscorides* writeth, That the Turnep it selfe being stamped, is with good successe applied vpon mouldie

mouldie or kibed heeles, and that also oile of roses boiled in a hollow turnep vnder the hot embers doth cure the same.

The young and tender shootes or springs of Turneps at their first comming forth of the ground, boiled and eaten as a sallade, prouoke vrine.

The seed is mixed with counterpoisons and treacles: and being drunke it is a remedie against poisons.

They of the lowe countries doe giue the oile which is pressed out of the seed, against the after throwes of women newly brought to bed, and also minister it to young children against the wormes, which it both killeth and driueth forth.

The oile washed with water doth allaie the feruent heat and ruggednesse of the skin.

CHAP. 2. Of wilde Turneps.

¶ The Kindes.

Here be three sorts of wilde Turneps; one our common Rape which beareth the seed whereof is made rape oile, and feedeth singing birds: the other the common enemy to corne, which call Charlock; whereof there be two Kindes, one with a yellow, or els purple floure, the other with a white floure: there is also another of the water and marish grounds.

1 *Rapum sylvestre.*
Wilde Turneps.

2 *Rapistrum aruorum.*
Charlocke or Chadlocke.

¶ The Description.

Wilde Turneps or Rapes, haue long broad, and rough leaues like those of Turneps, but not so deeply gashed in the edges. The stalkes are slender and brittle, somewhat hairie, of two cubits high, diuiding themselues at the top into many armes or branches, whereon doe grow little yellowish flowers: which being past, there doe succeed small long cods which containe the seed like that of the Turnep, but smaller, somewhat reddish, and of a fire hot and

and biting taste as is the mustard, but bitterer. The root is small, and perisheth when the seed is ripe.

2 Charlocke, or the wilde rape, hath leaues like vnto the former, but lesser, the stalke and leaues being also rough. The stalkes bee of a cubite high, slender, and branched; the floures are sometimes purplish, but more often yellow. The rootes are slender, with certaine threds or strings hanging on them.

† There is also another varietie hereof with the leaues lesse diuided, and much smoother than the two last described, hauing yellow floures and cods not so deeply joynted as the last described: this is that, which is set forth by *Marthiolus* vnder the name of *Lampsana*.

3 Water Chadlock groweth vp to the height of three foot or somewhat more, with branches slender and smooth in respect of any of the rest of his kinde, set with rough ribbed leaues, deeply indented about the lower part of the leafe. The floures grow at the top of the branches, vmbel or tuft fashion, sometimes of one colour, and sometimes of another. † The root is long, tough, and full of strings, creeping and putting forth many stalkes: the seed vessells are short and small. *Bauhine* hath this vnder the title of *Raphanus aquaticus alter*. †

2 *Rapistrum aruense alterum*.

Another wilde Charlocke.

3 *Rapistrum aquaticum*.

Water Chadlocke.

¶ The Place.

Wilde Turneps or Rapes, doe grow of themselves in fallow fields, and likewise by high wayes neere vnto old walls, vpon ditch-bankes, and neere vnto townes and villages, and in other vntoiled and rough places.

The Chadlocke groweth for the most part among corne in barraine grounds, and often by the borders of fields and such like places.

Water Chadlocke groweth in moist medowes and marish grounds, as also in water ditches, and such like places.

¶ The Time.

These doe floure from March, till Summer be farre spent, and in the meane season the seed is ripe.

¶ The

¶ The Names.

Wilde Turnep is called in Latine *Rapistrum*, *Rapum sylvestre*, and of some, *Simapi sylvestre*, or wild mustard: in high Dutch, *Hederich*: in low Dutch, *Herick*: in French, *Velar*: in English, Rape, and Rape seed. *Rapistrum aruorum* is called Charlock, and Carlock.

¶ The Temperature.

The seed of these wild kindes of Turneps as also the water Chadlock, are hot and drie as mustard seed is. Some haue thought that Carlock hath a drying and clenfing qualitie, and somewhat digesting.

¶ The Vertues.

Diuers vse the seed of Rape in steed of mustard seed, who either make hereof a sauce bearing the name of mustard, or else mixe it with mustard seed: but this kinde of sauce is not so pleasant to the taste, because it is bitter.

Galen writeth that these being eaten engender euill blood: yet *Dioscorides* saith, they warme the stomacke and nourish somewhat.

CHAP. 3. Of Nauewes.

¶ The Kindes.

There be fundrie kindes of Nape or Nauewes degenerating from the kindes of Turnep, of which some are of the garden; and other wilde, or of the field.

¶ The Description.

NAuew gentle is like vnto Turneps in stalkes, floures, and seed, as also in the shape of the leaues, but those of the Nauew are much smoother; it also differeth in the root: the Turnep is round like a globe, the Nauew root is somewhat stretched forth in length.

† 1 *Bunias*.
Nauew Gentle.

† 2 *Bunias sylvestris L'Obelij*.
Wilde Nauew.

2 The small or wilde Nauew is like vnto the former, sauing that it is altogether lesser. The root is small, somewhat long, with threads long and tough at the end thereof.

¶ The Place.

Nauew-gentle requireth a loose and yellow mould euen as doth the Turnep, and prospereth in a fruitfull soile: he is sown in France, Bauaria, and other places in the fields for the seeds sake, as is likewise that wild Colewort called of the old writers *Crambe*: for the plentiful increase of the seeds bringeth no small gaine to the husbandmen of that countrey, because that being pressed they yeeld an oile which is vsed not onely in lampes, but also in the making of sope; for of this oile and a lie made of certaine ashes, is boiled a sope which is vsed in the Lowe-countries euery where to scoure and wash linnen clothes. I haue heard it reported that it is at this day sown in England for the same purpose.

The wilde Nauew groweth vpon ditch bankes neere vnto villages and good townes, as also vpon fresh marshie bankes in most places.

¶ The Time.

The Nauew is sown, floureth and seedeth at the same time that the Turnep doth.

¶ The Names.

The Nauew is called in Latine *Napus*, and also *Bunias*: in Greeke *Bunias*: the Germanes call it *Steckruben*: the Brabanders, *Steckropen*: in Spanish, *Naps*: in Italian, *Nauo*: the Frenchmen, *Naneau*: in English, Nauew-gentle, or French Naueau. The other is called *Napus sylvestris*, or wild Nauew.

¶ The Temperature and Vertues.

The Nauew and the Turnep are all one in temperature and vertues, yet some suppose that the Nauew is a little drier, and not so soone concocted, nor passeth downe so easily, and doth withall ingender lesse winde. In the rest it is answerable to the Turnep.

A † The seeds of these taken in drinke or broth are good against poyson, and are vsually put into Antidotes for the same purpose. ‡.

† The figure that was in the first place is a kinde of the long Turnep described by me in the second place of the first chapter of this second booke. And that in the second place was a lesser kinde of the same.

CHAP. 4. Of Lyons Turnep, or Lyons leafe.

Leontopetalon.
Lyons leafe.

¶ The Description.

LYONS Turnep or Lyons leafe, hath broad leaues like vnto Coleworts, or rather like the pionyces cut and diuided into sundry great gashes: the stalke is two foot long, thicke, and full of iuyce, diuiding it selfe into diuers branches or wings; in the tops whereof stand red floures: afterward there appeareth long cods in which lie the seeds like vnto tares, or wilde chichs. The root is great, bumped like a Turnep, and blacke without.

¶ The Place.

It groweth among corne in diuers places of Italy, in Candie also, and in other Prouinces towards the South and East. The right honorable Lord Zouch brought a plant hereof from Italy at his returne into England, the which was planted in his garden. But as farre as I doe know, it perished.

¶ The Time.

It floureth in winter, as witnesseth *Petrus Belonius*.

¶ The Names.

The Grecians call it *Leontopetalon*, that is, *Leonis folium*, or Lyons leafe: *Plinie* doth call it also *Leontopetalon*: *Apuleius*, *Leontopodion*: yet there is another plant called by the same name. There bee many bastard Names giuen vnto it, as *Rapeium*,

Rapeium, Papauerculum, Semen Leoninum, Pes Leoninus, and Brumaria: in English Lyons leafe, and Lyons Turnep.

¶ *The Temperature.*

Lyons Turnep is of force to digest; it is hot and drie in the third degree, as *Galen* teacheth.

¶ *The Vertues.*

The root (saith *Dioscorides*) taken in wine doth helpe them that are bitten of Serpents, and it doth most speedily alay the paine. It is put into glisters which are made for them that bee tormented with the *Sciatica*.

CHAP. 5. Of Radish.

¶ *The Kindes.*

There be fundrie sorts of Radish, whereof some be long and white; others long and blacke; some round and white; others round, or of the forme of a peare, and blacke of colour; some wilde, or of the field; and some tame, or of the garden, whereof we will intreat in this present chapter.

1 *Raphanus sativus.*
Garden Radish.

2 *Radicula sativa minor.*
Small garden Radish.

¶ *The Description.*

The garden Radish sendeth forth great and large leaues, greene, rough, cut on both sides with deepe gashes, not vnlike to the garden Turnep, but greater. The stalkes bee round and parted into many branches; out of which spring small floures of a light purple colour, made of foure little leaues: and when they be past, there doe come in place sharpe pointed cods huff or blowne vp toward the stalke, full of spongius substance, wherein is contained the seed, of a light browne colour, somewhat greater than the seeds of Turneps or Coleworts. The root is grosse, long, and white both without and within, and of a sharpe taste.

2 The small garden Radish hath leaues like the former, but smaller, and more brittle in handling. The stalke of two cubits high, whereon be the floures like the former. The seed is smaller, and not so sharpe in taste. The root is small, long, white both within and without, except a little that sheweth it selfe aboue the ground of a reddish colour.

3 Radish with a round root hath leaues like the garden Turnep : among which leaues springeth vp a round and smooth stalke, diuiding it selfe toward the top into two or three branches, whereon doe grow small purplish floures made of foure leaues, apeece : which being past, there doe come in place small long cods puffed vp or bunched in two, and sometimes three places, full of pith as the common Radish ; wherein is contained the seed, somewhat smaller than the Colewort seed, but of a hotter taste. The root is round and firme, nothing waterish like the common Radish, more pleasant in taste, wholesomer, not causing such stinking belchings as the garden Radish doth.

4 The Radish with a root fashioned like a peare, groweth to the height of three or foure cubits, of a bright reddish colour. The leaues are deeply cut or iagged like those of the Turnep, somewhat rough. The floures are made of foure leaues, of a light carnation or fleshie colour. The seed is contained in small bunched cods like the former. The root is fashioned like a peare or long Turnep, blacke without and white within, of a firme and solide substance. The taste is quicke and sharpe, biting the tongue as the other kindes of Radish, but more strongly.

3 *Rhaphanus orbiculatus.*
Round Radish.

4 *Raphanus pyriformis, siue radice nigra.*
The blacke, or Peare-fashion Radish.

¶ The Place.

¶ All the kindes of Radish require a loose ground which hath beene long manured and is somewhat fat. They prosper well in sandie ground, where they are not so subiect to wormes, as in other grounds.

¶ The Time.

These kindes of Radish are most fitly sowed after the Summer Solstice in Iune or Iulie: for being sowed betimes in the spring they yeeld not their roots so kindly nor profitably, for then they doe for the most part quickly run vp to stalke and seed, where otherwise they doe not floure and seed till the next spring following. They may be sowed ten moneths in the yeere, but as I said before, the best time is in Iune and Iulie.

¶ The

¶ The Names.

Radish is called in Greeke of *Theophrastus*, *Dioscorides*, *Galen*, and other old writers *in shops*, *Raphanus*, and *Satira Radicula*: in high Dutch, *Rettich*: in low Dutch, *Radus*: in French, *Raisfort*: in Italian, *Raphano*: in Spanish, *Rauano*: in English, *Radish*, and *Rabone*: in the Bohemian tongue, *Rzedfew*. *Celius* affirmeth that the seed of Radish is called of *Marcellus Empericus*, *Bacanon*; and so likewise of *Aëtius* in the second chapter of the second booke of his *Tetrabible*: yet *Cornarius* doth not reade *Bacanon*, but *Cacanon*: The name of *Bacannum* is also found in *N. Myrepsus*, in the 255. Composition of his first booke.

¶ The Temperature.

Radish doth manifestly heat and drie, open and make thin by reason of the biting quality that ruleth in it. *Galen* maketh them hot in the third degree, and drie in the second, and sheweth that it is rather a sauce than a nourishment.

¶ The Vertues.

Radish are eaten raw with bread in stead of other food; but being eaten after that manner, they yeeld very little nourishment, and that faultie and ill. But for the most part, they are vsed as sauce with meates to procure appetite, and in that sort they ingender blood lesse faulty, than eaten alone or with bread onely: but seeing they be of a harder digestion than meates, they are also many times troublesome to the stomacke; neuerthelesse, they serue to distribute and disperse the nourishment, especially being taken after meat; and taken before meat, they cause belchings, and ouerthrow the stomacke.

Before meate they cause vomiting, and especially the rinde: the which as it is more biting than the inner substance, so doth it with more force cause that effect if it be giuen with Oximel, which is a syrupe made with vineger and hony.

Moreouer, Radish prouoketh vrine, and dissolueth cluttered sand, and driueth it forth, if a good draught of the decoction thereof be drunke in the morning. *Pliny* writeth, and *Dioscorides* likewise, that it is good against an old cough; and to make thin, thicke and grosse flegme which sticketh in the chest.

In stead hereof the Phisitians of our age doe vse water distilled thereof: which likewise procureth vrine mightily, and driueth forth stones in the kidnies.

The root sliced and laid ouer night in white or Rhenish wine, and drunke in the morning, driueth out vrine and grauell mightily, but in taste and smell it is very lothsome.

The root stamped with hony and the powder of a sheepes heart dried, causeth haire to grow in short space.

The seed causeth vomite, prouoketh vrine: and being drunke with honied vineger, it killeth and driueth forth wormes.

The root stamped with the meale of Darnell and a little white wine vineger, taketh away all blew and blacke spots, and brused blemishes of the face.

The root boiled in broth, and the decoction drunke, is good against an old cough: it moueth womens sicknesse, and causeth much milke.

† Those figures that were in the first and second place, were varieties of the long Turnep described in the second place, in the first Chapter of this second booke.

CHAP. 6.

Of wilde Radish.

¶ The Description.

1 Wilde Radish hath a shorter narrower leafe than the common Radish, and more deeply cut or iagged, almost like the leaues of Rocket, but much greater. The stalke is slender and rough, of two cubits high, diuided toward the top into many branches. The floures are small and white: the cod is long, slender, and ioynted, wherein is the seed. The root is of the bignesse of the finger, white within and without, of a sharpe and biting taste.

2 The water Radish hath long and broad leaues, deeply indented or cut euen to the middle rib. The stalke is long, weake, and leaneth this way and that way, being not able to stand vpriht without a prop, in so much that yee shall neuer find it, no not when it is very young, but leaning down vpon the mud or mire where it groweth. The floures grow at the top made of foure small yellow leaues. The root is long, set in sundrie spaces with small fibres or threds like the rowell of a spur, hot and burning in taste more than any of the garden Radishes.

¶ The Place.

The first growes vpon the borders of bankes and ditches cast vp, and in the borders of fields.

The

The second growes in ditches, standing waters, and riuers; as on the stone wall that bordereth vpon the riuer Thames by the Sauoy in London.

1 *Raphanus sylvestris*.
Wilde Radish.

2 *Raphanus aquaticus*.
Water Radish.

¶ The Time.

They floure in Iune, and the seed is ripe in August.

¶ The Names.

† The first of these is *Rapistrum flore albo Eruca folijs*, of Lobell: *Armorata*, or *Rapistrum album* of *Tabernamontanus*: and *Raphanus sylvestris*, of our Author: in English, wilde Radish.

The second is *Radicula sylvestris* of *Dodonæus*: and *Rhaphanus aquaticus*, or *palustris* of others: in English, water Radish.

¶ The Temperature.

The wilde Radishes are of like temperature with the garden Radish, but hotter and drier.

¶ The Vertues.

A *Dioscorides* writeth, that the leaues are receiued among the pot herbes, and likewise the boiled root, which as he saith, doth heate, and prouoke vrine.

CHAP. 7. Of Horse Radish.

¶ The Description.

1 **H**orse Radish bringeth forth great leaues, long, broad, sharpe pointed and snipped about the edges, of a deepe Greene colour like those of the great garden Docke, called, of some Monkes Rubarbe, of others Patience, but longer and rougher. The stalke is slender and brittle, bearing at the top small white floures: which being past, there follow small cods, wherein is the seed. The root is long and thicke, white of colour, in taste sharpe, and very much biting the tongue like mustard.

2 Dittander or pepperwort, hath broad leaues, long, and sharpe pointed, of a blewish Greene colour like woad, somewhar snipt or cut about the edges like a sawe. The stalke is round and tough:

rough: vpon the branches whereof grow little white floures. The root is long and hard, creeping farre abroad in the ground, in such sort that when it is once taken in a ground, it is not possible to root it out, for it will vnder the ground creepe and shoot vp and bud forth in many places farre abroad. The root also is sharp and biteth the tongue like pepper, whereof it tooke the name pepperwort.

‡ 3 This which we giue you in the third place hath a small fibrous root, the stalke growes vp to the height of two cubits, and it is diuided into many branches furnished with white floures, after which follow seeds like in shape and taste to Thlaspi, or Treacle mustard. The leaues are somewhat like those of Woad. This is nourished in some Gardens of the Low Countreyes, and Lobell was the first that gaue the figure hereof, and that vnder the same title as wee here giue you it. ‡.

1 *Raphanus rusticanus.*
Horfe Radish.

2 *Raphanus syluestris* Offic. *Lepidium Aeginete* Lob.
Dittander, and Pepperwort.

¶ The Place.

Horfe Radish for the most part groweth and is planted in gardens, yet haue I found it wilde in sundrie places, as at Namptwich in Cheshire, in a place called the Milne eye, and also at a small village neere London called Hogsdon, in the field next vnto a farne house leading to Kings-land, where my very good friend master Bredwell practitioner in Phisick, a learned and diligent searcher of Simples, and master William Martin one of the fellowship of Barbers and Chirurgians, my deere and louing friend, in company with him found it, and gaue me knowledge of the place, where it flourisheth to this day.

Dittander is planted in gardens, and is to be found wild also in England in sundry places, as at Clare by Ouenden in Essex, at the Hall of Brinne in Lancashire, and neere vnto Excester in the West parts of England. It delighteth to grow in sandie and shadowie places somewhat moist.

¶ The Time.

Horfe Radish for the most part floureth in Aprill or May, and the seed is ripe in August, and that so rare or seldome seene, as that Petrus Placentius hath written, that it bringeth forth no seed at all. Dittander floures in Iune and Iuly.

¶ The Names.

Horfe Radish is commonly called *Raphanus rusticanus*, or *Magnus*, and of diuers simply *Raphanus syluestris*.

syluestris: of the high Dutch men, **Herrattich Kraut** or **Kren**: in French, *Grand raifort* of the low Germanes, **Herradus**: in English, mountaine radish, Great Raifort, and Horfe Radish. It is called in the North part of England, Redcole.

Diuers thinke that this Horfe Radish is an enemy to Vines, and that the hatred betweene them is so great, that if the roots hereof be planted neere to the Vine it bendeth backward from it, as not willing to haue fellowship with it.

It is also reported that the root hereof stamped, and cast into good and pleasant wine, doth forthwith turne it into vineger: but the old writers doe ascribe this enmity to the vine and Brassica, our coleworts, which the most ancients haue named *Lepidium*.

Dittander is described of *Pliny* by the name of *Lepidium* in his 19. booke, 9. Chapter: likewise *Egineta* maketh mention of this plant, by the name *Lepidium*: in shops, *Raphanus syluestris*, and *Piperitis*: the Germans call it, **Pefferkraut**: the lowe Dutch men, **Pepper cruyt**: the English men, Dittander, Dittany, and Pepperwort.

3 *Lepidium Annum.*
Annuall Dittander.

¶ The Temperature.

These kindes of wilde Radishes, are hot and drie in the third degree: they haue a drying and clensing quality, and somewhat digesting.

¶ The Vertues.

Horfe Radish stamped with a little vineger put thereto, is commonly vsed among the Germanes for sauce to eat fish with, and such like meates, as we doe mustard: but this kinde of sauce doth heate the stomacke better, and causeth better digestion than mustard.

Oximel or syrupe made with vineger and honie, in which the rindes of Horfe radish haue beene infused three dayes, causeth vomit, and is commended against the quartaine ague.

The leaues boiled in wine, and a little oile oliue added thereto and laid vpon the grieved parts in manner of a Pultis, doe mollifie and take away the hard swellings of the liuer and milte; and being applied to the bottome of the belly is a remedie for the strangurie.

It profiteth much in the expulsion of the seconde or after-birth.

It mittigateth and asswageth the paine of the hip or haunch, commonly called Sciatica.

It profiteth much against the collicke, strangurie, and difficultie of making water, vsed in stead of mustard as aforesaid.

The root stamped and giuen to drinke, killeth the wormes in children: the iuyce giuen doth

the same: an ointment made thereof, doth the like, being annointed vpon the belly of the child.

H The leaues of Pepperwort but especially the rootes, be extreame hot, for they haue a burning and bitter taste. It is of the number of scorching and blistering simples, saith *Pliny* in his 20. booke, the 17. chap. and therefore by his hot qualitie, it mendeth the skin in the face, and taketh away scabs, scarres, and manginess, if any thing remaine after the healing of vlcers and such like.

CHAP. 8.

Of Winter Cresses.

¶ The Description.

The Winter Cresses hath many greene, broad, smoothe and flat leaues like vnto the common turneps, whose stalkes be round, and full of branches, bringing forth at the top small yellow floures: after them doe follow small cods, wherein is contained small reddish seed.

¶ The

1 *Barbarea.*
Winter Cresses.

¶ *The Place.*

It groweth in gardens among pot herbes, and very common in the fields, neere to pathes and high wayes, almost euery where.

¶ *The Time.*

This herbe is green all winter long, it floureth in May, and feedeth in Iune.

¶ *The Names.*

Winter Cresse is called of the Latines, *Cardamum*, or *Nasturtium Hibernum*, of some, *Barbarea*, and *Pseudobunium*: the Germanes call it *S. Barberen Kraut*: in lowe Dutch, *Winter Kerse*.

It seemeth to be *Dioscorides* his *Pseudobunium*, that is to say, false or bastard *Bunium*: in English, winter Cresses, or herbe Saint Barbara.

¶ *The Nature.*

This herbe is hot and drie in the second degree.

¶ *The Vertues.*

The seed of winter Cresse causeth one to A
make water, and driueth forth grauell, and helpeth the strangurie.

The iuyce thereof mundifieth corrupt and filthy vlcers, being made in forme of an vnguent B
with waxe, oyle, and turpentine.

In winter when salad herbes bee scarce, this C
herbe is thought to be equall with Cresses of the garden, or Rocket.

This herbe helpeth the scuruie, being boiled D
among scuruie grasse, called in Latine *Cochlearia*, causing it to worke the more effectually.

CHAP. 9. Of Mustard.

¶ *The Description.*

1 The tame or garden Mustard, hath great rough leaues like to those of the Turnep, but rougher and lesser. The stalke is round, rough, and hairie, of three cubits high, diuided into many branches; whereon doe grow small yellow floures, and after them long cods, slender and rough, wherein is contained round seed bigger then Rape seed, of colour yellow, of taste sharpe, and biting the tongue as doth our common field mustard.

2 Our ordinary Mustard hath leaues like Turneps, but not so rough, the stalkes are smooth, and grow sometimes to three, foure, or fise cubits high, they haue many branches, and the leaues vpon these branches, especially the vppermost, are long and narrow, and hang downward on small stalkes; the cods are short, and lie flat and close to the branches, and are somewhat square; the seed is reddish or yellow. ‡

3 The other tame Mustard is like to the former in leaues, and branched stalkes, but lesser, and they are more whitish and rough. The floures are likewise yellow, and the seed browne like the Rape seed, which is also not a little sharpe or biting.

4 This which I giue you bere being the *Sinapi sativum alterum*, of *Lobel*; and the *Sinapi album* of the shops, growes but low, and it hath rough crooked cods, and whitish seeds; the stalks, floures, and leaues, are much like the first described. ‡

5 The wilde Mustard hath leaues like those of shepheards purse, but larger, and more deeply indented, with a stalke growing to the height of two foot, bearing at the top small yellow floures made of foure leaues: the cods be small and slender, wherein is contained reddish seed, much smaller than any of the others, but not so sharpe or biting.

† 1 *Sinapi sativum.*
Garden Mustard.

† 3 *Sinapi sativum alterum, Dod.*
Field Mustard.

† 4 *Sinapi album.*
White Mustard.

† 5 *Sinapi sylvestre minus.*
Small wilde Mustard.

¶ The Place.

‡ Our ordinarie Mustard (whose description I haue added) as also the wilde and small grow wilde in many places of this kingdome, and may all three be found on the bankes about the back of Old-street, and in the way to Islington. ‡

¶ The Time.

Mustard may be sown in the beginning of the Spring: the seed is ripe in Iuly or August: It commeth to perfection the same yeare that it is sown.

¶ The Names.

The Greekes call Mustard, *σινάπι*: the Athenians called it *σινάπι*: the Latines, *Sinapi*: the rude and barbarous, *Sinapium*: the Germanes, *Senff*: the French, *Senese* and *Moustarde*: the low-Dutchmen, *Mostaert saet*: the Spaniards, *Mostaza*, and *Mostalla*: the Bohemians, *Horcice*: Pliny calls it *Tblaspi*, whereof doubtlesse it is a kinde: and some haue called it *Saurion*.

‡ These kindes of Mustard haue beene so briefly treated of by all Writers, that it is hard to giue the right distinctions of them, and a matter of more difficultie than is expected in a thing so vulgarly knowne and vsed: I will therefore endeauour in a few words to distinguish those kindes of mustard which are vulgarly written of.

1 The first is *Sinapi primum* of *Matthiolus* and *Dodonæus*; and *Sinapi sativum Erucæ aut Rapi folio* of *Lobel*.

2 The second I cannot iustly referre to any of those which are written of by Authours; for it hath not a cod like Rape, as *Pena* and *Lobel* describe it; nor a seed bigger than it, as *Dodonæus* affirmeth; yet I suspect, and almost dare affirme that it is the same with the former mentioned by them, though much differing from their figures and description.

3 The third (which also I suspect is the same with the fourth) is *Sinapi alterum* of *Matthiolus*, and *Sinapi agreste Apij, aut potius Laueris folio*, of *Lobel*: and *Sinapi sativum alterum* of *Dodonæus*.

4 The fourth is by *Lobel* called *Sinapi alterum sativum*; and this is *Sinapi album Officinarum*, as *Pena* and *Lobel* affirme, *Aduers. pag. 68.*

5 The fifth is *Sinapi sylvestre* of *Dodonæus*: and *Sinapi sylvestre minus Bursæ pastoris folio*, of *Lobel*. It is much like Rocket, and therefore *Bauhine* fitly calls it *Sinapi Erucæ folio*: in English it may be called Small wilde Mustard. ‡

¶ The Temperature.

The seed of Mustard, especially that which we chiefly vse, doth heat and make thinne, and also draweth forth. It is hot and dry in the fourth degree, according to *Galen*.

¶ The Vertues.

The seed of Mustard pound with vinegar, is an excellent sauce, good to be eaten with any grosse A meates either fish or flesh, because it doth helpe digestion, warmeth the stomacke, and prouoketh appetite.

It is giuen with good successe in like manner to such as be short winded, and are stopped in the B breast with tough flegme from the head and braine.

It appeaseth the tooth-ache being chewed in the mouth. C

They vse to make a gargarisine with honey, vinegar, and mustard seed, against the tumours and D swellings of the Vuula, and the almonds about the throat and root of the tongue.

Mustard drunke with water and honey prouoketh the termes and vrine. E

The seed of mustard beaten and put into the nostrils, causeth sneefing, and raiseth women sicke F of the mother out of their fits.

It is good against the falling sicknesse, and such as haue the Lithargie, if it be laid plaister- G wise vpon the head (after shauing) being tempered with figs.

It helpeth the Sciatica, or ache in the hip or huckle bone: it also cureth all manner of paines H proceeding of a cold cause.

It is mixed with good successe with drawing plaisters, and with such as waste and consume I nodes and hard swellings.

It helpeth those that haue their haire pulled off; it taketh away the blew and blacke marks that K come of bruifings.

‡ The seed of the white Mustard is vsed in some Antidotes, as *Electuarium de ouo, &c.* L

† The three figures in the former edition were all false: The first was of *Barbarea*, described in the precedent chapter: The second, of *Erucæ aquatica* minor of *Ta- bern*, The third, of *Erucæ aquat. minor*, Tab.

CHAP. 10. Of Rocket.

¶ The Kindes.

There be sundry kinds of Rocket; some tame, or of the garden; some wilde, or of the field; some of the water, and of the sea.

† 1 *Eruca sativa.*
Garden Rocket.

2 *Eruca sylvestris.*
Wilde Rocket.

¶ The Description.

1 **G**arden Rocket, or Rocket gentle, hath leaues like those of Turneps, but not neere so great nor rough. The stalks rise vp of a cubit, & somtimes two cubits high, weak and brittle; at the top whereof grow the floures of a whitish colour, and sometimes yellowish; which being past, there do succeed long cods, which containe the seed, not vnlike to rape seed, but smaller.

2 The common Rocket, which some keepe in Gardens, and which is vsually called the wilde Rocket, is lesse than the Romane Rocket, or Rocket-gentle, the leaues and stalkes narrower, and more iagged. The floures be yellow, the cods also slenderer, the seed thereof is reddish, and biteth the tongue.

3 This kinde of Rocket hath long narrow leaues almost such as those of Tarragon, but thicker and fatter, resembling rather the leaues of Myagrum, altogether vnlike any of the rest of the Rockets, sauing that the branch, floure, and seed are like the garden Rocket.

4 There is another kinde of Rocket, thought by that reuerend and excellent Herbarist *Carolus Clusius* to be a kinde of Cresses; if not Cresses it selfe, yet cousine germane at the least. Vnto whose censure *Lobelius* is indifferent, whether to call it Rocket with thinne and narrow leaues, or to call it Cousine to the kinds of Cresses, hauing the taste of the one, and the shape of the other. The leaues are much diuided, and the floures yellow.

5 There is a wild kind of Sea-Rocket which hath long weake and tender branches trailing vpon

upon the ground, with long leaues like vnto common Rocket, or rather Groundswell, hauing small and whitish blew floures; in whose place commeth small cods, wherein is contained seed like that of Barley.

‡ 6 Besides these there is another plant, whose figure which here I giue was by our Author formerly set forth in the precedent chapter, vnder the title of *Sinapi sylvestre*; together with a large kinde thereof, vnder the name of *Sinapi sativum alterum*. Now I will onely describe the later, which I haue sometimes found in wet places: The root is woody: the stalke some foot long, crested, and hauing many branches, lying on the ground: the leafe is much diuided, and that after the manner of the wilde Rocket: the floures are of a bright yellow; and are succeeded by short crooked cods, wherein is contained a yellowish seed. ‡

‡ 3 *Eruca sylvestris angustifolia*.
Narrow leaued wilde Rocket.

‡ 4 *Erucanasturtio cognata tenuifolia*.
Cressy-Rocket.

¶ The Place.

Romane Rocket is cherished in Gardens.

Common or wilde Rocket groweth in most gardens of it selfe: you may see most bricke and stone walls about London and elsewhere couered with it.

The narrow leaued Rocket groweth neere vnto water sides, in the chinkes and creuises of stone walls among the mortar. I found it as ye go from Lambeth bridge to the village of Lambeth, vnder a small bridge that you must passe ouer hard by the Thames side.

I found Sea Rocket growing vpon the sands neere vnto the sea in the Isle of Thanet, hard by a house wherein Sir Henry Crispe did sometimes dwell, called Queakes house.

¶ The Time.

These Kinde of Rocket floure in the moneths of Iune and Iuly, and the seed is ripe in September.

The Romane Rocket dieth euery yeare, and recouereth it selfe againe by the falling of his owne seed.

¶ The Names.

Rocket is called in Greeke, *ῥοζαριον* : in Latine, *Eruca* : in high Dutch, *Raukenkraut* : in French, *Roquette* : in Low-Dutch, *Rakette* : in Italian, *Ruchetta* : in Spanish, *Oruga*, in English, Rocket, and Racket. The Poets do oft times name it *Herbasalax* : *Eruca* doth signifie likewise a certaine canker worme, which is an enemy to pot-herbes, but especially to Coleworts.

- † The first is called *Eruca sativa*, or *Hortensis major* : Great Garden Rocket.
- 2 The second, *Eruca sylvestris* : Wilde Rocket.
- 3 This third is by *Lobel* called *Eruca sylvestris angustifolia* : Narrow leaved wilde Rocket.
- 4 *Clusius* fitly calls this, *Nasturtium sylvestre* : and he reprehendeth *Lobel* for altering the name into *Eruca Nasturtio cognata tenuifolia* : Cressly-Rocket.
- 5 The fifth is *Eruca marina*, (thought by *Lobel* and others to be *Cakile Serapionis*,) Sea Rocket.
- 6 *Eruca aquatica* : Water Rocket.

† 5 *Eruca marina*.
Sea Rocket.

† 6 *Eruca aquatica*.
Water Rocket.

¶ The Temperature.

Rocket is hot and dry in the third degree, therefore saith *Galen* it is not fit nor accustomed to be eaten alone.

¶ The Vertues.

- A Rocket is a good sallet herbe, if it be eaten with Lettuce, Purslane, and such cold herbes ; for being so eaten it is good and wholesome for the stomacke, and causeth that such cold herbes do not over-coole the same : otherwise, to be eaten alone, it causeth head-ache, and heateth too much.
- B The vse of Rocket stirreth vp bodily lust, especially the seed.
- C It prouoketh vrine, and causeth good digestion.
- D *Pliny* reporteth, That whosoever taketh the seed of Rocket before he be whipt, shall be so hardened, that he shall easily endure the paines.
- E The root and seed stamped, and mixed with Vineger and the gall of an Oxe, taketh away freckles, lentiles, blacke and blew spots, and all such deformities of the face.

† The figure that was in the third place, vnder the title of *Eruca syl. angustifolia*, is of the same plant that in the Chapter of *Turritis* is called *Camelina*, where you shall finde it treated of at large. And that in the first place is *Erysimum secundum* of *Tabern.* and I question whether it be not of *Sinapi sylvestre minus*.

CHAP. II. Of Tarragon.

Draco herba.
Tarragon.

¶ The description.

TArragon the sallade herbe hath long and narrow leaues of a deepe Greene colour, greater and longer than those of common Hyssope; with slender brittle round stalkes two cubites high: about the branches whereof hang little round flowers, neuer perfectly opened, of a yellow colour mixed with blacke, like those of common Wormewood. The root is long and fibrous, creeping farre abroad vnder the earth, as doe the rootes of Couch-grasse, by which sprouting forth it increaseth, yeelding no seede at all, but as it were a certaine chaffie or dustie matter that flieth away with the winde.

¶ The place.

Tarragon is cherished in gardens, and is increased by the young shootes: *Ruellius* and such others haue reported many strange tales hereof scarce worth the noting, saying, that the seed of flaxe put into a radish roote or sea Onion, and so set, doth bring forth this herbe Tarragon.

¶ The time.

It is Greene all Summer long, and a great part of Autumne, and floureth in Iuly.

The names.

It is called in Latine, *Draco*, *Dracunculus hortensis*, and *Tragum vulgare* by *Clusius*; Of the Italians, *Dragoncellum*; in French, *Dragon*; in English, Tarragon.

It is thought to be that *Tarchon* which *Auicenna* mentioneth in his 686. chapter, but he writeth so little thereof, as that nothing can certainly be affirmed of it. *Simeon Serhi* the Greeke also maketh mention of *Tarchon*.

¶ The temperature and vertues.

Tarragon is hot and drie in the third degree, and not to be eaten alone in sallades, but ioyned with other herbes, as Lettuce, Purslain, and such like, that it may also temper the coldnes of them, like as Rocket doth, neither doe we know what other vse this herbe hath.

CHAP. 12. Of garden Cresses.

¶ The description.

1 **G**arden Cresses or Towne Cresses hath small narrow iagged leaues, sharpe and burning in taste. The stalks be round, a cubite high, which bring forth many small white flowers, and after little flat huskes or seede vessels, like to those of the pheards purse, wherein are contained seeds of a browne reddish colour. The roote dieth when the seede is ripe.

2 There is another kinde in taste like the former, but in leaues farre different, which I recovered of seedes, sent me from *Robinus* dwelling in Paris. The stalkes rise vp to the height of a foot, garnished with many broad leaues deeply cut or indented about the edges; the middle of the leafe is deckt and garnished with many little small leaues or rather shreds of leaues, which make the same like a curlede fanne of feathers. The seede is like the former in shape.

3 Spanish Cresses riseth forth of the ground like vnto Basill, afterwards the leaues grow larger and broader, like those of Marigolds; among the which riseth vp a crooked lymmer stalke, where-

whereupon do grow small tufts or spokie rindles of white flowers. The seede followeth, browne of colour, and bitter in taste. The whole plant is of a loathsome smell and saour.

4 Stone-Cresse groweth flat vpon the ground, with leaues iagged and cut about the edges like the oake leafe, resembling well the leaues of shepheardes purse. I haue not seene the flowers, and therefore they be not exprest in the figure; notwithstanding it is reported vnto me, that they bee small and white of colour, as are those of the garden Cresses. The seed is contained in small pouches or seede vessels, like those of Treacle mustard or Thlaspi.

¶ The Place.

Cresses are sowne in gardens, it skils not what soile it be; for that they like any ground, especially if it be well watered. † M. Bowles found the fourth growing in Shropshire in the fields about Birch in the parish of Elefmere, in the grounds belonging to M. Richard Herbert, and that in great plenty. †

¶ The Time.

It may be sowne at any time of the yeere, vnlesse it be in Winter; it groweth vp quickly, and bringeth forth betimes both stalke and seede: it dieth euery yeere, and recouereth it selfe of the fallen or shaken seed.

1 *Nasturtium hortenfe.*
Garden Cresses.

¶ The Names.

Cresses is called in Greeke *κασσιωπή*: in Latine *Nasturtium*; in English Cresses: the Germanes call it *Kersse*: and in French, *Cresson*: the Italians, *Nasturtio*, and *Agretto*: of some, towne Cresses, and garden Karsse. It is called *Nasturtium*, as *Varro* and *Plinie* thinke *à narribus torquendis*, that is to say, of writhing the nostrils, which also by the loathsome smell and sharpnesse of the seede doth cause sneefing. † The first is called *Nasturtium hortenfe*, Garden Cresses. 2 *Nasturtium hortenfe crispum*, Garden Cresses with crispe, or curled leaues. 3 *Nasturtium Hispanicum*, or *Latifolium*; Spanish Cresses, or Broad-leaved Cresses. 4 This is *Nasturtium petraeum* of *Tabernamontanus* (and not of *Lobell*, as our Author termed it.) Stone Cresses. †

¶ The Temperature.

The herbe of garden Cresses is sharpe and biting the tongue; and therefore it is very hot and drie, but lesse hot whilest it is yong and tender, by reason of the waterie moisture mixed therewith, by which the sharpenesse is somewhat allaied.

The seede is much more biting then the herbe, and is hot and drie almost in the fourth degree.

¶ The Vertues.

Galen saith that the Cresses may be eaten with bread *Veluti obsonium*, and so the Antient Spartanes

vsually did; and the low-Countrie men many times doe, who commonly vse to feed of Cresses with bread and butter. It is eaten with other sallade hearbes, as Tarragon and Rocket: and for this cause it is chiefly sowne.

B It is good against the disease which the Germanes call *Scorbuch* and *Scorbupe*: in Latine, *Scorbutus*: which we in England call the Scuruie, and Scurby, and vpon the seas the Skyrby: it is as good and as effectuell as the Scuruie grasse, or water Cresses.

C *Dioscorides* saith, if the seed be stamped and mixed with hony, it cureth the hardnesse of the milt: with Vineger and Barley meale parched it is a remedie against the Sciatica, and taketh away hard swellings and inflammations. It scoureth away tetters, mixed with brine: it ripeneth felons, called in Greeke, *δυσήνη*: it forcibly cutteth and raiseth vp thicke and rough humors of the chest, if it be mixed with things proper against the stuffing of the lungs.

Dioscorides saith it is hurtfull to the stomacke, and troubleth the belly.

3 *Nasturtium Hispanicum.*
Spanish Cresses.

4 *Nasturtium Petreum.*
Stone Cresses.

It driueth forth wormes, bringeth downe the floures, killeth the child in the mothers womb, D
and prouoketh bodily lust.

Being inwardly taken, it is good for such as haue fallen from high places: it dissolueth clutte- E
red bloud, and preuenteth the same that it do not congeale and thicken in any part of the body:
it procureth sweate, as the later Physitions haue found and tried by experience.

CHAP. 13. Of Indian Cresses.

The Description.

Cresses of India haue many weake and feeble branches, rising immediately from the ground, dispersing themselues far abroad; by meanes whereof one plant doth occupie a great circuit of ground, as doth the great Bindweede. The tender stalkes diuide themselues into sundry branches, trailing likewise vpon the ground, somewhat bunched or swollen vp at euery ioint or knee, which are in colour of a light red, but the spaces betweene the ioints are Greene. The leaues are round like wall peniwort, called *Cotyledon*, the footestalke of the leafe commeth forth on the backside almost in the midst of the leafe, as those of Frogbit, in taste and smell like the garden Cresses. The flowers are dispersed throughout the whole plant, of colour yellow, with a crossed starre ouerthwart the inside, of a deepe orange colour; vnto the backe part of the same doth hang a taile or spurre, such as hath the Larkes heele, called in Latine *Consolida Regalis*, but greater, and the spurre or heele longer; which being past there succeed bunched and knobbed cods or seede vessels, wherein is contained the seede, rough, browne of colour, and like vnto the feedes of the beete, but smaller.

The Place.

The feedes of this rare and faire plant came first from the Indies into Spaine, and thence into France and Flanders, from whence I receiued seede that bore with me both flowers and seede; especially those I receiued from my louing friend *John Robin* of Paris.

The Time.

The feedes must be sown in the beginning of Aprill, vpon a bed of hot horse dung, and some fine

fine sifted earth cast thereon of an handfull thicke. The bed must be covered in fundry places with hoopes or poles, to sustaine the mat or such like thing that it must be covered with in the night, and layd open to the Sunne in the day time. The which being sprung vp, and hauing gotten three leaues, you must replant them abroad in the hottest place of the garden, and most fine and fertile mold. Thus may you do with Muske-Melons, Cucumbers, and all cold fruits that require haste, for that otherwise the frost will ouertake them before they come to fruit-bearing.

‡ They may also be sown in good mold like as other seeds, and vsually are. ‡

Nasturtium Indicum cum flore & semine.
Indian Cresses with floure and seed.

¶ *The Names.*

This beautifull plant is called in Latine, *Nasturtium Indicum*: in English, Indian Cresses. Although some haue deemed it a kinde of *Convolvulus*, or Binde-weed; yet I am well contented that it retain the former name, for that the smell and taste shew it to be a kinde of Cresses.

¶ *The Nature and Vertues.*

We haue no certain knowledge of his nature or vertues, but are content to refer it to the kindes of Cresses, or to a further consideration.

CHAP. 14. Of *Sciatica Cresses.*

¶ *The Description.*

1. *Sciatica Cresses* hath many slender branches growing from a stalke of a cubit high, with small long and narrow leaues like those of Garden Cresses. The floures be very small, and yellow of colour; the seed-vessels be little flat chaffie huskes, wherein is the seed of a reddish gold colour, sharpe and very bitter in taste. The root is small, tough, white within and without, and of a biting taste.

‡ The plant whose figure I here giue you in stead of that with the narrower leaues of our Author, hath leaues somewhat like Rocket, but not so deepe cut in, being only snipt about the edges: the

the vpper leaues are not snipt, nor diuided at all, and are narrower. The floures decking the tops of the branches are small and white, the seed vessels are lesse then those of Cresses, and the seed it selfe exceeding small, and of a blackish colour; the root is woody, sometimes single, otherwhiles diuided into two branches. ‡

¶ The Place.

It groweth vpon old wals and rough places by high waies sides, and such like: I haue found it in corne fields about Southfleete neere to Grauefend in Kent.

Iberis Cardamantica.
Sciatica Cresses.

¶ The Time.

It floureth according to the late or earely sowing of it in the fields, in Iune and Iuly.

¶ The Names.

Sciatica Cresses is called in Greeke *ἰβερικὴ*, and in Latine *Iberis*: of *Plinie*, *Heberis*, and *Nasturtium syluestre*, and in like manner also *Lepidium*. There is another *Lepidium* of *Plinie*: in English, Sciatica Cresse. ‡ The first described may be called *Iberis Cardamantica tenuifolia*, Small leaued Sciatica Cresses. The second, *Iberis latiore folio*, broad leaued Sciatica Cresses. ‡

¶ The Nature.

Sciatica Cresse is hot in the fourth degree, and like to garden Cresses both in smell and in taste.

¶ The Vertues.

The rootes gathered in Autumne, saith *Dioscorides*, doe heate and burne, and are with good successe with swines grease made vp in manner of a plaister, and put vpon such as are tormented with the Sciatica: it is to lie on the griued place but foure hours at the most, and then taken away, and the patient bathed with warme water, and the place afterwards anointed with oile, and wooll laid on it, which

things *Galen* in his ninth booke of medicines, according to the place greued, citeth out of *Democritus*, in certaine verses tending to that effect.

CHAP. 15. Of Banke Cresses.

¶ The Description.

BAnke Cresses hath long leaues, deeply cut or jagged vpon both sides, not vnlike to those of Rocket, or wilde mustard. The stalkes be smal, limber or pliant, yet very tough, and wil twist and writhe as doth the Ozier or water willow, wherupon do grow small yellow flowers, which being past there do succeed little slender cods, full of small seedes, in taste sharpe and biting the tongue as those of Cresses.

The second kinde of banke Cresses hath leaues like vnto those of Dandelion, somewhat resembling Spinach. The branches be long, tough, and pliant like the other. The flowers be yellowish, which are succeeded by smal long cods, hauing leaues growing amongst them: in these cods is contained small biting seed like the other of this kinde. The smell of this plant is very vngratefull.

¶ The Place.

Banke Cresses is found in stonie places among rubbish, by path waies, vpon earth or muddie walls, and in other vntoiled places.

The

The second kinde of banke Cresses groweth in such places as the former doth: I found it growing at a place by Chelmes forde in Essex called little Baddowe, and in fundrie other places.

‡ If our Author meant this which I haue described and giuen you the figure of, (as it is probable he did) I doubt he scarce found it wilde: I haue seene it in the garden of Master Parkinson, and it groweth wilde in many places of Italy. ‡

¶ The Time.

They flower in Iune and Iuly, and the seed is ripe in August and September.

¶ The Names.

Banke Cresses is called in Latine *Irio* and *Erysimum*: in Greeke *ἰρύσιμον*, and of some, *καμπυλίον*: according to *Dioscorides*: *Theophrastus* hath an other *Erysimum*. ‡ The first is called *Irio*, or *Erysimum* by *Matthiolus Dodonæus*, and others. *Turner*, *Fuchsius* and *Tragus* call it *Verbena femina*, or *recta*. The second is *Irio alter* of *Matthiolus*, and *Saxifraga Romanorum*, *Lugd*. It may be called Italian Banke Cressed: or Roman Saxifrage. ‡

1 *Erysimum Dioscoridis, Lobelij.*
Banke Cresses.

† 2 *Erysimum alterum Italicum.*
Italian banke Cresses.

¶ The Nature.

The seed of banke Cresses is like in taste to garden Cresses, and is as *Galen* saith of a fierie temperature, and doth extreemely attenuate or make thinne.

¶ The Vertues.

- A The seed of banke Cresses is good against the rheume that falleth into the chest, by rotting the same.
- B It remedieth the cough, the yellow jaundise, and the Sciatica or ache of the hucklebones, if it be taken with hony in manner of a lohoc and often licked.
- C It is also drunke against deadly poisons, as *Dioscorides* addeth: and being made vp in a plaister with water and hony and applied, it is a remedie against hidden cankrous apostumes behind the eares, hard swellings and inflammations of the pappes and stones.
- D ‡ The seeds of the Italian Banke Cresses, or Roman Saxifrage taken in the weight of a dram, in

in a decoction of Grasse roots, effectually cleanse the reines, and expell the stone, as the Authour of the *hist. Lugd.* affirms. †

† The figure that was here in the second place was of the *Sonchus sylvaticus*, or *Libanotis Theophrasti* of *Tabernamontanus*. You shall finde mention of it amongst the *Sonchi*, or *Sow-thistles*.

CHAP. 16. Of Docke Cresses.

† *Lampsana*.
Docke Cresses.

¶ The Description.

† Docke-Cresses is a wilde Wort or pot-herbe hauing roughish hairy leaues of an ouerworne greene colour, deeply cut or indented vpon both sides like the leaues of small Turneps. The stalkes grow to the height of two or three cubits, and sometimes higher, diuiding themselues toward the top into sundry little branches, whereon do grow many small yellow floures like those of *Hieracium*, or Hawke-weed; which decaying, are succeeded by little crested heads containing a longish small seed somewhat like Lettice seed, but of a yellowish colour: the plant is also milkie, the stalke woody, and the root small, fibrous, and white.

¶ The Place.

Dock-Cresses grow euery where by Highwaies, vpon walls made of mud or earth, and in stony places.

¶ The Time.

It floureth from May to the end of August: the seed is ripe in September.

¶ The Names.

Docke-Cresses are called in Greeke, *Λαυδάριον*: in Latine, *Lampsana*, and *Napium*, by *Dodonaus*: *Tabernamontanus* calleth this, *Sonchus sylvaticus*: *Camerarius* affirms, That in Prussia they call it *Papillaris*.

¶ The Nature.

Docke-Cresses are of nature hot, and somewhat absterfue or cleansing.

¶ The Vertues.

Taken in meate, as *Galen* and *Dioscorides* affirme, it ingendreth euill iuyce and naughtie nourishment.

† *Camerarius* affirmeth, That it is vsed with good successe in Prussia against vlceraed or sore breasts. †

† The figure that was here, was of the *Rapistrum aruorum*, described in the second chapter of this booke; and the true figure of this plant here described was pag. 231. vnder the name of *Sonchus sylvaticus*.

CHAP. 17.

Of Water-Parsenep, and Water-Cresses.

† Great Water-Parsenep groweth vpright, and is described to haue leaues of a pleasant saour, fat and full of iuyce as those of Alexanders, but somewhat lesser, resembling the Garden Parsenep: the stalke is round, smooth, and hollow, like to Kexe or Cashes: the root consisteth of many small strings or threds fastned vnto the stalke within the water

or

1 *Sium majus latifolium.*
Great Water Parsenep.

† *Sium majus angustifolium.*
The lesser water Parsenep.

‡ 4 *Sium alterum Olusatri facie.*
Long leaved water-Cresses.

or miry ground: at the top go grow many white floures, in spoky roundles like fen-nell; which being bruised do yeeld a very strong fauour, smelling like *Petroleum*, as doth the rest of the plant.

‡ 2 This plant much resembles the last described, and growes vp some cubit and a halfe high, with many leaues finely snipt about the edges, growing vpon one rib, and commonly they stand bolt vp-right. The vmbell consists of little white floures: the root is smal, and consisteth of many strings.

‡ 3 There is another very like this, but they thus differ: the stalkes and leaues of this later are lesse than those of the precedent, and not so many vpon one rib; the other growes vp-right, to some yard or more high: this neuer growes vp, but alwaies creepes, and almost at euerie ioynt puts forth an vmbel of floures.

4 To these may be added another, whose root consists of abundance of writhen and small blacke fibres; the stalkes are like Hemlock, some three cubits high; the leaues are long, narrow, and snipped about

about the edges, growing commonly two or three together: the umbel of floures is commonly of a yellowish Greene: the seed is like parsley seed, but in taste somewhat resembles *Cumme*, *Daucus Creticus*, and the rinde of a Citron, yet seemes somewhat hotter. ‡

5 Water-Cresse hath many fat and weake hollow branches trailing vpon the grauell and earth where it groweth, taking hold in sundry places as it creepeth; by meanes whereof the plant spreadeth ouer a great compasse of ground. The leaues are likewise compact and winged with many small leaues set vpon a middle rib one against another, except the point leafe, which stands by it selfe, as doth that of the ash, if it grow in his naturall place, which is in a grauelly spring. The vpper face of the whole plant is of a browne colour, and Greene vnder the leaues, which is a perfect marke to know the physicall kinde from the others. The white floures grow alongst the stalkes, and are succeeded by cods wherein the seed is contained. The root is nothing else but as it were a thrumme or bundle of threds.

† 5 *Nasturtium aquaticum*, siue *Cratæva Sium*.
Common Water-Cresses.

‡ 6 *Sium Matthioli & Italarum*.
Italian Water-Cresse.

¶ 6 There is also another kinde hereof, hauing leaues growing many on one stalke, snipt about the edges, being in shape betweene the garden Cresses and Cuckow-floures: the stalke is crested, and diuided into many branches; the floures white, and are succeeded by cods like those of our ordinarie Water-Cresse last described.

¶ The Place.

- ¶ 1 The first of these I haue not found growing, nor as yet heard of within this kingdome.
- 2 The second I first found in the company of M. Robert Larkin, going betweene Redriffe and Deptford, in a rotten boggy place on the right hand of the way.
- 3 The third growes almost in euery watery place about London.
- 4 This is more rare, and was found by M^r. Goodyer in the ponds about Moore Parke; and by M. George Bowles in the ditches about Ellesmere, and in diuers ponds in Flint-shire.
- 5 The fifth is as frequent as the third, and commonly they grow neere together.
- 6 This Lobel saith he found in Piemont, in riuers amongst the hills: I haue not yet heard that it growes with vs. ‡

¶ The Time.

They spring and wax greene in Aprill, and floure in Iuly.

The water Cresse to be eaten in sallads sheweth it selfe in March, when it is best, and floureth in Summer with the rest.

¶ The Names.

- 1 The first of these is *Sium minus latifolium* of *Tabernaemontanus*.
- 2 This is *Sion odoratum Tragi*: *Sium*, of *Matthiolus*, *Dodonæus*, and others: it is taken to be *Sium*, or *Lauer*, of *Dioscorides*. *Lobel* calls it also *Pastinaca aquatica*, or water Parsenep.
- 3 This may be called *Sium umbellatum repens*, Creeping water Parsenep. Of this there is a reasonable good figure in the *Historia Lugdunensis*, pag. 1092. vnder the title of *Sium verum Matthioli*; but the description is of that we here giue you in the sixth place.
- 4 This is *Sium alterum* of *Dodonæus*: and *Sium alterum Olusatris facie* of *Lobel*.
- 5 Many iudge this to be the *Sisymbrium alterum*, or *Cardamine* of *Dioscorides*: as also the *Sion* of *Cræteus*: and therefore *Lobel* termes it *Sion Cræteæ eruce folium*. It is called by *Dodonæus*, and vulgarly in shops knowne by the name of *Nasturtium aquaticum*, or water Cresses.
- 6 This is called *Sium vulgare* by *Matthiolus*: *Lobel* also termes it *Sium Matthioli & Italarum*. This was thought by our Countrey-man Doctor *Turner* to be no other than the second here described: of which opinion I must confesse I also was; but vpon better consideration of that which *Lobel* and *Bauhine* haue written, I haue changed my minde. ‡

¶ The Temperature.

Water-Cresse is euidently hot and dry.

¶ The Vertues.

- A Water-Cresse being boyled in Wine or Milke, and drunke for certaine dayes together, is very good against the Scuruy or Scorbute.
- B Being chopped or boyled in the broth of flesh, and eaten for thirty dayes together, at morning, noone, and night, it prouoketh vrine, waits the stone, and driueth it forth. Taken in the same manner, it doth cure yong maidens of the green sicknesse, bringeth downe the termes, and sendeth into the face their accustomed lively colour, lost by the stopping of their *Menstrua*.

CHAP. 18. Of wilde Water-Cresses, or Cuckow Floures.

¶ The Description.

- 1 The first of the Cuckow floures hath leaues at his springing vp somewhat round, and those that spring afterward grow iagged like the leaues of Greeke Valerian: among which riseth vp a stalke a foot long, set with the like leaues, but smaller, and more iagged, resembling those of Rocket. The floures grow at the top in small bundles, white of colour, hollow in the middle, resembling the white sweet-Iohn: after which do come small chaffie husks or seed vessels, wherein the seed is contained. The root is small and threddy.
- 2 The second sort of Cuckow floures hath small iagged leaues like those of small water Valerian, agreeing with the former in stalkes and roots: the floures be white, ouerdasht or declining toward a light carnation.
- 3 The leaues and stalks of this are like those of the last described; neither are the floures which first shew themselves much vnlike them; but when as they begin to faile, in their middle rise vp heads of pretty double floures made of many leaues, like in colour to these of the single. ‡
- 4 The fourth sort of Cuckow Floures groweth creeping vpon the ground, with small threddy stalkes, whereon do grow leaues like those of the field Clauer, or three leaved Grasse: amongst which do come vp small and tender stalkes two handfulls high, hauing floures at the top in greater quantitie than any of the rest, of colour white; and after them follow cods containing a small seed. The root is nothing else but as it were a bundle of thrums or threds.
- 5 Milke white Lady-smocke hath stalkes rising immediately from the root, diuiding themselves into sundry small twiggy and hard branches, set with leaues like those of *Serpillum*. The floures grow at the top, made of foure leaues of a yellowish colour: the root is tough and woody, with some fibres annexed thereto. ‡ This is no other than the first described, differing onely therefrom in that the floures are milke white, as our Author truly in the title of his figure made them; yet forgetting himselfe in his description, he makes them yellowish, contrarie to himselfe and the truth. ‡

1 *Cardamine*. Cuckow floures.

2 *Cardamine altera*. Ladies-smocks.

3 *Cardamine altera flore pleno*.
Double floured Lady-smocke.

4 *Cardamine Trifolia*.
Three leaved Lady-smocke.

6 *Cardamine Alpina.*
Mountaine Lady-Smocke.

† 7 *Sium minus impatiens.*
The impatient Lady-smocke.

8 *Cardamine pumila Bellidis folio Alpina.*
The Dwarfed Dasse-leaved Lady-smocke of the Alpes.

6 Mountaine Lady-smocke hath many roots, nothing else but as it were a bundle of threddy strings, from the which do come forth three or foure small weak or tender leaues made of sundry small leaues, in shew like to those of small water Valerian. The stalkes be small and brittle, whereupon doe grow small floures like the first kinde.

† 7 I should be blame-worthy if in this place I omitted that pretty conditioned *Sium* which is kept in diuers of our London gardens, and was first brought hither by that great Treasurer of Natures rarities, M. *Iohn Tradescant*. This plant hath leaues set many vpon a rib, like as the other *Sium* described in the second place hath; but they are cut in with two or three pretty deep gashes: the stalk is some cubit high, & diuided into many branches, which haue many small white floures growing vpon them: after these floures are past there follow small long cods containing a small white seed. Now the nature of this plant is such, that if you touch but the cods when as the seed is ripe, though you do it neuer so gently, yet will the seed fly all abroad with violence, as disdaining to be touched: whence they vsually call it *Noli me tangere*; as they for the like qualitie name the *Persicaria siliquosa*. The nature of this plant is somewhat admirable, for if the seeds (as I said) be fully ripe,

ripe, though you put but your hand neere them, as profering to touch them, though you doe it not, yet will they fly out vpon you, and if you expect no such thing, perhaps make you affraid by reason of the suddennesse thereof. This herbe is written of onely by *Prosper Alpinus*, vnder the title of *Siurn Minimum*: and it may be called in English, Impatient Lady-smocke, or Cuckow floure. It is an annuall, and yeerely sowes it selfe by the falling seeds. ‡

‡ 8 The leaues of this somewhat resemble those of Daisies, but lesse, and lie spread vpon the ground, amongst which rises vp a weake and slender stalke set with 3 or 4 leaues at certaine distances, it being some handfull high, the top is adorned with smal white floures consisting of foure leaues apeece, after which follow large and long cods, considering the smallnes of the plant, within these in a double order is contained a small reddish seed, of somewhat abiting taste. The root creepes vpon the top of the ground, putting vp new buds in diuers places. *Clusius* found this growing vpon the rockes on the Etscherian mountaine in Austria, and hath giuen vs the history and figure thereof vnder the name of *Plantula Cardamines emula*, and *Sinapi pumulum Alpinum*.

¶ The Time and Place.

That of the Alpish mountaines is a stranger in these cold Countries: the rest are to be found euery where, as aforefaid, especially in the castle ditch at Clare in Essex. ‡ The seventh growes naturally in some places of Italy.

These flower for the most part in Aprill and May, when the Cuckowe doth begin to sing her pleasant notes with out stammering.

¶ The Names.

They are commonly called in Latine, *Flos Cuculi*, by *Brunfelsius* and *Dodonaeus*, for the reason aforefaid; and also some call them *Nasturtium aquaticum minus*, or lesser water Cresse: of some, *Cardamine*, and *Sisymbrium alterum* of *Dioscorides*: it is called in the Germane tongue, *Wildercreutz*: in French, *Passerage sauvage*: in English, Cuckowe flowers: in Northfolke, Canterbury bells: at the Namptwich in Cheshire, where I had my beginning, Ladie smockes, which hath giuen me cause to Christen it after my Country fashion.

¶ The Nature and Vertues.

These herbes be hot and drie in the second degree: we haue no certaine prooffe or authority of their vertues, but surely from the kindes of water Cresse they cannot much differ, and therefore to them they may be referred in their vertues.

† The figure that was in the fourth place, being of the same plant that is described in the first place, the counterfeite stalkes and heades being taken away, as *Taubine* rightly hath obserued; as also the description thereof, which (as many other) our Author frames by looking vpon the figure, and the strength of his owne fancie: I haue omitted as impertinent.

CHAP. 19. Of Treacle Mustard.

¶ The Description.

1 **T**Reacle mustard hath long broad leaues, especially those next the ground, the others lesser, slightly indented about the edges like those of Dandelion. The stalkes be long and brittle, diuided into many branches euen from the ground to the top, where grow many small idle flowers tuft fashion, after which succeed large, flat, thin, chaffie huskes or seed vessels heart fashion, wherein are contained browne flat seeds, sharpe in taste, burning the tongue as doth mustard seed, leauing a taste or sauour of Garlicke behinde for a farewell.

2 Mithridate Mustard hath long narrow leaues like those of Woad, or rather Cow Basil. The stalkes be inclosed with small snipt leaues euen to the branches, Pyramidis fashion, that is to say, smaller and smaller toward the top, where it is diuided into sundrie branches, whereon doe grow small flowers: which being past, the cods, or rather thinne chaffie huskes do appeare full of sharpe seed, like the former. The roote is long and slender.

3 The third kinde of Treacle Mustard, named Knaues Mustard, (for that it is too bad for honest men) hath long, fat, and broad leaues, like those of Dwale or deadly Nightshade: in taste like those of Vuluaria or stinching Orach, set vpon a round stalke two cubits high, diuided at the top into small armes or branches, whereon do grow small foolish white spokie flowers. The seed is contained in flat pouches like those of Shepheards purse, brown, sharpe in taste, and of an ill sauour.

4 Bowyers Mustard hath the lower leaues resembling the ordinary Thlaspi, but the vpper are very small like tode flaxe but smaller. The stalkes be small, slender, and many. The flowers be small, and white, each consisting of foure leaues. The seeds be placed vpon the branches from the lowest part of them to the top, exceeding sharpe and hot in taste, and of a yellowish colour. The roote is small and woody.

5 Grecian mustard hath many leaues spred vpon the ground, like those of the common Daisie, of a darke greenish colour: from the midst whereof spring vp stalkes two foote long, diuided

1 *Thlaspi Dioscoridis.*
Treacle Mustard.

2 *Thlaspi Vulgarissimum.*
Mithridate Mustard.

3 *Thlaspi maius.*
Knaues Mustard.

4 *Thlaspi minus.*
Bowyers Mustard.

5 *Thlaspi*

5. *Thlaspi Grecum.*
Grecian Mustard.

6. *Thlaspi amarum.*
Clownes Mustard.

7. *Thlaspi Clypeatum* Lobelij.
Buckler Mustard.

8. *Thlaspi minus Clypeatum.*
Small Buckler Mustard.

into many small branches, whereupon grow small white flowers composed of foure leaues, after which succeed round flat huskes or seed vessels, set vpon the stalke by couples, as it were sundry paires of spectacles, wherein the seed is contained, sharpe and biting as the other. This is sometimes seen with yellow flowers.

† 6 Clownes mustard hath a short white fibrous root, from whence ariseth vp a stalke of the height of a foot, which a little aboue the root diuides it selfe into some foure or five branches, and these againe are subdiuided into other, smaller so that it resembles a little shrub: longish narrow leaues notched after the maner of Sciatica Cresses by turees garnish these branches, and these leaues are as bitter as the smaller Centaury. The flowers stand thicke together at the tops of these branches in manner of little umbels, and are commonly of a light blew and white mixed together (being seldome onely white, or yellow.) After the flowers succeed seed vessels after the manner of the other plants of this kinde, and in them is contained a small hot seed †

7 Buckler mustard hath many large leaues, spread vpon the ground like *Hieracium* or Hawke-weede, somewhat more toothed or snipt about the edges: among which comes vp stalkes small and brittle, a cubit high, garnished with many small pale yellowish flowers: in whose place succeed many round flat cods or pouches, buckler fashion, containing a seed like vnto the others.

8 Small Buckler Mustard, is a very small, base, or low plant, hauing whitish leaues like those of wild Time, set vpon small, weake and tender branches. The flowers grow at the top like the other buckler Mustard. The seed vessels are like, but not so round, somewhat sharpe pointed, sharp in taste, & burning the tongue. The whole plant lieth flat vpon the ground, like wild Tyme.

¶ The Place.

Treacle or rather Mithridate Mustard growes wild in sundry places in corn fields, ditch banks, and in sandy, drie, and barren ground. I haue found it in corne fields betweene Croydon & Godstone in Surrey, at South-fleete in Kent, by the path that leadeth from Harnsey (a small village by London) vnto Waltham crosse, and in many other places.

The other do grow vnder hedges, oftentimes in fields and in stonie and vntoiled places; they grow plentifully in Bohemia and Germany: they are seene likewise on the stonie banks of the riuer Rhene. They are likewise to be found in England in sundrie places wilde, the which I haue gathered into my garden. † I haue found none but the first and second growing wilde in any part of England as yet; but I deny not, but that some of the other may be found, though not all. †

¶ The Time.

These treacle Mustards are found with their flowers from May to Iuly, and the seed is ripe in the end of August.

¶ The Names.

The Grecians call these kindes of herbes *Θαλασσιον, θαλασσιδιον, or Σιναν αγγιον*. Of the huske or seed vessell, which is like a little shield. They haue also other names which be found among the bastard words: as *Scandulaceum, Capsella, Pes gallinaceus*. Neither be the later writers without their names, as *Nasturtium tectorum*, and *Sinapi rusticum*: it is called in Dutch, *Wilde Kerse*: in French, *Seneue sauvage*: in English, Treacle Mustard, dish Mustard, Bowyers Mustard: of some, *Thlaspi*, after the Greeke name, Churles mustard, and wilde Cresses.

† 1 This is *Thlaspi Dioscoridis Draba*, aut *Chamelina folio* of Lobell: *Thlaspi Latius* of Dodonæus: and the second *Thlaspi* of Matthioli.

2 This, *Thlaspi Vulgatissimum Vaccaria folio* of Lobell: the first *Thlaspi* of Matthioli, and second of Dodonæus; and this is that *Thlaspi* whose seed is vsed in shops.

3 This is *Thlaspi majus* of Tabernamontanus.

4 This is *Thlaspi minus* of Dodonæus: *Thlaspi angustifolium* of Fuchsius: *Thlaspi minus hortense* of Syridis folio, &c. of Lobell: and *Nasturtium sylvestre* of Thalins.

5 This is *Alysson* of Matthioli: *Thlaspi Gracum Polygonati folio*, of Lobell and Tabern.

6 This the Author of the *Hist. Lug.* calls *Nasturtium sylvestre*; Tabern. calls it *Thlaspi amarum*.

7 Lobell termes this *Thlaspi paruum Hieracifolium*, and *Lunaria Lutea Monspeliensium*.

8 This is *Thlaspi minus clypeatum Serpillifolio* of Lobell. †

† The figures of these two last mentioned were transposed in the former Edition.

¶ The Temperature.

The seed of these kindes of Treacle Mustards be hot and drie in the end of the third degree.

¶ The Vertues.

The seed of *Thlaspi* or treacle Mustard eaten, purgeth colour both vpward and downeward, prouoketh flowers, and breaketh inward apothumes.

The same vsed in clysters, helpeth the sciatica, and is good vnto those purposes for which Mustard seed serueth.

¶ The Danger.

The seed of these herbes be so extreame hot and vehement in working, that being taken in too great

great a quantitie, purgeth and scoureth euen vnto blood, and is hurtfull to women with child, and therefore great care is to be had in giuing them inwardly in any great quantitie.

CHAP. 20. Of Candie Mustard.

The Description.

Candie mustard excelleth all the rest, as well for the comely floures that it bringeth forth for the decking vp of gardens and houses, as also for that it goeth beyond the rest in his physickall vertues. It riseth vp with a very brittle stalke of a cubit high, which diuideth it selfe into sundry bowes or branches, set with leaues like those of stocke gilliflowres, of a gray or ouerworne greene colour. The floures grow at the top of thes stalke round, hicke clustering together, like those of Scabious or diuels bit, sometimes blew, often purple, carnation or horse flesh, but seldom white for any thing that I haue seen, varying according to the soile or Clymate. The seed is reddish, sharpe, and biting the tongue, wrapped in little huskes fashioned like an heart. † There is a lesser variety of this with white well smelling flowers, in other respects little differing from the ordinary. ‡

Thlaspi Candie.
Candie Mustard.

‡ *Thlaspi Candie paruum flo. albo.*
Small Candy mustard with a white floure.

The Place.

This growes naturally in some places of Austria, as also in Candy, Spaine, & Italy, from whence I receiued seeds by the liberality of the right Honorable the Lord Edward Zouch, at his returne into England from those parts. † *Clusius* found the later as he trauelled through Switzerland into Germany. ‡

The Time.

It floureth from the beginning of May vnto the end of September, at which time you shall haue floures and seeds vpon one branch, some ripe, and some that will not ripen at all.

The Name.

† This plant is called by *Dodonaeus* (but not rightly) *Arabis* and *Draba*: as also *Thlaspi Candie*: which last name is reteined by most writers: in English, Candy *Thlaspi*, or Candy Mustard. ‡

The Temperature.

The seed of Candie Mustard is hot and drie at the end of the third degree, as is that called *Scorodonthlaspi*, or treacle mustard.

Chap.

CHAP. 21. Of Treacle Mustard.

¶ The Description.

Round leaved Mustard hath many large leaues laid flat vpon the ground like the leaues of the wilde Cabbage, and of the same colour; among which rise vp many slender stalkes of some two handfulls high or thereabouts, which are set with leaues far vnlike to those next the ground, enclosing or embracing the stalkes as do the leaues of *Perfoliatum*, or Thorow-wax. The floures grow at the top of the branches, white of colour; which being past, there do succede flat huskes or pouches like vnto those of Shepheards purse, with hot seed biting the tongue.

1 *Thlaspi rotundifolium*.

Round leaved Mustard.

2 *Thlaspi Pannonicum* Clusij.

Hungary Mustard.

2 Hungary Mustard bringeth forth slender stalkes of one cubit high: the leaues which first appeare are flat, somewhat round like those of the wilde Beet; but those leaues which after doe garnish the stalkes are long and broad like those of the garden Colewort, but lesser and softer, Greene on the vpper side, and vnder declining to whitenesse, smelling like Garlicke. The floures be small and white, consisting of foure small leaues, which in a great tuft or umbel do grow thick thrust together: which being past, there followeth in euery small huske one dusky seed and no more, bitter and sharpe in taste. The root is white and small, creeping vnder the ground far abroad like the roots of Couch-grasse; preparing new shoots and branches for the yeare following, contrarie to all the rest of his kinde, which are encreased by seed, and not otherwise.

3 Churles Mustard hath many small twiggy stalkes, slender, tough, and pliant, set with small leaues like those of Cudweed, or Lauander, with small white floures: the huskes and seeds are small, few, sharpe, bitter, and vsfauorie: the whole plant is of a whitish colour.

4 Peasants Mustard hath many pretty large branches, with thin and iagged leaues like those of Cresses, but smaller, in sauer and taste like to the ordinarie *Thlaspi*: the floures be whitish, and grow in a small spoky tuft. The seed in taste and sauer is equall with the other of his kinde and countrey, or rather exceeds them in sharpnesse.

5 Yellow

3 *Thlaspi Narbonense Lobelij.*
Charles Mustard.

4 *Thlaspi umbellatum Narbonense.*
Pea sants Mustard of Narbone.

† 5 *Thlaspi supinum luteum.*
Yellow Mustard.

5 Yellow Mustard hath an exceeding number of whitish leaues spred vpon the ground in manner of a turfe or hassocke; from the midst whereof riseth vp an vp-right stalke of three foot high, putting forth many small branches or armes: at the top whereof grow many small yellow floures like those of the wall-floure, but much lesser: which being past, the husks appeare flat, pouch-fashion, wherein is the seed like Treacle Mustard, sharp also and biting.

6 White Treacle Mustard hath leaues spred vpon the ground like the other, but smaller: the stalkes rise vp from the midst thereof, branched, set with leaues smaller than those that lie vpon the ground euen to the top, where doth grow a tuft of white floures in fashion like to those of the other Thlaspies: the seed is like the other: † The cods of this are sometimes flat, and otherwhiles round: the floures also grow sometimes spike-fashion, otherwhiles in an vmbell, I haue giuen you two figures expressing both these varieties. †

6 *Thlaspi album supinum*, & eius varietas.
White Treacle Mustard.

7 *Thlaspi minus* Clusij.
Clusius his small Mustard.

8 *Thlaspi petraeum minus*.
Small Rocke Mustard.

7 This small kinde of Mustard hath a few small leaues spread vpon the ground like those of the lesser Dasie, but of a blewisher Greene colour; from which rise vp small tender stalks set with three, and sometimes foure small sharpe pointed leaues: the floures grow at the top, small and white; the cods are flat, pouch-fashion, like those of Shepherds purse, and in each of them there is contained two or three yellowish seeds.

† 8 To these we may fitly adde another small mountaine Thlaspi, first described by that diligent and learned Apothecarie *John Pona* of Verona, in his description of Mount Baldus. This from a threddy root brings forth many small whitish leaues lying spread vpon the ground, and a little nicked about their edges: among these riseth vp a stalke some two or three handfulls high, diuicuated toward the top into diuers small branches, vpon which grow white little floures consisting of foure leaues apiece: which fading, there follow round seed-vessels, like to those of *Myagrum*: whence *Pona*, the first describer thereof, calls it *Thlaspi petraum myagroides*. The seed is as sharpe and biting as any of the other Thlaspies. This growes naturally in the chinkes of the rocks, in that part of Baldus that is termed *Vallis frigida*, or, The cold Valley. †

¶ The Place.

These kinds of Treacle Mustard grow vpon hills and mountaines in corne fields, in stony barren and grauelly grounds.

¶ The Time.

These floure in May, Iune, and Iuly: the seed is ripe in September.

¶ The Names.

† 1 This is *Thlaspi oleraceum* of *Tabernamontanus*: *Thlaspi primum*, of *Daleschampsius*: *Thlaspi mitius rotundifolium* of *Columna*. Our Author confounded it with that whose figure is the first in the ensuing Chapter, and called it *Thlaspi incanum*.

2 *Thlaspi montanum peltatum* of *Clusius*: and *Thlaspi Pannonicum* of *Lobel* and *Taber*.

3 *Thlaspi Narbonense centunculi angustifolio*, of *Lobel*: and *Thlaspi maritimum* of *Daleschampsius*.

4 *Thlaspi umbellatum Nasturtij hortensis folio Narbonense*, of *Lobel*. The figures of this and the precedent were transposed in the former edition.

5 *Thlaspi supinum luteum* of *Lobel*. Our Authors figure was a varietie of the next following.

6 *Thlaspi album supinum* of *Lobel*: *Thlaspi montanum secundum* of *Clusius*.

7 *Thlaspi pumilum* of *Clusius*: *Thlaspi minimum* of *Tabernamontanus*.

8 *Thlaspi petraum myagroides* of *Pona*: *Thlaspi tertium saxatile* of *Camerarius*, in his *Epit. of Mat-thiolus*. †

¶ The Temperature and Vertues.

The seeds of these churlish kinds of Treacle Mustard haue a sharpe or biting qualitie, breake inward apostumes, bring downe the floures, kill the birth, and helpeth the Sciatica or pain in the hip. They purge choler vpward and downward, if you take two ounces and a halfe of them, as *Dioscorides* writeth. They are mixed in counterpoysons, as Treacle, Mythridate, and such like Compositions.

CHAP. 22.

Of Woody Mustard.

¶ The Description.

1 **W**oody Mustard hath long narrow leaues declining to whitenesse, like those of the stocke Gilloflower, but smaller, very like the leaues of Rosemary, but somewhat broader, with rough stalks very tough and pliant, being of the substance of wood: the floures grow at the top, white of colour: the seeds do follow, in taste sharpe and biting. The huskes or seed-vessels are round and somewhat longish.

2 Small woody Mustard groweth to the height of two cubits, with many stalkes set with small narrow leaues like those of Hyssop, but rougher; and at the top grow floures like those of Treacle Mustard, or Thlaspi. The whole plant groweth as a shrub or hedge-bush.

3 Thorny Mustard groweth vp to the height of foure cubits, of a woody substance, like vnto a hedge-bush, or wilde shrub, with stalkes beset with leaues, floures, and seeds like the last before mentioned; agreeing in all points, sauing in the cruell pricking sharpe thornes wherewith this plant is armed; the other not. The root is tough, woody, and some strings or fibres annexed thereto.

1 *Thlaspi fruticosum incarnum.*
Hoary woody Mustard.

2 *Thlaspi fruticosum minus.*
Small woody Mustard.

3 *Thlaspi spinosum.*
Thorny Mustard.

4 *Thlaspi fruticosum folio Lencøj marini.*
Bushy Mustard.

5 *Thlaspi*

‡ 5 *Thlaspi hederaceum*.
Ivy Mustard.

4 There is another sort of woody Mustard growing in shadowie and obscure mountaines, and rough stony places resembling the last described; sauing that this plant hath no prickles at all, but many small branches set thick with leaues, resembling those of the lesser sea *Leucoion*: the floures are many and white; the seed like the other *Thlaspies*: the root is woody and fibrous.

‡ 5 There is (saith *Lobel*) in Portland and about Plimouth, and vpon other rockes on the sea coast of England, a creeping little herbe hauing small red crested stalkes about a spanne high: the leaues are thicke and fashioned like Ivy; the white floures and small seeds do in taste and shape resemble the *Thlaspies*. ‡

¶ The Place.

‡ 1 The first of these groweth about Mechline.

2. 3. 4. These plants grow vpon the Alpiſh and Pyrene mountaines: in Piemont and in Italy, in stony and rockie grounds.

¶ The Time.

They floure when the other kindes of *Thlaspies* do; that is, from May to the end of August.

¶ The Names.

‡ 1 This *Clusius* and *Lobel* call *Thlaspi incanum Mechliniense*: *Bauhine* thinks it to be the *Iberis prima* of *Tabernaemontanus*, whose figure retained this place in the former edition.

2 This is *Thlaspi fruticosum alterum* of *Lobel*: *Thlaspi* 5. *Hispanicum* of *Clusius*.

3 *Lobel* calls this, *Thlaspi fruticosum spinosum*.

4 *Camerarius* calls this, *Thlaspi sempervirens biflorum folio Leucoij*, &c. *Lobel*, *Thlaspi fruticosum folio Leucoij*, &c.

5 This *Lobel* calls *Thlaspi hederaceum*. ‡

¶ The Nature and Vertues.

I finde nothing extant of their nature or vertues, but they may be referred to the kinds of *Thlaspies*, whereof no doubt they are of kindred and affinitie, as well in facultie as forme.

CHAP. 23. Of Towers Mustard.

¶ The Description.

1 **T**OWERS Mustard hath beene taken of some for a kinde of Cresses, and referred by them to it: of some, for one of the Mustards, and so placed among the *Thlaspies* as a kinde thereof; and therefore my selfe must needs bestow it somewhere with others. Therefore I haue with *Clusius* and *Lobel* placed it among the *Thlaspies*, as a kinde thereof. It commeth out of the ground with many long and large rough leaues, like those of Hounds-tongue, especially those next the ground: amongst which riseth vp a long stalke of a cubit or more high, set about with sharpe pointed leaues like those of Woad. The floures grow at the top, if I may terme them floures, but they are as it were a little dusty chaffe driuen vpon the leaues and branches with the winde: after which come very small cods, wherein is small reddish seed like that of Cameline or English Worm-seed, with a root made of a tuft full of innumerable threds or strings.

‡ 2 This second kinde hath a thicker and harder root than the precedent, hauing also fewer fibers; the leaues are bigger than those of the last described, somewhat curled or sinuated, yet lesse, rough, and of a lighter Greene; in the midst of these there rise vp one or two stalkes or more, vsually some two cubits high, diuided into some branches, which are adorned with leaues almost ingirting them round at there setting on. The floures are like those of the former, but somewhat larger, and the colour is either white, or a pale yellow: after these succeed many long cods filled with a seed somewhat larger than the last described. ‡

3 Gold of pleasure is an herbe with many branches set vpon a straight stalke, round, and diuided into sundry wings, in height two cubits. The leaues be long, broad, and sharpe pointed, somewhat snipt or indented about the edges like those of Sow-thistles. The flowers along the stalkes are white; the seed contained in round little vessels is fat and oily.

1 *Turritis.*

Towers Mustard.

‡ 2 *Turritis maior.*

Great Tower Mustard.

4 Treacle Wormeseed riseth vp with tough and pliant branches, whereupon do grow many small yellow flowers; after which come long slender cods like Flixeweeder, or Sophia, wherein is contained small yellowish seed, bitter as Wormeseed or Coliquintida. The leaues are small and darke of colour, in shape like those of the wilde stocke Gillofloures, but not so thicke, nor fat. The root is small and single.

¶ The Place.

Towers Treacle groweth in the West part of England, vpon dunghils and such like places. I haue likewise seen it in sundrie other places, as at Pym by a village called Edmonton neere London, by the Citie wals of West-chester in corne fields, and where flaxe did grow about Cambridge. ‡ The second is a stranger with vs, yet I am deceiued if I haue not seene it growing in M. Parkinsons garden. ‡

The other grow in the territorie of Leiden in Zeeland, and many places of the Low-countries; and likewise wilde in sundrie places of England.

¶ The Time.

These herbes doe floure in May and Iune, and their seed is ripe in September.

¶ The Names.

‡ 1 This is *Turritis* of Lobell: *Turrita Vulgati* of Clusius.

‡ 2 This is *Turrita maior*, of Clusius, who thinkes it to be *Brassica Virgata* of Cordus.

3 *Matthiolus* calls this, *Pseudomyagrum*: *Tragus* calls it, *Sesamum*: *Dodonæus*, *Lobel*, and others call it *Myagrum*.

4 This *Lobel* calls *Myagrum thlaspi effigie*. *Tabernamontanus* hath it twice; first vnder the name of *Erysimum tertium*: secondly, of *Myagrum secundum*. And so also our Authour (as I formerly noted) had it before vnder the name of *Erucasyluestris angustifolia*; and here vnder the name of *Camelina*. ‡

3 *Myagrum*.

Gold of pleasure.

4 *Camelina*.

Treacle Worm-seed.

¶ The Temperature.

These Plants be hot and dry in the third degree.

¶ The Vertues.

It is thought, saith *Dioscorides*, That the roughnesse of the skinne is polished and made smooth A with the oylie fatnesse of the seed of *Myagrum*.

Ruellius teacheth, That the iuyce of the herbe healeth vlcers of the mouth; and that the poore B peasant doth vse the oile in banquets, and the rich in their lampes.

The seed of *Camelina* stamped, and giuen children to drinke, killeth the wormes, and driueth C them forth both by siege and vomit.

† The two *Drabaes* here omitted are treated of at large in the following Chapter.

‡ CHAP. 24. Of Turkey Cresses.

¶ OUr Author did briefly in the precedent Chapter make mention of the two plants we first mention in this Chapter; but that so briefly, that I thought it conuenient to discourse more largely of them; as also to adde to them other two, being by most Writers adiudged to be of the same Tribe or kindred. The vertues of the first were by our Author out of *Dodonæus* formerly put to the *Thlaspi Candia*, Chapter 20. from whence I haue brought them to their proper place, in the end of this present Chapter.

¶ The Description.

† 1 The first hath crested slender, yet firme stalkes of some foot long, which are set with leaues of some inch in length, broad at the setting on, sinuated about the edges, and sharpe pointed, their colour is a whitish Greene, and taste acride; the leaues that are at the bottome of the stalke are many, and larger. The tops of the stalkes are diuided into many branches of an vnequall length, and sustain many floures; each whereof consists of foure litle white leaues, so that together they much resemble the vmbell of the Elder when it is in floure. Little swolne seed vessels diuided into two cells follow the fading floures: the seed is whitish, about the bignesse of millet, the root also is white, slender and creeping.

† 2 This hath creeping roots, from which arise many branches lying vpon the ground here and there, taking root also; the leaues, which vpon the lower branches are many, are in forme and colour much like those of the last described, but lesse, and somewhat snipt about the edges. The stalkes are about a handfull high, or somewhat more, round, Greene, and hairy, hauing some leaues growing vpon them. The floures grow spoke fashion at the top of the stalkes, white, and consisting of foure leaues; which fallen, there follow cods containing a small red seed.

1 *Draba Dioscoridis.*
Turkie Cresses.

2 *Draba primarepens.*
The first creeping Cresse.

3 From a small and creeping root rise vp many shootes, which while they are young haue many thicke juicy and darke Greene leaues rose fashion adorning their tops, out of the midst of which spring out many slender stalkes of some foot high, which at certain spaces are encompassed (as it were) with leaues somewhat lesser then the former, yet broader at the bottome: the floures, cods, and seed are like the last mentioned.

4 There is a plant also by some refer'd to this Classis; and I for some reasons thinke good to make mention thereof in this place. It hath a strong and very long root of colour whitish, and of as sharpe a taste as Cresses; the stalkes are many, and oft times exceed the height of a man, yet slender, and towards their tops diuided into some branches, which make no vmbell, but carry their floures disperst; which consist of foure small yellow leaues; after the floure is past there follow long slender cods containing a small, yellowish, acride seed. The leaues which adorne this plant are long, sharpe pointed, and snipt about the edges, somewhat like those of Saracens. Confound, but that these towards the top are more vnequally cut in.

¶ The

‡ 3 *Draba altera repens.*
The other creeping Cresse.

¶ The Time.

The first of these floures in May and the beginning of Iune. The 2 and 3 in Aprill. The fourth in Iune and Iuly.

¶ The Place.

None of these (that I know of) are found naturally growing in this kingdome; the last excepted, which I thinke may be found in some places.

¶ The Names.

1 This by a generall consent of *Matthiolum*, *Anguillara*, *Lobell*, &c. is iudged to be the *Arabis*, or *Draba* of the Ancients.

2 *Draba altera* of *Clusius*.

3 *Draba tertia succulento folio*, of *Clusius*; *Eruca Muralis* of *Daleschampsius*.

4 This by *Camerarius* is set forth vnder the name of *Arabis quorundam*, and he affirms in his *Hor. Med.* that he had it out of England vnder the name of *Solidago*; The which is very likely, for without doubt this is the very plant that our Author mistooke for *Solidago Sarracenicæ*; for he bewraies himselfe in the Chapter of *Epimedium*, whereas he saith it hath cods like *Sarracens Confound*, when as both he, and all other giue no cods at all to *Sarracens Confound*. My very good friend Mr. *John Good-*

ger was the first, I thinke, that obserued this mistake in our Author; for which his obseruation, together with some others formerly and hereafter to be remembred, I acknowledge my selfe beholden to him.

¶ The Vertues, attributed to the first.

1 *Dioscorides* saith, that they vse to eate the dried seed of this herbe with meate, as we do pepper especially in *Cappadocia*.

They vse likewise to boyle the herbe with the decoction of barley, called *Ptisana*; which being so boyled, concocteth and bringeth forth of the chest tough and raw flegme which sticketh therein.

The rest are hot, and come neere to the vertues of the precedent. ‡

CHAP. 25. Of Shepherds-purse.

¶ The Description.

1 The leaues of Shepherds purse grow vp at the first long, gashed in the edges like those of *Rocket*, spread vpon the ground: from these spring vp very many little weake stalks diuided into sundry branches, with like leaues growing on them, but lesser; at the top whereof are orderly placed small white floures: after these come vp little seed vessels, flat, and cornered, narrow at the stem like to a certaine little pouch or purse, in which lieth the seed. The root is white not without strings. ‡ There is another of this kinde with leaues not sinuated, or cut in. ‡

2 The small Shepherds purse commeth forth of the ground like the *Cuckow floure*, which I haue Englished *Ladie-smockes*, hauing small leaues deeply indented about the edges; among which rise vp many small tender stalks with floures at the top, as it were chaffe. The huskes and seed is like the other before mentioned.

¶ The Place.

These herbes do grow of themselves for the most part, neere common high waies, in desert and vntilled places, among rubbish and old walls.

¶ The

1 *Bursa Pastoris.*
Shepherds purse.

2 *Bursa Pastoria minima.*
Small Shepherds purse.

¶ *The Time.*

They floure, flourish, and seed all the Sommer long.

¶ *The Names.*

Shepherds purse is called in Latine, *Pastoris bursa*, Or *Pera pastoris*: in high Dutch, **Seckel**: in low-Dutch, **Boyskens cruyt**: in French, *Bourse de pasteur ou Curé*: in English, Shepherds purse or scrip: of some, Shepherds pouch, and poore mans Parmacetic: and in the North part of England, Toy-wort, Pick-purse, and Case-weed.

¶ *The Temperature.*

They are of temperature cold and dry, and very much binding, after the opinion of *Ruellius*, *Mathiolus*, and *Dodonæus*; but *Lobel* and *Pena* hold them to be hot and dry, iudging the same by their sharpe taste: which hath caused me to insert them here among the kindes of *Thlaspi*, considering the fashion of the leaues, cods, seed, and taste thereof: which do so wel agree together, that I might very well haue placed them as kindes thereof. But rather willing to content others that haue written before, than to please my selfe, I haue followed their order in marshalling them in this place, where they may stand for cousine germanes.

¶ *The Vertues.*

- A Shepherds purse stayeth bleeding in any part of the body, whether the iuyce or the decoction thereof be drunke, or whether it be vsed pultesse-wise, or in bath, or any other way else.
- B In a Clyster it cureth the bloody flux: it healeth greene and bleeding wounds: it is maruellous good for inflammations new begun, and for all diseases which must be checked backe and cooled.
- C The decoction doth stop the laske, the spitting and pissing of blood, and all other fluxes of blood.

CHAP. 26. Of Italian Rocket.

¶ The Description.

ITalian Rocket hath long leaues cut into many parts or diuisions like those of the Ash tree, resembling *Ruellins* his Bucks-horne: among which rise vp stalks weake and tender, but thicke and grosse, two foot high, garnished with many small yellowish floures like the middle part of Tansie floures, of a naughty fauor or smell. The seed is small like sand or dust, in taste like Rocket seed, whereof in truth wee suspect it to be a kinde. The root is long and woody.

1 *Rheseda Plinij.*
Italian Rocket.

2 *Rheseda maxima.*
Crambling Rocket.

2 Crambling Rocket hath many large leaues cut into sundry sections, deeply diuided to the middle rib, branched like the hornes of a stag or hart: among which there do rise vp long fat and fleshy stalkes two cubits high, lying flat vpon the ground by reason of his weake and feeble branches. The floures grow at the top, clustering thicke together, white of colour, with brownish threds in them. The seed is like the former. † *Lobel* affirms it growes in the Low-country gardens with writhen stalkes, sometimes ten or twelue cubits high, with leaues much diuided. †

¶ The Place.

These Plants grow in sandy, stony, grauelly, and chalky barren grounds. I haue found them in sundry places of Kent, as at South-fleet, vpon Long-field downes, which is a chalkie and hilly ground very barren. They grow at Greenhithe vpon the hills, and in other places of Kent. † The first growes also vpon the Wolds in Yorke-shire. The second I haue not seene growing except in gardens, and much doubt whether it grow wilde with vs or no. †

¶ The Time.

These Plants do flourish in Iune, Iuly, and August.

¶ The

¶ The Names.

The first is called of *Pliny*, *Reseda*, *Erucaperegrina*, & *Erucacantabrica*: in English, Italian Rocket.
The second is called *Reseda maxima*: of *Anguillara*, *Pignocomon*, whereof I finde nothing extant worthy the memorie, either of temperature or vertues.

CHAP. 27. Of Groundsell.

¶ The Description.

THe stalke of Groundsell is round, chamfered and diuided into many branches: the leaues be Greene, long, and cut in the edges almost like those of Succorie, but lesser, like in a manner to the leaues of Rocket. The floures be yellow, and turne to downe, that is carried away with the winde. The root is full of strings and threds.

1 *Erigerum*.
Groundsell.

2 *Erigerum Tomentosum*.
Cotton Groundsell.

2 Cotton Groundsel hath a straight stalke of a browne purple colour, couered with a fine cotton or downy haire, of the height of two cubits. The leaues are like those of S. Iames Wort, or Rag-wort; and at the top of the stalke grow small knops, from which come floures of a pale yellow colour; which are no sooner opened and spred abroad, but they change into downe like that of the Thistle, euen the same houre of his flourishing, and is carried away with the winde: the root is small and tender.

3 There is another with leaues more iagged, and finelie cut than the last mentioned, soft also and downie: the floures are fewer, lesse and paler than in the ordinarie, but turne speedily into downe like as the former. ‡

¶ The Place.

These herbes are very common throughout England, and do grow almost euery where.

¶ The Time.

They flourish almost euery moneth of the yeare.

¶ The

‡ 3 *Erigeron tomentosum alterum.*
The other Cotton Groundsell.

¶ The Names.

Groundsell is called in Greek *εργησταν*: in Latine, *Senecio*, because it waxeth old quickly: by a bastard name *Herbutum*: in Germany, *Creulz-wurtz*: in low-Dutch, *Cruys cruyt*, and *Cruysken cruyt*: in Spanish, *Yerva cana*: in Italian, *Cardoncello*, *Speliciofa*: in English, Groundsell.

Cotton Groundsell seemeth to be all one with *Theophrastus* his *Aphace*; hee maketh mention of *Aphace* in his seventh booke, which is not onely a kinde of pulse, but an herbe also, vnto which this kinde of Groundsell is very like. For as *Theophrastus* saith, The herbe *Aphace* is one of the pot-herbs and kindes of *Succorie*: adding further, That it floureth in haste, but yet soone is old, and turneth into down; and such a one is this kind of Groundsell. But *Theophrastus* saith further, That it floureth all the winter long, and so long as the Spring lasteth, as my selfe haue often seene this Groundsell do.

¶ The Temperature.

Groundsell hath mixt faculties; it cooleth, and withall digesteth, as *Paulus Aegineta* writeth.

¶ The Vertues.

The leaues of Groundsell boyled in wine or water, and drunke, healeth the paine and ache of the stomacke that proceedeth of choler.

The leaues and floures stamped with a little Hogs grease ceaseth the burning heat of the stones and fundament. By adding to a little saffron or salt it helpeth the *Struma* or Kings Euill.

The leaues stamped and strained into milke and drunke, helpeth the red gummes and frets in children.

Dioscorides saith, That with the fine powder of Frankinsence it healeth wounds in the sinewes. The like operation hath the downe of the floures mixed with vinegar.

Boyled in Ale with a little honey and vinegar, it prouoketh vomit, especially if you adde thereto a few roots of *Assarabacca*.

CHAP. 28. Of Saint James his Wort.

¶ The Kindes.

THE herbe called Saint James his wort is not without cause thought to be a kinde of Groundsell: of which there be sundry sorts; some of the pasture, and one of the sea; some sweet smelling, and some of a loathsome fauor. All which Kindes I will set downe.

¶ The Description.

Saint James his wort or Rag-wort is very well knowne euery where, and bringeth forth at the first broad leaues, gashed round about like to the leaues of common Wormewood, but broader, thicker, not whitish or soft, of a deepe Greene colour, with a stalke which riseth vp aboue a cubit high, chamfered, blackish, and somewhat red withall. The armes or wings are set with lesser leaues like those of Groundsell or of wilde Rocket. The floures at the top be of a yellow colour like Marigolds, as well the middle button as the small floures that stand in a pale round about, which turne into downe as doth Groundsell. The root is threddy.

‡ 2 This hath stalkes some cubit high, crested, and set with long whitish leaues; the lower leaues are the shorter; but the vpper leaues the longer, yet the narrower: at the top of the stalke grow some foure or fve floures as in an vmbell, which are of a darke red colour before they open themselves,

1 *Iacobaea*. Rag-wort.† 2 *Iacobaea angustifolia*. Narrow leaved Rag-weed.‡ 3 *Iacobaea latifolia*. Broad leaved Rag-weed.4 *Iacobaea marina*. Sea Rag-weed.

themselues, but opened, of a bright golden colour, and those are ingirt by fiftene or more little leaues, which are of a flame colour aboue, and red vnderneath. The floures fly away in downe, and the seed is blackish, and like that of the former. The roots are made of many strings like those of the precedent.

3 This broad leaued Rag-weed hath stiffe crested stalkes, which are set with broad wrinckled sharpe pointed leaues, of a greene colour: the bottome leaues are the larger and rounder, the top leaues the lesse, and more diuided. The floures grow at the top of the stalkes, in shape and colour like those of the common Rag-weed, but much bigger: They also turne into Downe as the former. †

4 Sea Rag-wort groweth to the height of two cubits: the stalkes be not reddish as the other, but contrariwise Ash-coloured, gray and hoary: the leaues be greater and broader than the other: the floures grow at the top, of a pale yellow colour, couered on the cup or huske of the floure, as also the leaues, with a certaine soft white Downe or freeze: the floures vanish into Downe, and fly away with the winde.

¶ The Place.

Land Rag-wort groweth euery where in vntilled pastures and fields, which are somewhat moist especially, and neere vnto the borders of fields.

† 2 3 These grow vpon the Austrian and Heluetian Alpes. †

The fourth kinde of Rag-wort groweth neere the sea side in sundry places: I haue seene it in the field by Margate, by Queakes house, and by Byrchenton in the Isle of Tenet: likewise it groweth neere the Kings ferry in the Isle of Shepey, in the way leading to Sherland house, where S^r. Edward Hobby dwelleth: and likewise at Queenborough castle in the same Isle; and in other places. † I haue been at the former and later of these places to finde out plants, yet could I not see this plant. It growes in the garden of M^r. Ralph Tuggy; but I feare hardly wilde in this kingdome. †

¶ The Time.

They floure in Iuly and August, at which time they are carried away with the Downe.

¶ The Names.

The first is called in Latine, *Herba S. Iacobi*, or *S. Iacobi flos*, and *Iacobaea*: in high-Dutch, **Sant Jacobs bloumen**: in low-Dutch, **Sant Jacobs crypt**: in French, *Fluer de S. Iacques*: in English, *S. James his Wort*: the countrey people do call it Stagger-wort, and Staner-wort, and also Rag-wort, † and Rag-weed. In Holderneffe in Yorke-shire they call it Seggrum.

The second is *Iacobaea Pannonica* 2. of *Clusius*.

The third is his *Iacobaea latifolia*. *Gesner* calls it *Coniza montana*. †

The fourth is named *Cineraria*, or Ash-coloured *S. James Wort*: some call it *Erigeron maritimum*, or Sea Groundsell: of some, *Artemisia marina*. † And by *Prosper Alpinus*, *Artemisia alba*. †

¶ The Temperature.

S. James wort is hot and dry in the second degree, and also cleansing, by reason of the bitterneffe which it hath.

¶ The Vertues.

It is commended by the later Physitions to be good for greene wounds, and old filthy Vlcers which are not scoured, mundified, and made cleane; it also healeth them, with the iuyce hereof tempered with honey and May butter, and boyled together to the forme of an Vnguent or salve. A

It is much commended, and not without cause, to helpe old aches and pains in the armes, hips, and legs, boyled in hogs grease to the forme of an ointment. B

Moreouer, the decoction hereof gargarised is much set by as a remedie against swellings and impostumations of the throat, which it wasteth away and thoroughly healeth. C

The leaues stamped very small, and boyled with some hogs grease vnto the consumption of the iuyce, adding thereto in the end of the boyling a little Masticke and Olibanum, and then strained, taketh away the old ache in the huckle-bones called Sciatica. D

† The Egyptians (saith *Prosper Alpinus*) vse the Sea Rag-wort, for many things: for they commend the decoction made with the leaues thereof against the stone in the kidnies and bladder, as also to helpe the old obstructions of the inward parts, but principally those of the wombe; as also the coldnesse, strangulation, barrennesse, inflation thereof, and it also brings downe the intercepted courses: wherefore women troubled with the mother are much eased by baths made of the leaues and floures hereof. † E

CHAP. 29. Of Garden Succorie.

¶ The Kindes.

There be fundry sorts of plants comprehended vnder the title of *Cichoracea*, that is to say Cichorie, Endiue, Dandelion, &c. differing not so much in operation and working, as in shape and forme, which hath caused many to deeme them diuers, who haue distinguished them vnder the titles aforesaid: of euery which kinde there be diuers sorts, the which shall be diuided in their feuerall chapters, wherein the differences shall be exprest.

¶ The Description.

1 Garden Succory is of two sorts, one with broad leaues, and the other with narrow, deeply cut and gashed on both sides. The first hath broad leaues somewhat hairie, not much vnlike to Endiue, but narrower; amongst which doe rise vp stalkes, whereon are placed the like leaues, but smaller. The stalke diuideth it selfe toward the top into many branches, whereon doe grow little blew floures consisting of many small leaues, after which followeth white seed. The root is tough, long, and white of colour, continuing many yeeres; from the which as from euery part of the plant doth issue forth bitter and milkie juice. The whole plant is of a bitter taste likewise.

2 *Cichorium sativum.*
Garden Succorie.

3 *Itibus satina.*
Garden Endiue.

2 The second kinde of Succorie is like vnto the former, but greater in euery point. That which causeth the difference is, that this beareth floures white of colour tending to blewnesse; the others blew, as I haue said.

3 Garden Endiue bringeth forth long leaues, broad, smooth, more Greene than white, like almost to those of lettuce, something nicked in the edges. The stalke groweth vp among the leaues, being round and hollow, diuided into branches; out of which being broken or cut there issueth a juice like milke, somewhat bitter: the floures vpon the branches consist of many leaues, in colour com-

‡ 5 *Cichorium spinosum*.
Thornie Succory.

commonly blew, feldome white. The root is long, white, with strings growing thereat, which withereth after the seed is ripe.

4 Curled Endiue hath leaues not vnlike to those of the curled or Cabbage lettuce, but much greater; among which rise vp strong and thicke stalkes, set with the like leaues, but lesser, and not so notably curled or crisped. The flours grow at the top, blew of colour. The root periseth, as doth the whole plant, when it hath brought forth his ripe seed.

‡ 5 To these may fitly be added the thorny or prickly Succory of Candy, being of this kindred, and there vsed in defect of the true Succorie, in stead thereof. The root is pretty long, white, with few fibers hanging thereat; the stalke is hard, woody, and diulicated into many branches, which commonly end in two or three prickles like hornes: The leaues are bitter, long, narrow, and sharpe pointed, and lie spread vpon the ground, and are a little sinuated, or cut about the edges: The flours, which vsually grow vpon little footstalkes at the diuisions of the branches, are much like those of the ordinary Succory, yet much lesse, consisting of five blew leaues, with yellow chiues in the middle. The seed is like those of the common Succory. It floures in Iuly and August. ‡

¶ The Place and Time.

This Succory, and these Endiues are only sowne in gardens.

Endiue being sown in the spring quickly commeth vp to floure, which seedeth in haruest, and afterward dieth. But being sown in Iuly it remaineth till winter, at which time it is taken vp by the roots, and laid in the sunne or aire for the space of two houres; then will the leaues be tough, and easily endure to be wrapped vpon an heape, and buried in the earth with the roots vponward, where no earth can get within it (which if it did, would cause rottenesse) the which so couered may be taken vp at times conuenient, and vsed in sallades all the winter, as in London and other places is to be seen; and then it is called white Endiue, whereof *Pliny* seemeth not to be ignorant, speaking to the same purpose in his 20. booke and 8. chapter.

¶ The Names.

These herbes be called by one name in Greek *Σπιδίς*: notwithstanding for distinctions sake they called the garden Succory, *Σπιδίς ἡμερῆς*, and the wilde Succory, *σπιδίς ἀγρία*; *Pliny* nameth the Succory *Hedynois*: and the bitterer *Dioscorides* calleth *μαρίς*: in Latine, *Intybum syluestre*, *Intybum agreste*, *Intybum erraticum*, and *Cichorium*: in shops it is called *Cichorea*, which name is not onely allowed of the later Physitions, but also of the Poet *Horace* in the 31. Ode of his first booke,

Mepascunt oliuæ,

Me Cichorea, lenesque maluæ.

With vs, saith *Pliny* in his 20. booke, 8. chapter, they haue called *Intybum erraticum*, or wilde Endiue, *Ambugia* (others reade *Ambubeia*:) and some there be that name it *Rostrum porcinum*: and others, as *Guilielmus Placentinus*, and *Petrus Crescentius*, terme it *Sponsa solis*: the Germanes call it *Megwarten*, which is as much to say, as the keeper of the waies: the Italians, *Cichorea*: the Spaniards, *Almerones*: the English-men, *Cicorie* and *Succory*: the Bohemians, *Czakanka*.

Endiue is named in Greeke *Σπιδίς ἡμερῆς*: in Latine, *Intybum sativum*: of some, *Endiua*: of *Auicenna* and *Serapio*, *Taraxacon*: of the Italians, *Scariola*, which name remaineth in most shops; also *Seriola*, as though they should fitly call it *Seris*, but not so well *Serriola*, with a double *r*: for *Serriola* is *Lactuca syluestris*, or wilde lettuce: it is called in Spanish, *Serraya Ennide*: in English, *Endiue*, and *Scariole*: and when it hath been in the earth buried as aforesaid, then it is called white Endiue.

‡ 5 This was first set forth by *Clusius* vnder this name, *Chondrilla genus elegans caruleo flore*: since, by *Pona* and *Bauhine*, by the title we giue you, to wit, *Cichorium spinosum*. *Honorius Bellus* writes that in Candy where as it naturally growes, they vulgarly terme it *supurayen*, that is, *Hydria spina*, the Pitcher Thorne; because the people fetch all their water in stone pots or Pitchers, which they stop with this plant, to keepe mice and other such things from creeping into them: and it growes so round, that it seems by nature to be provided for that purpose. ‡

¶ The Nature.

Endiue and Succorie are cold and drie in the second degree, and withall somewhat binding: and because they be something bitter, they doe also clense and open.

Garden Endiue is colder, and not so drie or clensing, and by reason of these qualities they are thought to be excellent medicines for a hot liuer, as *Galen* hath written in his 8. book of the compositions of medicines according to the places affected.

¶ The Vertues.

A These herbs when they be Greene haue vertue to coole the hot burning of the liuer, to helpe the stopping of the gall, yellow jaundice, lacke of sleepe, stopping of vrine, and hot burning feauers.

B A Syrup made thereof and sugar is very good for the diseases aforesaid.

C The distilled water is good in potions, cooling and purging drinks.

D The distilled water of Endiue, Plantaine, and roses, profiteth against excoriations in the conduit of the yarde to be iniected with a syringe, whether the hurt came by vncleanenesse or by small stones and grauell issuing forth with the vrine; as often hath been seene.

E These herbes eaten in sallades or otherwise, especially the white Endiue, doth comfort the weake and feeble stomacke, and cooleth and refresheth the stomacke ouermuch heated.

F The leaues of Succorie brused are good against inflammation of the eyes, being outwardly applied to the griued place.

CHAP. 30. Of wilde Succorie.

‡ 1 *Cichorium sylvestre*.
Wilde Succorie.

‡ 2 *Cichorium luteum*.
Yellow Succorie.

¶ The

¶ The Kindes.

IN like manner as there be sundrie sorts of Succories and Endiues, so is there wilde kinds of either of them.

¶ The Description.

1 Wilde Succorie hath long leaues, somewhat snipt about the edges like the leaues of Sow-thistle, with a stalke growing to the height of two cubits, which is diuided towards the top into many branches. The floures grow at the top blew of colour: the root is tough, and wooddie, with many strings fastned thereto.

2 Yellow Succorie hath long and large leaues, deeply cut about the edges like those of the Hawkeweed. The stalke is branched into sundry arms, wheron do grow yellow flours very double, resembling the floures of Dandelion, or Pisse-abed; the which being withered, it flieth away in downe with euery blast of winde.

3 *Intybum sylvestre.*
Wilde Endiue.

3 Wilde Endiue hath long smooth leaues slightly snipt about the edges. The stalke is brittle and full of milkie juice, as is all the rest of the plant: the floures grow at the top, of a blew or skie colour: the root is tough and threddie.

4 Meadow Endiue, or Endiue with broad leaues, hath a thicke, tough, and wooddie root with many strings fastened thereto, from which rise vp many broad leaues spread vpon the ground like those of garden Endiue, but lesser, and somewhat rougher, among which rise vp many stalkes immediately from the root; euery of them are deuided into sundrie branches, whereupon doe grow many floures like those of the former, but smaller.

¶ The Place.

These plants doe grow wilde in sundrie places in England, vpon wilde and vntilled barren grounds, especially in chalkie and stonie places.

¶ The Time.

They floure from the middest to the end of August.

¶ The Names.

† The first of these is *Seris Picris* of Lobell, or *Cichorium sylvestre*: or *Intybus erratica* of Tabernamontanus. †

Yellow Succorie is not without cause thought to be *Hyosiris*, or (as some copies haue it) *Hyosiris*, of which *Pliny* in his 20. booke and 8. chapter writeth, *Hyosiris* (saith he) is like to Endiue, but lesser and rougher: it is called of *Lobelius*, *Hedypnois*: the rest of the names set forth in their seuerall titles shall be sufficient for this time.

¶ The Temperature.

They agree in temperature with the garden Succorie, or Endiue.

¶ The Vertues.

The leaues of these wilde herbes are boiled in pottage or brothes, for sicke, and feeble persons that haue hot, weake, and feeble stomackes, to strengthen the same.

They are iudged to haue the same vertues with those of the garden, if not of more force in working.

† The first figure was of *Cichorium album sativum* of Tabernamontanus. The second is *Cichorium luteum*. But the true figures of those our Author meant, were under these titles. The first, of *Hieracium latifolium*. The second, *Dent. Leonis Cichoriata*; for that is Lobell's *Hedypnois*.

CHAP. 31. Of Gumme Succorie.

¶ The Description.

Gumme Succorie with blew floures hath a thicke and tough root, with some strings annexed thereto, full of a milkie iuyce, as is all the rest of the plant, the floures excepted. The leaues are great and long, in shape like to those of garden Succorie, but deeplier cut or iagged, somewhat after the manner of wilde Rocket: among which rise tender stalkes very easie to be broken, branched toward the top in two or sometimes three branches, bearing very pleasant floures of an azure colour or deepe blew; which being past, the seed flieth away in downe with the winde.

1 *Chondrilla cœrulea.*
Blew Gum Succorie.

2 *Chondrilla cœrulea latifolia.*
Robinus Gum Succory.

2 Gum Succorie with broad leaues, which I have named *Robinus* Gum Succorie (for that he was the first that made any mention of a second kind, which he sent me as a great dainty, as indeed I confesse it) in roots is like the former: the leaues be greater, not vnlike to those of Endiue, but cut more deeply euen to the middle rib: the stalkes grow to the height of two foot: the floures likewise are of an azure colour, but sprinkled ouer as it were with siluer sand; which addeth vnto the floure great grace and beauty.

3 Yellow gum Succorie hath long leaues like in forme and diuision of the cut leaues to those of wild Succorie, but lesser, couered all ouer with a hoarie down. The stalke is two foot high, white and downie also, diuided into sundry branches, whereupon doe grow torne floures like those of Succorie, but in colour yellow, which are turned into downe that is caried away with the winde. The root is long, and of a meane thicknesse, from which, as from all the rest of the plant, doth issue forth a milky iuyce, which being dried is of a yellowish red, sharp, or biting the tongue. There is found vpon the branches hereof a gum, as *Dioscorides* saith, which is vsed at this day in physicke in the Isle Lemnos, as *Bellonius* witneseth.

4 Spanish Gum Succorie hath many leaues spred vpon the ground, in shape like those of Groundsell, but much more diuided, and not so thicke nor fat; amongst which rise vp branched stalkes set with leaues like those of *Stæbe salamantica minor*, or Silver-weed, whereof this is a kinde. The floures grow at the top, of an ouerworne purple colour, which seldome shew themselues a-broad blowne: ‡ The seed is like that of *Carthamus* in shape, but blacke and shining. ‡

† 3 *Chondrilla lutea.*

Yellow Gum Succorie.

† 4 *Chondrilla Hispanica.*

Spanish Gum Succorie.

5 Rushy Gum Succorie hath a tough and hard root, with a few short threds fastned thereto; from the which rise vp a few iagged leaues like those of Succorie, but much more diuided: The stalke groweth vp to the height of two foot, tough and limmer like vnto rushes, whereon are set many narrow leaues. The floures be yellow, single, and small, which being faded doe fly away with the winde: the whole plant hauing milky iuyce like vnto the other of his kinde.

‡ There is another sort of this plant to be found in some places of this kingdome, and it is mentioned by *Bauhinus* vnder the name of *Chondrilla viscosa humilis*.

† 6 Sea Gum Succorie hath many knobby or tuberous roots full of iuyce, of a whitish purple colour, with long strings fastned to them; from which immediately rise vp a few small thinne leaues fashioned like those of Succory, narrower below, and somewhat larger towards their ends; among which spring vp small tender stalkes, naked, smooth, hollow, round, of some foot high, or thereabout: each of these stalkes haue one floure, in shape like that of the Dandelion, but lesser. The whole plant is whitish or hoary, as are many of the sea plants. ‡

7 Swines Succorie hath white small and tender roots, from the which rise many indented leaues like those of Dandelion, but much lesse, spred or laid flat vpon the ground; from the midst whereof rise vp small soft and tender stalkes, bearing at the top double yellow floures like those of Dandelion or Pisse-abled, but smaller: the seed with the downy tuft flieth away with the wind.

8 The male Swines Succorie hath a long and slender root, with some few threds or strings fastned thereto; from which spring vp small tender leaues about the bignesse of those of Daisies, spred vpon the ground, cut or snipt about the edges confusedly, of an ouerworne colour, full of a milky iuyce: among which rise vp diuers small tender naked stalkes, bearing at the top of euery stalke one floure and no more, of a faint yellow colour, and something double: which being ripe,

do

5 *Chondrilla juncea.*
Rushy Gum Succorie.

6 *Chondrilla marina* Lobelij.
Sea Gum Succorie.

7 *Hypochoeris, Porcellia.*
Swines Succorie.

8 *Hyoseris mascula.*
Male Swines Succorie.

doe turne into downe that is carried away with the winde: the seed likewise cleaveth vnto the said downe, and is also carried away with the winde. The whole plant perisheth when it hath perfected his seed, and recovereth it selfe againe by the falling thereof.

‡ 9 *Cichorium verrucarium*.
Wart-Succorie.

‡ 9 I thinke it expedient in this place to deliuer vnto you the historie of the *Cichorium verrucarium*, or *Zacantha* of *Matthiolus*; of which our Author maketh mention in his Names and Vertues, although he neither gaue figure, nor the least description thereof. This Wart-Succory (for so I will call it) hath leaues almost like Endiue, Greene, with pretty deepe gashes on their sides; the stalkes are much crested, and at the top diuided into many branches; betweene which, and at their sides grow many short stalkes with yellow floures like those of Succorie, but that these turne not into Downe, but into cornered and hard heads, most commonly diuided into eight cels or parts, wherein the seed is contained. ‡

¶ The Place.

† These plants are found only in gardens in this country; the seventh & eighth excepted, which peradventure may be found to grow in vntilled places, vpon ditch banks and the borders of fields, or the like.

¶ The Time.

They do floure from May to the end of August.

¶ The Names.

Gum Succorie hath beene called of the Grecians, *γερσίον*: of the Latines, *Condrilla*, and *Chondrilla*: *Dioscorides* and *Pliny* call it *Cichorion*, and *Seris*, by reason of some likeness they haue with Succorie, especially

the two first, which haue blew floures as those of the Succories. *Lobelius* maketh *Cichorea verrucaria* to be *Zacantha* of *Matthiolus*.

‡ ¶ Names in particular.

- ‡ 1 This is called *Chondrilla caerulea Belgarum*, of *Lobel*: *Apate*, of *Daleschampsius*.
- 2 *Condrilla* 2. of *Matthiolus*: *Chondrilla latifolia caerulea*, of *Tabernamontanus*.
- 3 *Chondrilla prior Dioscoridis*, of *Clusius* and *Lobel*.
- 4 *Chondrilla rara purpurea*, &c. of *Lobel*: *Chondrilla Hispanica Narbonensis*, of *Tabern.* *Seneciocardus Apulus*, of *Columna*.
- 5 *Chondrilla prima Dioscoridis*, of *Columna* and *Bauhinus*: *Viminea, viscosa*, of *Lobel* and *Clusius*.
- 6 *Chondrilla altera Dioscoridis*, of *Columna*: some thinke it to be *αφίστα* of *Theophrastus*: *Lobell* calls it, *Chondrilla pusilla marina lutea bulbosa*.
- 7 *Hypocharis, porcellia*, of *Tabernamontanus*.
- 8 *Hieracium minimum* 9. of *Clusius*: *Hyoseris latifolia*, of *Tabern.* The two last should haue bin put among the *Hieracia*.
- 9 *Cichorium verrucarium*, and *Zacanthus* of *Matthiolus* and *Clusius*. ‡

¶ The Nature and Vertues.

These kinds of gum Succorie are like in temperature to the common Succory, but drier.

The root and leaues tempered with hony, and made into Trochiskes, or little flat cakes, with niter or salt-peter added to them, cleanse away the morpew, sun-burnings, and all spots of the face. A

The gum which is gathered from the branches, whereof it tooke his name, layeth downe the staining haire of the eye-browes and such like places: and in some places it is vsed for Mastick, as *Bellonius* obserues. B

The gum poudered with myrrh, and put into a linnen cloath, and a pessarie made thereof like a finger, and put vp, bringeth downe the termes in yong Wenches and such like. C

The

D The feedes of *Zazimba* beate to powder, and giuen in the decreasing of the Moone to the quantitie of a spoonefull, taketh away warts, and such like excrescence, in what part of the body soeuer they be; the which medicine a certaine Chirurgion of Padua did much vse, whereby he gained great sums of mony, as reporteth that ancient Physition *Ioachimus Camerarius* of Noremberg a famous citie in Germanie. And *Matthiolus* affirms that he hath knowne some helped of warts, by once eating the leaues hereof in a Sallade.

† The figure of the third was of the same plant as the first, and was *Chondrilla alba* of Taber. The fourth was of *Hieracium montanum minus* *Latifolium* of Tabern. which you shall finde in the tenth place in the fourth and thirtieth Chapter.

CHAP. 32.

Of Dandelion.

¶ The Description.

1 **T**He herbe which is commonly called Dandelion doth send forth from the root long leaues deeply cut and gashed in the edges like those of wilde Succorie, but smoother: vpon euery stalke standeth a floure greater than that of Succorie, but double, and thicke set together, of colour yellow, and sweet in smell, which is turned into a round downie blowball, that is carried away with the winde. The root is long, slender, and full of milkie juice when any part of it is broken, as is the Endiue or Succorie, but bitterer in taste than Succorie.

‡ There are diuers varieties of this plant, consisting in the largenesse, smallnesse, deepenesse, or shallownesse of the diuisions of the leafe, as also in the smoothnesse and roughnesse thereof. ‡

1 *Dens Leonis.*
Dandelion.

‡ **3** *Dens Leonis bulbosus.*
Knottie rooted Dandelion.

2 There is also another kinde of Succorie which may be referred heereunto, whose leaues are long, cut like those of broad leaved Succorie: the stalkes are not vnlike, being diuided into branches as those of Dandelion, but lesser, which also vanisheth into downe when the seed is ripe, hauing a long and white root.

‡ **3** There is another *Dens Leonis*, or Dandelion, which hath many knotty, and tuberous roots like

like those of the Asphodil, the leaues are not so deeply cut in as those of the common Dandelion, but larger, and somewhat more hairy: the floures are also larger, and of a paler yellow, which flie away in such downe as the ordinary. †

¶ The Place.

They are found often in meadowes neere vnto water ditches, as also in gardenes and high waies much troden.

¶ The Time.

They floure most times in the yeere, especially if the winter be not extreame cold.

¶ The Names.

These plants belong to the Succory which Theophrastus, & Pliny call *Aphaca*, or *Aphace Leonardus*: Fuchsius thinketh that Dandelion is *Hedypnois* Plinij, of which he writeth in his 20. booke, and eighth chapter, affirming it to be a wilde kinde of broad leaved Succorie, and that Dandelion is *Taraxacon*: but *Taraxacon*, as Auicenna teacheth in his 692. chapter, is garden Endiue, as Serapio mentioneth in his 143. chapter, who citing Paulus for a witnesse concerning the faculties, setteth down these words which Paulus writeth of Endiue and Succorie. Diuers of the later Physitions do also call it *Dens Leonis*, or Dandelion: it is called in high Dutch, *Kolkraut*; in low-Dutch, *Wapencruut*; in French, *Pissenlit* ou *couronne de prestre*, or *Dent de lyon*: in English, Dandelion: and of diuers, Pisseabed. The first is also called of some, and in shops *Taraxacon*, *Caput monachi*, *Rostrum porcinum*, and *Vrinaria*. The other is *Dens Leonis Monspelienfium* of Lobell, and *Cichoreum Constantinopolitanum*, of Matthiolus.

¶ The Temperature and Vertues.

Dandelion is like in temperature to Succorie, that is to say, to wilde Endiue. It is cold, but it drieth more, and doth withall clense, and open by reason of the bitternesse which it hath ioyned with it: and therefore it is good for those things for which Succory is. † Boiled, it strengthens the weake stomacke, and eaten raw it stops the bellie, and helps the Dysentery, especially being boyled with Lentiles; The juice drunke is good against the vnuoluntary effusion of seed, boyled in vineger, it is good against the paine that troubles some in making of water; A decoction made of the whole plant helps the yellow jaundice. †

† The figure which was in the 2 place was of the *Cicob. Luteum*, where you may find it, but to what plant the description may be referred, I cannot yet determine;

CHAP. 20. Of Sow-thistle.

† 1 *Sonchus asper*. Prickly Sow-thistle.

‡ 2 *Sonchus asperior*. The more prickly Sow-thistle.

¶ The

¶ The Kindes.

There be two chiefe Kindes of Sow-thistles; one tenderer and softer; the other more pricking and wilder: but of these there be sundry sorts more found by the diligence of the later Writers; all which shall be comprehended in this chapter, and euery one be distinguished with a seuerall description.

¶ The Description.

THe prickly Sow-thistle hath long broad leaues cut very little in, but full of smal prickles round about the edges something hard and sharpe, with a rough and hollow stalke: the floures stand on the tops of the branches, consisting of many small leaues, single, and yellow of colour; and when the seed is ripe it turneth into downe, and is carried away with the winde. The whole plant is full of a white milky iuyce.

¶ 2 There is another kinde of this, whose leaues are sometimes prettily deepe cut in like as those of the ordinarie Sow-thistle; but the stalkes are commonly higher than those of the last described, and the leaues more rough and prickly; but in other respects not differing from the rest of this kinde. It is also sometimes to be found with the leaues lesse diuided. ¶

† 3 *Sonchus Lani.*
Hares Lettuce.

¶ 4 *Sonchus lani latifolius.*
Broad leaued Sow-thistle.

3 The stalke of Hares Lettuce, or smooth-Thistle is oftentimes a cubit high, edged and hollow, of a pale colour, and sometimes reddish: the leaues be greene, broad, set round about with deepe cuts or gashes, smooth, and without prickles. The floures stand at the top of the branches, yellow of colour, which are caried away with the winde when the seed is ripe. ¶ This is sometimes found with whitish, and with snow-white floures, but yet seldome: whence our Authour made two Kindes more, which were the fourth and fifth; calling the one, The white floured Sow-thistle; and the other, The snow-white Sow-thistle. Both these I haue omitted as impertinent, and give you others in their stead. ¶

4 Broad leaued Sow-thistle hath a long thicke and milky root, as is all the rest of the Plant, with many strings or fibres; from the which commeth forth a hollow stalke branched or diuided into sundry sections. The leaues be great, smooth, sharpe pointed, and greene of colour: the floures be

be white, in shape like the former. † The floures of this are for the most part yellow like as the former. †

‡ 5 Wall Sow-thistle hath a fibrous woody root, from which rises vp a round stalke not crested: the leaues are much like to those of the other Sow-thistles, broad at the setting on, then narrower, and after much broader, and sharpe pointed, so that the end of the leafe much resembles the shape of an iuy leafe; these leaues are very tender, and of somewhat a whitish colour on the vnder side: the top of the stalke is diuided into many small branches, which beare little yellow floures that fly away in downe.

6 This hath longish narrow leaues soft and whitish, vnequally diuided about the edges. The stalkes grow some foot high, hauing few branches, and those set with few leaues, broad at their setting on, and ending in a sharpe point: the floures are pretty large like to the great Hawk-weed, and fly away in downe: the root is long, white, and lasting. It floures most part of Summer; and in Tuscany, where it plentifully growes, it is much eaten in sallets, with oile and vineger, it hauing a sweetish and somewhat astringent taste. †

‡ 5 *Sonchus leuis muralis.*

Wall (or Iuy-leaued) Sow-thistle.

‡ 6 *Sonchus leuis angustifolius.*

Narrow leaued Sow-thistle.

† 7 This blew floured Sow-thistle is the greatest of all the rest of the kindes, somewhat resembling the last described in leaues, but those of this are somewhat rough or hairy on the vnder side: the floures are in shape like those of the ordinarie Sow-thistle, but of a faire blew colour; which fading, flie away in Downe that carries with it a small ash-coloured seed. The whole plant yeeldeth milke as all the rest do. †

8 Tree Sow-thistle hath a very great thicke and hard root set with a few hairy threds; from which ariseth a strong and great stalke of a woody substance, set with long leaues not vnlike to Languedebefe, but more deeply cut in about the edges, and not so rough: vpon which do grow faire double yellow floures, which turne into Downe, and are caried away with the winde. The whole plant is posselt with such a milky iuyce as are the tender and hearby Sow-thistles; which certainly sheweth it to be a kinde thereof: otherwise it might be referred to the Hawke-weeds, whereunto in face and shew it is like. † This hath a running root, and the heads and tops of the stalkes are very rough and hairy. †

7 *Sonchus flore caruleo.*
Blew-floured Sow-thistle.

† 9 *Sonchus arborescens alter.*
The other Tree Sow-thistle.

8 *Sonchus Arborescens.*
Tree Sow-thistle.

† 10 *Sonchus sylvaticus.*
Wood Sow-thistle.

‡ 9 This other Tree Sow-thistle growes to a mans height or more, hauing a firme crested stalke, smooth, without any prickles, and set with many leaues incompassing the stalke at their setting on, and afterwards cut in with foure, or sometimes with two gashes only: the vpper leaues are not diuided at all: the colour of these leaues is green on the vpper side, and grayish vnderneath: the top of the stalke is hairy, and diuided into many branches, which beare the floures in an equall height, as it were in an umbell: the floures are not great, considering the largeness of the plant, but vsually as big as those of the common Sow-thistle, and yellow, hauing a hairy head or cap: the seed is crested, longish, and ash-coloured, and flies away with the downe: the root is thicke, whitish, hauing many fibres, putting out new shoots, and spreading euery year. *Bauhine* maketh this all one with the other, according to *Clusius* his description: but in my opinion there is some difference betweene them, which chiefly consists, in that the former hath larger and fewer floures; the plant also not growing to so great a height. ‡

‡ 10 This plant (whose figure our Author formerly gaue, pag. 148. vnder the title of *Erysimum sylvestre*) hath long knotty creeping roots, from whence ariseth a round slender stalke some two foot high, set at first with little leaues, which grow bigger and bigger as they come neerer the middle of the stalke, being pretty broad at their setting on, then somewhat narrower, and so broader againe, and sharpe pointed, being of the colour of the Wall (or Iuy-leaued) Sow-Thistle. The top is diuided into many small branches, which end in small scaly heads like those of the wilde Lettuce, containing floures consisting of foure blewish purple leaues, turned backe and snipped at their ends; there are also some threds in the middle of the floure, which turning into Downe, carry away with them the seed, which is small, and of an Ash-colour. *Bauhine* makes a bigger and a lesser of these, distinguishing betweene that of *Clusius* (whose figure I here giue you) and that of *Columna*; yet *Fabius Columna* himselfe could finde no difference, but that *Clusius* his plant had five leaues in the floure, and his but foure: which indeed *Clusius* in his description affirms; yet his figure (as you may see) expresse but foure: adding, That the root is not well expressed; which notwithstanding *Clusius* describes according to *Columna's* expression. ‡

¶ The Place.

The first foure grow wilde in pastures, meadowes, woods, and marishes neere the sea, and among pot-herbes.

The fifth growes vpon walls, and in wooddy mountainous places.

The Tree Sow-thistle growes amongst corne in waterie places.

The sixth, seuenth and tenth are strangers in England.

¶ The Time.

They floure in Iune, Iuly, August, and sometimes later.

¶ The Names.

Sow-thistle is called in Greeke, *Σονχίς*: in Latine, *Sonchus*: of diuers, *Cicerbita*, *lactucella*, and *Lacteron*: *Apuleius* calleth it *Lactuca Leporina*, or Hares-thistle: of some, *Brasica Leporina*, or Hares Colewort. The English names are sufficiently touched in their seuerall titles: In Dutch it is called *Hasen Latoutoe*: the French, *Palays de lieure*.

‡ ¶ Names in particular.

1 This is *Sonchus asper major* of *Cordus*: *Sonchus tenerior aculeis asperior* of *Lobel*: *Sonchus 3. asperior* of *Dodoneus*.

2 This is *Sonchus asper*, of *Matthiolus*, *Fuchsius*, and others.

3 This, *Matthiolus*, *Dodoneus*, *Lobel*, and others call *Sonchus lauis*: *Tragus* calls it *Intybus erratica tertia*.

4 This *Tabernamontanus* onely giues, vnder the title as you haue it here.

5 *Matthiolus* styles this, *Sonchus lauis alter*: *Casalpinus* calls it *Lactuca murorum*: and *Tabern. Sonchus syluaticus quartus*: *Lobel*, *Sonchus alter folio sinuato hederaceo*.

6 *Lobel* calls this, *Sonchus lauis Matthioli*: it is *Terracrepulus* of *Casalpinus*: and *Crepis* of *Dalchampsius*.

7 *Clusius* and *Camerarius* giue vs this vnder the title of *Sonchus caeruleus*.

8 Onely *Tabern.* hath this figure, vnder the title our Author giues it: *Bauhine* puts it amongst the *Hieracia*, calling it *Hieracium arborescens palustre*.

9 This *Bauhine* also makes an *Hieracium*, and would persuaदे vs that *Clusius* his description belongs to the last mentioned, and the figure to this: to which opinion I cannot consent. *Clusius* giueth it vnder the name of *Sonchus 3. lauis altissimus*.

10 This *Clusius* giues vnder the name of *Sonchus lauior Pannonicus 4. flore purp.* *Tabern.* calls it *Libanotis Theophrasti sterilis*: *Columna* hath it by the name of *Sonchus montanus purpureus* *ἡβοντάριον*: *Cordus*, *Gesner*, *Thalins*, and *Bauhine* refer it to the *Lactuca sylvestres*: the last of them terming it, *Lactuca montana purpureo-caerulea*. ‡

¶ The Temperature.

The Sow-thistles, as *Galen* writeth, are of a mixt temperature; for they consist of a watery and earthy substance, cold, and likewise binding.

¶ The Vertues.

- A Whilest they are yet yong and tender they are eaten as other pot-herbes are; but whether they be eaten, or outwardly applied in manner of a pultesse, they do evidently coole: therefore they be good for all inflammations or hot swellings, if they be laid thereon.
- B Sow-thistle giuen in broth taketh away the gnawings of the stomacke proceeding of an hot cause; and increase milke in the breasts of Nurseries, causing the children whom they nurse to haue a good colour: and of the same vertue is the broth if it be drunken.
- C The iuyce of these herbes doth coole and temper the heate of the fundament and priuy parts.

CHAP. 34. Of Hawke-weed.

¶ The Kindes.

Hawke-weed is also a kinde of Succorie; of which *Dioscorides* maketh two sorts, and the later Writers more: the which shall be described in this chapter following, where they shall be distinguished as well with severall titles as sundry descriptions.

† 1 *Hieracium majus Dioscoridis.*
Great Hawke-weed.

2 *Hieracium minus, sive Leporinum.*
Small Hares Hawk-weed, or Yellow Diuels-bit.

¶ The Description.

1 The great Hawke-weed hath large and long leaues spred vpon the ground, in shape like those of the Sow-thistle: the stalk groweth to the height of two cubits, branched into fundry armes or diuisions, hollow within as the yong Kexe, reddish of colour; whereupon do grow yellow floures thicke and double, which turne into Downe that flieth away with the winde when the seed is ripe. The root is thicke, tough and threddy.

2 The

2 The small Hawke-weed, which of most writers hath been taken for yellow Diuels-bit, hath long leaues deeply cut about the edges, with some sharpe roughnesse thereon like vnto Sow-thistle. The stalkes and floures are like the former: the root is compact of many small strings, with a small knob, or as it were the stumpe of an old root in the middle of those strings, cut or bitten off; whereupon it tooke his name Diuels bit.

3 Blacke Hawke-weed hath very many long iagged leaues, not much vnlike to those of Bucks horne, spred flat and farre abroad vpon the ground, which the picture cannot expresse as is requisite, in so little roome: among which rise vp many stalkes slender and weake, the floures growing at the top yellow and very double: it hath also a threddy root.

† Our Author formerly gaue three figures, and so many descriptions of this small *Hieracium*, which I haue contracted into two; for the onely difference that I can finde is, that the one hath the root as it were bitten off, with the leaues lesse cut in; the other hath a root somewhat longer, and fibrous as the former; the leaues also in this are much more finely and deepe cut in: in other respects there is no difference. †

3 *Hieracium nigrum*.
Blacke Hawke-weed.

4 *Hieracium Aphacoides*.
Succory Hawke-weed.

4 Succory Hawke-weed hath many long and large leaues spred vpon the ground, deeply cut on both sides almost to the middle rib; from which rise vp small stalkes and floures like those of the lesse Dandelion, but lesser. The root consisteth of many small threddy strings.

5 Endiue Hawke-weed hath many broad leaues, indented about the edges very like vnto Garden Endiue, but narrower; among which rise vp stalkes a foot or more high, slender, hairy, and brittle: the floures are yellow, and grow at the top double, and thick set in a scaly huske like the Knapweed or Iacea, hauing great thicke and threddy roots. † This hath a stalke sometimes more, and otherwhiles lesse rough, with the leaues somtimes more cut in, more long and narrow, and againe otherwhiles more short and broad. †

6 Long rooted Hawk-weed hath many broad leaues spread vpon the ground, sleightly & confusedly indented about the edges, with somewhat a bluntish point; among which leaues spring vp strong and rough stalks a foot and halfe high, set on the top with faire double yellow floures much like vnto a Pisse-bed. The root is very long, white and tough.

7 Sharpe Hawk-weed hath leaues like those of Languebeefe or Ox-tongue, but much narrower, sharpe about the edges, and rough in the middle: the stalks be long and slender, set with the like leaues, but lesser: the floures grow at the top, double and yellow: the root is tough & threddy.

5 *Hieracium intybaceum.*
Endiues Hawke-weed.

6 *Hieracium longius radicum.*
Long rooted Hawke-weed.

7 *Hieracium asperum.*
Sharpe Hawke-weed.

8 *Hieracium falcatum* Lobelij.
Crooked Hawke-weed.

9 *Hieracium.*

† 8 Crooked or falked Hawkweed hath leaues like vnto the garden Succory, yet much smaller, and lesse diuided, slightly indented on both sides, with tender, weake, and crooked stalkes; whereupon doe grow floures like those of *Lampfana*, of a blacke, or pale yellow colour, and the roote small and threddy. The seedes are long, and falcated, or crooked, so that they somewhat resemble the foot or clawes of a bird, and from these seeds the plant hath this Epirhite, *Falcatum*, or crooked in maner of a Sicke or Sithe.

‡ 9 This in leaues is not much vnlike the last described, but that they are somewhat broader, and lesse cut in, hauing little or no bitternesse nor milkinesse, the stalkes are some foot high commonly bending, or falling vpon the ground; the floures are small and yellow, and seeme to grow out of the middest of the seed, whenas indeed they grow at the top of them, the rest being but an empty huske which is falcated like that of the last described. This figure we giue you was taken before the floures were blowne, so that by that meanes the falcated or crooked seed vessels are not exprest in this, but you may see there manner of growing by the former. ‡

‡ 9 *Hieracium falcatum alterum.*

The other crooked Hawkweed.

† 10 *Hieracium Latifolium montanum.*

Broad leaued mountaine Hawkweed.

10 The broad leaued mountaine Hawkweed hath broad, long, smooth leaues, deeply indented toward the stalke, resembling the leaues of the greatest Sowthistle. The stalke is hollow, and spungious, full of a milkie iuice, as is the rest of the plant, as also all the other of his kinde: the floures grow at the top of the stalkes, double and yellow.

11 The narrow leaued mountaine Hawkweed hath leaues like those of the last described, but narrower. The stalkes be fat, hollow, and full of milke: the floures grow at the top double, and yellow of colour. The root is small and threddy.

There is a small mountaine Hawkweed hauing leaues like vnto the former, but more deeply cut about the edges, and sharper pointed; the stalkes are tender and weake; the floures be double and yellow like those of *Pilosella*, or great Mouse-eare; the root is small and threddy.

¶ The Place.

These kindes of herbes doe grow in vntoiled places neere vnto the borders of corne fields, in medowes, high-waies, woode, mountaines, and hillie places, and neere to the brinks of ditches.

‡ The two falcated Hawkweeds grow onely in some few gardens. ‡

¶ The

- II *Hieracium montanum Latifolium minus.*
The lesser broad leaved mountaine
Hawke-weed.

¶ The Time.

They floure for the most part all the summer long, some sooner, and others later.

¶ The Names in generall.

These plants are all conteined vnder the name of *Hieracium*: which is called in Greeke also *ἰερὰκιον*: diuers name it in Latine, *Accipitrina*, which is termed in French, *Cichoree iaulne*: in English, Hawkeweed. These herbes tooke there name from a Hawke, which is called in Latine *Accipiter*, and in Greeke, *ἰεραξ*, for they are reported to cleere their sight by conueying the juice heereof into their eyes. *Gaza* calleth it *Porcellia* for it is numbred among the Succories, they are called also *Lampuca*.

Yellow Hawkeweed is called of some *Morsus diaboli*, or yellow Diuels bit, for that the root doth very well resemble the bitten or cropt root of the common Diuels bit, being like Scabious.

‡ ¶ The Names in particular.

1 *Matthiolus*, *Fuchsius*, *Dodonæus*, and others call this *Hieracium minus*.

2 3 These are varieties of the same plant, the first of them being called by *Fuchsius*, *Dodonæus*, and *Matthiolus*, *Hieracium minus*, *Lobell* calls it,

Hieracium minus præmorsa radice. That sort of this with more cut leaues is by *Tabernamontanus* called, *Hieracium nigrum*.

4 *Lobell* calls this *Hieracium folijs & facie Chondrilla*; *Bauhinus* makes this to differ from that which our Author gaue in this 4. place out of *Tabern* for he termes this *Hieracium Chondrilla folio hirsutum*, and the other, *Hieracium Chondrilla folio Glabrum*; the one smooth leaved, the other rough; yet that which growes frequently with vs, and is very well represented by this figure, hath smooth leaues, as he also obserued it to haue in Italy and about Mountpelier in France.

5 This is *Hieracium alterum grandius*, and *Hieracium montanum angustifolium primum* of *Tabernamontanus*.

6 *Lobell* calls this from the length of the root (though sometimes it be not so long) *Hieracium Longius radicatum*; as also *Taber.* *Hieracium macrorhizon*, it is thought to be the *Apargia* of *Theophrastus*, by *Daleschampsius* in the *Hist. Lugd.* pag. 562. but the figure there that beares the title is of *Hieracium minus*.

7 *Tabernamontanus* first gaue this vnder the name of *Hieracium intybaceum asperum*; *Bauhine* refers it to the wilde yellow Succories, and calls it *Cichoreum montanum angustifolium hirsutie asperum*.

8 This *Lobell* calls *Hieracium Narbonense falcata filiqua*.

9 He calls this *Hieracium facie Hedypnois*: and *Casalpini* termes this *Rhagadiolus*; and the last mentioned, *Rhagadiolus alter*.

10 This by *Tabernamontanus* is called *Hieracium montanum majus Latifolium*; The figure of this was giuen by our Author, chap. 30. vnder the title of *Chondrilla Hispanica*.

11 *Tabernamontanus* also stiles this *Hieracium montanum Latifolium minus*. ‡

¶ The Nature.

The kindes of Hawkeweed are cold and drie, and somewhat binding.

¶ The Vertues.

A They are in vertue and operation like to *Sonchus* or Sowthistle, and being vsed after the same manner, be as good to all purposes that it doth serue vnto.

B They be good for the eie-sight, if the juice of them be dropped into the eyes, especially that which is called Diuels bit, which is thought to be the best, and of greatest force.

Therefore

Therefore as *Dioscorides* writeth, it is good for an hot stomacke, and for inflammations if it be laid vpon them. C

The herbe and root being stamped and applied, is a remedie for those that be stung of the scorpion; which effect not onely the greater Hawkeweeds, but the lesser ones also doe performe. D

CHAP. 35. Of *Clusius* Hawkeweed.

¶ The Kindes.

There be likewise other sorts of Hawkeweeds, which *Carolus Clusius* hath set forth in his Pantheonick observations, the which likewise require a particular chapter, for that they do differ in forme very notably.

1 *Hieracium primum latifolium Clusij.*

The first Hawkeweed of *Clusius*.

2 *Hieracium 5. Clusij.*

Clusius his 5. kinde of Hawkeweed.

¶ The Description.

1 The first of *Clusius* his Hawkeweeds haue great broad leaues spred vpon the ground, somewhat hairie about the edges, oftentimes a little iagged, also soft as is the leafe of Mullen, or Higtaper, and sometimes dasht here and therewith some blacke spots, in shape like the garden Endiue, full of a milkie iuice: among which riseth vp a thicke hollow stalke of a cubit high, diuiding it selfe at the top into two or three branches, whereupon do grow sweete smelling floures not vnlike to those of yellow Succorie, set or placed in a blacke hoarie and woollie cup or huske, of a pale bleake yellow colour, which turneth into a downie blowball that is caried away with the winde: the root entereth deeply into the ground, of the bignesse of a finger, full of milke, and couered with a thicke blacke barke.

2 The second sort of great Hawkeweed according to my computation, and the 5. of *Clusius*, hath leaues like the former, that is to say soft, and hoarie, and as it were couered with a kinde of white

white woollinesse or hairinesse, bitter in taste, of an inch broad. The stalke is a foot high, at the top whereof doth grow one yellow floure like that of the great Hawkweed, which is caried away with the winde when the seed is ripe. The root is blacke and full of milkie juice, and hath certaine white strings annexed thereto.

3 This kinde of Hawkweed hath blacke roots a finger thicke, full of milkie juice, decpely thrust into the ground, with some small fibers belonging thereto: from which come vp many long leaues halfe an inch or more broad, couered with a soft downe or hairinesse, of an ouerorne russet colour: and amongst the leaues come vp naked and hard stalkes, whereupon doe grow yellow floures set in a woollie cup or chalice, which is turned into downe, and caried away with his seed by the winde.

4 The fourth Hawkweed hath a thicke root aboue a finger long, blackish, creeping vpon the top of the ground, and putting out some fibres, and it is diuided into some heads, each whereof at the top of the earth putteth out some six or seuen longish leaues some halfe an inch broad, and somewhat hoarie, hairie, and soft as are the others precedent, and these leaues are snipt about the edges, but the deepest gasches are neere the stalkes, where they are cut in even to the middle rib, which is strong and large. The stalke is smooth, naked, and somewhat high: the floures be yellow and double as the other.

3 *Hieracium* 6. *Clusij*.
Clusius his 6. Hawkweed.

4 *Hieracium* 7. *Clusij*.
Clusius his 7. Hawkweed.

† 5 The same Author hath also set forth another *Hieracium*, vnder the name of *Hieracium paruum Creticum*, which he thus describes; this is an elegant little plant spreading some six, or more leaues vpon the top of the ground, being narrower at that part whereas they adhere to the root, and broader at the other end, and cut about the edges, hauing the middle rib of a purple colour; amongst these rise vp two or three little stalkes about a foot high, without knot vntill you come almost to the top, whereas they are diuided into two little branches, at which place growes forth leaues much diuided; the floures grow at the top of a sufficient bignesse, considering the magnitude of the plant, and they consist of many little leaues lying one vpon another, on the vpper side wholly white, and on the vnder side of a flesh colour. The root is single, longish, growing small towards

towards the end, and putting forth stringy fibres on the sides. Thus much *Clusius*, who received this figure and description from his friend *Iaques Plateau* of Tournay. I coniecture this to be the same plant that *Bauhine* hath somewhat more accurately figured and described in his *Prod.* pag. 68. vnder the title of *Chondrilla purpurascens foetida*: which plant being an annuall, I haue seen growing some yeares since with M^r. *Tuggy* at Westminster; and the last Summer with an honest and skilfull Apothecarie one M^r. *Nicholas Swayton* of Feuerham in Kent: but I must confesse I did not compare it with *Clusius*; yet now I am of opinion, that both these figures and descriptions are of one and the same plant. It floures in Iuly and August, at the later end of which moneth the seeds also come to ripenesse.

6 This other (not described by *Clusius*, but by *Lobel*) hath long rough leaues cut in and toothed like to Dandelion, with naked hairy stalkes, bearing at their tops faire large and very double yellow floures, which fading fly away in downe. It growes in some medowes.

‡ 5 *Hieracium paruum Creticum*.
Small Candy Hawk-weed.

‡ 6 *Hieracium Dentis leonis folio hirsutum*.
Dandelion Hawk-weed.

¶ The Place.

These kinds of Hawke-weeds, according to the report of *Clusius*, do grow in Hungarie and Austria, and in the grassy dry hills, and herby and barren Alpish mountaines, and such like places; notwithstanding if my memorie faile me not I haue seene them growing in sundry places in England; which I meane, God willing, better to obserue hereafter, as opportunitie shall serue me.

¶ The Time.

He saith they floure from May to August, at what time the seed is ripe.

¶ The Names.

The Author himselfe hath not said more than here is set downe as touching the names, so that it shall suffice what hath now been said, referring the handling thereof to a further consideration.

¶ The Nature and Vertues.

I finde not any thing at all set downe either of their nature or vertues, and therefore I forbear to say any thing else of them, as a thing not necessarie to write of their faculties vpon my owne conceit and imagination.

CHAP. 36.

‡ Of French or Golden Lung-wort.

‡ 1 *Pulmonaria Gallica sine aurea latifolia.*
Broad-leaved French or golden
Lung-wort.

‡ 2 *Pulmonaria Gallica sine aurea angustifolia.*
Narrow leaved French or golden
Lung-wort.

¶ The Description.

‡ 1 **T**His which I here giue you in the first place, as also the other two, are of the kinds of Hawke-weed, or *Hieracium*; wherefore I thought it most fit to treat of them in this place, and not to handle them with the *Pulmonaria maculosa*, or Sage of Ierusalem: whereas our Author gaue the name *Pulmonaria Gallorum*, and pointed at the description; but his figure being false, and the description imperfect, I iudged it the best to handle it here next to those plants which both in shape and qualities it much resembles. This first hath a pretty large yet fibrous and stringy root; from the which arise many longish leaues, hairy, soft, and vnequally diuided, and commonly cut in the deepest neere the stalke; they are of a darke green colour, and they are sometimes broader and shorter, and otherwhiles narrower and longer (whence *Tabernamontanus* makes three sorts of this, yet are they nothing but varieties of this same plant.) Amongst these leaues grow vp one or two naked stalks, commonly hauing no more than one leafe apiece, and that about the middle of the stalke; these stalks are also hairy, and about a cubit high, diuided at their tops into sundry branches, which beare double yellow floures of an indifferent bignesse, which fading and turning into downe, are together with the seed carried away with the winde. This whole plant is milky like as the other Hawk-weeds.

‡ 2 This Plant (though confounded by some with the former) is much different from the last described; for the root is small and fibrous; the leaues also are small, of the bignesse, and somewhat of the shape (though otherwise indented) of Dasse leaues, whitish and hoarie; the stalke is not aboue an handfull high, crested, hoary, and set with many longish narrow leaues; and at the top on short foot-stalkes it beares foure or fve floures of a bright yellow colour, and pretty large, considering

‡ 3 *Hieracium hortense latifolium, sine Pilosella major.*

Golden Mouse-eare, or Grimme the Colliar.

considering the smallness of the plant. The floures, like as others of this kinde, fly away in downe, and carry the seeds with them.

3 This plant (which some also haue confounded with the first described) hath a root at the top, of a reddish or brownish colour, but whitish within the earth, & on the lower side sending forth whitish fibres: it bringeth forth in good and fruitfull grounds leaues about a foot long, and two or three inches broad, of a darke Greene colour, and hairy, little or nothing at all cut in about the edges; amongst these leaues riseth vp a stalke some cubit high, round, hollow, and naked, but that it sometimes hath a leafe or two toward the bottome, and towards the top it puts forth a branch or two. The floures grow at the top as it were in an vmbell, and are of the bignes of the ordinarie Mouse-eare, and of an orange colour. The seeds are round, & blackish, and are caried away with the downe by the wind. The stalkes and cups of the floures are all set thicke with a blackish downe or hairinesse as it were the dust of coles; whence the women, who keep in it gardens for noueltie sake, haue named it Grim the Colliar.

¶ The Time.

All these floure in Iune, Iuly, and August, about the later part of which moneth they ripen their seed.

¶ The Place.

I receiued some plants of this from Mr. John Goodyer, who first found it May 27, 1631. in floure; and the 3 of the following May, not yet flourishing, in a copse in Godlemen in Surrey, adioyning to the Orchard of the Inne whose signe is the Antelope.

2 This I had from my kinde friend Mr. William Coote, who wrot to mee, That he found them growing on a hill in the Lady Bridget Kingsmills ground, in an old Romane campe, close by the Decumane port, on the quarter that regards the West-South-West, vpon the skirts of the hill.

3 This is a stranger, and onely to be found in some few gardens.

¶ The Names.

1 This was first set forth by Tragus, vnder the name of *Auricula muris major*: and by Tabern. (who gaue three figures expressing the seuerall varieties thereof) by the name of *Pulmonaria Gallica sine aurea*: Dalechampius hath it vnder the name of *Corchorus*.

2 This was by Lobel (who first set it forth) confounded with the former, as you may see by the title ouer the figure in his Obseruations, pag. 317. yet his figure doth much differ from that of Tragus, who neither in his figure nor description allowes so much as one leafe vpon the stalke; and Tabernamontanus allowes but one, which it seldome wants. Now this by Lobels figure hath many narrow leaues; and by the Description, Aduers. pag. 253. it is no more than an handfull, or handfull and halfe high: which very well agrees with the plant wee heere giue you, and by no meanes with the former, whose naked stalkes are at least a cubit high. So it is manifest that this plant I haue described is different from the former, and is that which Pena and Lobel gaue vs vnder the title of *Pulmonaria Gallorum flore Hieracij*. Bauhine also confounds this with the former.

3 Basil Besler in his *Hortus Eystettensis* hath well exprest this plant vnder the title of *Hieracium latifolium peregrinum Phlomoideis*: Bauhinus calls it *Hieracium hortense floribus atropurpureiscentibus*; and saith that some call it *Pilosella major*: and I iudge it to be the *Hieracium Germanicum* of Fabius Columna. This also seemes rather to be the herbe *Costa* of Camerarius, than the first described; and I dare almost be bold to affirme it the same: for he saith that it hath fat leaues lying flat vpon the ground, and as much as he could discern by the figure, agreed with the *Hieracium latifolium* of Clusius: to which indeed in the leaues it is very like, as you may see by the figure which is in the first place in the foregoing chapter, which very well resembles this plant, if it had more and smaller floures.

¶ The Temper and Vertues.

- I iudge these to be temperate in qualitie, and endued with a light astringion.
- A 1 The decoction or the distilled water of this herbe taken inwardly, or outwardly applied, conduce much to the mundifying and healing of greene wounds; for some boyle the herb in wine, and so giue it to the wounded Patient; and also apply it outwardly.
- B It also is good against the internall inflammations and hot distempers of the heart, stomacke, and liuer.
- C The iuyce of this herbe is with good successe dropped into the eares when they are troubled with any pricking or shooting paine or noyse.
- D Lastly, The water hath the same qualitie as that of Succorie. *Tragus.*
- E 2 *Pena* and *Lobel* affirme this to be commended against whitlowes, and in the diseases of the lungs.
- F 3 This (if it be the *Costa* of *Camerarius*) is of singular vse in the Pthisis, that is, the vlceration or consumption of the lungs: whereupon in Misnia they giue the conserue, fyrrup, and poulder thereof for the same purpose: and they also vse it in broths and otherwise. *Cam.* ‡

CHAP. 37. Of Lettuce.

1 *Lactuca sativa.*
Garden Lettuce.2 *Lactuca crispa.*
Curled Lettuce.

¶ The Kindes.

There be according to the opinion of the Antients, of Lettuce two sorts; the one wilde, or of the field; the other tame, or of the Garden: but time, with the industrie of later Writers haue found out others both wilde and tame, as also artificiall, which I purpose to lay downe.

¶ The

¶ The Description.

1 **G**arden Lettuce hath a long broad leafe, smooth, and of a light green colour: the stalke is round, thicke set with leaues full of milky iuyce, bushed or branched at the top: whereupon do grow yellowish floures, which turne into downe that is carried away with the winde. The seed sticketh fast vnto the cottony downe, and flieth away likewise, white of colour, and somewhat long: the root hath hanging on it many long tough strings, which being cut or broken, do yeeld forth in like manner as doth the stalke and leaues, a iuyce like to milke. And this is the true description of the naturall Lettuce, and not of the artificiall; for by manuring, transplanting, and hauing a regard to the Moone and other circumstances, the leaues of the artificiall Lettuce are oftentimes transformed into another shape: for either they are curled, or else so drawne together, as they seeme to be like a Cabbage or headed Colewort, and the leaues which be within and in the middest are something white, tending to a very light yellow.

5 *Lactuca capitata.*

Cabbage Lettuce.

**6** *Lactuca intybacea.*

Lumbard Lettuce.

2 The curled Lettuce hath great and large leaues deeply cut or gashed on both the sides, not plaine or smooth as the former, but intricately curled and cut into many sections. The floures are small, of a bleake colour, the which do turne into downe, and is carried away with the winde. The seed is like the former, sauing that it changeth sometime into blacknesse, with a root like vnto the former.

3 This small sort of curled Lettuce hath many leaues hackt and torne in pieces very confusedly, and withall curled in such an admirable fort, that euery great leafe seemeth to be made of many small leaues set vpon one middle rib, resembling a fan of curled feathers vsed among Gentlemen: the floures, roots, and seeds agree with the former.

4 The Sauoy Lettuce hath very large leaues spred vpon the ground, at the first comming vp broad, cut or gashed about the edges, crisping or curling lightly this or that way, not vnlike to the leaues of Garden Endiue, with stalkes, floures, and seeds like the former, as well in shape, as yeelding that milky iuyce wherewith they do all abound.

5 Cabbage Lettuce hath many plaine and smooth leaues at his first growing vp, which for the most part lie flat still vpon the ground: the next that do appeare are those leaues in the midst, which turne themselues together, embracing each other so closely, that it is formed into that globe

or round head, whereof the simplest is not ignorant. The seed hereof is blacke, contrary to all the rest; which may be as it were a rule whereby ye may know the seed of Cabbage Lettuce from the other sorts.

¶ The Lumbard Lettuce hath many great leaues spred vpon the ground like vnto those of the garden Endiue, but lesser. The stalkes rise vp to the height of three foot: the floures be yellowish, which turne into downe and flie away with the winde: the seed is white as snow.

¶ The Place.

Lettuce delighteth to grow, as *Palladius* saith, in a mannured, fat, moist, and dunged ground: it must be sown in faire weather in places where there is plenty of water, as *Columella* saith, and prospereth best if it be sown very thin.

¶ The Time.

It is certaine, saith *Palladius*, that Lettuce may well be sown at any time of the yeare, but especially at euery first spring, and so soone as winter is done, till summer be well nigh spent.

¶ The Names.

Garden Lettuce is called in Latine, *Lactuca satina*: *Galen* names it *βηλακίνη*: the Pythagorians *ινυβγος*: some iudge it to be *Lactuca*, à *Lacteo succo*, called of the milkie iuice which issueth forth of the wounded stalkes and rootes: the Germanes name it **Lattich**: the low Duch, **Latouwe**: the Spaniards, *Lechuga*, and *Alface*: the English, Lettuce: and the French, *Laitue*. When the leaues of this kinde are curled or crompted, it is named of *Pliny*, *Lactuca crispa*: and of *Columella*, *Lactuca Ceciliana*: in English, curl'd or crompted Lettuce.

The Cabbage Lettuce is commonly called *Lactuca capitata*, and *Lactuca sessilis*: *Pliny* nameth it *Lactuca Laconica*: *Columella*, *Lactuca Batica*: *Petrus Crescentius*, *Lactuca Romana*: in English, Cabbage Lettuce, and Loued Lettuce.

There is another sort with reddish leaues, called of *Columella*, *Lactuca Cypria*: in English, red Lettuce.

¶ The Temperature.

Lettuce is a cold and moist pot-herbe, yet not in the extreame degree of cold or moisture, but altogether moderately; for otherwise it were not to be eaten.

¶ The Vertues.

A Lettuce cooleth the heate of the stomacke, called the heart-burning; and helpeth it when it is troubled with choller: it quencheth thirst, causeth sleepe, maketh plenty of milke in nurses, who through heate and drinesse grow barren and drie of milke: for it breedeth milke by tempering the drienesse and heate. But in bodies that be naturally cold, it doth not ingender milke at all, but is rather an hinderance thereunto.

B Lettuce maketh a pleasant sallad, being eaten raw with vineger, oyle, and a little salt: but if it be boyled it is sooner digested, and nourisheth more.

C It is serued in these dayes, and in these countries in the beginning of supper, and eaten first before any other meate: which also *Martiall* testifieth to be done in his time, maruelling why some did vse it for a seruice at the end of supper, in these verses.

Claudere quæ cænas Lactuca solebat anorum,

Dic mihi, cur nostras incohât illa dapes?

Tell mewhy Lettuce, which our Grandfathers last did eate,

Is now of late become, to be the first of meate?

D Notwithstanding it may now and then be eaten at both those times to the health of the body: for being taken before meat it doth many times stir vp appetite: and eaten after supper it keepeth away drunkenness which commeth by the wine; and that is by reason that it stayeth the vapors from rising vp into the head.

E The iuice which is made in the veines by Lettuce is moist and cold, yet not ill, nor much in quantity: *Galen* affirmeth that it doth neither binde the belly nor loose it, for it hath in it no harshnes nor stiptike qualitie by which the belly is stayed, neither is there in it any sharpe or biting facultie, which scoureth and prouoketh to the stoole.

F But howsoeuer *Galen* writeth this, and howsoeuer the same wanteth these qualities, yet it is found by experience, that it maketh the body soluble, especially if it be boyled; for by moistning of the belly it maketh it the more slippery: which *Martiall* very well knew, writing in his 11. booke of Epigrams in this manner: *Prima tibi dabitur; ventri Lactuca mouendo*

Vtilis.

G Lettuce being outwardly applied mitigateth all inflammations; it is good for burnings and scaldings, if it be laid thereon with salt before the blisters doe appeare, as *Plinie* writeth.

H The iuice of Lettuce cooleth and quencheth the naturall seed if it be too much vsed, but procureth sleepe.

‡ CHAP. 38. Of Wilde Lettuce.

¶ The Description.

‡ **T** Here are three sorts of wilde Lettuce growing wilde here with vs in England, yet I know not any that haue mentioned more than two; yet I thinke all three of them haue beene written of, though two of them be confounded together and made but one (a thing often happening in the history of Plants) and vnlesse I had seene three distinct ones, I should my selfe haue beene of the same opinion.

1 The first and rarest of these hath long and broad leaues, not cut in, but only snipt about the edges, and those leaues are they that are on the lower part of the stalke almost to the middle thereof: then come leaues from thence to the top, which are deeply diuided with large gashes: the stalke if it grow in good grounds exceeds the height of a man, (for I haue seene it grow in a garden to the height of eight or nine foot) it is large, round, and smooth, and towards the top diuided into many branches which beare yellow floures somewhat like to the garden Lettuce, after which also succeed blackish seeds like to other plants of this kinde. The whole plant is full of a clammy milky iuice, which hath a very strong and grieuous smell of *Opium*.

‡ 1 *Lactuca syl. maior odore Opj.*

The greater wilde Lettuce smelling of *Opium*.

‡ 3 *Lactuca sylvestris folijs dissectis.*

The wilde Lettuce with the diuided Leafe.

2 This hath broad leaues only cut about the edges, but not altogether so large as those of the last described: the stalke, which commonly is two cubits or better high, is also smooth, and diuided into many branches, bearing such floures and seeds as the last described; and this also hath a milky iuice of the same smell as the last described, from which it differs only in the magnitude, and that this hath all the leaues whole, and not some whole and some diuided, as the former.

3 This in stalkes, floures and seedes is like to the last described, but the leaues are much different, for they are all deeply gashed or cut in like as the leaues of Succory, or Dandelion. This also is full of a milky iuice, but hath not altogether so strong a sent of *Opium* as the two former, though it partake much thereof. The stalke of this is sometimes a little prickly, and so also is the middle rib vpon the backside of the leafe. All these three haue woody roots which die euery yeare, and so they come vp againe of the scattered feed.

¶ The Place.

The first of these was found in Hampshire by M^r. Goodyer and the seeds hereof sent to M^r. Parkinson

in whose garden I saw it growing some two yeares agoe. The other grow plentifully between London and Pancridge Church, about the ditches and highway side.

¶ The Time.

They come vp in the Spring, and sometimes sooner, and ripen their seed in Iuly and August.

¶ The Names.

1 I take the first of these to be the *Lactuca Sylvestris* of *Dioscorides* and the Ancients, and that which the Authours of the *Adversaria* gaue vs vnder the title of *Lactuca agrestis scariola hortensis folio*, *Lactuca flore*, *Opjodore vehementi*, *soporifero & viroso*.

2 This is the *Endivia* of *Tragus*, pag. 268. and the *Thesion* of *Daleschampsius*, pag. 564. *Bauhine* confounds this with the former.

3 This is the *Lactuca Sylvestris prior*, of *Tragus*: the *Lactuca Sylvestris* of *Matthiolus*, *Fuchsius*, *Dodonaeus*, and others: it is the *Seris Domestica* of *Lobell*.

The Temper.

These certainly, especially the two first, are cold, and that in the later end of the third or beginning of the fourth degree (if *Opium* be cold in the fourth.)

The Vertues.

- A Some (saith *Dioscorides*) mix the milkie iuice hereof with *Opium*; (for his *Meconium* is our *Opium*.) in the making thereof.
- B He also saith, that the iuice hereof drunke in *Oxycrate* in the quantity of 2 obuli, (which make some one scruple) purgeth watrish humors by stooles; it also clenseth the little vicer in the eye called *Argemon* in Greeke, as also the mystines or darkenesse of sight.
- C Also beaten and applied with womans milke it is good against burnes and scaldes.
- D Lastly, it procures sleepe, asswages paine, moues the courses in women, and is drunke against the stingings of scorpions, and bitings of spiders.
- E The seed taken in drinke, like as the Garden Lettuce, hindreth generation of seed and venereous imaginations. ‡

CHAP. 39. Of Lambs Lettuce, or Corne sallad.

1 *Lactuca Agnina*.
Lambes Lettuce.

2 *Lactuca Agnina latifolia*.
Corne sallade.

¶ The Description.

THe plant which is commonly called *Olus album*, or the white pot-herbe (which of some hath been set out for a kinde of Valerian, but vnproperly, for that it doth very notably resemble the Lettuce, as well in forme, as in meate to be eaten, which propertie is not to be found in Valerian, and therefore by reason and authoritie I place it as a kinde of Lettuce) hath many slender weake stalkes trailing vpon the ground, with certaine edges a foot high when it growes in most fertile ground; otherwise a hand or two high, with sundry ioynts or knees: out of euery one whereof grow a couple of leaues narrow and long, not vnlike to Lettuce at the first comming vp, as well in tenderesse as taste in eating; and on the top of the stalkes stand vpon a broad tuft as it were certaine white floures that be maruellous little, which can scarcely be known to be floures, sauing that they grow many together like a tuft or vmbel: it hath in stead of roots a few slender threads like vnto haire.

2 The other kind of Lettuce, which *Dodonæus* in his last edition setteth forth vnder the name of *Album olus*: the Low-countrie men call it *Witmoes*, and vse it for their meate called *Wermose*; with vs, *Loblollie*. This plant hath small long leaues a finger broad, of a pale green colour; among which shooteth vp a small cornered and slender stem halfe a foot high, ioynted with two or three ioynts or knees, out of which proceed two leaues longer than the first, bearing at the top of the branches tufts of very smal white floures closely compact together, with a root like the former.

‡ Both these are of one plant, differing in the bignesse and broadnesse of the leafe and the whole plant besides. ‡

¶ The Place.

These herbes grow wilde in the corne fields; and since it hath growne in vse among the French and Dutch strangers in England, it hath bene sown in gardens as a sallad herbe.

¶ The Time.

They are found greene almost all Winter and Sommer.

¶ The Names.

The Dutch-men do call it *Witmoes*; that is to say, *Album olus*: of some it is called *Welterop*: the French terme it *Sallade de Chanoine*: it may be called in Greeke, *λευκὰ λατάνη*: in English, *The White Pot-herbe*; but commonly, *Corne sallad*.

¶ The Temperature and Vertues.

This herbe is cold and something moist, and not vnlike in facultie and temperature to the garden Lettuce; in stead whereof, in Winter and in the first moneths of the Spring it serues for a sallad herbe, and is with pleasure eaten with vineger, salt and oile, as other sallads be, among which it is none of the worst.

CHAP. 40. Of Coleworts.

¶ The Kindes.

D*ioscorides* maketh two kinds of Coleworts; the tame and the wilde: but *Theophrastus* makes more kinds hereof; the ruffed or curled Cole, the smooth Cole, and the wilde Cole. *Cato* imitating *Theophrastus*, setteth downe also three Coleworts: the first hee describeth to be smooth, great, broad leaued, with a big stalke; the second ruffed; the third with little stalks, tender, and very much biting. The same distinction also *Pliny* maketh, in his twentieth booke, and ninth chapter; where he saith, That the most ancient Romanes haue diuided it into three kinds; the first roughed, the second smooth, and the third which is properly called *κράμβη*, or Colewort. And in his nineteenth booke he hath also added to these, other moe kinds; that is to say, *Tritianum*, *Cumanum*, *Pompeianum*, *Brutianum*, *Sabellium*, and *Lacuturrium*.

The Herbarists of our time haue likewise obserued many sorts, differing either in colour or else in forme; other headed with the leaues drawne together; most of them white, some of a deepe greene, some smooth leaued, and others curled or ruffed; differing likewise in their stalkes, as shall be expressed in their seuerall descriptions.

¶ The

1 *Brassica vulgaris sativa.*
Garden Colewort.

2 *Brassica sativa crispa.*
Curled Garden Cole.

3 *Brassica rubra.*
Red Colewort.

4 *Brassica capitata alba.*
White Cabbage Cole.

5 *Brassica*

¶ The Description.

1 **T**He Garden Colewort hath many great broad leaues of a deepe blacke Greene colour, mixed with ribs and lines of reddish and white colours: the stalke groweth out of the midst from among the leaues, branched with sundry armes bearing at the top little yellow floures: and after they be past, there do succeed long cods full of round seed like those of the Turnep; but smaller, with a wooddy root hauing many strings or threds fastned thereto.

2 There is another lesser sort than the former, with many deepe cuts on both sides euen to the midst of the rib, and very much curled and roughed in the edges; in other things it differeth not.

3 The red kinde of Colewort is likewise a Colewort of the garden, and differeth from the common in the colour of his leaues, which tend vnto rednesse; otherwise very like.

4 There is also found a certaine kinde hereof with the leaues wrapped together into a round head or globe, whose head is white of colour, especially toward Winter when it is ripe. The root is hard, and the stalkes of a wooddy substance. ‡ This is the great ordinarie Cabbage knowne euery where, and as commonly eaten all ouer this kingdome. ‡

5 *Brassica capitata rubra.*
Red Cabbage Cole.

6 *Brassica patula*
Open Cabbage Cole.

5 There is another sort of Cabbage or loued Colewort which hath his leaues wrapped together into a round head or globe, yet lesser than that of the white Cabbage, and the colour of the leaues of a lighter red than those of the former.

6 The open loued Colewort hath a very great hard or wooddy stalke, whereupon do grow very large leaues of a white Greene colour, and set with thicke white ribs, and gathereth the rest of the leaues closely together, which be lesser than those next the ground; yet when it commeth to the shutting vp or closing together, it rather dilateth it selfe abroad, than closeth all together.

7 Double Colewort hath many great and large leaues, whereupon doe grow here and there other small iagged leaues, as it were made of ragged shreds and iaggies set vpon the smooth leafe, which giueth shew of a plume or fan of feathers. In stalke, root, and euery other part besides it doth agree with the Garden Colewort.

8 The

8 The double crispe or curled Colewoort agreeth with the last before described in euery respect, onely it differeth in the leaues, which are so intricately curled, and so thick set ouer with other small cut leaues, that it is hard to see any part of the leafe it selfe, except ye take and put aside some of those iaggges and ragged leaues with your hand.

9 *Brassica florida.*
Cole-Florie.

10 *Brassica Tophosa.*
Swollen Colewoort.

9 Cole flore, or after some Colieflore, hath many large leaues sleightly indented about the edges, of a whitish Greene colour, narrower and sharper pointed than Cabbage: in the middest of which leaues riseth vp a great white head of hard floures closely thrust together, with a root full of strings; in other parts like vnto the Colewoorts.

10 The swollen Colewoort of all other is the strangest, which I receiued from a worshipfull merchant of London master *Nicholas Lete*, who brought the seed thereof out of France; who is greatly in loue with rare and faire floures & plants, for which he doth carefully send into Syria, hauing a seruant there at Aleppo, and in many other countries, for the which my selfe and likewise the whole land are much bound vnto him. This goodly Colewoort hath many leaues of a blewish green, or of the colour of Woade, bunched or swollen vp about the edges as it were a peece of leather wet and broiled on a gridiron, in such strange sort that I cannot with words describe it to the full. The floures grow at the top of the stalkes, of a bleake yellow colour. The root is thicke and strong like to the other kindes of Colewoorts.

11 Sauoy Cole is also numbred among the headed Colewoorts or Cabbages. The leaues are great and large very like to those of the great Cabbage, which turne themselves vpwards as though they would embrace one another to make a loued Cabbage, but when they come to the shutting vp they stand at a stay, and rather shew themselves wider open, than shut any neerer together; in other respects it is like vnto the Cabbage.

12 The curled Sauoy Cole in euery respect is like the precedent, sauing that the leaues hereof doe somewhat curle or crispe about the middle of the plant: which plant if it be opened in the spring time, as sometimes it is, it sendeth forth branched stalkes, with many small white floures at the top, which being past their follow long cods and seeds like the common or first kinde described.

13 This kinde of Colewoort hath very large leaues deeply iaggged euen to the middle rib, in face resembling great, and ranke parsley. It hath a great and thicke stalke of three cubites high, whereupon doe grow floures, cods, and seed like the other Colewoorts.

11 *Brassica Sabauda*.
Sauoy Cole.

13 *Brassica Selinoides*.
Parfeley Colewoort.

12 *Brassica Sabauda crissa*.
Curled Sauoy Cole.

† 15 *Brassica marina Anglica*.
English sea Colewoorts.

14 The small cut Colewoort hath very large leaues, wonderfully cut, hackt and hewen euen to the middle rib, resembling a kinde of curled parsley, that shall be described in his place, (which is not common nor hath not beene knowne nor described vntill this time) very well agreeing with the last before mentioned, but differeth in the curious cutting and iagging of the leaues: in stalke floures and seed not vnlike.

† 16 *Brassica sylvestris.*
Wilde Colewoorts.

stones, which those that dwell neere the sea doe call Bayche: I found it growing betweene Whytstable and the Ile of Thanet neere the brinke of the sea, and in many places neere to Colchester and elsewhere by the sea side.

¶ The Time.

Petrus Crescentius saith that the Colewoort may bee sowne and remooued at any time of the yeere; whose opinion I altogether mislike. It is sowne in the spring, as March, Aprill, and oftentimes in May, and sometimes in August, but the speciall time is about the beginning of September.

The Colewoort, saith *Columella*, must be remoued when it attaineth to six leaues, after it is come vp from seed; the which must be done, in Aprill or May, especially those that were sowne in Autumne; which afterwards flourish in the winter moneths, at what time, they are fittest for meate.

But the Sauoy-Cole, and the Cole florey, must be sowne in Aprill, in a bed of hot horsedung, and couered with straw or such like, to keepe it from the cold, and frosty mornings; and when it hath gotten six leaues after this sort, then shall you remoue him as aforesaid, otherwise if you tarry for temperate weather before you sow, the yeare will be spent, before it come to ripenesse.

¶ The Names.

Euery of the Colewoorts, is called in Greeke by *Dioscorides* and *Galen* *καυλις*: it is also called *καυλις*: so named, not only because it driueth away drunkenesse, but also for that it is like in colour to the precious stone called the Amethyst: which is meant by the first and garden Colewoort. The Apothecaries and the common Herbarists doe call it *Caulis*, of the goodnesse of the stalke: in the Germane tongue it is called *Koole kraut*: in French, *des Choux*: in English, Colewoorts.

Cole-florey is called in Latine *Brassica Cypria*, and *Cauliflora*: in Italian, *Caulifiore*: it seemeth to agree with *Brassica pompeiana* of *Pliny*, whereof he writeth in his 19. booke, and 8. chapter.

¶ The

15 Sea Colewoort hath large and broad leaues very thicke and curled, and so brittle that they cannot be handled without breaking, of an over-worne greene colour, tending to graynesse: among which rise vp stalkes two cubits high, bearing small pale floures at the top; which being past their follow round knobs wherein is contained one round seed and no more, blacke of colour, of the bignesse of a tare and a fetch: † And therefore *Pena* and *Lobell* called it *Brassica marina monospermos*. †

16 The wilde Colewoort hath long broad leaues not vnlike to the tame Colewoort, but lesser, as is all the rest of the plant, and is of his owne nature wilde, and therefore not sought after as a meate, but is sowne and husbanded up on ditch bankes and such like places for the feeds sake, by which oftentimes great gaine is gotten.

¶ The Place.

The greatest sort of Colewoorts doe grow in gardens, and doe loue a soile which is fat and thoroughly dunged and well manured: they doe best prosper when they be remooued, and euery of them grow in our English gardens, except the wilde, which groweth in fields and new digged ditch bankes.

The sea Colewoort groweth naturally vpon the bayche and brims of the sea, where there is no earth to bee seene, but sand and rowling pibble

¶ *The Temperature.*

All the Colewoorts haue a drying and binding facultie, with a certaine nitrous or salt quality, whereby they mightily cleanse, either in the iuice, or in the broth. The whole substance or body of the Colewoort is of a binding and drying faculty, because it leaueth in the decoction this salt quality; which lieth in the iuice and watry part thereof: the water wherein it is first boyled, draweth to it selfe all the quality; for which cause the decoction thereof looseth the belly, as doth also the iuice of it, if it be drunke: but if the first broth in which it was boyled be cast away, then doth the Colewoort dry and binde the belly. But it yeeldeth to the body small nourishment, and doth not ingender good, but a grosse and Melancholicke bloud. The white Cabbage is best next vnto the Cole-florey; yet *Cato* doth chiefly commend the russet Cole: but he knew neither the white ones, nor the Cole-florey; for if he had, his censure had beene otherwise.

¶ *The Vertues.*

Dioscorides teacheth, that the Colewoort being eaten is good for them that haue dim eyes, A and that are troubled with the shaking palsie.

The same author affirmeth, that if it be boiled and eaten with vineger, it is a remedie for those B that be troubled with the spleene.

It is reported, that the raw Colewoort being eaten before meate, doth preferue a man from C drunkenesse: the reason is yeelded, for that there is a naturall enmity betweene it and the vine, which is such, as if it grow neere vnto it, forthwith the vine perisheth and withereth away: yea, if wine be poured vnto it while it is in boyling, it will not be any more boiled, and the colour thereof quite altered, as *Cassius* and *Dionysius Vticensis* doe write in their bookes of tillage: yet doth not *Athenaus* ascribe that vertue of driuing away drunkenesse to the leaues, but to the seeds of Colewoort.

Moreouer, the leaues of Colewoorts are good against all inflammations, and hot swellings, D being stamped with barley and meale, and laid vpon them with salt: and also to breake carbuncles.

The iuice of Colewoorts, as *Dioscorides* writeth, being taken with floure-deluce and niter, doth E make the belly soluble: and being drunke with wine, it is a remedie against the bitings of venomous beasts.

The same being applyed with the powder of Fennugreeke, taketh away the paine of the gout, F and also cureth old and foule vlcers.

Being conueied into the nostrils, it purgeth the head: being put vp with barley meale it bringeth G downe the floures.

Pliny writeth, that the iuice mixed with wine, and dropped into the eares, is a remedie against H deafenesse.

The seed, as *Galen* saith, driueth forth wormes, taketh away freckles of the face, sun-burning, I and what thing soeuer that need to be gently scoured or clenfed away.

They say that the broth wherein the herbe hath beene sodden is maruellous good for the si- K newes and ioynts, and likewise for Cankers in the eies, claied in Greeke *Carcinomata*, which cannot be healed by any other meanes, if they be washed therewith.

† The fifteenth and sixteenth figures were formerly transported.

CHAP. 41.

Of Rape-Cole.

¶ *The Description.*

1 THE first kinde of Rape Cole hath one single long root, garnished with many threddy strings: from which riseth vp a great thicke stalke, bigger than a great Cucumber or great Turnep: at the top whereof shooteth forth great broad leaues, like vnto those of Cabbage Cole. The floures grow at the top on slender stalkes, compact of foure small yellow floures: which being past the seed followeth inclosed in litle long cods, like the seed of Mustard.

2 The second hath a long fibrous root like vnto the precedent; the tuberous stalke is very great and long, thrusting forth in some few places here and there, small footstalkes, whereupon doe grow smooth leaues, sleightly indented about the edges: on the top of the long Turnep stalke grow leane stalkes and floures like the former. † This second differs from the former onely in the length of the swolne stalke, whence they call it *Caulorapum longum*, or Long Rape Cole. †

¶ *The Place.*

They grow in Italy, Spaine, and some places of Germanie, from whence I haue receiued seedes for my garden, as also from an honest and curious friend of mine called master Goodman, at the Minories neere London.

1 *Caulorapum rotundum.*
Round rape Cole.

1 *Beta alba.* White Beets.

2 *Beta rubra.* Red Beets.

2 There

¶ *The Time.*

They floure and flourish when the other Colewoorts doe, whereof no doubt they are kinds, and must be carefully set and sowne, as muske Melons and Cucumbers are.

¶ *The Names.*

They are called in Latine, *Caulorapum*, and *Rapocaulis*, bearing for their stalkes, as it were Rapes and Turneps, participating of two plants, the Colewort and Turnep; whereof they tooke their names.

¶ *The Temperature and Vertues.*

There is nothing set downe of the faculties of these plants, but are accounted for daintie meate, contending with the Cabbage Cole in goodnesse and pleasant taste.

CHAP. 42. Of Beets.

¶ *The Description.*

1 **T**He common white Beet hath great broad leaues, smooth, and plain: from which rise thicke crested or chamfered stalks: the floures grow along the stalks clustering together, in shape like little starres; which being past, there succeed round and vneuen priky feed. The root is thicke, hard, and great.

‡ 3 *Betarubra Romana.*
Red Roman Beet.

2 There is another sort like in shape and proportion to the former, saving that the leaues of this be streaked with red here and there confusedly, which setteth forth the difference.

3 There is likewise another sort hereof, that was brought vnto me from beyond the seas, by that courteous merchant master *Lete*, before remembred, the which hath leaues very great, and red of colour, as is all the rest of the plant, as well root, as stalke, and floures, full of a perfect purple iuyce tending to rednesse: the middle rib of which leaues are for the most part very broad and thicke, like the middle part of the Cabbage leafe, which is equall in goodnesse with the leaues of Cabbage being boyled. It grew with me 1596. to the height of viij. cubits, and did bring forth his rough and vneuen seed very plentifully: with which plant nature doth seeme to play and sport herselfe: for the seeds taken from that plant, which was altogether of one colour and sown, doth bring forth plants of many and variable colours, as the worshipfull gentleman master *Iohn Norden* can very well testifie, vnto whom I gaue some of the seeds aforesaid, which in his garden brought forth many other of beautifull colours.

¶ The Place.

The Beete is sown in gardens: it loueth to grow in a moist and fertile ground. ‡ The ordinary white Beet growes wilde vpon the sea-coast of Tenet and diuers other places by the Sea, for this is not a different kind as some would haue it. ‡

¶ The Time.

The fittest time to sow it is in the spring: it flourisheth and is greene all sommer long, and likewise in winter, and bringeth forth his seed the next yeare following.

¶ The Names.

The Grecians haue named it *βήτα*: the Latines, *Beta*: the Germanes, *Maugolt*: the Spaniards, *Aselgas*: the French, *de la Porée*, *des Iotes*, and *Beets*: *Theophrastus* saith, that the white Beete is surnamed *σικυλη*, that is to say, *Sicula*, or of Sicilia: hereof commeth the name *Sicla*, by which the Barbarians, and some Apothecaries did call the Beet; the which word we in England doe vse, taken for the same.

¶ The Nature.

The white Beets are in moisture and heate temperate, but the other kinds are drie, and all of them absterfue: so that the white Beete is a cold and moist pot-herbe, which hath ioyned with it a certaine salt and nitrous quality, by reason whereof it clenseth and draweth flegme out of the nostrils.

¶ The Vertues.

Being eaten when it is boyled, it quickly descendeth, looseth the belly, and prouoketh to the stoole, especially being taken with the broth wherein it is sodden: it nourisheth little or nothing, and is not so wholesome as Lettuce.

The iuyce conueied vp into the nostrils doth gently draw forth flegme, and purgeth the head. B

The great and beautifull Beet last described may be vsed in winter for a sallad herbe, with C vinegar, oyle, and salt, and is not onely pleasant to the taste, but also delightfull to the eye.

The greater red Beet or Roman Beet, boyled and eaten with oyle, vinegar and pepper, is a most D excellent and delicate sallad: but what might be made of the red and beautifull root (which is to be preferred before the leaues, as well in beauty as in goodnesse) I refer vnto the curious and cunning cooke, who no doubt when he hath had the view thereof, and is assured that it is both good and wholesome, will make thereof many and diuers dishes, both faire and good.

CHAP. 43. Of Blites.

¶ The Description.

1 **T**He great white Blite groweth three or foure foot high, with grayish or white round stalkes : the leaues are plaine and smooth, almost like to those of the white Orach, but not so soft nor mealy : the floures grow thrust together like those of Orach : after that commeth the seed inclosed in little round flat husky skinned.

2 There is likewise another sort of Blites very smooth and flexible like the former, sauing that the leaues are reddish, mixed with a darke Greene colour, as is the stalke and also the rest of the plant.

3 There is likewise found a third sort very like vnto the other, sauing that the stalkes, branches, leaues, and the plant is altogether of a Greene colour. But this growes vp right, and creepes not at all.

4 There is likewise another in our gardens very like the former, sauing that the whole Plant traileth vpon the ground : the stalks, branches, and leaues are reddish : the seed is small, and clustering together, Greene of colour, and like vnto those of *Ruellius* his *Coronopus*, or Bucks-horne.

¶ 1 *Blitum majus album.*
The great white Blite.

¶ 2 *Blitum majus rubrum.*
The great red Blite.

¶ The Place.

The Blites grow in Gardens for the most part, although there be found of them wilde many times.

¶ The Time.

They flourish all the Summer long, and grow very Greene in Winter likewise.

¶ The Names.

It is called in Greeke, *Βλῖτον* : in Latine, *Blitum* : in English, Blite, and Blites : in French, *Blites*, or *Blitres*.

¶ The

‡ 3 *Blitum minus album.*
The small white Blite.

‡ 4 *Blitum minus rubrum.*
The small red Blite.

¶ The Nature.

The Blite (saith *Galen* in his sixth booke of the faculties of simple medicines) is a pot-herbe which serueth for meate, being of a cold moist temperature, and that chiefly in the second degree. It yeeldeth to the body small nourishment, as in his second booke of the faculties of nourishments he plainly shewes; for it is one of the pot-herbes that be vnflauoury or without taste, whose substance is waterish.

¶ The Vertues.

The Blite doth nourish little, and yet is fit to make the belly soluble, though not vehemently, seeing it hath no nitrous or sharpe qualitie whereby the belly should be prouoked. I haue heard many old wiues say to their seruants, Gather no Blites to put into my pottage, for they are not good for the eye-sight: whence they had those words I know not, it may be of some Doctor that neuer went to schoole, for that I can finde no such thing vpon record, either among the old or later Writers.

CHAP. 44. Of Floure-Gentle.

¶ The Kindes.

There be diuers sorts of floure-Gentle, differing in many points very notably; as in greatnesse and smallnesse; some purple, and others of a skarlet colour; and one about the rest where-with Nature hath seemed to delight her selfe, especially in the leaues, which in variable colours do striue with the Parats feathers for beautie.

1 *Amaranthus purpureus*.
Purple Floure-Gentle.

2 *Amaranthus coccineus*.
Scarlet Floure-Gentle.

3 *Amaranthus tricolor*.
Floramor and Passucelours.

4 *Amaranthus Pannicula sparsa*.
Branched Floure-Gentle.

5 *Amaranthus*

¶ The Description.

1 Purple floure Gentle riseth vp with a stalke a cubit high, and sometime higher, streaked or chamfered alongst the same, often reddish toward the root, and very smooth: which diuideth it selfe toward the top into small branches, about which stand long leaues, broad, sharpe pointed, soft, slippery, of a Greene colour, and sometimes tending to a reddish: in stead of floures, come vp eares or spokie tufts, very braue to looke vpon, but without smell; of a shining light purple, with a glosse like veluet, but far passing it: which when they are bruised, doe yeeld a iuyce almost of the same colour, and being gathered, doe keepe their beauty a long time after; insomuch that being set in water, it will reuiue againe as at the time of his gathering, and it remaineth so, many yeares, whereupon likewise it hath taken its name. The seed standeth in the ripe eares, of colour blacke, and much glittering: the root is short, and full of strings.

† 5 *Amaranthus pannicula incurua holoferica.*
Veluet Floures Gentle.

2 The second sort of floure Gentle hath leaues like vnto the former: the stalke is vp-right with a few small slender leaues set vpon it: among which doe grow small clusters of scaly floures, of an ouerworne scarlet colour. The seed is like the former.

3 It far exceedeth my skill to describe the beauty and excellency of this rare plant called *Floramor*; and I thinke the pensill of the most curious painter wil be at a stay, when he shall come to set him downe in his liuely colours: but to colour it after my best manner this I say: *Floramor* hath a thicke knobby root, whereupon doe grow many threddy strings: from which riseth a thicke stalke, but tender and soft, which beginneth to deuide himselfe into sundry branches at the ground and so vpward, whereupon doe grow many leaues, wherein doth consist his beauty: for in few words, euery leafe doth resemble in colours the most faire and beautifull feather of a Parrat, especially those feathers that are mixed with most sundry colours, as a stripe of red, and a line of yellow, a dash of white, and a rib of green colour, which I cannot with words set forth, such are the sundry mixtures of colours that nature hath bestowed in her greatest iollitie vpon this floure: the floures doe grow betweene the foot-stalkes of those leaues and the body of the stalke or trunke, base, and of no moment in respect of the leaues, being as it were little chaffie husks of an ouerworne

tawnie colour: the seed is blacke, and shining like burnished horne. † I haue not seene this thus variegated as our Author mentions, but the leaues are commonly of three colours; the lower part, or that next to the stalke is Greene; the middle red, and the end yellow; or else the end red, the middle yellow, and the bottome Greene. †

4 This plant hath a great many of threds and strings, of which his roots doe consist. From which doe rise vp very thicke fat stalkes, crested and streaked, exceeding smooth, and of a shining red colour, which begin at the ground to diuide themselues into branches; whereupon doe grow many great and large leaues of a darke Greene colour tending to rednesse, in shew like those of the red Beet, streaked and dasht here and there with red, mixed with Greene. The floures grow alongst the stalkes, from the middest thereof euen to the top, in shape like *Panicum*, that is, a great number of chaffie confused eares thrust hard together, of a deepe purple colour. I can compare the shape thereof to nothing so fitly as to the veluet head of a Stag, compact of such soft matter as is the same: wherein is the seed, in colour white, round, and bored through the middle.

† 5 This in stalkes and leaues is much like the purple floure Gentle, but the heads are larger, bended round, and laced, or as it were wouen one with another looking very beautifull like to Crimson veluet: this is seldome to be found with vs; but for the beauties sake is kept in the Gardens of Italy, whereas the women esteemed it not only for the comelinesse and beautilous aspect, but

1 *Atriplex sativa alba.*
White Orach.

† 2 *Atriplex sativa purpurea.*
Purple Orach.

3 *Atriplex sylvestris, sine Polyspermon.*
Wilde Orach, or All-feed.

† 4 *Atriplex marina.*
Sea Orach.

but also for the efficacy thereof against the bloody issues, and sanious vlcers of the wombe and kidneyes, as the Authors of the *Aduersaria* affirme. ‡

¶ The Place and Time.

These pleasant floures are sown in gardens, especially for their great beauty.

They floure in August, and continue flourishing till the frost ouertake them, at what time they perish. But the Floramor would be sowne in a bed of hot horse-dung, with some earth strewed thereon in the end of March, and ordered as we doe muske Melons, and the like.

¶ The Names.

This plant is called in Greeke *Amaranthos*, because it doth not wither and wax old: in Latin, *Amaranthus purpureus*: in Dutch, *Samatbluomen*: in Italian, *Fior velluto*: in French, *Passe velours*: in English, floure Gentle, purple Veluet floure, Floramor, and of some floure Velure.

¶ The Temperature, and Vertues.

Most attribute to floure Gentle a binding faculty, with a cold and dry temperature.

It is reported they stop all kinds of bleeding, which is not manifest by any apparant quality A in them, except peradventure by the colour only that the red eares haue: for some are of opinion, that all red things stanch bleeding in any part of the body: because some things, as *Bolearmoniacke*, *sanguis Draconis*, *terra Sigillata*, and such like of red colour doe stop blood: But *Galen*, lib. 2. & 4. de simp. facult. plainly sheweth, that there can be no certainty gathered from the colours, touching the vertues of simple and compound medicines: wherefore they are ill perswaded, that thinke the floure Gentle to stanch bleeding, to stop the laske or bloody flux, because of the colour only, if they had no other reason to induce them thereto.

CHAP. 45. Of Orach.

¶ The Description.

1 THE Garden white Orach hath an high and vpright stalke, with broad sharpe pointed leaues like those of Blite, yet smother and softer. The floures are small and yellow, growing in clusters: the seed round, and like a leafe couered with a thin skin, or filme, and groweth in clusters. The root is woody and fibrous: the leaues and stalkes at the first are of a glittering gray colour, and sprinkled as it were with a meale or floure.

2 This differs from the former, only in that it is of an ouerworne purple colour.

‡ 3 This might more fitly haue bene placed amongst the Blites, yet finding the figure here (though a contrary discription) I haue let it inioy the place. It hath a white and slender root, and it is somewhat like, yet lesse then the Blite, with narrow leaues somewhat resembling Bassill: it hath abundance of small floures, which are succeeded by a numerous sort of seeds, which are blacke and shining. ‡

4 There is a wilde kinde growing neere the sea, which hath pretty broad leaues, cut deeply about the edges, sharpe pointed, and couered ouer with a certaine mealinesse, so that the whole plant as well leaues, as stalkes and floures, looke of an hoary or gray colour. The stalks lye spread, on the shore or Beach, whereas it vsually growes.

‡ 5 The common wilde Orach hath leaues vnequally sinuated, or cut in somewhat after the manner of an oaken leafe, and commonly of an ouerworne grayish colour: the floures and seeds are much like those of the garden, but much lesse.

6 This is like the last described, but the leaues are lesser and not so much diuided, the seeds grow also in the same manner as those of the precedent.

7 This also in the face and manner of growing is like those already described, but the leaues are long and narrow, sometimes a little notched: and from the shape of the leafe *Lobell* called it *Atriplex Sylvestris polygoni*, aut *Helxines folio*.

8 This elegant Orach hath a single and small root, putting forth a few fibers, the stalkes are some foot high, diuided into many branches, and lying along vpon the ground; and vpon these grow leaues at certaine spaces whitish and vnequally diuided, somewhat after the manner of the wilde Orach; about the stalke or setting on of the leaues grow as it were little berries, somewhat like a little mulberry, and when these come to ripenesse, they are of an elegant red colour, and make a fine shew. The seed is small round and ash coloured. ‡

¶ The Place.

The Garden Oraches grow in most gardens. The wilde Oraches grow neere paths-ways and ditch sides; but most commonly about dung-hills and such fat places. Sea Orach I haue found at Queeneborough, as also at Margate in the Ile of Thanet: and most places about the sea side.

‡ The eighth groweth only in some choice gardens, I haue seen it diuers times with M^r. Parkinson. ‡

¶ The

‡ 5 *Atriplex sylvestris vulgaris.*
Common wilde Orach.

‡ 6 *Atriplex sylvestris altera.*
The other wilde Orach.

‡ 7 *Atriplex sylvestris angustifolia.*
Narrow leaved wilde Orach.

‡ 8 *Atriplex baccifera.*
Berry-bearing Orach.

¶ The Time.

They floure and seed from Iune to the end of August.

¶ The Names.

Garden Orach is called in Greeke, *αἰσάρις*: in Latine, *Atriplex*, and *Aureum Olus*: in Dutch, *Weld*: in French, *Arrouches ou bonnes dames*: in English, Orach, and Orage: in the Bohemian tongue, *Leboda*: Pliny hath made some difference betweene *Atriplex* and *Chrysolachanum*, as though they differed one from another; for of *Atriplex* he writeth in his twentieth booke; and of *Chrysolachanum* in his twenty eighth booke, and eighth chapter: where he writeth thus, *Chrysolachanum*, saith he, groweth in Pinetum like Lettuce: it healeth cut sinewes if it be forthwith applied.

3 This wilde Orach hath bene called of *Lobel*, *Polypermon Cassani Bassi*, or All seed.

¶ The Temperature.

Orach, saith *Galen*, is of temperature moist in the second degree, and cold in the first.

¶ The Vertues.

Dioscorides writeth, That the garden Orach is both moist and cold, and that it is eaten boyled A as other sallad herbes are, and that it softneth and looseth the belly.

It consumeth away the swellings of the throat, whether it be laid on raw or sodden. B

The seed being drunke with meade or honied water, is a remedie against the yellow jaundice. C

Galen thinketh, that for that cause it hath a clensing qualirie, and may open the stoppings of the D liuer.

† The figure which was in the second place was of *Pes Asperulæ* 2. of *Taber*. The figure in the fourth place was of the wild Orach, that I have described in the fifth place.

CHAP. 46. Of Stinking Orach.

Atriplex olida.

Stinking Orach.

¶ The Description.

Stinking Orach growes flat vpon the ground and is a base and low plant with many weak and feeble branches, whereupon doe grow small leaues of a grayish colour, sprinkled ouer with a certaine kinde of dusty meallinesse, in shape like the leaues of *Basill*: amongst which leaues here and there confusedly be the seeds dispersed, as it were nothing but dust or ashes. The whole plant is of a most loathsome sauour or smel, vpon which plant if any should chance to rest and sleepe, he might very well report to his friends, that he had reposed himselfe among the chiefe of *Scoggins* heires.

¶ The Place.

It groweth vpon dunghills, and in the most filthy places that may be found, as also about the common pissing places of great princes and Noblemens houses. Sometime it is found in places neere bricke kilns and old walls, which doth somewhat alter his smel, which is like tosted cheese: but that which groweth in his naturall place smells like stinking salt-fish, whereof it tooke his name *Garosmus*.

¶ The Time.

It is an herbe for a yeare, which springeth vp, and when the seed is ripe it perisheth, and recouereth it selfe againe of his owne seed; so that if it be gotten into a ground, it cannot be destroyed.

¶ The Names.

Stinking Orach is called of *Cordus*, *Garosmus*, because it smelleth like stinking fish: it is likewise called

called *Tragium Germanicum*, and *Atriplex fetidagarum olens*, by *Pena* and *Lobel*: for it smelleth more stinking than the rammysh male Goat: whereupon some by a figure haue called it *Vulvaria*: and it may be called in English, stinking Mother-wort.

¶ *The Nature and Vertues.*

A There hath been little or nothing set down by the Antients, either of his nature or vertues, notwithstanding it hath beene thought profitable, by reason of his stinking smell, for such as are troubled with the mother: for as *Hippocrates* saith, when the mother doth stiffe or strangle, such things are to be applied vnto the nose as haue a ranke and stinking smell.

CHAP. 47. Of Goose-foot.

¶ *The Description.*

A 1 **G**oose-foot is a common herbe, and thought to be a kinde of Orach: it riseth vp with a stalke a cubit high or higher, somewhat chamfered and branched: the leaues be broad, smooth, sharpe pointed, shining, hauing certaine deepe cuts about the edges, and resembling the foot of a goose: the floures be small, something red: the seed standeth in clusters vpon the top of the branches, being very like the seed of wilde Orach, and the roote is diuided into sundry strings.

‡ 2 This differs from the last described, in that the leaues are sharper cut, and more diuided, the seed somewhat smaller, and the colour of the whole plant is a deeper or darker greene.

‡ 1 *Atriplex sylvestris latifolia, siue Pes Anserinus.*
Goose-foot.

‡ 2 *Atriplex sylvestris latifolia altera.*
The other Goose-foot.

¶ *The Place.*

It growes plentifully in obscure places neere old walls and high-waies, and in desert places.

¶ *The Time.*

It flourisheth when the Orach doth, whereof this is a wilde kinde.

¶ *The Names.*

The later Herbarists haue called it *Pes anserinus*, and *Chenopodium*, of the likenesse the leaues haue with the foot of a Goose: in English, Goose-foot, and wilde Orach.

¶ *The*

¶ The Temperature.

This herbe is cold and moist, and that no lesser than Orach, but as it appeareth more cold.

¶ The Vertues.

It is reported that it killeth swine if they do eate thereof: it is not vsed in Physicke: and much lesse as a fallade herbe.

CHAP. 48. Of English Mercurie.

Bonus Henricus.

English Mercurie, or good Henrie.

¶ The Description.

Good Henrie called *Tota bona*, so named of the later Herbarists, is accounted of them to be one of the Dockes, but not properly. This bringeth forth very many thicke stalkes, set with leaues two foot high; on the branches wherof towards the top stand greene floures in clusters, thicke thrust together. The seed is flat like that of the Orach, whereof this is a kinde. The leaues be fastened to long foote-stalkes, broad behinde, and sharpe pointed, fashioned like the leaues of Aron, or Wake-robin, white, or grayish of colour, and as it were couered ouer with a fine meale: in handling it is fat and olious, with a very thicke root, and parted into many diuisions, of a yellow colour within, like the sharpe pointed Docke.

¶ The Place.

It is commonly found in vntilled places, and among rubbish neere common waies, old walls, and by hedges in fields.

¶ The Time.

It floureth in Iune and Iuly especially.

¶ The Names.

It is called of some *Pes Anserinus*, and *Tota bona*: in English, All-Good, and Good Henrie: in Cambridshire it is called Good king Harry: the Germanes call it *Guter Heinrich*, of a certaine good qualitie it hath, as they also name a certaine pernicious herbe, *Malus Henricus*, or bad Henry. It is taken for a kinde of Mercurie, but vnproperly, for that it hath no participation with Mercurie, either in forme or quality, except yee will call euery herbe Mercurie which hath power to loose the belly.

¶ The Temperature.

Bonus Henricus, or Good Henrie is moderately hot and dry, clenfing and scouring withall.

¶ The Vertues.

The leaues boiled with other pot-herbes and eaten, maketh the body soluble.

The same brused and laid vpon greene wounds, or foule and old vlcers, doth scoure, mundifie and heale them.

A
B

CHAP. 49. Of Spinach.

Spinacia.
Spinach.

¶ The Description.

1 Spinach is a kinde of Blite, after some; notwithstanding I rather take it for a kinde of Orach. It bringeth forth soft and tender leaues of a darke Greene colour, full of juice, sharpe pointed, and in the largest part or neather end square; parted oftentimes with a deepe gash on either side next to the stemme or foot-stalke: the stalke is round, a foot high, hollow within: on the tops of the branches stand little floures in clusters, in whose places doth grow a prickly seed. The root consisteth of many small threds.

2 There is another sort found in our gardens like vnto the former in goodnesse, as also in shape, sauing that the leaues are not so great, nor so deeply gasht or indented: and the seed hath no prickles at all, for which cause it is called round Spinach.

¶ The Place.

It is sowne in gardens without any great labor or industrie, and forsaketh not any ground being but indifferent fertill.

¶ The Time.

It may be sowne almost at any time of the yeere, but being sowne in the spring it quickly groweth vp, and commeth to perfection within

two moneths: but that which is sowne in the fall of the leafe groweth not so soone to perfection, yet continueth all the win ter and seedeth presently vpon the first spring.

¶ The Names.

It is called in these daies *Spinachia*: of some, *Spinacheum olus*: of others, *Hispanicum olus*: *Fuchsius* nameth it *Emersonia*: the Arabians and *Serapio* call it *Hispane*: the Germanes, *Spinet*: in English, Spinage and Spinach: in French, *Espinas*.

¶ The Nature.

Spinach is euidently cold and moist almost in the second degree, but rather moist. It is one of the pot-herbes whose substance is waterie, and almost without taste, and therefore quickly descendeth and looseth the bellie.

¶ The Vertues.

- A It is eaten boiled, but it yeeldeth little or no nourishment at all: it is something windie, and easily causeth a desire to vomit: it is vsed in fallades when it is young and tender.
- B This herbe of all other pot-herbes and fallade herbes maketh the greatest diuersitie of meates and fallades.

CHAP. 50. Of Pellitorie of the wall.

¶ The Description.

Pellitorie of the wall hath round tender stalkes somewhat browne or reddish of colour and somewhat shining: the leaues be rough like to the leaues of Mercurie, nothing snipt about the edges. The floures be small, growing close to the stemmes: the seed is blacke and very small, covered with a rough huske which hangeth fast vpon garments: the root is somewhat reddish.

¶ The

Parietaria.

Pellitorie of the wall.

¶ *The Place.*

It groweth neere to old walls in the moist corners of Churches and stone buildings, among rubbish and such like places.

¶ *The Time.*

It commeth vp in May : it feedeth in July and August : the root onely continueth and is to be found in Winter.

¶ *The Names.*

It is commonly called *Parietaria*, or by a corrupt word *Paritaria*, because it groweth neere to walls : and for the same cause it is named of diuers *Muralis* : also *Muralium* of *Pliny* and *Celsus* : of the Grecians *ἡλξίνη*. There is also another *Helxine* surnamed *Cissampelos* : some call it *Perdicium*, of Partridges which somtimes feed hereon : some, *Vreolaris*, and *Vitraria*, because it serueth to scoure glasse, pipkins, and such like : it is called in high-Dutch, *Tag und nacht* : in Spanish, *Terna del muro* : in English, Pellitorie of the wall : in French, *Parietaire*.

¶ *The Temperature.*

Pellitorie of the wall (as *Galen* saith) hath force to scoure, and is something cold and moist.

¶ *The Vertues.*

Pellitory of the wall boyled, and the decoction of it drunken, helpeth such as are vexed with an old cough, the grauell and stone, and is good against the difficultie of making water, and stopping of the same, not onely inwardly, but also outwardly applied vpon the region of the bladder, in

manner of a fomentation or warme bathing, with sponges or double clouts, or such like.

Dioscorides saith, That the iuyce tempered with Ceruse or white leade maketh a good ointment against Saint Anthonies fire and the Shingles : and mixed with the Cerot of Alcanna, or with the male Goats tallow, it helpeth the gout in the feet : which *Pliny* also affirmeth, *Lib. 22. cap. 17.*

It is applied (saith he) to paines of the feet with Goats suet and wax of Cyprus ; where in stead of wax of Cyprus there must be put the Cerot of Alcanna.

Dioscorides addeth, That the iuyce hereof is a remedy for old coughs, and taketh away hot swellings of the almonds in the throat, if it be vsed in a gargarisme, or otherwise applied : it mitigateth also the paines of the eares, being poured in with oile of Roses mixed therewith.

It is affirmed, That if three ounces of the iuyce be drunke it prouoketh vrine out of hand.

The leaues tempered with oyle of sweet almonds in manner of a pultesse, and laid to the pained parts, is a remedie for them that be troubled with the stone, and that can hardly make water.

CHAP. 51. Of French Mercurie.

¶ *The Kindes.*

There be two Kindes of Mercury reckoned for good, and yet both somtimes wilde ; besides two wilde neuer found in gardens, vnlesse they be brought thither.

¶ *The Description.*

1 The male garden Mercurie hath tender stalks full of ioints and branches, whereupon do grow Greene leaues like Pellitorie of the wall, but snipt about the edges : amongst which come forth two hairy bullets round, and ioyned together, like those of Goose-grasse or Cleuers, each containing in it selfe one small round seed : the root is tender, and full of white hairy strings.

2 The female is like vnto the former in leaues, stalks, and manner of growing, differing but in

the floures and seed : for this kinde hath a greater quantitie of floures and seed growing together like little clusters of grapes, of a yellowish colour. The seed for the most part is lost before it can be gathered.

1 *Mercurialis mas.*
Male Mercurie.

2 *Mercurialis femina.*
Female Mercurie.

¶ The Place.

French Mercurie is sown in Kitchen gardens among pot-herbes, in Vineyards, and in moist shadowie places : I found it vnder the dropping of the Bishops house at Rochester; from whence I brought a plant or two into my garden, since which time I cannot rid my garden from it.

¶ The Time.

They floure and flourish all the Sommer long.

¶ The Names.

It is called in Greeke, *λινισκος*, and *ἰσὺς κοταρῖος*, or Mercurie his herbe; whereupon the Latines call it *Mercurialis* : it is called in Italian, *Mercorella* : in English, French Mercurie : in French, *Mercuriale*, *Vignoble*, and *Foirelle*, quia *Fluidam laxamue alvum reddit*, Gallobelga enim *foize & foizeus*, ventris *Fluorem* vocant.

¶ The Temperature.

Mercury is hot and dry, yet not above the second degree : it hath a cleansing facultie, and (as *Galen* writeth) a digesting qualitie also.

¶ The Vertues.

- A It is vsed in our age in clisters, and thought very good to cleanse and scoure away the excrements and other filth contained in the guts. It serueth to purge the belly, being eaten or otherwise taken, voiding out of the belly not only the excrements, but also phlegme and choler. *Dioscorides* reporteth, that the decoction hereof purgeth waterish humors.
- B The leaues stamped with butter, and applied to the fundament, prouoketh to the stoole; and the herbe bruised and made vp in manner of a pessary, cleanseth the mother, and helpeth conception.
- C *Costans* in his booke of the nature of plants saith, that the iuyce of Mercurie, Hollihocks, & purslane mixed together, and the hands bathed therein, defendeth them from burning, if they be thrust into boyling leade.

CHAP. 52. *Of Wilde Mercurie.*† 1 *Cynocrambe.*
Dogs Mercury.† 2 *Phyllon arrhenogonon, sine marificum.*
Male childrens Mercury.3 *Phyllon Thelygonon, sine Feminificum.*
Childrens Mercurie, the female.

¶ The Description.

1 **D**ogs Mercury is somewhat like vnto the garden Mercury, saving the leaues hereof are greater, and the stalke not so tender, and yet very brittle, growing to the height of a cubit, without any branches at all, with smal yellow floures. The seed is like the female Mercurie. † It is also found like the male Mercurie, as you see them both exprest in the figure, and so there is both male & female of this Mercury also. †

2 Male childrens Mercury hath three or foure stalkes, or moe: the leaues be somewhat long, not much vnlike the leaues of the oliue tree, couered ouer with a soft downe or wooll gray of colour; and the seed also like those of Spurge, growing two together, being first of an ash-colour, but after turne to a blew.

† 3 This is much in shape like to the last described, but the stalkes are weaker, and haue more leaues vpon them; the floures also are small and mossy, and they grow vpon long stalks, whereas the seeds of the other are fastened to very short ones: the seed is contained in round little heads, being sometimes two, otherwhiles three or more in a cluster. †

¶ *The Place.*

They grow in woods and copses, in the borders of fields, and among bushes and hedges. ‡ But the two last described are not in England, for any thing that I know. ‡

The Dogs Mercurie I haue found in many places about Green-hithe, Swaines-combe village, Grauesend, and South-fleet in Kent; in Hampsted wood, and all the villages thereabout, foure miles from London.

¶ *The Time.*

These flourish all the Sommer long, vntill the extreame frost do pull them downe.

¶ *The Names.*

Dogs Mercurie is called in Greeke, *κυνόραϊον*: in Latine, *Canina*, and *Brassica Canina*, and *Mercurialis sylvestris*: in English, Dogs Cole, and Dogs Mercury.

Childrens Mercury is called *Phyllon thelygonon*, and *Phyllon Arrhenogonon*.

¶ *The Temperature and Vertues.*

These wilde kindes of Mercurie are not vsed in phyicke, notwithstanding it is thought they agree as well in nature as qualitie with the other kindes of Mercury.

A ‡ It is reported by the Antients, that the male *Phyllon* conduces to the generation of boyes, and the female to girles.

B At Salamantica they giue and much commend the decoction of either of these against the bitings of a mad dog.

C The Moores at Granado vse them frequently in womens diseases. ‡

† The figure of the *Cynocrambe* was omitted, and in stead thereof was put the figure of *Phyllon mariscum*.

CHAP. 53. Of Torne-sole.

1 *Heliotropium maius.*
Great Torne-sole.

† 2 *Heliotropium minus.*
Small Torne-sole.

¶ *The Kindes.*

There be foure sorts of Torne-sole, differing one from another in many notable points, as in greatnesse and smallnesse, in colour of floures, in forme and shape.

¶ *The*

The description.

1 **T**he great Tornesole hath great straight stalks covered with a white hairy cotton, especially about the top; the leaues are soft and hairy in handling, in shape like the leaues of Basill: the floures grow at the top of the branches, in colour white, thicke together in rowes vpon one side of the stalke, which stalke doth bend or turne backward like the taile of a scorpion: the root is small and hard.

2 The small Tornesole hath many little and weake branches trailing vpon the ground, whereupon doe grow small leaues, like those of the lesser Basill. The floures doe grow without any certaine order, amongst the leaues and tender branches, gray of colour, with a little spot of yellow in the middest, the which turne into crooked tailes like those of the precedent, but not altogether so much.

† 3 *Heliotropium supinum* Clusij & Lobelij. Hairie Tornesole.

4 *Heliotropium Tricoccum*, Widowwaile Tornsole.

3 Hairie Tornesole hath many feeble and weake branches trailing vpon the ground, set with small leaues, lesser than the great Tornsole; of which it is a kinde, hauing the seed in small chaffe husks, which do turne back like the taile of a scorpion, iust after the manner of the first described.

4 This kinde of Tornesole hath leaues very like to those of the great Tornsole, but of a blacker greene colour: the floures be yellow, and vnprofitable; for they are not succeeded by the fruit, but after them commeth out the fruit hanging vpon small foot-stalks three square, and in euery corner there is a small seed like to those of the Tythimales; the root is small and threddy.

¶ *The Place.*

Tornsole, as *Dioscorides* saith, doth grow in fennie grounds and neere vnto pooles and lakes. They are strangers in England as yet: It doth grow about Montpelier in Languedock, where it is had in great vse to staine and die clouts withall, wherewith through Europe meat is coloured.

¶ *The Time.*

They flourish especially in the Sommer solstice, or about the time when the sun entreteth into Cancer.

¶ *The Names.*

The Græcians call it *Heliotropium*: the Latines keepe these names, *Heliotropium magnum*, and

and *Scorpiurum*: of *Ruellius*, *Herba Cancræ*: it is named *Heliotropium*, not because it is turned about at the daily motion of the sun, but by reason it floweth in the sommer solstice, at which time the sun being farthest gone from the *Æquinoctiall* circle, returneth to the same: and *Scorpiurum* of the twiggie tops, that bow backward like a scorpions taile: of the Italians, *Tornesole bobo*; in French, *Tournesol*: some thinke it to be *Herba Clytiæ*, into which the Poets feigne *Clytiæ* to be metamorphosed; whence one hath these verses:

*Herba velut Clytiæ semper petit obuia solem,
Sic pia mens Christum, quo prece spectet, habet.*

¶ The Nature.

Tornsole, as *Paulus Aegineta* writeth, is hot and dry, and of a binding faculty.

¶ The Vertues.

- A A good handfull of great Tornsole boyled in wine, and drunke, doth gently purge the body of hot cholericke humours and tough clammie or slimie flegme.
- B The same boyled in wine and drunke is good against the stings of Scorpions, or other venomous beasts, and is very good to be applyed outwardly vpon the grieve or wound.
- C The seed stamped and layd vpon warts and such like excrescences, or superfluous out-growings, causeth them to fall away.
- D The small Tornesole and his seed boyled with Hyssope, Cresses, and salt-peter and drunke, driueth forth flat and round wormes.
- E With the small Tornsole they in France doe die linnen rags and clouts into a perfect purple colour, wherewith cookes and confectioners doe colour iellies, wines, meates, and sundry confections: which clouts in shops be called Tornsole, after the name of the herbe.

† The second and third figures were formerly transposed: the fourth was the figure of the hairy Scorpion-grasse, described in the fourth place, in the following Chapter.

CHAP. 54. Of Scorpion Grasse.

¶ The Description.

1 Scorpion grasse hath many smooth, plaine, euen leaues, of a darke Greene colour; stalks small, feeble and weake, trailing vpon the ground, and occupying a great circuit in respect of the plant. The floures grow vpon long and slender foot-stalks, of colour yellow, in shape like to the floures of broome; after which succeed long, crooked, rough cods, in shape and colour like vnto a Caterpillar; wherein is contained yellowish seed like vnto a kidney in forme. The roote is small and tender: the whole plant perisherh when the seed is ripe.

2 There is another Scorpion grasse, found among (or rather resembling) pease and tares, and thereupon called *Scorpioides Leguminosa*, which hath small and tender roots like small threds: branches many, weake and tender, trailing vpon the ground, if there be nothing to take hold vpon with his clasping and crooked seed vessels; otherwise it rampeth vpon whatsoeuer is neere vnto it. The leaues be fewe and small: the floures very little and yellow of colour: the seed followeth, little and blackish, contained in little cods, like vnto the taile of a Scorpion.

3 There is another sort almost in euery shallow grauelly running streame, hauing leaues like to *Becabunga* or Brooklime. The floures grow at the top of tender fat Greene stalkes, blew of colour, and sometimes with a spot of yellow among the blew; the whole branch of floures doe turne themselves likewise round like the scorpions taile.

There is also another growing in watric places, with leaues like innto *Anagallis aquatica*, or water Chickweed, hauing like slender stalkes and branches as the former, and the floures not vnlike, sauing that the floures of this are of a light blew or watched colour, somewhat bigger, and layd more open, whereby the yellow spot is better seene.

4 There is likewise another sort growing vpon moist dry grauelly and barren ditch bankes, with leaues like those of or Mouse-eare: this is called *Myosotis scorpioides*; it hath rough and hairy leaues, of an ouerborne russet colour: the floures doe grow vpon weake, feeble, and rough branches, as is all the rest of the plant. They likewise grow for the most part vpon one side of the stalke, blew of colour, with a like little spot of yellow as the others, turning themselves backe againe like the taile of a Scorpion.

There

There is another of the land called *Myosotis Scorpioides repens*, like the former: but the flowers are thicker thrust together, and doe not grow all vpon one side as the other, and part of the flowers are blew, and part purple, confusedly mixt together.

¶ The Place.

1, 2 These Scorpion grasses grow not wilde in England, notwithstanding I haue received seed of the first from beyond the seas, and haue dispersed them through England, which are esteemed of gentlewomen for the beauty and strangeness of the crooked cods resembling Caterpillars.

The others doe grow in waters and streames, as also on drie and barren banks.

¶ The Time.

The first floureth from May to the end of August: the others I haue found all the sommer long.

¶ The Names.

† 1 *Fabius Columna* iudges this to be the *Glymenon* of *Dioscorides*: others call it *Scorpioides*, and *Scorpioides bupleuri folio*.

2 This is the *Scorpioides* of *Matthiolus*, *Dod.* *Lobell*, and others; and I iudge it was this plant our Author in this place intended, and not the *Scorpioides Leguminosa* of the *Aduersaria*, for that hath not a few leaues, but many vpon one rib; and besides, *Dodonæus*, whom in descriptions & history our Author chiefly followes, describes this immediatly after the other: *Guilandinus*, *Casalpinus*, and *Bauhine* iudge it to be the *Telephium* of *Dioscorides*.

3 This and the next want no names, for almost euery writer hath giuen them severall ones: *Brunfelsius* called it *Cynoglossa minor*: *Tragus*, *Tabernamontanus*, and our Author (page 537. of the former edition) haue it vnder the name of *Euphrasia Carulea*: *Dodonæus* calls it *Scorpioides fœmina*: *Lonicerus*, *Leontopodium*; *Casalpinus*, *Heliotropium minus in palustribus*: *Cordus* and *Thalins*, *Echium palustre*.

4 This is *Auricula muris minor tertia*, *Euphrasia quarta*, and *Pilosella sylvestris* of *Tragus*: *Scorpioides mas* of *Dodonæus*; *Alfina Myosotis*: and *Myosotis hirsuta repens* of *Lobell*; *Heliotropium minus alterum* of *Casalpinus*; *Echium minimum* of *Columna*; and *Echium palustre alterum* of *Thalins*: our Author had it thrise: first in the precedent chapter, by the name of *Heliotropium rectum*, with a figure: secondly in this present chapter, without a figure: and thirdly pag. 514. also with a figure vnder the name of *Pilosella flore ceruleo*. †

¶ The Nature and Vertues.

There is not any thing remembred of the temperature: yet *Dioscorides* saith, that the leaues of Scorpion grasse applyed to the place, is a present remedy against the stinging of Scorpions: and likewise boyled in wine and drunke, preuaileth against the said bitings, as also of adders, snakes, and such venomous beasts: being made in an vnguent with oile, wax, and a little gum *Elemmi*, is profitable against such hurts as require a healing medicine.

CHAP. 55. Of Nightshade.

¶ The Kindes.

There be diuers Nightshades, whereof some are of the garden; and some that loue the fields; and yet euery of them found wilde; whereof some cause sleepiness euen vnto death: others cause sleepiness, and yet Physicall: and others very profitable vnto the health of man, as shall be declared in their severall vertues.

¶ The Description.

1 Garden Nightshade hath round stalkes a foot high, and full of branches, whereon are set leaues of a blackish colour, soft and full of iuice, in shape like to leaues of Basil, but much greater: among which doe grow small white flowers with yellow pointals in the middle; which being past, there succeed round berries, greene at the first, and blacke when they be ripe, like those of Iuy: the root is white, and full of hairy strings.

† 2 The root of this is long, pretty thicke and hard, being couered with a brownish skin; from this root grow vp many smal stalks of the height of a cubit and better, somewhat thick withall: the leaues that grow alongst the stalke are like those of the Quince tree, thicke, white, soft and downy. The flowers grow about the stalke at the setting on of the leafe, somewhat long and of a pale colour, diuided into foure parts, which are succeeded by seeds contained in hairy or woolly receptacles: which when they come to ripeness are red, or of a reddish saffron colour. †

¶ The Place.

This Nightshade commeth vp in many places, and not only in gardens, of which not withstanding

1 *Scorpioides Bupleuri folio*, Pena & L'Obelij.
Scorpion grasse, or Caterpillers.

2 *Scorpioides Matthioli*.
Matthiolus his Scorpion grasse.

3 *Myosotis scorpioides palustris*?
Water Scorpion grasse.

4 *Myosotis scorpioides arvensis hirsuta*,
Moufe-eare Scorpion grasse.

ding it hath taken his surname, and in which it is often found growing with other herbes, but also neere common high waies, the borders of fields, by old walls and ruinous places.

‡ 2 This growes not with vs, but in hotter Countries *Clusius* found it growing among rubbish at Malago in Spaine. ‡

1 *Solanum Hortense.*
Garden Nightshade.

‡ 2 *Solanum Somniferum.*
Sleepie Nightshade.

¶ The Time.

It flowreth in Sommer, and oftentimes till Autumne be well spent; and then the fruit cometh to ripenesse.

‡ 2 This *Clusius* found in flower and with the seede ripe in Februarie; for it liueth many yeares in hot Countries, but in cold it is but an annuall. ‡

¶ The Names.

It is called of the Græcians *Σννίσις*: of the Latines, *Solanum*, and *Solanum Hortense*: in shops, *Solanum*: of some, *Morella*, *Vua Lupina*, and *Vua Vulpis*: in Spanish likewise, *Morella*, and *Terua Mora*: *Marcellus* an old Phisicke writer, and diuers others of his time called it *Strumum*: *Plinie* in his 27. booke chap. 8. sheweth that it is called *Cucubalus*: both these words are likewise extant in *Apuleius* among the confused names of Nightshade; who comprehending all the kinds of Nightshade together in one chapter; being so many, hath strangely & absurdly confounded their names. In English it is called Garden Nightshade, Morel, and Petie Morell: in French, *Morelle*, *Gallobelgis*: *feu ardent*: *quia medetur igni sacro*.

¶ The Temperature.

Nightshade (as *Galen* saith. in his booke of the faculties of simple medicines) is vsed for those infirmities that haue need of cooling and binding; for these two qualities it hath in the second degree: which thing also hee affirmeth in his booke of the faculties of nourishments, where hee saith that there is no pot-herbe which wee vse to eat that hath so great astringent or binding as Nightshade hath; and therefore Physitions do worthily vse it, and that seldome as a nourishment, but alwaies as a medicine.

¶ The Vertues.

1 *Dioscorides* writeth, that Nightshade is good against S. Anthonies fire, the shingles, paine of the head, the heart burning or heat of the stomacke, and other like accidents proceeding of sharp and biting humours. Notwithstanding that it hath these vertues, yet it is not alwaies good that it should be applied vnto those infirmities, for that many times there hapneth more dangers by applying

plying of these remedies, than of the disease it selfe: for as *Hippocrates* writeth in the 6. book of his Aphorismes, the 25. particular, that it is not good, that S. Anthonies fire should be driven from the outward parts to the inward. And likewise in his Prognosticks he saith, that it is necessary that S. Anthonies fire should breake forth, and that it is death to haue it driven in; which is to be vnderstood not onely of S. Anthonies fire, but also of other like burstings out procured by nature. For by vsing of these kindes of cooling and repelling medicines, the bad, corrupt, and sharpe humors are driuen backe inwardly to the chiefe and principall parts, which cannot be done without great danger and hazard of life. And therefore we must not vnaduisedly, lightly, or rashly minister such kinde of medicines vpon the comming out of Saint Anthonies fire, the shingles, or such hot pimples and blemishes of the skinne.

B The iuice of the greene leaues of Garden Nightshade mixed with Barley meale, is very profitably applied vnto Saint Anthonies fire, and to all hot inflammations.

C The iuice mixed with oile of Roses, Ceruse, and Littarge of gold, and applied, is more proper and effectually to the purposes before set downe.

D † Neither the iuice heereof, nor any other part is vsually giuen inwardly, yet it may without any danger.

E The leaues stamped are profitably put into the ointment of Popler buds, called *Vnguentum populeon*, and it is good in all other ointments made for the same purpose.

F † 2 The barke of the root of Sleepie Nightshade, taken in the weight of 3 1. hath a somniferous qualitie; yet is it milder then *Opium*, and the fruit thereof vehemently prouokes vrine. But (as *Pliny* saith) the remedies hereof are not of such esteeme that we should long insist vpon them, especially seeing wee are furnished with such store of medicines lesse harmefull, yet seruing for the same purpose. †

† The Figure in the second place was of the *Solanum Pemiferum*, or *Mala Esbiopica*, treated of at large in the 61. Chap. of this Booke, and therefore it is omitted here: and in stead thereof another put in the place.

CHAP. 56. Of sleepey Nightshade.

Solanum Lethale.

Dwale, or deadly Nightshade.

¶ The Description.

Dwale or sleeping Nightshade hath round blackish stalkes six foot high, wherupon do grow great broad leaues of a darke greene colour; among which doe grow small hollow flowers bel fashion, of an ouerborne purple colour; in the place wherof come forth great round berries of the bignesse of the blacke cherry, greene at the first, but when they be ripe of the color of black iette or burnished horne, soft and full of purple iuice: among which iuice lie the seeds like the berries of Iuy: the root is very great, thicke, and long lasting.

The Place.

It groweth in vntoiled places neere vnto high waies and the sea marshes, and such like places.

It groweth very plentifully in Holland in Lincolnshire, and in the Ile of Ely at a place called Walsoken, neere vnto Wisbitch.

I found it growing without the gate of Highgate neere vnto a pound or pinfold on the left hand.

The Time.

This flourisheth all the Sommer and Spring, beareth his seed and flower in Iuly and August.

¶ The Names.

It is called of *Dioscorides*, *ἐπιμανθάνου*: of *Theophrastus*, *ἐπιμανθάνου*: of the Latines, *Solanum somniferum*,

somniferum, or sleeping Nightshade; and *Solanum lethale*, or deadly Nightshade; and *Solanum manicum*, raging Nightshade: of some, *Apollinaris minor ulticana*, and *Herba Opago*: in English, Dwale, or sleeping Nightshade: the Venetians and Italians call it *Bella dona*: the Germanes, *Dollwurtz*: the low Dutch, *Dulle besien*: in French, *Morelle mortelle*: it cometh very neere vnto *Theophrastus* his *Mandragoras*, (which differeth from *Dioscorides* his *Mandragoras*.)

¶ The Nature.

It is cold euen in the fourth degree.

¶ The Vertues.

This kinde of Nightshade causeth sleep, troubleth the minde, bringeth madnesse if a few of the berries be inwardly taken, but if moe be giuen they also kill and bring present death. *Theophrastus* in his 6. booke doth likewise write of Mandrake in this manner; Mandrake causeth sleepe, and if also much of it be taken it bringeth death.

The greene leaues of deadly Nightshade may with great aduice be vsed in such cases at Petri-mortell: but if you will follow my counsell, deale not with the same in any case, and banish it from your gardens and the vse of it also, being a plant so furious and deadly: for it bringeth such as haue eaten thereof into a dead sleepe wherein many haue died, as hath been often seen and prooued by experience both in England and else where. But to giue you an example heereof it shall not be amisse: It came to passe that three boyes of Wisbich in the Ile of Ely did eate of the pleasant & beautifull fruite hereof, two whereof died in lesse than eight houres after that they had eaten of them. The third child had a quantitie of hony and water mixed together giuen him to drinke, causing him to vomit often: God blessed this meanes and the child recovered. Banish therefore these pernicious plants out of your gardens, and all places neere to your houses, where children or women with child do resort, which do oftentimes long and lust after things most vile and filthie, and much more after a berry of a bright shining blacke colour, and of such great beautie, as it were able to allure any such to eate thereof.

The leaues heereof laid vnto the temples cause sleepe, especially if they be imbibed or moistened in wine vineger. It easeth the intollerable paines of the head-ache proceeding of heate in furious agues, causing rest being applied as aforesaid.

CHAP. 57. Of winter Cherries.

¶ The Description.

1 The red winter Cherrie bringeth forth stalkes a cubit long, round, slender, smooth, and somewhat reddish, reeling this way and that way by reason of his weakenesse, not able to stand vpriht without a supporter: whereupon do grow leaues not vnlike to those of common Nightshade, but greater, among which leaues come forth white floures, consisting of fve small leaues: in the middle of which leaues standeth out a berry, greene at the first, and red when it is ripe, in colour of our common Cherry and of the same bignesse, inclosed in a thinne huske or little bladder, it is of a pale reddish colour, in which berrie is contained many small flat seeds of a pale colour. The rootes be long, not vnlike to the rootes of Couch-grasse, ramping and creeping within the vpper crust of the earth farre abroad, whereby it encreaseth greatly.

2 The blacke winter Cherrie hath weake and slender stalkes somewhat crested, and like vnto the tendrels of the vine, casting it selfe all about, and taketh hold of such things as are next vnto it: whereupon are set jagged leaues deeply indented or cut about the edges almost to the middle ribbe. The floures be very small and white standing vpon long foote-stalkes or stemmes. The skinnie bladders succede the floures, parted into three fells or chambers, euery of the which containeth one seed and no more, of the bignesse of a small pease, and blacke of colour, hauing a marke of white colour vpon each berrie, in proportion of an heart. The roote is very small and threddie.

¶ The Place.

The red winter Cherrie groweth vpon old broken walls, about the borders of fieldes, and in moist shadowie places, and in most gardens, where some cherish it for the beautie of the berries, and others for the great and worthy vertues thereof.

2 The blacke winter Cherrie is brought out of Spaine and Italy, or other hot regions, from whence I haue had of those blacke seeds marked with the shape of a mans hart, white, as aforesaid: and haue planted them in my garden where they haue borne floures, but haue perished before the fruit could grow to maturitie, by reason of those vnseasonable yeeres, 1594. 95. 96.

¶ The Time.

The red winter Cherrie beareth his floures and fruite in August.

The blacke beareth them at the same time, where it doth naturally grow.

¶ The Names.

The red winter Cherrie is called in Greeke, *Σκύνδα*: in Latine, *Vescaria*, and *Solanum Vescarium*: in shops, *Alkekengi*: *Plinie* in his 21. booke nameth it *Halicacabus*, and *Vescaria*, of the little bladders: or as the same Author writeth, because it is good for the bladder and the stone: it is called in Spanish, *Vexiga de porro*: in French, *Alquequenges*, *Bagenauldes*, and *Cerises d'outre mer*: in English, red Nightshade, Winter Cherries, and Alkakengie.

1 *Solanum Halicacabum*.
Red winter Cherries.2 *Halicacabum Peregrinum*.
Blackewinter Cherries.

The blacke winter Cherrie is called *Halicacabum Peregrinum*, *Vescaria Peregrina*, or strange winter Cherrie: of *Pena* and *Lobel* it is called, *Cor Indum*, *Cor Indicum*: of others, *Pisum Cordatum*: in English, the Indian heart, or heart pease: some haue taken it to be *Dorycnion*, but they are greatly deceived, being in truth not any of the Nightshades; it rather seemeth to agree with the graine named of *Serapio*, *Abrong*, or *Abrugi*, of which he writeth in his 153. chapter in these words: It is a little graine spotted with blacke and white, round, and like the graine Maiz, with which notes this doth agree.

¶ The Temperature.

The red winter Cherrie is thought to be cold and drie, and of subtile parts.

The leaues differ not from the temperature of the garden Nightshade, as *Galen* saith.

¶ The Vertues.

- A The fruite brused and put to infuse or steepe in white wine two or three houres, and after boiled two or three bubblings, straining it, and putting to the decoction a little sugar and cinnamon, and drunke, preuaileth very mightily against the stopping of vrine, the stone and grauell, the difficultie and sharpenes of making water, and such like diseases: if the grieve be old, the greater quantity must be taken; if new and not great, the lesse: it scoureth away the yellow jaundise also, as some write.

CHAP. 58. Of the Maruell of the World.

Mirabilia Peruviana flore luteo.

The maruell of Peru with yellowish floures.

‡ *Mirabilia Peruviana flore albo.*

The maruell of Peru with white floures.

*The description.*

THIS admirable plant called the maruell of Peru, or the maruell of the World, springeth forth of the ground like unto Basill in leaues; amongst which it sendeth out a stalke two cubits and a halfe high, of the thickenesse of a finger; full of iuice, very firme, and of a yellowish Greene colour, knotted or kneed with ioints somewhat bunching forth, of purplish color, as in the female Balsamina: which stalke diuideth it selfe into fundrie branches or boughes, and those also knot-tie like the stalke. His branches are decked with leaues growing by couples at the ioints like the leaues of wilde Peascods, Greene, fleshie, and full of ioints, which beeing rubbed doe yeeld the like vnpleasant smell as wilde Peascods doe, and are in taste also verie vnfaurie, yet in the latter end they leaue a taste and sharpe smacke of Tabaco. The stalkes towards the top are garnished with long hollow single flowers, folded, as it were, into fise parts before they be opened; but being fully blowne doe resemble the flowers of Tabaco, not ending into sharpe corners, but blunt and round as the flowers of Bindeweede, and larger than the flowers of Tabaco, glittering oftentimes with a fine purple or Crimson colour; many times of an horse-flesh; sometime yellow; sometime pale, and sometime resembling an old red or yellow colour; sometime whitish, and most commonly two colours occupying halfe the flower, or intercoursing the whole flower with streakes and orderly streames, now yellow, now purple, diuided through the whole; hauing sometime great, sometime little spots of a purple colour, sprinkled and scattered in a most variable order, and braue mixture. The ground or field of the whole flower is either pale, red, yellow, or white, containing in the middle of the hollownesse a pricke or pointell set round about with sixe small strings or chiues. The flowers are verie sweet and pleasant, resembling the Narcisse or white Daffodill, and are very suddenly fading; for at night they are flowred wide open, and so continue untill eight of the clocke the next morning: at which time they beginne to close or shut vp (after the manner of the Bindeweede) especially if the weather be very hot: but if the aire be more temperate they remaine open the whole day, and are closed onely at night, and so perish, one flower la-

sting but onely one day, like the true Ephemeron or Hemerocallis. This marvellous varietie doth not without cause bring admiration to all that obserue it. For if the flowers be gathered and reserved in severall papers, and compared with those flowers that will spring and flourish the next day, you shall easily perceiue that one is not like another in colour, though you should compare one hundreth which flower one day, and another hundred which you gathered the next day; and so from day to day during the time of their flowring. The cups and huskes which containe and embrace the flowers are diuided into five pointed sections, which are Greene, and, as it were, consisting of skinnes, wherein is contained one seede and no more, couered with a blackish skinnie, hauing a blunt point whereon the flower groweth; but on the end next the cup or huske it is adorned with a little five cornered crowne. The seed is as bigge as a pepper corne, which of it selfe fadeth with any light motion. Within this seede is contained a white kernell, which being bruised, resolueth into a very white pulpe like starch. The root is thicke and like vnto a great radish, outwardly blacke, and within white, sharpe in taste, wherewith is mingled a superficial sweetnes. It bringeth new floures from Iuly vnto October in infinite number, yea euen vntill the frosts doe cause the whole plant to perish: notwithstanding it may be reserved in pots, and set in chambers and cellars that are warme, and so defended from the iniurie of our cold climate; provided alwaies that there be not any water cast vpon the pot, or set forth to take any moisture in the aire vntill March following; at which time it must bee taken forth of the pot and replanted in the garden. By this meanes I haue preserved many (though to small purpose) because I haue sowne seeds that haue borne floures in as ample manner and in as good time as those reserved plants.

Of this wonderfull herbe there be other sorts, but not so amiable or so full of varietie, and for the most part their floures are all of one color. But I haue since by practise found out another way to keepe the roots for the yeare following with very little difficultie, which neuer faileth. At the first frost I dig vp the rootes and put vp or rather hide the roots in a butter ferkin, or such like vessel, filled with the sand of a riuer, the which I suffer still to stand in some corner of a house where it neuer receiue moisture vntill Aprill or the midst of March, if the weather be warme; at which time I take it from the sand and plant it in the garden, where it doth flourish exceeding well and increaseth by roots; which that doth not which was either sowne of seed the same yeare, nor those plants that were preserved after the other manner.

¶ The Place.

The seed of this strange plant was brought first into Spaine, from Peru, whereof it tooke his name *Mirabilia Peruana*, or *Peruiana*: and since dispersed into all the parts of Europe: the which my selfe haue planted many yeares, and haue in some temperate yeares receiued both floures and ripe seed.

¶ The Time.

It is sowne in the midst of Aprill, and bringeth forth his variable floures in September, and perisheth with the first frost, except it be kept as afore said.

¶ The Names.

It is called in Peru of those Indians there, *Hachal*. Of others after their name *Hachal Indi*: of the high and low Dutch, *Solanum Odoriferum*: of some, *Iasminum mexicanum*: and of *Carolus Clusius*, *Admirabilia Peruiana*: in English rather the Maruell of the World, than of Peru alone.

¶ The Nature and Vertues.

We haue not as yet any instructions from the people of India concerning the nature or vertues of this plant: the which is esteemed as yet rather for his rarenesse, beautie, and sweetnesse of his floures, than for any vertues knowne; but it is a pleasant plant to decke the gardens of the curious. Howbeit *Iacobus Antonius Cortusus* of Padua hath by experience found out, that two drams of the root thereof taken inwardly doth very notably purge waterish humours.

CHAP. 59. Of Madde Apples.

¶ The Description.

R Aging Apples hath a round stalke of two foot high, diuided into sundry branches, set with broad leaues somewhat indented about the edges, not vnlike the leaues of white Henbane, of a darke browne Greene colour, somewhat rough. Among the which come the floures of

of a white colour, and some times changing into purple, made of six parts, wide open like a starre with certaine yellow chutes or thrums in the middle; which beeing past the fruit cometh in place, set in a cornered cup or huske after the manner of the great Nightshade, great and somewhat long, of the bignesse of a swans egge, and somtimes much greater, of a white color, sometimes yellow, and often browne, wherein is contained small flat seed of a yellow colour. The root is thicke, with many threds fastned thereto.

Mala insana.

Madde or raging Apples.

¶ The Place.

This plant groweth in Egypt almost euery where in sandie fields euen of it selfe, bringing forth fruit of the bignesse of a great Cucumber, as *Petrus Bellonius* reporteth in the second booke of his singular obseruations.

Wee had the same in our London Gardens, where it hath borne floures, but the Winter approaching before the time of ripening, it perished: notwithstanding it came to beare fruit of the bignesse of a goose egge one extraordinarie temperate yeare, as I did see in the garden of a worshipfull Merchant M^r. *Harvie* in Limestreet, but neuer to the full ripenesse.

¶ The Time.

This herbe must be sowne in Aprill in a bed of hot horse dounge, as Muske-Melons are, and floureth in August.

¶ The Names.

Petrus Bellonius hath iudged it to bee *Malina: thalla Theophrasti*. In the Dukedome of Millaine it is called *Melongena*: and of some, *Melanzana*: in Latine, *Mala insana*: and in English, Mad Apples: in the Germaine tongue, *Dollopffel*: In Spanish, *Verangenes*.

¶ The Nature.

The hearbe is cold almost in the fourth degree.

¶ The vse and danger.

The people of Tolledo do eat them with great deuotion being boiled with fat flesh, putting thereto some scraped cheefe, which they do keepe in vineger, honie, or salt pickell all Winter to procure lust.

Petrus Bellonius, and *Hermolaus Barbarus*, report that in Egypt and Barbary they vse to eat the fruit of *Mala insana* boiled or roasted vnder ashes, with oile, vineger, & pepper, as people vse to eat Mushrooms. But I rather wish Englishmen to content themselves with the meat and sauce of our owne Countrey, than with fruit and sauce eaten with such perill: for doubtlesse these apples haue a mischieuous qualitie, the vse whereof is vtterly to be forsaken. And as wee see and know many haue eaten and doe eat Mushrooms more for wantonnesse than for need: for there are two kindes thereof venemous and deadly, which being in the handling of an vnskilful cooke, may procure vntimely death. Therefore it is better to esteeme this plant and haue him in the Garden for your pleasure and the rarenesse threof, than for any vertue or good qualities yet knowne.

CHAP. 60. Of Apples of Loue.

¶ The Description.

The Apple of Loue bringeth forth very long round stalkes or branches, fat and full of iuice, trailing vpon the ground, not able to sustaine himselfe vpright by reason of the tendernesse of the stalkes, and also the great weight of the leaues and fruit wherewith it is surcharged. the leaues are great and deeply cut or iagged about the edges, not vnlike to the leaues of Agri-mony, but greater, and of a whiter Greene colour: among which come forth yellow floures growing vpon

vpon short stems or foot stalks, clustering together in bunches: which being fallen, there do come in place faire and goodly apples, chamfered, vneuen, and bunched out in many places; of a bright shining red colour, and the bignesse of a goose egge or a large pippin. The pulpe or meat is verie full of moisture, soft, reddish, and of the substance of a wheat plumme. The seed is small, flat and rough: the root small and threddie: the whole Plant is of a ranke and stinking saour.

There hath happened vnto my hands another sort, agreeing very notably with the former, as well in leaues and stalkes as also in floures and roots, onely the fruit hereof was yellow of colour, wherein consisted the difference.

Poma Amoris.

Apples of Loue.

¶ The Place.

Apples of Loue grow in Spaine, Italie, and such hot Countries, from whence my selfe haue receiued seeds for my garden, where they do increase and prosper.

¶ The Time.

It is sowne in the beginning of Aprill in a bed of hot horse dung, after the maner of musk Melons and such like cold fruits.

¶ The Names.

The Apple of Loue is called in Latine *Pomum Aureum*, *Poma Amoris*, and *Lycopersicum*: of some, *Glaucium*: in English, Apples of Loue, and Golden Apples: in French, *Pommes d'amours*. Howbeit there be other golden Apples whereof the Poets doe fable, growing in the Gardens of the daughters of *Hesperus*, which a Dragon was appointed to keepe, who, as they fable, was killed by *Hercules*.

¶ The Temperature.

The Golden Apple, with the whole herbe it selfe is cold, yet not fully so cold as Mandrake, after the opinion of *Dodonæus*. But in my iudgement it is very cold, yea perhaps in the highest degree of coldnesse: my reason is, because I haue in the hottest time of Sommer cut away the superfluous branches from the mother root, and cast them away carelesly in the allies of my gar-

den, the which (notwithstanding the extreme heat of the Sun, the hardnesse of the trodden allies, and at that time when no raine at all did fall) haue growne as fresh where I cast them, as before I did cut them off; which argueth the great coldnesse contained therein. True it is, that it doth argue also a great moisture wherewith the plant is possessed, but as I haue said, not without great cold, which I leaue to euery mans censure.

¶ The Vertues.

A In Spaine and those hot Regions they vse to eat the Apples prepared and boiled with pepper, salt, and oile: but they yeeld very little nourishment to the bodie, and the same nought and corrupt.

B Likewise they doe eat the Apples with oile, vineger and pepper mixed together for sauce to their meat, euen as we in these cold Countries doe Mustard.

CHAP. 61.

Of the Æthiopian Apple.

¶ The Description.

THE Apple of Æthiopia hath large leaues of a whitish Greene colour, deeply indented about the edges, almost to the middle rib; the which middle rib is armed with a few sharpe prickles. The floures be white, consisting of six smal leaues, with a certain yellow pointel in the midst.

The

Mala Æthiopica.

Apples of Æthiopia.

The fruit is round, and bunched with vneuen lobes or bankes lesser than the golden Apple, of colour red, and of a firme and solid substance; wherein are contained small flat seeds. The root is small and threddy.

¶ *The Place.*

The seeds of this plant haue beene brought vnto vs out of Spaine, and also sent into France and Flanders: but to what perfection it hath come vnto in those parts I am ignorant, but mine perished at the first approach of Winter. His first original was from Æthiopia, whereof it tooke his name.

¶ *The Time.*

This Plant must be sown as Muske-Melons, and at the same time. They floure in Iuly, and the fruit is ripe in September.

¶ *The Names.*

In English wee haue thought good to call it the Æthiopian Apple, for the reason before alledged: in Latine, *Mala Æthiopica*: of some it hath been thought to be *Malinathalla*. ‡ This is the *Solanum pomiferum* of Lobel and others; by which name our Author also formerly had it, in the fiftieth chapter of the former edition. ‡

¶ *The Nature.*

The temperature agreeth with the Apple of Loue.

¶ *The Vertues.*

These Apples are not vsed in physicke that I can reade of, onely they are vsed for a sauce and seruice vnto rich mens tables to be eaten, being

first boyled in the broth of fat flesh with pepper and salt, and haue a lesse hurtfull iuyce than either mad apples or golden Apples.

CHAP. 62. Of Thornie-Apples.

¶ *The Description.*

THe stalkes of Thorny-apples are oftentimes aboue a cubit and a halfe high, seldome higher, an inch thicke, vpright and straight, hauing very few branches, sometimes none at all, but one vpright stemme; whereupon doe grow leaues smooth and euen, little or nothing indented about the edges, longer and broader than the leaues of Night-shade, or of the mad Apples. The floures come forth of long toothed cups, great, white of the forme of a bell, or like the floures of the great Withwinde that rampeth in hedges; but altogether greater and wider at the mouth, sharpe cornered at the brimmes, with certaine white chiues or threds in the middest, of a strong ponticke sauour, offending the head when it is smelled vnto: in the place of the floure commeth vp round fruit full of short and blunt prickles, of the bignesse of a greene Wall-nut when it is at the biggest, in which are the seeds of the bignesse of tares or of Mandrakes, and of the same forme. The herbe it selfe is of a strong sauor, and doth stuffe the head, and causeth drowfinesse. The root is small and threddy.

2 There is another kinde hereof altogether greater than the former, whose seeds I receiued of the right honorable the Lord *Edward Zouch*; which he brought from Constantinople, and of his liberalitie did bestow them vpon me, as also many other rare & strange seeds; and it is that Thorn-apple that I haue dispersed through this land, whereof at this present I haue great vse in Surgery, as well in burnings and scaldings, as also in virulent and malignant vlcers, apostumes, and such like. The which plant hath a very great stalke in fertile ground, bigger than a mans arme, smooth; and greene of colour, which a little aboue the ground diuideth it selfe into sundry branches or armes, in manner of an hedge tree; whereupon are placed many great leaues cut and indented deeply

about

about the edges, with many vneuen sharpe corners : among these leaues come white round floures made of one piece in manner of a bell, shutting it selfe vp close toward night, as do the floures of the great Binde-weed, whereunto it is very like, of a sweet smell, but so strong, that it offends the senses. The fruit followeth round, sometimes of the fashion of an egge, set about on euerie part with most sharpe prickles ; wherein is contained very much seed of the bignesse of tares, and of the same fashion. The root is thicke, made of great and small strings : the whole plant is sown, beareth his fruit, and perisheth the same yeare. ‡ There are some varieties of this plant, in the colour and doubleness of the floures. ‡

1 *Stramonium Peregrinum.*
The Apple of Peru.

2 *Stramonium spinosum.*
Thorny Apples of Peru.

¶ The Place.

1 This plant is rare and strange as yet in England : I receiued seeds thereof from *John Robin* of Paris, an excellent Herbarist ; which did grow and bare floures, but perished before the fruit came to ripeness.

2 The Thorne-apple was brought in seed from Constantinople by the right honourable the Lord *Edward Zouch*, and giuen vnto me, and beareth fruit and ripe seed.

¶ The Time.

The first is to be sown in a bed of horse-dung, as we do cucumbers and Muske-melons.

The other may be sown in March or Aprill, as other seeds are.

¶ The Names.

The first of these Thorne-apples may be called in Latine, *Stramonium*, and *Pomum*, or *Malum spinosum* : of some, *Corona regia*, and *Melospinum* : The Grecians of our time name it *πικρὸν ἄκκλον*, or rather *καρποκόκκλον* ; as though they should say, a nut stuffing, and causing drowynesse and disquiet sleepe : the Italians, *Paracoculi* : it seemeth to *Valerius Cordus* to be *Hyoscyamus Peruvianus*, or Henbane of Peru : *Cardanus* doubteth whether it should be inserted among the Night-shades as a kinde thereof : of *Matthiolus* and others it is thought to be *Nux metel* : *Serapio*, cap. 375. saith, That *Nux metel* is like vnto *Nux vomica* ; the seed whereof is like that of Mandrake : the huske is rough or full of prickles ; the taste pleasing and strong : the qualitie thereof is cold in the fourth degree. Which description agreeth herewith, except in the forme or shape it should haue with *Nux vomica* : *Anguillara* suspecteth it to be *Hippomanes* which *Theocritus* mentioneth, wherewith in his second *Eclog* he

he sheweth that horses are made mad : for *Cratæus*, whom *Theocritus* his Scholiast doth cite, writeth, That the plant of *Hippomanes* hath a fruit full of prickles, as hath the fruit of wilde Cucumbers. In English it may be called Thorne-apple, or the Apple of Peru.

‡ The words of *Theocritus*, *Eidyll. 2.* are these:

Ἰππομάνης φυτόν ἐστι παρ' Ἀρκαδίων, &c.

Which is thus in English:

*Hippomanes' amongst the Arcadians springs, by which even all
The Colts and agile Mares in mountaines mad do fall.*

Now in the Greeke *Scholia* amongst the Expositions there is this : *κρατæος φυτόν, &c.* That is ; *Cratæus* saith, That the plant hath a fruit like the wilde Cucumber, but blacker ; the leanes are like a poppie, but thorny or prickly. Thus I expound these words of the Greeke Scholiast, being pag. 51. of the edition set forth by *Dan. Heinsius*, *Ann. Dom. 1603.* *Julius Scaliger* blames *Theocritus*, because he calls *Hippomanes* *φύτον*, a Plant : but *Heinsius*, as you may see in his notes vpon *Theocritus*, pag. 120, probably iudges, that *φύτον* in this place signifies nothing but *ἄνθος*, a Thing [growing.] Such as are curious may haue recourse to the places quoted, where they may finde it more largely handled than is fit for me in this place to insist vpon. There is no plant at this day knowne, in mine opinion, whereto *Cratæus* his description may be more fitly referred, than to the *Papaner spinosum*, or *sicus infernalis*, which we shall hereafter describe. ‡

¶ The Nature.

The whole plant is cold in the fourth degree, and of a drowfie and numming qualitie, not inferior to Mandrake.

¶ The Vertues.

The iuyce of Thorne-apples boiled with hogs grease to the forme of an vnguent or salve, cureth all inflammations whatsoever, all manner of burnings or scaldings, as well of fire, water, boyling leade, gun-powder, as that which comes by lightning, and that in very short time, as my self haue found by my daily practise, to my great credit and profit. The first experience came from Colchester, where Mistresse *Lobel* a Merchants wife there being most grievously burned with lightning, and not finding ease or cure in any other thing, by this found help when all hope was past, by the report of Mr. *William Ranne*, publique Notarie of the said towne, was perfectly cured.

The leaues stamped small, and boiled with oyle Oliue vntill the herbes be as it were burnt, then strained and set to the fire againe with some wax, rosin, and a little Turpentine, and made into a salve, doth most speedily cure old vlcers, new and fresh wounds, vlcers vpon the glandulous part of the yard, and other fores of hard curation.

CHAP. 63.

Of Bitter-sweet, or Woody Nightshade.

¶ The Description.

Bitter-sweet bringeth forth woody stalkes as doth the Vine, parted into many slender creeping branches, by which it climeth and taketh hold of hedges and shrubs next vnto it. The barke of the oldest stalkes are rough and whitish, of the colour of ashes, with the outward rinde of a bright Greene colour, but the yonger branches are Greene as are the leaues : the wood brittle, hauing in it a spongie pith ; it is clad with long leaues, smooth, sharpe pointed, lesser than those of the Binde-weed. At the lower part of the same leaues doth grow on either side one small or lesser leafe like vnto two eares. The floures be small, and somewhat clustered together, consisting of five little leaues apiece, of a perfect blew colour, with a certaine pricke or yellow pointall in the middle : which being past, there do come in place faire berries, more long than round, at the first green, but very red when they be ripe ; of a sweet taste at the first, but after very vnpleasant, of a strong saour, growing together in clusters like burnished coral. The root is of a meane bignesse, and full of strings.

I haue found another sort which bringeth forth most pleasant white floures with yellow pointals in the middle, in other respects agreeing with the former.

¶ The Place.

Bitter-sweet doth grow in moist places about ditches, rivers, and hedges, almost euery where.

The

Amara dulcis.
Bitter-sweet.

The other sort with the white floures I found in a ditch side against the right honorable the Earle of Suffex his garden wall at his house in Bermonsey street by London, as you go from the court which is full of trees, vnto a farne house neere thereunto.

¶ *The Time.*

The leaues come forth in the Spring, the floures in Iuly, the berries are ripe in August.

¶ *The Names.*

The later Herbarists haue named this plant *Dulcamara*, *Amarodulcis*, and *Amaradulcis*; that is in Greeke, *γλυκύμηρος*: they call it also *Solanum lignosum*, and *Siliquastrum*: Pliny calleth it *Melortum*: Theophrastus, *Vitis sylvestris*: in English we call it Bitter-sweet, and Woody Nightshade. But euery Author must for his credit say something, although to small purpose; for *Vitis sylvestris* is that which we call our Ladies Seale, which is no kinde of Nightshade: for *Tamus* and *Vitis sylvestris* are both one; as likewise *Solanum lignosum* or *Fruticosum*; and also *Solanum rubrum*: whereas indeed it is no such plant, nor any of the Nightshades, although I haue followed others in placing it here. Therefore those that vse to mixe the berries thereof in compositions of diuers cooling ointments, in stead of the berries of Nightshade haue committed the greater error; for the fruit of this is not cold at all, but hot, as forthwith shall be shewed. *Dioscorides* saith it is *Cyclaminus altera*; describing it by the description of

those with white floures aforesaid, whereunto it doth very well agree. ‡ *Dioscorides* describeth his *Muscoflo*re with a mossy floure, that is, such an one as consists of small chiues or threds, which can by no meanes be agreeable to the floure of this plant. ‡

¶ *The Temperature.*

The leaues and fruit of Bitter-sweet are in temperature hot and dry, clenfing and wasting away.

¶ *The Vertues.*

- A The decoction of the leaues is reported to remoue the stoppings of the liuer and gall; and to be drunke with good successe against the yellow jaundice.
- B The iuyce is good for those that haue fallen from high places, and haue beene thereby bruised, or dry beaten: for it is thought to dissolue bloud congealed or cluttered any where in the intrals, and to heale the hurt places.
- C *Hieronymus Tragus* teacheth to make a decoction of Wine with the wood finely sliced and cut into small pieces; which he reporteth to purge gently both by vrine and siege those that haue the dropisie or jaundice.
- D *Dioscorides* doth ascribe vnto *Cyclaminus altera*, or Bitter-sweet with white floures as I conceiue it, the like faculties.
- E The fruit (saith he) being drunke in the weight of one dram, with three ounces of white wine, for forty dayes together helpeth the spleene.
- F It is drunke against difficultie of breathing: it thoroughly cleanseth women that are newly brought a bed.

CHAP. 64. Of Binde-weed Nightshade.

¶ *The Description.*

Inchanters Night-shade hath leaues like to Peti-morel, sharpe at the point like vnto Spinage: the stalke is straight and vpright, very brittle, two foot high: the floures are white tending to carnation, with certaine small browne chiues in the midst: the seed is contained in small round bullets

Circaea Lutetiana.
Inchanters Night-shade.

bullets, rough and very hairy. The roots are rough, and many in number, thrusting themselves deep into the ground, and dispersing far abroad; whereby it doth greatly increase, insomuch that when it hath once taken fast rooting, it can hardly with great labour be rooted out or destroyed.

¶ *The Place.*

It groweth in obscure and darke places, about dung-hills, and in vntoiled grounds, by path-ways and such like.

¶ *The Time.*

It flourisheth from Iune to the end of September.

¶ *The Names.*

It is called of *Lobel*, *Circaea Lutetiana*: in English, Inchanters Night-shade, or Binde-weed Nightshade.

¶ *The Nature and Vertues.*

There is no vse of this herbe either in physicke or Surgerie that I can reade of, which hath happened by the corruption of time and the error of some who haue taken *Mandragoras* for *Circaea*; in which error they haue still persisted vnto this day, attributing vnto *Circaea* the vertues of *Mandragoras*; by which means there hath not any thing been said of the true *Circaea*, by reason, as I haue said, that *Mandragoras* hath been called *Circaea*: but doubtlesse it hath the vertue of Garden Night-shade, and may serue in stead thereof without error.

CHAP. 65. Of Mandrake.

¶ *The Description.*

THe male Mandrake hath great broad long smooth leaues of a darke Greene colour, flat spread vpon the ground: among which come vp the floures of a pale whitish colour, standing euery one vpon a single small and weake foot-stalke of a whitish Greene colour: in their places grow round Apples of a yellowish colour, smooth, soft, and glittering, of a strong smell; in which are contained flat and smooth seeds in fashion of a little kidney, like those of the Thorne-apple. The root is long, thicke, whitish, diuided many times into two or three parts resembling the legs of a man, with other parts of his body adioyning thereto, as the priuy part, as it hath bene reported; whereas in truth it is no otherwise than in the roots of carrots, parseneps, and such like, forked or diuided into two or more parts, which Nature taketh no account of. There hath been many ridiculous tales brought vp of this plant, whether of old wiuers, or some runnagate Surgeons or physicke-mongers I know not, (a title bad enough for them) but sure some one or moe that sought to make themselves famous and skilfull aboue others, were the first brochiers of that error I speake of. They adde further, That it is neuer or very seldome to be found growing naturally but vnder a gallows, where the matter that hath fallen from the dead body hath giuen it the shape of a man; and the matter of a woman, the substance of a female plant, with many other such doltish dreams. They fable further and affirme, That he who would take vp a plant thereof must tie a dog therunto to pull it vp, which will giue a great shreeke at the digging vp; otherwise if a man should do it, he should surely die in short space after. Besides many fables of louing matters, too full of scurrilitie to set forth in print, which I forbear to speake of. All which dreames and old wiuers tales you shall from henceforth cast out of your books and memory; knowing this, that they are all and euerie part of them false and most vntue: for I my selfe and my seruants also haue digged vp, planted, and replanted very many, and yet neuer could either perceiue shape of man or woman, but sometimes one straight root, sometimes two, and often six or seuen branches comming from the maine great

great root, even as Nature list to bestow vpon it, as to other plants. But the idle drones that haue little or nothing to do but eate and drinke, haue bestowed some of their time in caruing the roots of Brionie, forming them to the shape of men & women: which falsifying practise hath confirmed the errour amongst the simple and vnlearned people, who haue taken them vpon their report to be the true Mandrakes.

The female Mandrake is like vnto the male, sauing that the leaues hereof be of a more swart or darke greene colour; and the fruit is long like a peare, and the other is round like an apple.

Mandragoras mas & femina.

The male and female Mandrake.

¶ *The Place.*

Mandrake groweth in hot Regions, in woods and mountaines, as in mount Garganus in Apulia, and such like places; we haue them onely planted in gardens, and are not elsewhere to be found in England.

¶ *The Time.*

They spring vp with their leaues in March, and floure in the end of Aprill: the fruit is ripe in August.

¶ *The Names.*

Mandrake is called of the Grecians *Mandragora*: of diuers, *Kaprata*, and *Circea*, of *Circe* the witch, who by art could procure loue: for it hath bene thought that the Root hereof serueth to win loue: of some, *Antropomorphos*, and *Morion*: some of the Latines haue called it *Terra malum*, and *Terrestre malum*, and *Canina malus*: Shops, and also other Nations doe receiue the Greeke name. *Dioscorides* saith, That the male is called of diuers *Morion*: and describeth also another Mandrake by the name of *Morion*, which, as much as can be gathered by the description, is like the male, but lesse in all parts: in English we call it Mandrake, Mandrage, and Mandragon.

¶ *The Temperature.*

Mandrake hath a predominate cold facultie, as *Galen* saith, that is to say cold in the third degree: but the root is cold in the fourth degree.

¶ *The Vertues.*

- A *Dioscorides* hath particularly set downe many faculties hereof; of which notwithstanding there be none proper vnto it, sauing those that depend vpon the drowisie and sleeping power thereof: which qualitie consisteth more in the root than in any other part.
- B The Apples are milder, and are reported that they may be eaten, being boyled with pepper and other hot spices.
- C *Galen* saith that the Apples are something cold and moist, and that the barke of the root is of greatest strength, and doth not onely coole, but also dry.
- D The iuyce of the leaues is very profitably put into the ointment called *Populeon*, and all cooling ointments.
- E The iuyce drawne forth of the roots dried, and taken in small quantitie, purgeth the belly exceedingly from flegme and melancholike humors.
- F It is good to be put into medicines and colliries that do mitigate the paine of the eyes; and put vnder a pessarie it draweth forth the dead childe and secondine.
- G The greene leaues stamped with barrowes grease and barley meale, coole all hot swellings and inflammations; and they haue vertue to consume apostumes and hot vlcers, being bruised and applied thereon.
- H A suppositorie made with the same iuyce, and put into the fundament causeth sleepe.
- I The wine wherein the root hath bene boyled or infused prouoketh sleepe and asswageth paine.
- K The smell of the Apples moueth to sleepe likewise; but the iuyce worketh more effectually if you take it in small quantitie.

Great

Great and strange effects are supposed to be in the Mandrakes, to cause women to be fruitfull and beare children, if they shall but carry the same neere vnto their bodies. Some doe from hence ground it, for that *Rahel* desired to haue her sisters Mandrakes (as the text is translated) but if we looke well into the circumstances which there we shall finde, we may rather deeme otherwise. Young *Ruben* brought home amiable and sweet smelling floures (for so signifieth the Hebrew word, which is vsed *Cantic. 7. 13.* in the same sense :) and the lad brought them home, rather for their beauty and smell, than for their vertue. Now in the floures of Mandrake there is no such delectable or amiable smell as was in these amiable floures which *Ruben* brought home. Besides, wee read not that *Rahel* conceived hereupon, for *Leah Jacobs* wife had foure children before God granted that blessing of fruitfulness vnto *Rahel*. And last of all (which is my chiefest reason) *Iacob* was angry with *Rahel* when she said, Giue me children else I die : and demanded of her, whether he were in the stead of God or no, who had withheld from her the fruit of her body. And we know that the Prophet *Danid* saith, Children and the fruit of the wombe are the inheritance, that commeth from the Lord, *Psalm. 127.*

Serapio, *Anicen*, and *Paulus Aegineta* doe write, that the seed and fruit of *Mandragoras* taken in drinke, doe cleanse the matrix or mother, and *Dioscorides* wrote the same long before them.

He that would know more hereof, may reade that chapter of doctor *Turner* his booke, concerning this matter, where he hath written largely and learnedly of this Simple.

CHAP. 66.

Of Henbane.

1 *Hyoscyamus Niger.*
Blacke Henbane.

2 *Hyoscyamus Albus.*
White Henbane.

¶ The Description.

THe common blacke Henbane hath great and soft stalkes : leaues very broad, soft, and woolly, somewhat iagged, especially those that grow neere vnto the ground, and those that grow vpon the stalke, narrower, smaller, and sharper. The floures are bel fashion, of a faint yellowish white, and browne within towards the bottome ; when the floures are

G g

gone

gone, there commeth hard knobby huskes, like small cups or boxes, wherein are small browne seeds.

2 The White Henbane is not much vnlike to the blacke, sauing that his leaues are smaller, whiter and more woolly, and the floures also whiter. The cods are like the other, but without pricks; it dieth in winter, and must likewise be sowne againe the next yeere.

† 3 *Hyoscyamus albus minor.*

The lesser White Henbane.

† 4 *Hyoscyamus albus Creticus.*

White Henbane of Candy.

† 3 This other white Henbane is much like the last described, but that it is lesser: the leaues smaller and rounder, hanging vpon pretty long stalkes, the floures and seed vessels are like those of the last mentioned.

4 This is softer and tenderer than the last described, the leaues also hang vpon long foot-stalkes, and are couered ouer with a soft downines: and they are somewhat broader, yet thinner and more sinuated than those of the white, and somewhat resemble the forme of a vine leafe, being snipt about the edges; the stalkes are also couered with a white downe. The floures are of a gold yellow, with a veluet coloured circle in their middles: the root is sufficiently thicke and large: *Clusius* had the figure and description of this from his friend *Iaques Plateau*, who had the plant growing of seed receiued from Candy.

5 The stalke of this growes some cubit high, being pretty stiffe, about the thickenesse of ones little finger, and couered ouer with a soft and white downe: the leaues grow disperfed vpon the stalk, not much vnlike those of the common kinde, but lesser and more diuided, and white (while they are young) couered with a slender and long downinesse: the top of the stalke is diuided into certaine branches that bend or hang downe their heads, which alternately amongst narrower, lesser and vndiuided leaues carry cups like as the common one, ending in five pretty stiffe points, in which are contained floures at first somewhat like the common kinde, but afterwards, as they grow bigger, they change into an elegant red purplish colour, with deepe coloured veines: neither is the ring or middle part purple as in the common kinde, but whitish, hauing a purplish pointall, and five threds in the middle: the seeds and seed vessels are like those of the common kind. *Clusius* receiued the seed hereof from *Paludanus* returning from his trauailes into Syria and Egypt, wherefore he calls it *Hyoscyamus Aegyptius*, Egyptian Henbane. †

¶ The

‡ 5 *Hyoscyamus flore rubello.*

Henbane with a reddish floure.

¶ The Place.

Blacke Henbane grows almost euerie where by high-ways, in the borders of fields, about dung-hills and vntoiled places; the white Henbane is not found but in the gardens of those that loue physicall plants: the which groweth in my garden, and doth sow it selfe from yeare to yeare.

¶ The Time.

They spring out of the ground in May, bring forth their floures in August, and the seed is ripe in October.

¶ The Names.

Henbane is called of the Grecians, *ὑοσῆμας* of the Latines, *Apollinaris*, and *Faba suilla*: of the Arabians, as *Pliny* saith, *Altercum*: of some, *Faba Iouis*, or *Iupiters beame*: of *Pythagoras*, *Zoroastes*, and *Apuleius* *Insana*, *Alterculum*, *Symphoniaca*, and *Calicularis*: of the Tuscans, *Fabulonia*, and *Faba lupina*: of *Matthaeus Sylvaticus*, *Dens Caballinus*, *Milimandrum*, *Castilago*: of *Iacobus à Manlijs*, *Herbapinnula*: in shops it is called *Insquiamus*, and *Hyoscyamus*: in English, Henbane in Italian, *Hyosquiamo*: in Spanish, *Veleno*: in high Dutch, *Bilsen kraut*: in French, *Hannebane*, *Endormie*: the other is called *Hyoscyamus albus*, or white Henbane.

¶ The Temperature.

These kindes of Henbane are cold in the fourth degree.

¶ The Vertues.

Henbane causeth drowinesse, and mitigateth all kinde of paine: it is good against hot and sharpe distillations of the eyes and other parts: it stayeth bleeding and the disease in women: it is applied to inflammations of the stones and other secret parts.

The leaues stamped with the ointment *Populeon*, made of poplar buds, asswageth the paine of the gout, and the swellings of the stones, and the tumors of womens breasts; and are good to be put into the same ointment, but in small quantitie

To wash the feet in the decoction of Henbane causeth sleepe, or giuen in a clister it doth the same; and also the often smelling to the floures.

The leaues, seed, and iuyce taken inwardly causeth an vnquiet sleepe like vnto the sleep of drunkenesse, which continueth long, and is deadly to the party.

The seed of white Henbane is good against the cough, the falling of waterie humours into the eyes or brest, against the inordinate flux of womens issues, and all other issues of blood; taken in the weight of ten graines, with water wherein honey hath bene sodden.

The root boyled with vineger, and the same holden hot in the mouth, easeth the paine of the teeth. The seed is vsed by Mountibanke Tooth-drawers which runne about the countrie, for to cause wormes come forth of mens teeth, by burning it in a chafing-dish with coles, the party holding his mouth ouer the fume thereof: but some crafty companions to gaine mony conuey small lute string into the water, perswading the patient that those small creeping beasts came out of his mouth or other parts which he intended to ease.

CHAP. 67. Of yellow Henbane, or English Tabaco.

Hyoscyamus luteus.
Yellow Henbane.

¶ The Description.

Yellow Henbane groweth to the height of two cubits: the stalke is thicke, fat, and Greene of colour, full of a spongy pith, and is diuided into sundry branches set with smooth and euen leaues, thick, and full of juice. The floures grow at the tops of the branches, orderly placed, of a pale yellow colour, something lesser than those of the blacke Henbane. The cups wherein the floures do stand are like, but lesser, tenderer, and without sharpe points, wherein is set the husk or cod somewhat round, full of very small seed like the seed of Marjerome. The root is small and threddy.

¶ The Place.

Yellow Henbane is sown in gardens, where it doth prosper exceedingly, insomuch that it cannot be destroyed where it hath once sown it selfe, and it is dispersed into the most parts of England.

¶ The Time.

It floureth in the Sommer moneths, and oftentimes till Autumne be farre spent, in which time the seed commeth to perfection.

¶ The Names.

Yellow Henbane is called *Hyoscyamus luteus*: of some, *Petum*, and *Petun*: of others, *Nicotiana*, of *Nicot* a Frenchman that brought the seeds from the Indies, as also the seeds of the true Tabaco, whereof this hath beene taken for a kinde; insomuch that *Lobel* hath called it *Dubius Hyoscyamus*, or doubtfull Henbane, as a plant participating of Henbane and Tabaco: and it is vsed of diuers in stead of Tabaco, and called by the same name, for that it hath beene brought from Trinidad, a place so called in the Indies, as also from Virginia and Norembega, for Tabaco; which doubtlesse taken in smoke worketh the same kinde of drunkenesse that the right Tabaco doth. ‡ Some vse to call this Nicotian, in English, being a name taken from the Latine. ‡

¶ The Nature.

This kinde of Henbane is thought of some to be cold and moist, but after *Lobel* it rather heateth than cooles at all, because of the biting taste, as also that roseninesse or gummynes it is possessed of; which is evidently perceiued both in handling and chewing it in the mouth.

¶ The Vertues.

- A** This herbe auaieth against all apostumes, tumors, inueterate vlcers, botches, and such like, being made into an vnguent or salve as followeth: Take of the Greene leaues three pounds and an halfe, stampe them very small in a stone mortar; of Oyle Oliue one quart; set them to boyle in a brasie pan or such like, vpon a gentle fire, continually stirring it vntill the herbes seem blacke, and will not boyle or bubble any more: then shall you haue an excellent Greene oyle; which being strained from the feces or drosse, put the cleare and strained oyle to the fire againe; adding thereto of wax halfe a pound, of rosen foure ounces, and of good Turpentine two ounces: melt them all together, and keepe it in pots for your vse, to cure inueterate vlcers, apostumes, burnings, Greene wounds, and all cuts and hurts in the head; wherewith I haue gotten both crownes and credit.
- B** It is vsed of some in stead of Tabaco, but to small purpose or profit, although it do stupifie and dull the senses, and cause that kinde of giddinesse that Tabaco doth, and likewise spitting; which any other herbe of hot temperature will do, as Rosemary, Time, winter Sauorie, sweet Marjerome, and such like: any of the which I like better to be taken in smoke than this kinde of doubtfull henbane.

CHAP. 68.

Of Tabaco, or Henbane of Peru.

¶ The Kindes.

There be two sorts or Kindes of Tabaco; one greater, the other lesser: the greater was brought into Europe out of the prouinces of America, which we call the West Indies; the other from Trinidad, an Island neere vnto the continent of the same Indies. Some haue added a third sort: and others make the yellow Henbane a kinde thereof.

† 1 *Hyoscyamus Peruvianus.*
Tabaco or Henbane of Peru.

† 2 *Sana Sancta Indorum.*
Tabaco of Trinidad.

¶ The Description.

1 **T**abaco, or Henbane of Peru hath very great stalkes of the bignesse of a childe's arme, growing in fertile and well dunged ground of seven or eight foot high, diuiding it selfe into sundry branches of great length; whereon are placed in most comely order very faire long leaues, broad, smooth, and sharpe pointed, soft, and of a light Greene colour, so fastened about the stalke, that they seeme to embrace and compasse it about. The floures grow at the top of the stalkes, in shape like a bell-floure, somewhat long and cornered, hollow within, of a light carnation colour, tending to whitenesse toward the brimmes. The seed is contained in long sharpe pointed cods or seed-vessels like vnto the seed of yellow Henbane, but somewhat smaller and browner of colour. The root is great, thicke, and of a woody substance, with some threddie strings annexed thereunto.

2 Trinidad Tabaco hath a thicke tough and fibrous root, from which immediately rise vp long broad leaues and smooth, of a greenish colour, lesser than those of Peru: among which riseth vp a stalke diuiding it selfe at the ground into diuers branches, whereon are set confusedly the like leaues, but lesser: at the top of the stalks stand vp long necked hollow floures of a pale purple tending to a bluish colour: after which succeed the cods or seed-vessels, including many small seeds like vnto the seed of Marjerome. The whole plant perisheth at the first approach of Winter.

‡ 3 *Tabacum minimum.*
Dwarfe Tabaco.

May, because I durst not haſard all my ſeed at one time, leſt ſome vnkindely blaſt ſhould happen after the ſowing, which might be a great enimie thereunto.

¶ The Names.

The people of America call it *Petun*: Some, as *Lobel* and *Pena*, haue giuen it theſe Latine names, *Sacra herba*, *Sancta herba*, and *Sana sancta Indorum*: and other, as *Dodonaeus*, call it *Hyoscyamus Peruvianus*, or Henbane of Peru: *Nicolaus Monardus* names it *Tabacum*. That it is *Hyoscyami ſpecies*, or a kind of Henbane, not onely the forme being like to yellow Henbane, but the qualitie alſo doth declare; for it bringeth drowſineſſe, troubleth the ſences, and maketh a man as it were drunke by taking of the ſume onely; as *Andrew Theuet* teſtifieth, (and common experience ſheweth:) of ſome it is called *Nicotiana*: the which I refer to the yellow Henbane, for diſtinctions ſake.

¶ The Temperature.

It is hot and dry, and that in the ſecond degree, as *Monardus* thinketh, and is withall of power to diſcuſſe or reſolve, and to cleaſe away filthy humors, hauing alſo a ſmall aſtriction, and a ſtupifying or benumbing qualitie, and it purgeth by the ſtoole: and *Monardus* writeth that it hath a certaine power to reſiſt poyſon. And to proue it to be of an hot temperatute, the biting qualitie of the leaues doth ſhew, which is eaſily perceiued by taſte: alſo the greene leaues laid vpon vlcers in ſinewie parts may ſerue for a prooſe of heate in this plant; becauſe they do draw out filth and corrupted matter, which a cold Simple would neuer do. The leaues likewiſe being chewed draw forth flegme and water, as doth alſo the ſume taken when the leaues are dried: which things declare that this is not a little hot; for what things ſoever, that being chewed or held in the mouth bring forth flegme and water, the ſame be all accounted hot; as the root of *Pellitorie* of Spaine, of *Saxifrage*, and other things of like power. Moreouer, the benumbing qualitie hereof is not hard to be perceiued, for vpon the taking of the ſume at the mouth there followeth an infirmitie like vnto drunkenneſſe, and many times ſleepe; as after the taking of *Opium*: which alſo ſheweth in the taſte a biting qualitie, and therefore is not without heate; which when it is chewed and

‡ 3 This third is an herbe ſome ſpanne or better long, not in face vnlike the precedent, neither defectiue in the hot and burning taſte. The floures are much leſſe than thoſe of the yellow Henbane, & of a greeniſh yellow. The leaues are ſmall, and narrower thoſe of Sage of Ieruſalem. The root is ſmall and fibrous. ‡

¶ The Place.

Theſe were firſt brought into Europe out of America, which is called the Weſt Indies, in which is the prouince or countrey of Peru: but being now planted in the gardens of Europe it proſpereth very well, and commeth from ſeed in one yeare to beare both floures and ſeed. The which I take to be better for the conſtitution of our bodies than that which is brought from India; and that growing in the Indies better for the people of the ſame Countrey: notwithstanding it is not ſo thought, nor receiued of our Tabaconiſts; for according to the Engliſh Prouerbe, Ear fetcht and deare bought is beſt for Ladies.

¶ The Time.

Tabaco muſt be ſowen in the moſt fruitfull ground that may be found, careleſly caſt abroad in the ſowing, without raking it into the ground or any ſuch paine or indurie taken as is requiſite in the ſowing of other ſeeds, as my ſelf haue found by prooſe, who haue experimented euery way to cauſe it quickly to grow: for I haue committed ſome to the earth in the end of March, ſome in Aprill, and ſome in the beginning of

and inwardly taken, it doth forthwith shew, causing a certaine heat in the chest, and yet withall troubling the wits, as *Petrus Bellonius* in his third Booke of Singularities doth declare; where also hee sheweth, that the Turkes oftentimes doe vse *Opium*, and take one dramme and a halfe thereof at one time; without any other hurt following, sauing that they are thereupon (as it were) taken with a certaine light drunkenesse. So also this Tabaco being in taste biting, and in temperature hot, hath notwithstanding a benumbing qualitie. Hereupon it seemeth to follow, that not onely this Henbane of Peru, but also the iuice of poppie otherwise called *Opium*, consisteth of diuers parts; some biting and hot, and others extreame cold, that is to say, stupifying or benumbing: if so bee that this benumbing qualitie proceed of extreme cold (as *Galen* and all the old Physicians doe hold opinion) Then should this bee cold; but if the benumbing facultie doth not depend of an extreme cold qualitie, but proceedeth of the essence of the substance; then Tabaco is not cold and benumbing; but hot and benumbing, and the latter not so much by reason of his temperature, as through the propertie of his substance; no otherwise than a purging medicine, which hath his force not from the temperature, but from the essence of the whole substance.

¶ The Vertues.

Nicolaus Monardis saith, that the leaues hereof are a remedy for the paine in the head called the Megram or Migraime that hath beene of long continuance: and also for a cold stomacke, especially in children; and that it is good against the paines in the kidneies. A

It is a present remedie for the fits of the Mother: it mitigateth the paine of the gout if it bee roasted in hot embers and applied to the grieved part. B

It is likewise a remedie for the tooth-ache, if the teeth and gums be rubbed with a linnen cloth dipped in the iuice; and afterward a round ball of the leaues laid vnto the place. C

The iuice boiled with Sugar in forme of a sirrup and inwardly taken, driueth forth wormes of the bellie; if withall a leafe be laid to the Nauell. D

The same doth likewise scoure and cleanse old and rotten vlcers, and bringeth them to perfect digestion as the same Author affirmeth. E

In the Low Countreyes it is vsed against scabbes and filthinesse of the skinne, and for the cure of wounds: but some hold opinion that it is to bee vsed but onely to hot and strong bodies: for they say that the vse is not safe in weake and old folkes: and for this cause, as it seemeth, the women in America (as *Theuet* sayth) abstayne from the hearbe *Petun* or Tabaco, and doe in no wise vse it. F

The weight of foure ounces of the iuice heereof drunke purgeth both vpwards and downwards, and procureth after a long and sound sleepe, as wee haue learned of a friend by obseruation, affirming that a strong Countreyman of a middle age, hauing a dropsie, tooke of it, and being wakened out of his sleepe, called for meat and drinke, and after that became perfectly whole. G

Moreouer the same man reported, that he had cured many countriemen of agues with the distilled water of the leaues drunke a little while before the fit. H

Likewise there is an oile to be taken out of the leaues that healeth merry-gals, kided heels and such like. I

It is good against poison, and taketh away the malignitie thereof, if the iuice be giuen to drink or the wounds made by venemous beasts be washed therewith. K

The drie leaues are vsed to be taken in a pipe set on fire and suckt into the stomacke, and thrust forth againe at the nostrils against the paines of the head, rheumes, aches in any part of the body whereof soeuer the originall proceed, whether from France, Italy, Spaine, Indies, or from our familiar and best knowne diseases: those leaues doe palliate or ease for a time, but neuer performe any cure absolutely: for although they emptie the body of humours, yet the cause of the grieve cannot be so taken away. But some haue learned this principle, that repletion requireth euacuation; that is, fulnesse craueth emptinesse, and by euacuation assure themselves of health: But this doth not take away so much with it this day, but the next bringeth with it more: As for example, a Well doth neuer yeeld such store of water as when it is most drawne and emptied. My selfe speake by prooffe, who haue cured of that infectious disease a great many; diuers of which had couered or kept vnder the sicknesse by the helpe of Tabaco as they thought, yet in the end haue beene constrained to haue vnto such an hard knot, a crabbed wedge, or else had vtterly perished. L

Some vse to drinke it (as it is tearmed) for wantonnesse or rather custome, and cannot forbear it, no not in the midst of their dinner, which kind of taking is vnwholesome and very dangerous: although to take it seldome and that Physically is to be tolerated and may do some good: but I commend the syrrip about this fume or smokie medicine. M

- N** It is taken of some physically in a pipe for that purpose once in a day at the most, and that in the morning fasting against paines in the head, stomacke, and grieve in the brest and lungs: against catarrhes and rheumes, and such as haue gotten cold and hoarsenesse.
- O** Some haue reported that it little preuaileth against an hot disease, and that it profiteth an hot complexion nothing at all: but experience hath not shewed it to bee iniurious vnto either.
- P** They that haue seene the prooffe hereof haue credibly reported, that when the Moores and Indians haue fainted either for want of food or rest, this hath bene a present remedie vnto them to supplie the one, and to helpe them to the other.
- Q** The priests and Inchanters of the hot countries do take the fume thereof vntill they be drunke, that after they haue lien for dead three or foure houres, they may tell the people what wonders, visions, or illusions they haue seene, and so giue them a propheticall direction or foretelling (if we may trust the Diuell) of the successe of their businesse.
- R** The iuice or distilled water of the first kind is very good against catarrhes, the dizziness of the head, and rheumes that fall downe the eies, against the paine called the Megram, if either you applye it vnto the temples, or take one or two greene leaues, or a dry leafe moistned in wine, and dried cunningly vpon the embers and laid thereto.
- S** It cleereth the sight and taketh away the webs and spots thereof, being annointed with the iuice bloud warme.
- T** The oile or iuice dropped into the eares is good against deafenesse, a cloth dipped in the same and laid vpon the face, taketh away the lentils, rednesse, and spots thereof.
- V** Many notable medicines are made hereof against the old and inueterate cough, against asthmaticall or pectorall griefes, which if I should set downe at large, would require a peculiar Volume.
- X** It is also giuen to such as are accustomed to swoone, and are troubled with the Collicke and windinesse, against the Dropsie, the Wormes in children, the Piles and the Sciatica.
- Y** It is vsed in outward medicines either the herbe boiled with oile, waxe, rosin and turpentine, as before is set downe in yellow Henbane, or the extraction thereof with salt, oile, balsame, the distilled water and such like, against tumours, apostumes, old vlcers, of hard curation, bitches, scabbes, stinging with nettles, carbuncles, poisoned arrowes, and wounds made with gunnes or any other weapon.
- Z** It is excellent good in burnings and scaldings with fire, water, oile, lightning, or such like, boiled with Hogges greace in forme of an Ointment, which I haue often prooued, and found most true, adding a little of the iuice of thorne apple leaues, spreading it vpon a cloth and so applying it.
- A** I doe make hereof an excellent balsame to cure deepe wounds and punctures, made by some narrow sharpe pointed weapon. Which balsame doth bring vp the flesh from the bottome verie speedily, and also heale simple cuts in the flesh according to the first intention, that is, to glew or solder the lips of the wound together, not procuring matter or corruption vnto it, as is commonly seene in the healing of wounds. The receit is this: Take oile of roses, oile of S. Johns wort, of either one pinte, the leaues of Tabaco stamped small in a stone mortar two pounds, boile them together to the consumption of the iuice, straine it and put it to the fire againe, adding thereto of Venice Turpentine two ounces, of Olibanum and masticke of either halfe an ounce, in most fine and subtil powder, the which you may at all times make an vnguent or salue by putting thereto wax and rosin to giue vnto it a stiffe body, which worketh exceeding well in maligne and virulent vlcers, as in wounds and punctures. I send this ieuell vnto you women of all sorts, especially to such as cure and helpe the poore and impotent of your Countrey without reward. But vnto the beggerly rabble of witches, charmers, and such like coufeners, that regard more to get money, than to helpe for charitie, I wish these few medicines far from their vnderstanding, and from those deceiuers whom I wish to be ignorant herein. But courteous gentlewomen, I may not for the malice that I doe beare vnto such, hide any thing from you of such importance: and therefore take one more that followeth, wherewith I haue done very many and good cures, although of small cost, but regard it not the lesse for that cause. Take the leaues of Tabaco two pound, hogges grease one pound, stampe the herbe small in a stone mortar, putting thereto a small cup full of red or claret wine, stir them well together, couer the mortar from filth and so let it rest vntill morning; then put it to the fire and let it boile gently, continually stirring it vntill the consumption of the wine; straine it, and set it to the fire againe, putting thereto the iuice of the herbe one pound, of Venice turpentine foure ounces; boile them together to the consumption of the iuice, then adde thereto of the

the roots of round *Aristolochia* or Birthwoort in most fine powder two ounces, sufficient waxe to giue it a body, the which keep for thy wounded poore neighbour, as also the old and filthy vlcers of the legs and other parts of such as haue need of helpe.

† The figures were formerly transposed.

CHAP. 69. Of Tree Nightshade.

Amomum Plinij.
Tree Nightshade.

¶ The Description.

THIS rare and pleasant Plant, called tree Nightshade, is taken of some to be a kinde of Ginnie pepper, but not rightly; of others for a kinde of Nightshade, whose iudgement and censure I gladly admit; for that it doth more fitly answer it both in the forme and nature. It groweth vp like vnto a small shrubbe or woody hedge bush, two or three cubits high, couered with a greenish barke set with many small twiggie branches, and garnished with many long leaues very Greene, like vnto those of the Peach tree. The floures are white, with a certaine yellow pricke or pointell in the middle, like vnto the floures of garden Nightshade. After which succede small round berries verie red of colour, and of the same substance with Winter Cherries, wherein are contained little flat yellow seeds. The root is compact of many small hairie yellow strings.

¶ The Place.

It groweth not wilde in these cold regions, but we haue them in our gardens, rather for pleasure than profit, or any good qualitie as yet knowne.

¶ The Time.

It is kept in pots and tubs with earth and such like in houses during the extremity of Winter, because it cannot indure the coldnesse of our colde climate, and is set abroad into the Garden in March or Aprill: it floureth in May, and the fruit is ripe in September.

¶ The Names.

Tree Nightshade is called in Latine *Solanum Arborescens*: of some, *Strychnodendron*: and some iudge it to be *Amomum* of *Plinie*: it is *Pseudocapsicum* of *Dodoneus*.

¶ The Nature and Vertues.

We haue not as yet any thing set downe as touching the temperature or vertues of this Plant, but it is referred of some to the kindes of Ginnie pepper, but without any reason at all; for Ginny pepper though it bring forth fruit very like in shape vnto this plant, yet in taste most vnlike, for that *Capsicum* or Ginny pepper is more sharpe in taste than our common pepper, and the other hath no taste of biting at all, but is like vnto the Berries of Garden Nightshade in taste, although they differ in colour: which hath moued some to call this plant red Nightshade, of the colour of the berries: and Tree Nightshade, of the woody substance which doth continue and grow from yeare to yeare: and Ginnie pepper dieth at the first approach of Winter.

CHAP.

CHAP. 70. Of Balme Apple, or Apple of Hierusalem.

1 *Balsamina mas.*

The male Balsam Apple.

2 *Balsamina femina.*

The female Balsam Apple.

The Description.

1 **T**He male Balme Apple hath long, small, and tender branches, set with leaues like those of the vine; and the like small clasping tendrels wherewith it catcheth hold of such things as do grow neere vnto it, not able by reason of his weakenesse to stand vpright without some pole or other thing to support it. The floures consist of fve small leaues of a meane bignesse, and are of a faint yellow colour: which being past, there doe come in place long Apples, something sharpe toward the point almost like an egge, rough all ouer as it were with small harmelesse prickles, red both within and without when they be ripe, and cleaue in sunder of themselues: in the Apple lieth great broad flat seeds, like those of Pompion or Citrull, but something blacke when they be withered. The root is threddie, and disperfeth it selfe far abroad in the ground.

2 The female Balm Apple doth not a little differ from the former: it bringeth forth stalks not running or climbing like the other, but a most thicke and fat truncke or stocke full of iuice, in substance like the stalks of Purslane, of a reddish color and somewhat shining. The leaues be long and narrow, in shape like those of Willow or the Peach tree, somewhat toothed or notched about the edges: among which grow the floures of an incarnate colour tending to blewnesse, hauing a small spur or taile annexed thereto as hath the Larks heele, of a faire light crimson colour: in their places come vp the fruit or Apples rough and hairy, but lesser than those of the former, yellow when they be ripe, which likewise cleaue asunder of themselues and cast abroad their seedes much like vnto Lentils, saith mine Author. But those which I haue from yeare to yeare in my Garden bring forth seed like the Cole-florey or Mustard seed; whether they be of two kindes, or the climate doe alter the shape, it resteth disputable.

¶ The Place.

These plants do prosper best in hot Regions : they are strangers in England, and doe with great labour and industrie grow in these cold Countries.

¶ The Time.

They must be sowne in the beginning of Aprill in a bed of hot horse dung, euen as Muske-Melons, Cucumbers, and such like cold fruits are; and replanted abroad from the said bed into the most hot and fertile place of the Garden at such time as they haue gotten three leaues a peece.

¶ The Names.

Diuersly hath this plant been named; some calling it by one name, and some by another, euery one as it seemed good to his fancie. *Baptista Sardus* calleth it *Balsamina Cucumerina*: others, *Vitella*, and *Charantia*, as also *Pomum Hierosolymitanum*, or Apples of Hierusalem: in English, Balme Apple: in Italian, *Caranza*: in the Germane tongue, *Balsam opffel*: in French, *Merueille*: some of the Latines haue called it *Pomum mirabile*, or maruellous Apples. It is thought to be named *Balsamina*, because the oile wherein the ripe Apples be steeped or infused, is taken to bee profitable for many things, as is *Opobalsamum*, or the liquor of the plant *Balsamum*.

The female Balsam Apple is likewise called *Balsamina*, and oftentimes in the Neuter Gender *Balsaminum*: *Gesner* chooseth rather to name it *Balsamina amygdaloides*: *Valerius Cordus*, *Balsamella*: others, *Balsamina femina*: in English, the Female Balme Apples.

¶ The Nature.

The fruit or apples hereof, as also the leaues, doe notably drie, hauing withall a certaine moderate coldnesse very neere to a meane temperature, that is after some hot, in the first, and drie in the second degree.

¶ The Vertues.

The leaues are reported to heale Greene wounds if they be bruised and laid thereon; and taken A with wine they are said to be a remedie for the collicke; and an effectuell medicine for burstings and convulsions or crampes.

The leaues of the male *Balsamina* dried in the shadow, and beaten into powder and giuen in B wine vnto those that are mortally wounded in the body, doth cure them inwardly, and helpeth also the Collicke.

The oile which is drawne forth of the fruit doth cure all Greene and fresh wounds as the true C naturall Balsam: it helpeth the crampes and convulsions, and the shrinking of sinewes, being annointed therewith.

It profiteth women that are in great extremitie of childe-birth in taking away the paine of the D matrix, causing easie deliuerance beeing applied to the place, and annointed vpon their bellies, or cast into the matrix with a syringe, and easeth the dolour of the inward parts.

It cureth the Hemorrhoides and all other paines of the fundament, being thereto applied with E lint of old clouts.

The leaues drunken in wine, heale ruptures.

I finde little or nothing written of the property or vertues of the female kinde, but that it is F G thought to draw neere vnto the first in temperament and vertue.

Oile oliue in which the fruit (the seede taken forth) is either set in the Sun, as we doe when wee H make oile of roses, or boiled in a double glasse set in hot water, or else buried in hot horse dung, taketh away inflammations that are in wounds. It doth also easily and in short time consolidate or glew them together, and perfectly cure them.

It cureth the vlcers of the dugs or paps, the head of the yard or matrix, as also the inflammation I thereof being iniected or conueied into the place with a syringe or mother pessarie.

This apple is with good successe applied vnto wounds, prickes and hurts of the sinewes. It hath K great force to cure scaldings and burnings: it taketh away scarres and blemishes, if in the meane time the powder of the leaues be taken for certaine daies together.

It is reported that such as be barren are made fruitfull herewith, if the woman first be bathed in L a fit and conuenient bath for the purpose, & the parts about the share and matrix annointed herewith, and the woman presently haue the company of her husband.

CHAP. 71. Of Ginnie or Indian Pepper.

1 *Capsicum longioribus siliquis.*
Long coddled Ginnie Pepper.

2 *Capsicum rotundioribus siliquis.*
Round coddled Ginnie Pepper.

3 *Capsicum minimis siliquis.*
Small coddled Ginnie Pepper.

4 *Capsici siliqua varia.*
Varieties of the cods of Ginnie Pepper.

¶ The Description.

1 The first of these plants hath square stalkes a foot high or somewhat more, set with many thicke and fat leaues, not vnlike to those of garden Nightshade, but narrower and sharper pointed, of a darke Greene colour. The floures grow alongst the stalkes, out of the wings of the leaues, of a white colour, hauing for the most part fine small leaues blasing out like a star, with a Greene button in the middle. After them grow the cods, Greene at the first, and when they be ripe of a braue colour glittering like red corall, in which is contained little flat seeds, of a light yellow colour, of a hot biting taste like common pepper, as is also the cod it selfe: which is long, and as big as a finger, and sharpe pointed.

2 The difference that is betweene this and the last described is small, for it consists in nothing but that the cods are pretty large and round, after the fashion of cherries, and not so long as those of the former. ‡

3 The third kinde of Ginnie pepper is like vnto the precedent in leaues, floures, and stalkes. The cods hereof are small, round, and red, very like to the berries of *Dulcamara* or woody Nightshade, both in bignesse, colour, and substance, wherein consisteth the difference: notwithstanding the seed and cods are very sharpe and biting, as those of the first kinde.

‡ *Capici siliqua varia.*

Varieties of the cods of Ginnie pepper.

¶ There are many other varieties of Ginnie pepper, which chiefly consist in the shape and colour of the cods: wherefore I thought good (and that chiefly because it is a plant that will hardly brooke our climate) only to present you with the figures of their seuerall shapes, whereof the cods of some stand or grow vpright, and other some hang downe: such as desire further information of this plant, may be abundantly satisfied in *Clusius* his *Curæposther*. from pag. 95. to pag. 108. where they shall finde these treated of at large in a treatise written in Italian by *Gregory de Regio*, a Capuchine Fryer, and sent to *Clusius*, who translating it into Latine, left it to be set forth with other his obseruations, which was performed 2. yeares after his death, to wit *Anno Domini 1611*. The figures we here giue are the same which are in that tractate. ‡

¶ The Place.

These plants are brought from forrein countries, as Ginnie, India, and those parts, into Spaine

and Italy: from whence we haue receiued seed for our English gardens, where they come to fruit-bearing: but the cod doth not come to that bright red colour which naturally it is possessed with, which hath happened by reason of these vnkindly yeeres that are past: but we expect better when God shall send vs a hot and temperate yeere.

¶ The Time.

The seeds hereof must be sown in a bed of hot horse-dung, as muske-Melons are, and remooued into a pot when they haue gotten three or foure leaues, that it may the more conueniently be caried from place to place to receiue the heate of the sunne: and are toward Autumne to be caried into some house, to auoide the iniurie of the cold nights of that time of the yeere, when it is to beare his fruite.

¶ The Names.

Actuarius calleth it in Greeke *καπσίον*: in Latine, *Capiscum*: and it is thought to be that which *Auicenna* nameth *Zinziber caninum*, or dogs Ginger: and *Pliny*, *Siliquastrum*, which is more like in taste to pepper than is *Panax*, and it is therefore called *Piperitis*, as he hath written in his 19. booke, 12. chap. *Panax* (saith he) hath the tast of pepper and *Siliquastrum*, for which cause it is called *Piperitis*. The later Herbarists do oftentimes call it *Piper Indianum*, or *Indicum*, sometimes *Piper Calicutium*, or *Piper Hispanicum*: in English it is called Ginnie pepper, and Indian pepper: in the Germane tongue, *Indianischer Pfeffer*: in low Dutch, *Bresilie Peper*: in French, *Poiure d'Inde*, verie well knowne in the shops at Billingsgate by the name of Ginnie pepper, where it is vsually to be bought.

¶ The Temperature.

Ginnie pepper is extreame hot and drie euen in the fourth degree: that is to say, far hotter and drier then *Auicenna* sheweth dogs ginger to be.

¶ The Vertues.

- A Ginnie pepper hath the taste of pepper, but not the power or vertue, notwithstanding in Spaine and fundrie parts of the Indies they do vse to dresse their meate therewith, as we doe with Calicut pepper: but (saith my Authour) it hath in it a malicious qualitie, whereby it is an enemy to the liuer and other of the entrails. *Auicenna* writeth that it killeth dogs.
- B It is said to die or colour like Saffron; and being receiued in such sort as Saffron is vsually taken, it warmeth the stomacke, and helpeth greatly the digestion of meates.
- C It dissolueth the swellings about the throat called the Kings Euill, as kernels and cold swellings; and taketh away spots and lentiles from the face, being applied thereto with honie.

C H A P. 72. Of horned Poppie.

¶ The Description.

THe yellow horned Poppie hath whitish leaues very much cut or jagged, somewhat like the leaues of garden Poppie, but rougher and more hairie. The stalks be long, round, and brittle. The floures be large and yellow, consisting of foure leaues; which being past, there come long huskes or cods, crooked like an horne or cornet, wherein is contained small blacke seede. The roote is great, thicke, scalie, and rough, continuing long.

The second kinde of horned Poppie is much slenderer and lesser than the precedent, and hath leaues with like deepe cuts as Rocket hath, and something hairie. The stalks be very slender, brittle, and branched into diuers armes or wings; the floures small, made of foure little leaues, of a red colour, with a small strake of blacke toward the bottome, after which commeth the seed, inclosed in slender, long, crooked cods full of blackish seed. The root is small and single, and dieth euery yeere.

This is much like the last described, and according to *Clusius*, rather a variety than difference. It is distinguished from the last mentioned by the smoothnes of the leaues, and the colour of the floures, which are of a pale yellowish red, both which accidents *Clusius* affirms happen to the former, towards the later end of sommer.

There is another sort of horned Poppie altogether lesser than the last described, hauing tenderer leaues, cut into fine little parcels: the floure is likewise lesser, of a blew purple colour like the double Violets

¶ The

1 *Papaver cornutum flore luteo.*
Yellow horned Poppie.

2 *Papaver cornutum flore rubro.*
Red horned Poppie.

3 *Papaver corniculatum phæniceum glabrum.*
Red horned Poppie with smooth leaues.

4 *Papaver cornutum flore violaceo.*
Violet coloured horned Poppie.

¶ The Place.

The yellow horned Poppie groweth vpon the sands and banks of the sea : I haue found it growing neere vnto Rie in Kent, in the Iles of Shepey and Thanet, at Lee in Essex, at Harwich, at Whitstable, and many other places alongst the English coast.

The second groweth not wilde in England. *Angelus Palea*, and *Bartholomaeus ab Vrbe-veterum*, who haue commented vpon *Mesue*, write that they found this red horned Poppie in the kingdomes of Arragon and Castile in Spaine, and the fields neere vnto common paths. They doe grow in my Garden very plentifully.

¶ The Time.

They floure from May to the end of August.

¶ The Names.

Most Writers haue taken horned Poppie, especially that with red floures to be *Glaucium* : neither is this their opinion altogether vnprobable ; for as *Dioscorides* saith, *Glaucium* hath leaues like those of horned Poppey, but *ἡμικύβητος*, that is to say fatter, *χαμύβητος*, low, or lying on the ground, of a strong smell and of a bitter taste; the iuice also is much like in colour to Saffron. Now *Lobel* and *Pena* witnesse, that this horned Poppie hath the same kinde of iuice, as my selfe likewise can testifie. *Dioscorides* saith that *Glaucium* groweth about Hierapolis, a citie in Syria ; but what hindereth that it should not bee found also somewhere else? These things shew it hath a great affinity with *Glaucium*, if it be not the true and legitimate *Glaucium* of *Dioscorides*. Howbeit the first is the *Mecon Ceratites*, or *Papauer corniculatum* of the Antients, by the common consent of all late Writers : in English, Sea Poppie[†] and Horned Poppie : in Dutch, *Geelheul* and *Horne Heule* : in the Germane Tongue, *Gelbomag*; in French, *Pauot Cornu* : in Spanish, *Dormidera marina*.

¶ The Nature.

Horned Poppies are hot and drie in the third degree.

¶ The Vertues.

- A The root of horned Poppie boiled in water vnto the consumption of the one halfe, and drunke, prouoketh vrine, and openeth the stopping of the liuer.
- B The seed taken in the quantitie of a spoonefull looseth the belly gently.
- C The iuice mixed with meale and honie, mundifieth old rotten and filthie vlcers.
- D The leaues and floures put into vnguents or salues appropriate for greene wounds, digest them that is, bring them to white matter, with perfect quittance or sanies.

[†] The figure that formerly was in the fourth place of this chap. vnder the title of *Papauer corniculatum luteum minus*, was of a Bindweed called by *Clasius*, *Convolvulus*, fol. *Alba*. You shall finde it hereafter in the due place. The Description as far as I can iudge was of the *Cuminum carniculatum* which was pag. 909.

CHAP. 73. Of Garden Poppies.

¶ The Description.

1 The leaues of white Poppie are long, broad, smooth, longer than the leaues of Lettuce, whiter, and cut in the edges : the stem or stalke is straight and brittle, oftentimes a yard and a halfe high : on the top whereof grow white floures, in which at the very beginning appeareth a small head, accompanied with a number of threds or chiues, which being full growne is round, and yet something long withall, and hath a couer or cownet vpon the top; it is with many filmes or thin skins diuided into coffers or seuerall partitions, in which is contained abundance of small round and whitish seed. The root groweth deepe, and is of no estimation nor continuance.

2 Like vnto this is the blacke garden Poppie, sauing that the floures are not so white and shining, but vsually red, or at least spotted or straked with some lines of purple. The leaues are greater, more iagged, and sharper pointed. The seed is likewise blacker, which maketh the difference.

3 There is also another garden Poppie whose leaues are much more sinuated, or crested, and the floure also is all iagged or finely cut about the edges, and of this sort there is also both blacke and white. The floures of the blacke are red, and the seed blacke; and the other hath both the floures and seed white.

4 There are diuers varieties of double Poppies of both these kindes, and their colours are commonly either white, red, darke purple, scarlet, or mixt of some of these. They differ from the former onely in the doublenesse of their floures.

1 *Papaver sativum album.*
White garden Poppie.

2 *Papaver sativum nigrum.*
Blacke Garden Poppie.

3 *Papaver fimbriatum album.*
White iagged Poppie.

4 *Papaver flo. multipl. albo & nigro.*
The double white and blacke Poppie.

5 There is also another kinde of Poppie which oft times is found wilde; the stalkes, leaues floures, and heads are like, but lesse than those of the precedent: the floures are of an ouerworn blewish purple color; after which follow heads short and round, which vnder their couer or crowne haue little holes by which the seed may fall out; contrarie to the heads of the former, which are close and open not of themselves. There is also a double one of this kinde. ‡

¶ The Place.

These kinde of Poppies are sowne in gardens, & do afterward come of the fallings of their seed.

¶ The Time.

They floure most commonly in Iune. The seed is perfected in Iuly and August.

‡ 5 *Papauer sylvestre.*
Wilde Poppie.

¶ The Names.

Poppie is called of the Græcians *πικνον*: of the Latines, *Papauer*: the shops keepe the Latine name: it is called in high Dutch, *Magflamen*; in low Dutch, *Hu- el* and *Mancop*; in English, Poppie & Cheesebowls: in French, *Pauot*, and *Oliette*, by the Wallons.

The garden Poppie which hath blacke seeds, is sur- named of *Dioscorides* *επιον*, or wilde, and is as hee saith called *πικνις*, because *Opium* flowes from it: of *Pliny* and of the Latines, *Papauer nigrum*: whereof there be ma- ny variable colours, and of great beautie, although of euill smell, whereupon our gentlewomen doe call it Ione Siluer pin.

¶ The Temperature.

All the Poppies are cold, as *Galen* testifieth in his booke of the Faculties of simple medicines.

¶ The Vertues.

This seed, as *Galen* saith in his booke of the Facul- ties of nourishments, is good to season bread with; but the white is better than the black. He also addeth, that the same is cold and causeth sleepe, and yeeldeth no commendable nourishment to the body; it is often v- sed in comfits, serued at the table with other iun- ketting dishes.

The oile which is pressed out of it is pleasant and delightfull to be eaten, and is taken with bread or any other waies in meat, without any sence of cooling.

A greater force is in the knobs or heads, which doe specially preuaile to mooue sleepe, and to stay and re- presse distillations or rheums, and come neere in force

to *Opium*, but more gentle. *Opium* or the condensed iuice of Poppie heads is strongest of all: *Me- conium* (which is the iuice of the heads and leaues) is weaker. Both of them any waies taken either inwardly, or outwardly applied to the head, prouoke sleepe. *Opium* somewhat too plentifully taken doth also bring death, as *Plinie* truely writeth.

D It mitigateth all kinde of paines: but it leaueth behinde it oftentimes a mischiefe worse than the disease it selfe, and that hard to be cured, as a dead palsie and such like.

E The vse of it, as *Galen* in his 11. booke of medicines according to the places affected, saith, is so offenseue to the firme and solide parts of the body, as that they had need afterwards to be restored.

F So also colliries or eie medicines made with *Opium* haue beene hurtfull to many; insomuch that they haue weakned the eies and dulled the sight of those that haue vsed it: whatsoeuer is com- pounded of *Opium* to mittigate the extreeme paines of the eares bringeth hardnesse of hearing. Wherefore all those medicines and compounds are to bee shunned that are to be made of *Opium*, and are not to be vsed but in extreme necessitie; and that it is, when no other mitigater or asswager of paine doth any thing preuaile, as *Galen* in his third booke of Medicines, according to the places affected, doth euidently declare.

G The leaues of poppie boiled in water with a little sugar and drunke, causeth sleep: or if it be boi- led without sugar, and the head, feet, and temples bathed therewith, it doth effect the same.

H The heads of Poppie boiled in water with sugar to a sirrup causeth sleepe, and is good against rheumes and catarrhes that distill & fal downe from the brain into the lungs, & easeth the cough.

I The greene knobs of Poppie stamped with barley meale, and a little barrowes grease, helpeth S. Anthonies fire, called *Ignis sacer*.

The leaues, knops and seed stamped with vineger, womans milke, and saffron, cureth an *Erysipe- K*
las, (another kinde of S. Anthonies fire, and easeth the gout mightily, and put in the fundamient
 as a clister causeth sleepe.

The seed of black Poppy drunke in wine stoppeth the flux of the belly, and the ouermuch flow- L
 ing of womens sicknesse.

A Caudle made of the seeds of white poppy, or made into Almond milk, and so giuen causeth M
 sleepe.

† It is manifest that this wilde Poppy (which I haue described in the fifth place) is that of N
 which the composition *Diacodium* is to be made; as *Galen* hath at large treated in his seuenth
 booke of Medicines, according to the places affected. *Crito* also, and after him *Themison* and *De-
 mocrates* do appoint *zmm*, or the wilde Poppy, to be in the same composition; and euen that same
Democritus addeth, that it should be that which is not sowed: and such an one is this, which grow-
 eth without sowing. *Dod.*

CHAP. 74. Of Corne-Rose, or wilde Poppy.

1 *Papauer Rhæas.*

Red Poppy, or Corne-rose.

‡ 4 *Papauer spinosum.*

Prickly Poppy.

¶ The Description.

1 THE stalkes of red Poppy be blacke, tender, and brittle, somewhat hairy: the leaues are
 cut round about with deepe gashes like those of Succory or wilde Rocket: the floures
 grow forth at the tops of the stalks, being of a beautifull and gallant red colour, with
 blackish threds compassing about the middle part of the head: which being fully growne, is lesser
 than that of the garden Poppy: the seed is small and blacke.

† 2 There is also a kinde hereof in all points agreeing with the former, sauing that the
 floures of this are very double and beautifull, and therein only consists the difference. †

‡ 3 There

† 3 There is a small kinde of red Poppy growing commonly wilde together with the first described, which is lesser in all parts, and the floures are of a fainter or ouerworne red, inclining somewhat to orange.

† 4 Besides these there is another rare plant, which all men, and that very fitly, haue referred to the kindes of Poppy. This hath a slender long and fibrous root, from which arises a stalke some cubit high, diuided into sundry branches, round, crested, prickly, and full of a white pith. The leaues are diuided after the maner of horned poppy, smooth, with white veins & prickly edges: the floure is yellow, and consists of foure or fise leaues; after which succeeds a longish head, being either foure, fise, or six cornered, hauing many yellow threds incompassing it: the head whilst it is tender is reddish at the top, but being ripe it is blacke, and it is set with many and stiffe pricks. The seed is round, blacke, and pointed, being six times as big as that of the ordinary Poppy. †

¶ The Place.

They grow in earable grounds, among wheat, spelt, rie, barley, otes, and other graine, and in the borders of fields. † The double red, and prickly Poppy are not to be found in this kingdome, vnlesse in the gardens of some prime herbarists. †

¶ The Time.

The fields are garnished and ouerspred with these wilde poppies in Iune and August.

¶ The Names.

† Wilde Poppy is called in Greeke of *Dioscorides*, *ρῑκνῑς*: in Latine, *Papauer erraticum*: *Gaza* according to the Greeke nameth it *Papauer fluidum*: as also *Lobel*, who calls it *Pap. Rhæas*, because the floure thereof soone falleth away. Which name *Rhæas* may for the same cause be common, not onely to these, but also to the others, if it be so called of the speedy falling of the floures: but if it be syrnamed *Rhæas* of the falling away of the seed (as it appeareth) then shall it be proper to that which is described in the fifth place in the foregoing chapter, out of whose heads the seed easily and quickly falls; as it doth also out of this, yet lesse manifestly. They name it in French *Cocquelicot*, *Confanons*, *Pauot sauvage*: in Dutch, *Collen bloemen*, *Cozen rosen*: in high Dutch, *Klapper Rossen*: in English, Red Poppy, and Corne-rose.

† 4 Some haue called this *Ficus infernalis*, from the Italian name *Figo del inferno*. But *Clusius* and *Bauhine* haue termed it *Papauer spinosum*: and the later of them would haue it (and that not without good reason) to be *Glaucium* of *Dioscorides*, lib. 3. cap. 100. And I also probably coniecture it to be the *Hippomanes* of *Cræteas*, mentioned by the Greeke Scholiast of *Theocritus*, as I haue formerly briefly declared Chap. 62. †

¶ The Nature.

The facultie of the wilde poppies is like to that of the other poppies; that is to say cold, and causing sleepe.

¶ The Vertues.

A Most men being led rather by false experiments than reason, commend the floures against the Pleurisie, giuing to drinke as soone as the paine commeth, either the distilled water, or syrrup made by often infusing the leaues. And yet many times it happeneth that the paine ceaseth by that meanes, though hardly sometimes, by reason that the spittle commeth vp hardly, and with more difficultie, especially in those that are weake, and haue not a strong constitution of body. *Baptista Sardus* might be counted the Author of this error; who hath written, That most men haue giuen the floures of this poppy against the paine of the sides, and that it is good against the spitting of bloud.

CHAP. 75. Of Bastard wilde Poppy.

¶ The Description.

THe first of these bastard wilde Poppies hath slender weake stemmes a foot high, rough and hairy, set with leaues not vnlike to those of Rocket, made of many small leaues deeply cut or iagged about the edges. The floures grow at the top of the stalkes, of a red colour, with some small blacknesse toward the bottome. The seed is small, contained in little round knobs. The seed is small and threddy.

2 The second is like the first, sauing that the cods hereof be long, and the other more round, wherein the difference doth consist.

¶ The Place.

These plants do grow in the corne fields in Somersetshire, and by the hedges and high-ways, as ye trauell from London to Bathe. *Lobel* found it growing in the next field vnto a village in Kent called

called Southfleet, my selfe being in his company, of purpose to discover some strange plants not hitherto written of.

‡ M^r. Robert Lorkin and I found both these growing in Chelsey fields, as also in those belonging to Hamersmith: but the shorter headed one is a floure of a more elegant colour, and not so plentifull as the other. ‡

1 *Argemone capitulo torulo.*
Bastard wilde Poppy.

2 *Argemone capitulo longiore.*
Long codded wilde Poppy.

¶ The Time.

They floure in the beginning of August, and their seed is ripe at the end thereof.

¶ The Names.

The bastard wilde Poppy is called in Greeke *Argemone*: in Latine, *Argemone*, *Argemonia*, *Concordia*, *Concordalis*, and *Herba liburnica*: of some, *Pergalium*, *Arsela*, and *Sacrocolla Herba*: in English, *Wind-rose*, and *bastard wilde poppy*.

¶ The Temperature.

They are hot and dry in the third degree.

¶ The Vertues.

The leaues stamped, and the iuyce dropped into the eyes easeth the inflammation thereof; and cureth the disease of the eye called *Argema*, whereof it tooke his name: which disease when it happeneth on the blacke of the eye it appears white, and contrariwise when it is in the white then it appeareth blacke of colour.

The leaues stamped and bound vnto the eyes or face that are blacke or blew by meanes of some blow or stripe, doth perfectly take it away. The dry herbe steeped in warme water worketh the like effect.

The leaues and roots stamped, and the iuyce giuen in drinke, helpeth the wringings or gripings of the belly. The dry herbe infused in warme water doth the same effectually.

The herbe stamped, cureth any wound, vicer, canker, or fistula, being made vp into an vnguent or salve, with oile, wax, and a little turpentine.

The iuyce taken in the weight of two drammes, with wine, mightily expelleth poyson or venome.

The

F The iuyce taketh away warts if they be rubbed therewith; and being taken in meate it helps the milt or spleene if it be wasted.

CHAP. 76.

Of Winde-floures.

¶ The Kindes.

THe stocke or kindred of the *Anemones* or Winde-floures, especially in their varieties of colours, are without number, or at the least not sufficiently knowne vnto any one that hath written of plants. For *Dodonæus* hath set forth fīue sorts; *Lobel* eight; *Tabernamontanus* ten: My selfe haue in my garden twelue different sorts: and yet I do heare of diuers more differing very notably from any of these; which I haue briefly touched, though not figured, every new yeare bringing with it new and strange Kindes; and euery countrey his peculiar plants of this sort, which are sent vnto vs from far countries, in hope to receiue from vs such as our countrey yeeldeth.

1 *Anemone tuberosa radice.*
Purple Winde-floure.

2 *Anemone coccinea multiplex.*
Double Skarlet Winde-floure.

¶ The Description.

THe first kinde of *Anemone* or Winde-floure hath small leaues very much snipt or iagged almost like vnto Camomile, or Adonis floure: among which riseth vp a stalke bare or naked almost vnto the top; at which place is set two or three leaues like the other: and at the top of the stalke commeth forth a faire and beautifull floure compact of seuen leaues, and sometimes eight, of a violet colour tending to purple. It is impossible to describe the colour in his full perfection, considering the variable mixtures. The root is tuberous or knobby, and very brittle.

3 *Anemone maxima Chalcedonica polyanthos.*
The great double Winde-floure of Bithynia.

4 *Anemone Chalcedonica simplici flore.*
The single Winde-floure of Bithynia.

5 *Anemone Bulbocastani radice.*
Chesnut Winde-floure.

2 The second kind of *Anemone* hath leaues like to the precedent, inso much that it is hard to distinguish the one from the other but by the floures onely: for those of this plant are of a most bright and faire skarlet colour, and as double as the Marigold; and the other not so. The root is knobby and very brittle, as is the former.

3 The great *Anemone* hath double floures, vsually called the *Anemone* of Chalcedon (which is a city in Bithynia) and great broad leaues deeply cut in the edges, not vnlike to those of the field Crow-foot, of an ouerworne greene colour: amongst which riseth vp a naked bare stalke almost vnto the top, where there stand two or three leaues in shape like the others, but lesser; sometimes changed into reddish stripes, confusedly mixed here and there in the said leaues. On the top of the stalke standeth a most gallant floure very double, of a perfect red colour, the which is sometimes striped amongst the red with a little line or two of yellow in the middle; from which middle commeth forth many blackish thrums. The seed is not to be found that I could euer obserue, but is carried away with the winde. The root is thicke and knobby.

4 The fourth agreeth with the first kind of *Anemone*, in roots, leaues, stalks, and shape of floures, differing in that, that this plant bringeth forth faire single red floures, and the other of a violet colour, as aforesaid.

5 The fifth sort of *Anemone* hath many small iagged leaues like those of Coriander, proceeding from a knobby root resembling the root of *Bulbocastanum* or earth Chesnut. The stalke rises vp amongst the leaues of two hands high, bearing at the top a single floure, consisting of a pale or border of little purple leaues, sometimes red, and often of a white colour set about a blackish pointall, thrummed ouer with many small blackish haire.

6 *Anemone latifolia* Clusij.
Broad leaued Winde-floure.

7 *Anemone latifolia duplofloro* flore.
The double yellow wind-floure.

6 The sixt hath very broad leaues in respect of all the rest of the *Anemones*, not vnlike to those of the common Mallow, but greene on the vpper part, and tending to rednesse vnderneath, like the leaues of Sow-bread. The stalke is like that of the last described, on the top whereof growes a faire yellow star-floure, with a head ingirt with yellow thrums. The root (saith my Author) is a finger long, thicke and knobby.

7 There is also another whose lower leaues resemble those of the last described, yet those which grow next above them are more diuided or cut in: amongst these leaues, riseth vp a stalke
some

8 *Anemone Geraniifolia.*
Storkes bill Winde-floure.

10 *Anemone trifolia.*
Three leaved Winde-floure.

9 *Anemone Matthioli.*
Matthiols white Winde-floure.

11 *Anemone Papaveracea.*
Poppy Winde-floure.

some foot high, the top whereof is adorned with a floure consisting of two ranks of leaues, whereof those on the outside are larger, rounder pointed, and sometimes snipt in a little; the rest are narrower and sharper pointed: the colour of these leaues is yellow, deeper on the inside, and on the outside there are some small purple veines running alongst these leaues of the floure. The root is some two inches long, the thickenesse of ones little finger, with some tuberous knobs hanging thereat ‡

8 The eighth hath many large leaues deeply cut or iagged, in shape like those of the Storks bill or Pinke-needle; among which riseth vp a naked stalke, set about toward the top with the like leaues, but smaller and more finely cut, bearing at the top of the stalke a single floure consisting of many small blew leaues, which do change sometimes into purple, and oftentimes into white, set about a blackish pointall, with some small threds like vnto a pale or border. The root is thick and knobby.

9 The ninth sort of Anemone hath leaues like vnto the garden Crow-foot: the stalke riseth vp from amongst the leaues, of a foot high, bearing at the top faire white floures made of five small leaues; in the middle whereof are many little yellow chiues or threds. The root is made of many slender threds or strings, contrarie to all the rest of the Winde-floures.

10 The tenth sort of Anemone hath many leaues like vnto the common meadow Trefoile, sleightly snipt about the edges like a saw: on the top of the slender stalkes standeth a single white floure tending to purple, consisting of eight small leaues, resembling in shape the floures of common field Crow-foot. The root is knobby, with certaine strings fastned thereto.

11 The eleuenth kinde of Anemone hath many iagged leaues cut euen to the middle rib, resembling the leaues of *Geranium Columbinum*, or Doves foot. The leaues that do embrace the tender weake stalkes are flat and sleightly cut: the floures grow at the top of the stalkes, of a bright shining purple colour, set about a blackish pointall, with small thrums or chiues like a pale. The root is knobby, thicke, and very brittle, as are most of those of the Anemones.

¶ The Place.

All the sorts of Anemones are strangers, and not found growing wilde in England; notwithstanding all and euery sort of them do grow in my garden very plentifully.

¶ The Time.

They do floure from the beginning of Ianuarie to the end of Aprill, at what time the floures do fade, and the seed flieth away with the winde, if there be any seed at all; the which I could neuer as yet obserue.

¶ The Names.

Anemone, or Winde floure is so called, *ἄνεμος αἰλίαν*; that is to say, of the winde; for the floure doth neuer open it selfe but when the winde doth blow, as *Pliny* writeth: whereupon also it is named of diuers *Herba venti*: in English, Winde-floure.

Those with double floures are called in the Turky tongue *Giul*, and *Gul Catamer*: and those with small iagged leaues and double floures are called *Lalé ben-zede*, and *Galipoli lalé*. They do call those with small iagged leaues and single floures *BiniZate & binizade*, and *BiniZante*.

¶ The Temperature.

All the kindes of Anemones are sharpe, biting the tongue, and of a binding qualitie.

¶ The Vertues.

- A The leaues stamped, and the iuyce snipped vp into the nose purgeth the head mightily.
- B The root champed or chewed procureth spitting, and causeth water and flegme to run forth out of the mouth, as Pellitorie of Spaine doth.
- C It profiteth in collyries for the eyes, to cease the inflammation thereof.
- D The iuyce mundifieth and clenseth maligne, virulent, and corrosiue vlcers.
- E The leaues and stalkes boyled and eaten of Nurses cause them to haue much milke: it prouoketh the termes, and easeth the leprosie, being bathed therewith.

‡ CHAP. 77. Of diuers other Anemones, or Winde-floures.

¶ The Kindes.

‡ These floures which are in such esteeme for their beauty may well be diuided into two sorts, that is, the *Latifolia*, or broad leaued, and the *Tenuifolia*, or narrow leaued: now of each of these sorts there are infinite varieties, which consist in the singlenesse and doubleness of the floures, and in their diuersitie of colours, which would aske a large discourse to handle exactly. Wherefore I onely intend (besides those set downe by our Authour) to giue you the figures

figures of some few others, with their description, briefly taken out of the Workes of the learned and diligent Herbarist *Carolus Clusius*; where such as desire further discourse vpon this subiect may be abundantly satisfied: and such as do not vnderstand Latine may finde as large satisfaction in the late Worke of Mr. *John Parkinson*; whereas they shall not onely haue their historie at large, but also learne the way to raise them of seed, which hath been a thing not long knowne (except to some few;) and thence hath risen this great varietie of these floures, wherewith some gardens so much abound.

¶ The Description.

1 **T**He root of this is like to that of the great double red *Anemone* described in the third place of the precedent chapter; and the leaues also are like, but lesser and deeper coloured. The stalke growes some foot high, slender and greene, at the top whereof groweth a single floure, consisting of eight leaues of a bright shining skarlet colour on the inside, with a paler coloured ring incompassing a hairy head set about with purple thrums; the outside of the floure is hairy or downie. This is *Anem. latifol. simpl. flo. 16. of Clusius*.

‡ 1 *Anemone latifolia flore coccineo.*

The broad leaued skarlet Anemone.

‡ 2 *Anemone latifolia flore magno coccineo.*

The skarlet Anemone with the large floure.

2 This in shape of roots & leaues is like the former, but the leaues are blacker, and more shining on their vpper sides: the stalke also is like to others of this kinde, and at the top carrieth a large floure consisting of eight broad leaues, being on the inside of a bright skarlet colour, without any circle; and the thrums that ingirt the hairy head are of a sanguine colour. This head (as in others of this kindred) growes larger after the falling of the floure, and at length turns into a downie substance, wherein a smooth blacke seed is inclosed like as in other *Anemones*; which sown as soone as it is ripe vsually comes vp before winter. This is *Anem. latifol. simpl. flore 17. of Clusius*.

3 This differs not from the former but in floures, which are of an orange-tawny colour, like that of *Corne-rose*, or red *Poppy*; and the bottomes of the leaues of the floures are of a paler colour, which make a ring or circle about the hairy head. This is the eighteenth of *Clusius*.

Besides these varieties here mentioned, there are many others, which in the colour of the leaues of the floure, or the nailes which make a circle at the bottome thereof, doe differ each from other. Now let vs come to the narrow leaued ones, which also differ little but in colour of their floures.

‡ 3 *Anemone latifolia Byzantina.*
The broad leaved Anemone of Constantinople.

‡ 4 *Anemone tenuifolia flore amplo sanguineo.*
Small leaved Anemone with the sanguine
floure.

‡ 5 *Anemone tenuifolia flore coccineo.*
The small leaved skarlet Anemone.

‡ 6 *Anemone tenuifol. flo. dilute purpureo.*
The light purple small leaved Anemone.

‡ 7 *Anemone tenuifol. flo. exalbido.*
The whitish small leaved Anemone.

‡ 8 *Anemone tenuifolia flo. carneo striato.*
The striped flesh-coloured Anemone.

‡ 9 *Anemone tenuifol. flo. pleno coccin.*
The small leaved double crimson Anemone.

‡ 10 *Anemone tenuifol. flo. pleno atropurpurascen.*
The double darke purple Anemone.

4 The root of this is knotty and tuberous like those of other Anemones, and the leaues are much diuided and cut in like to those of the first described in the former Chapter: the stalke (which hath three or foure leaues ingirting it, as in all other Anemones) at the top sustaineth a faire sanguine floure consisting of six large leaues with great white nailes. The seeds are contained in downie heads like as those of the former. This is *Anem. tenuifol. simpl. flo. 6.* of *Clusius*.

5 This differs from the former in the floure, which consists of six leaues made somewhat rounder than those of the precedent: their colour is betweene a skarlet and sanguine. And there is a varietie hereof also of a bricke colour. This is the eighth of *Clusius*.

6 This differs from the rest, in that the floure is composed of some fourteene or more leaues, and these of a light purple, or flesh-colour. This is the ninth of *Clusius*.

7 The floure of this is large, consisting of six leaues, being at the first of a whitish Greene, and then tending to a flesh colour, with their nailes Greene on the outside, and white within, and the threds in the middle of a flesh colour. There is a lesser of this kinde, with the floure of a flesh colour, and white on the outside, and wholly white within, with the nailes greenish. These are the tenth and eleuenth of *Clusius*.

8 This floure also consists of six leaues of a flesh colour, with whitish edges on the outside; the inside is whitish, with flesh coloured veines running to the middest thereof.

Besides these single kinds there are diuers double both of the broad and narrow leaued Anemones, whereof I will only describe and figure two, and refer you to the forementioned Authors for the rest, which differ from these onely in colour.

9 This broad leaued double Anemonie hath roots, stalkes, and leaues like those of the single ones of this kinde, and at the top of the stalke there stands a faire large floure composed of two or three rankes of leaues, small and long, being of a kinde of skarlet or orange-tawny colour; the bottomes of these leaues make a whitish circle, which giues a great beauty to the floure, and the downie head is ingirt with sanguine threds tipt with blew. This is the *Pano major 1.* of *Clusius*.

10 This in shape of roots, leaues, and stalkes resembles the formerly described narrow leaued Anemones, but the floure is much different from them; for it consists first of diuers broad leaues, which incompasse a great number of smaller narrow leaues, which together make a very faire and beautifull floure: the outer leaues hereof are red, and the inner leaues of a purple Veluet colour.

Of this kinde there are diuers varieties, as the double white, crimson, bluish, purple, blew, carnation, rose-coloured, &c.

¶ The Place and Time.

These are onely to be found in gardens, and bring forth their floures in the Spring.

¶ Their Names.

I iudge it no waies pertinent to set downe more of the names than is already deliuered in their feuerall titles and descriptions.

¶ Their Temper and Vertues.

A These are of a hot and biting facultie, and not (that I know of) at this day vsed in medicines, vnlesse in some one or two ointments: yet they were of more vse amongst the Greeke Physitions, who much commend the iuyce of them for taking away the scares and scales which grow on the eyes; and by them are called *ελας*, and *Δουκώματα*.

B *Trallianus* also saith, That the floures beaten in oyle, and so anointed, cause haire to grow where it is deficient.

The vertues set downe in the former Chapter do also belong to these here treated of, as these here deliuered are also proper to them. ‡

CHAP. 78. Of wilde Anemones, or Winde-floures.

¶ The Kindes.

L Ike as there be many and diuers sorts of the garden Anemones, so are there of the wild kinds also, which do vary especially in their floures.

¶ The

1 *Anemone nemorum lutea.*

Yellow wilde Winde floure.

2 *Anemone nemorum alba.*

White winde floure.

3 *Anemone nemorum flo. pleno albo.*

The double white wood Anemone.

4 *Anemone nemorum flo. pleno purpurascens.*

The double purplish wood Anemone.

¶ The description.

1 The first of these wilde *Anemones* hath iagged leaues deeply cut or indented, which do grow vpon the middle part of a weake and tender stalke: at the top whereof doth stand a prettie yellow floure made of six small leaues, and in the middle of the floure there is a little blackish pointell, and certaine slender chiues or threds. The root is small, somewhat knottie and very brittle.

2 The second hath iagged leaues, not vnlike to water Crowfoot or mountaine Crowfoot. The flower groweth at the top of the stalke not vnlike to the precedent in shape, sauing that this is of a milke white colour, the root is like the other.

‡ There is also of this single kinde two other varieties, the one with a purple floure, which wee may therefore call *Anemone nemorum purpurea*, the wilde purple Winde-floure. And the other with a Scarlet (or rather a Blush) coloured floure, which we may terme *Anemone nemorum coccinea*, The wilde Scarlet wind floure. These two differ not in other respects from the white wind floure. ‡

3 There is in some choice gardens one of this kinde with white floures very double, as is that of the Scarlet *Anemone*, and I had one of them giuen mee by a worshipfull Merchant of London, called Mr. John Franqueuille, my very good friend.

‡ 4 This in roots and stalkes is like the last described wood *Anemones*, or winde floures. But this and the last mentioned double one haue leaues on two places of their stalks; whereas the single ones haue them but in one, and that is about the middle of the stalkes. The floure of this double one consists of some fortie or more little leaues, whereof the outermost are the biggest; the bottomes or nailes of these leaues are of a deepe purple, but the other parts of a lighter blush colour. ‡

¶ The Place.

All these wilde single *Anemones* grow in most woods and copses through England, except that with the yellow floure, which as yet I haue not seene: notwithstanding I haue one of the greater kindes which beareth yellow floures, whose figure is not expressed nor yet described, for that it doth very notably resemble those with single floures, but is of small moment, either in beautie of the floure, or otherwise. ‡ The double ones grow onely in some few gardens. ‡

¶ The Time.

They floure from the middest of Februarie vnto the end of Aprill, or the midst of May.

¶ The Names.

‡ The first of these by most Writers is referred to the *Ranunculi*, or Crowfeet; and Lobel calls it fitly *Ranunculus nemorosus luteus*: only Dodonæus, Casalpinus, and our Authour haue made it an *Anemone*.

2 This with the varieties also, by Tragus, Fuchsius, Cordus, Gesner, Lobell, and others, is made a *Ranunculus*: yet Dodonæus, Casalpinus, and our Authour haue referred it to the *Anemones*. Clusius thinkes this to be *Anemone*, *Aquilegia* of Theophrastus.

3 Clusius calls this *Anemone Limonia*, or *Ranunculus sylvarum sto. pleno albo*.

4 And he styles this *Anem. limonia*, or *Ranunc. syl. flore pleno purpurascens*. ‡

¶ The Temperature and Vertues.

The faculties and temperature of these plants are referred to the garden forts of *Anemones*.

CHAP. 79. Of Bastard *Anemones*, or Pasque floures.

¶ The Description.

1 The first of these Pasque floures hath many small leaues finely cut or iagged, like those of Carrots: among which rise vp naked stalkes, rough and hairie; whereupon doe grow beautifull floures bell fashion, of a bright deliaed purple colour: in the bottome whereof groweth a tuft of yellow thrums, and in the middle of the thrums it thrusteth forth a small purple pointell: when the whole floure is past there succeedeth an head or knop compact of many gray hairy lockes, and in the solide parts of the knops lieth the seed flat and hoarie, euery seed hauing his owne small haire hanging at it. The root is thicke and knobby, of a finger long, running right downe, and therefore not like vnto those of the *Anemone*, which it doth in all other parts very notably resemble, and whereof no doubt this is a kinde.

2 There is no difference at all in the leaues, roots, or feedes, betweene this red Pasque floure and the precedent, nor in any other point, but in the colour of the floures: for whereas the other are

are of a purple colour, these are of a bright red, which setteth forth the difference.

3 The white Passe floures hath many fine iagged leaues, closely couched or thrust together, which resemble an Holi-water sprinkle, agreeing with the others in rootes, feedes, and shape of floures, sauing that these are of a white colour, wherein chiefly consisteth the difference.

4 This also in shape of roots and leaues little differs from the precedent, but the floures are lesser, of a darker purple colour, and seldome open or shew themselves so much abroad as the other of the first described, to which in all other respects it is very like.

5 There is also another kinde with leaues lesse diuided, but in other parts like those already described, sauing that the floure is of a yellow colour something inclining to a red. ‡

1 *Pulsatilla vulgaris.*
Purple Passe floure.

2 *Pulsatilla rubra.*
Red Passe floure.

¶ The Place.

Ruellius writeth, that the Passe floure groweth in France in vntoiled places: in Germanie they grow in rough and stonie places, and oftentimes on rockes.

Those with purple floures doe grow verie plentifully in the pasture or close belonging to the parsonage house of a small village six miles from Cambridge, called Hilderham: the Parsons name that liued at the impression hereof was Mr. Fuller, a very kind and louing man, and willing to shew vnto any man the said close, who desired the same.

¶ The Time.

They floure for the most part about Easter, which hath mooued mee to name it *Pasque Floure*, or Easter floure: and often they doe floure againe in September. ‡ The yellow kinde floures in May. ‡

¶ The Names.

† Passe floure is called commonly in Latine *Pulsatilla*: and of some, *Apium risus*, & *herbaven-ti*. Dalechampius would haue it to be *Anemone Limonia* & *Samolus* of Pliny: in French, *Coquelourdes*: in Dutch, *Kneekenschell*: in English, *Pasque floure*, or *Passe floure*, and after the Latine name *Pulsatill*, or *Flaw floure*: in Cambridge-shire where they grow, they are named *Couentrie bels*.

¶ The

3 *Pulsatilla flore albo.*
White Passe floure.

4 *Pulsatilla flore minore.*
The lesser purple Passe floure.

¶ *The Temperature.*

Passe floure doth extremely bite, and exulcerateth and eateth into the skinne if it be stamped and applied to any part of the body; whereupon it hath been taken of some to be a kinde of Crow-foot, and not without reason, for that it is not inferiour to the Crowfoots : and therefore it is hot and drie.

¶ *The Vertues.*

There is nothing extant in writing among Authours of any peculiar vertue, but they serue onely for the adorning of gardens and garlands, being floures of great beautie.

CHAP. 80. Of *Adonis* floure.

¶ *The Description.*

1 **T**He first hath very many slender weake stalkes, trailing or leaning to the ground, set on euerie part with fine iagged leaues very deeply cut like those of Camomill, or rather those of May-weed : vpon which stalkes do grow small red floures, in shape like the field Crow-foot, with a blackish Greene pointell in the middle, which being growne to maturitie turneth into a small greenish bunch of seeds, in shape like a little bunch of grapes. The root is small and threddie.

2 The second differeth not from the precedent in any one point, but in the colour of the floures, which are of a perfect yellow colour, wherein consisteth the difference.

¶ *The Place.*

The red floure of *Adonis* groweth wilde in the West parts of England among their corne, euen as May-weed doth in other parts, and is likewise an enemy to corne as May-weed is : from thence I brought the seed, and haue sowne it in my garden for the beautie of the floures sake. That with the yellow floure is a stranger in England.

¶ *The*

1 *Flos Adonis flore rubro.*
Adonis, with red floures.

¶ *The Time.*

They floure in the Sommer moneths, May, Iune, and Iuly, and sometimes later.

¶ *The Names.*

Adonis floure is called in Latine *Flos Adonis*, and *Adonidis*: of the Dutchmen, *Feld-droozlin*: in English wee may call it Red Maythes, by which name it is called of them that dwell where it groweth naturally, and generally Red Camomill: in Greeke, *ῥανδευον*, & *Eranthemum*: our London women doe call it Rose-a-rubie.

¶ *The Temperature.*

There hath not beene any that hath written of the Temperature hereof; notwithstanding, so farre as the taste thereof sheweth, it is something hot, but not much.

¶ *The Vertues.*

The seed of Adonis flower is thought to A be good against the stone: amongst the Ancients it was not knowne to haue any other facultie: albeit experience hath of late taught vs, that the seed stamped, and the pouder giuen in wine, ale, or beere to drinke, doth wonderfully and with great effect helpe the collicke.

CHAP: 81. Of Dockes.

¶ *The Kindes.*

Dioscorides setteth forth foure kinds of Dockes; wilde or sharpe pointed Docke; Garden Docke; round leaved Docke; and the Soure Docke called Sorrell: besides these the later Herbarists haue added certaine other Dockes also, which I purpose to make mention of.

¶ *The Description.*

1 **T**hat which among the Latines signifieth to soften, ease, or purge the bellie, the same signification hath *λεπιδωδης*, among the Græcians: whereof *Lapathum* and *λεπιδωδης* (as some do reade) tooke their names for herbes which are vsed in portage and medicine, very well knowne to haue the power of cleansing: of these there be many kinds and differences, great store euery where growing, among whom is that which is now called sharpe pointed Docke, or sharpe leaved Docke. It groweth in most meadowes and by running streames, hauing long narrow leaues sharpe and hard pointed: among the which commeth vp round hollow stalks of a browne colour, hauing ioynts like knees, garnished with such like leaues, but smaller: at the end whereof grow many floures of a pale colour, one aboue another; and after them commeth a brownish three square seede, lapped in browne chaffie huskes like Patience. The roote is great, long, and yellowe within.

‡ There is a varietie of this with crisped or curled leaues whose figure was by our Authour giuen in the second place in the following chapter, vnder the Title of *Hydrolapathum minus*. ‡

2 The second kind of sharpe pointed Docke is like the first, but much smaller, and doth beare his seed in rundles about his branches in chaffie huskes, like Sorrell, not so much in vse as the former, called also sharpe pointed Docke.

‡ 3 This in roots, stalkes, and seeds is like to the precedent; but the leaues are shorter, and rounder than those of the first described, & therein consists the chiefe difference betwixt this & it. ‡

¶ *The Place.*

These kinds of Docks do grow, as is before said, in meadowes and by riuers sides.

¶ *The*

† 1 *Lapathum acutum.*
Sharpe pointed Docke.

2 *Lapathum acutum minimum.*
Small sharpe Docke.

‡ 3 *Lapathum sylvestre fol. minus acuto.*
The roundish leaved wilde Docke.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

They are called in Latine *Lapathum acutum*, *Rumex*, *Lapatium*, & *Lapathium*: of some, *Oxylapathum*: in English, Docke, and sharpe pointed Docke, the greater and the lesser: of the Græcians, *ῥυμη*: in high Dutch, *Wengelwurtz*, *Streichwurtz*: in Italian, *Rombice*: in Spanish, *Romaça*, *Paradella*, in Low Dutch, *Patich* (which word is deriued of *Lapathum*) and also *Peerdick*: in French, *Parcille*.

‡ The third is *Lapathum folio retuso*, or *minus acuto* of Lobell; and *Hippolapathum sylvest.* of Tabern.

¶ The Nature and Vertues.

These herbes are of a mixture between cold and heat, and almost drie in the third degree, especially the seed which is very astringent.

The powder of any of the kinds of Docks drunk in wine, stoppeth the laske and bloudie fixe, and easeth the pains of the stomacke.

The roots boiled til they be very soft, and stamped with barrowes grease, and made into an ointment helpeth the itch and all scurvie scabs and mangines. And for the same purpose it shall bee necessarie to boile them in water, as aforesaid, and the partie to be bathed and rubbed therewith.

† The first figure in the former edition was of *Hydrolapathum magnum*, being the first in the next chapter; and the figure of that we give you in the third place of this chap. was that in the first place of the following chap. under the former named title.

CHAP. 82. Of Water Dockes.

† 1 *Hydrolapathum magnum.*
Great Water Docke.† 2 *Hydrolapathum minus.*
Small Water Docke.† 3 *Hippolapathum sativum.*
Patience, or Munkes Rubarb.† 4 *Hippolapathum rotundifolium.*
Bastard Rubarb.

‡ 5 *Lapathum sativum sanguineum.*
Bloudwoort.

The Description.

1 The Great water Docke hath very long and great leaues, stiffe, and hard, not vnlike to the Garden Patience, but much longer. The stalke riseth vp to a great height, oftentimes to the height of fise foot or more. The floues groweth at the top of the stalke in spokie tufts, brown of colour. The seed is contained in chaffie huskes, three square, of a shining pale colour. The root is very great, thicke, browne without, and yellowish within.

2 The small water Docke hath short narrow leaues, set vpon a stiffe stalke. The floues grow from the middle of the stalke vppward in spokie rundles, set in spaces by certaine distances round about the stalke, as are the floues of Horehound: Which Docke is of all the kindes most common and of lesse vse, and taketh no pleasure or delight in any one soile or dwelling place, but is found almost euery where, as well vpon the land as in waterie places, but especially in gardens among good and hole-some pot-herbes, being there better known than welcome or desired: wherefore I intend not to spend further time about his description.

3 The Garden Patience hath very strong stalks, furrowed or chamfered, of eight or nine foot high when it groweth in fertile ground, set about with great large leaues like to those of the water Docke, hauing alongst the stalkes toward the top floues of a light purple colour declining to brownenesse. The seed is three square, contained in thin chaffie huskes, like those of the common Docke. The root is verie great, browne without, and yellow within, in colour and taste like the true Rubarb.

4 Bastard Rubarb hath great broad round leaues, in shape like those of the great Bur-docke. The stalke and seeds are so like vnto the precedent, that the one cannot be knowne from the other, sauing that the seeds of this are somewhat lesser. The root is exceeding great and thicke, very like vnto the Rha of Barbarie, as well in proportion as in colour and taste, and purgeth after the same manner, but must be taken in greater quantitie, as witnesseth that famous learned Physition now liuing, Mr. Doctor Bright, and others, who haue experimented the same.

5 This fifth kinde of Docke is best knowne vnto all, of the stocke or kindred of Dockes; it hath long thin leaues, sometimes red in euery part thereof, and often stripped here and there with lines and strakes of a darke red colour; among which rise vp stiffe brittle stalkes of the same colour: on the top whereof come forth such floues and seed as the common wilde docke hath. The root is likewise red, or of a bloudie colour.

¶ *The Place.*

They do grow for the most part in ditches and water-courses, very common through England. The two last saue one do grow in gardens; my selfe and others in London and elsewhere haue them growing for our vse in Physicke and chirurgerie. The last is sowne for a pot-herbe in most gardens.

¶ *The Time.*

Most of the dockes do rise vp in the Spring of the yeare, and their seed is ripe in Iune and August.

¶ *The Names.*

The docke is called in Greeke *ῥυμηξ*: in Latine, *Rumex*, and *Lapathum*; yet Pliny in his 19 Booke, 12. Chapter, seemeth to attribute the name of *Rumex* onely to the garden docke.

The

The Monkes Rubarbe is called in Latine *Rumex sativus*, and *Patientia*, or Patience, which word is borrowed of the French, who call this herbe *Patience*: after whom the Dutch men name this pot herbe also *Patientie*; of some, *Rhabarbarum Monachorum*, or Monkes Rubarbe: because as it should seeme some Monke or other haue vsed the root hereof in stead of Rubarbe.

Bloudwoort, or bloody Patience, is called in Latine *Lapathum sanguineum*: of some, *sanguis Draconis*, of the bloudie colour wherewith the whole plant is possest, and is of pot-herbes the chiefe or principall, hauing the propertie of the bastard Rubarbe; but of lesse force in his purging quality.

¶ The Temperature.

Generally all the Dockes are cold, some little and moderately, and some more: they doe all of them drie, but not all after one manner: notwithstanding some are of opinion that they are dry almost in the third degree.

¶ The Vertues.

The leaues of the Garden Docke or Patience may be eaten, and are somewhat colde, but more moist, and haue withall a certaine clamminesse; by reason whereof they easily and quickly passe through the belly when they be eaten: and *Dioscorides* writeth, that all the Dockes beeing boiled doe mollifie the bellie: which thing also *Horace* hath noted in his second booke of Sermons, the fourth Satyre, writing thus,

— *Si dura morabitur alvus*
Mugilus & viles pellent obstantia concha,
Et lapathi brevis herba.

He calleth it a short herbe, being gathered before the stalke be growne vp; at which time it is fittest to be eaten.

And being sodden, it is not so pleasant to bee eaten as either Beetes or Spinage: it ingendreth moist bloud of a meane thicknesse, and which nourisheth little.

The leaues of the sharpe pointed Dockes are cold and drie: but the seed of Patience, and the water Docke doe coole, with a certaine thinnesse of substance.

The decoction of the roots of Monkes Rubarbe is drunke against the bloody flux, the laske, the wambling of the stomacke which commeth of choler: and also against the stinging of serpents, as *Dioscorides* writeth.

It is also good against the spitting of bloud, being taken with Acacia (or his *succedaneum*, the dried iuice of sloes) as *Plinie* writeth.

Monkes Rubarb or Patience is an excellent wholesome pot-herbe; for being put into the pot- tage in some reasonable quantitie, it doth loosen the belly, helpeth the iaunders, the timpany and such like diseases, proceeding of cold causes.

If you take the roots of Monkes Rubarb, and red Madder, of each halfe a pound; Sena foure ounces, annise seed and licorice, of each two ounces; Scabiose and Agrimonie, of each one handfull; slice the roots of the Rubarb, bruise the annise seed and licorice, breake the herbes with your hands, and put them into a stone pot called a steane, with foure gallons of strong ale to steepe or infuse the space of three daies; and then drinke this liquour as your ordinarie drinke for three weekes together at the least, though the longer you take it, so much the better; prouiding in a readinesse another steane so prepared that you may haue one vnder another, being alwaies carefull to keepe a good diet: it cureth the drop sicke, the yellow iaunders, all manner of itch, scabbes, breaking out, and manginess of the whole body: it purifieth the bloud from all corruption; preuaileth against the greene sicknesse very greatly, and all oppilations or stoppings: maketh young wenches to looke faire and cherrie like, and bringeth downe their tearmes, the stopping whereof hath caused the same.

The seed of bastard Rubarb is of a manifest astringent nature, insomuch that it cureth the bloody flux, mixed with the seed of Sorrell, and giuen to drinke in red wine.

There haue not beene any other faculties attributed to this plant either of the antient or later writers, but generally of all it hath beene referred to the other Dockes or Monks Rubarb, of which number I assure my selfe this is the best, and doth approach neere vnto the true Rubarb. Manie reasons induce me so to thinke and say, first this hath the shape and proportion of Rubarbe, the same colour, both within and without, without any difference. They agree as well in taste as smell: it coloureth the spittle of a yellow colour when it is chewed, as Rubarb doth; and lastly it purgeth the belly after the same gentle manner that the right Rubarb doth, onely herein it differeth, that this must be giuen in three times the quantitie of the other. Other distinctions and differences, with the temperature and euery other circumstance, I leaue to the learned Physitions of our London colledge (who are very well able to search this matter) as a thing farre aboue my reach, being

no graduate, but a Countrey Scholler, as the whole framing of this Historie doth well declare: but I hope my good meaning will be well taken, considering I doe my best; not doubting but some of greater learning will perfect that which I haue begun according to my small skill, especially the ice being broken vnto him, and the wood rough hewed to his hands. Notwithstanding I thinke it good to say thus much more in mine owne defence, that although there bee many wants and defects in me, that were requisite to performe such a worke; yet may my long experience by chance happen vpon some one thing or other that may do the learned good: considering what a notable experiment I learned of one *John Bennet* a Chirurgion of Maidstone in Kent, a man as slenderly learned as my selfe, which he practised vpon a Butchers boy of the same towne, as himselfe reported vnto me; his practise was this: Being desired to cure the foresaid lad of an ague, which did grievously vex him, he promised him a medicine, & for want of one for the present (for a shift as himselfe confessed vnto me) he tooke out of his garden three or foure leaues of this plant of Rubarb, which my selfe had among other simples giuen him, which he stamped & strained with a draught of ale, and gaue it the lad in the morning to drinke: it wrought extremely downeward and vward within one houre after, and neuer ceased vntill night. In the end the strength of the boy ouercame the force of the Physicke, it gaue ouer working, and the lad lost his ague; since which time (as hee saith) he hath cured with the same medicine many of the like maladie, hauing euer great regard vnto the quantitie, which was the cause of the violent working in the first cure. By reason of which accident, that thing hath been reuealed vnto posteritie, which heretofore was not so much as dreamed of. Whose blunt attempt may set an edge vpon some sharper wit, and greater iudgement in the faculties of plants, to seeke farther into their nature than any of the Antients haue done: and none fitter than the learned Physitions of the Colledge of London; where are many singularly well learned and experienced in naturall things.

L The roots sliced and boiled in the water of *Carduus Benedictus* to the consumption of the third part, adding thereto a little honie, of the which decoction eight or ten spoonfuls drunke before the fit, cureth the ague in two or three times so taking it at the most: vnto robustous or strong bodies twelue spoonfuls may be giuen. This experiment was practised by a worshipfull Gentlewoman mistresse *Anne Wylbraham*, vpon diuers of her poore Neighbours with good successe.

† That figure that was in the first place was of the *Lapathum fol. minus acuto*, described by me in the third place of the preceding chapter. The second was of *Lapathum acutum crispum* of *Tabernaemontanus*. The third was of *Hydrolapathum minus*.

CHAP. 83. Of Rubarb.

† IT hath happened in this as in many other forreine medicines or simples, which though they be of great and frequent vse, as *Hermodytyls*, *Muske*, *Turbeth*, &c. yet haue we no certaine knowledge of the very place which produces them, nor of their exact manner of growing, which hath giuen occasion to diuers to thinke diuersly, and some haue been so bold as to counterfeit figures out of their owne fancies, as *Matthiolus*: so that this saying of *Pliny* is found to be very true, *Nulla medicina pars magis incerta, quam quæ ab alio quam nostro orbe petitur*. But we will endeauour to shew you more certaintie of this here treated of than was knowne vntill of very late yeres.

¶ The Description.

1 THIS kinde of Rubarb hath very great leaues, somewhat snipt or indented about the edges like the teeth of a Saw, not vnlike the leaues of *Enula campana*, called by the vulgar sort *Elecampane*, but greater: among which riseth vp a straight stalke of two cubits high, bearing at the top a scalie head like those of *Knappe-weed*, or *Iacca maior*: in the middle of which knap or head thrusteth forth a faire floure consisting of many purple threds like those of the *Artichoke*; which being past, there followeth a great quantitie of downe, wherein is wrapped long seede like vnto the great *Centorie*, which the whole plant doth very well resemble. The root is long and thicke, blackish without, and of a pale colour within: which being chewed maketh the spittle very yellow, as doth the Rubarb of *Barbarie*.

2 This other bastard Rha, which is also of *Lobels* description, hath a root like that of the last described: but the leaues are narrower almost like those of the common *Dock*, but hoarie on the other side: the stalke growes vp straight, and beareth such heads and floures as the precedent.

3 I haue thought good here to omit the counterfeit figure of *Matthiolus*, giuen vs in this place by our Authour; as also the Historie, which was not much pertinent, and in lieu of them to present you with a perfect figure and description of the true *Rha Ponticum* of the Antients, which was

1 *Rha Capitatum L'obelij.*
Turkie Rubarbe.

2 *Rha Capitatum angustifolium.*
The other bastard Rubarbe.

3 *Rha verum antiquorum.*
The true Rubarbe of the Antients.

Rhabarbarum siccatum.
The drie roots of Rubarbe.

was first of late discovered by the learned *Prosper Alpinus*, who writ a peculiar tract thereof, and it is also againe figured and described in his worke *de Plantis exoticis*. Our Countryman M^r *John Parkinson* hath also set forth very well both the figure and description hereof, in his *Paradisus terrestris*. This plant hath many large roots diuersly spreading in the ground, of a yellow colour, from which grow vp many very great leaues like those of the Butter-burre, but of a fresh Greene colour, with great and manifest veines dispersed ouer them. The stalke also is large and crested, sending forth sundry branches bearing many small white floures, which are succeeded by seeds three square and brownish, like as those of other Docks. D^r *Lister* one of his Maiesties Physitions was the first that enricht this kingdome with this elegant and vsfull plant, by sending the seedes thereof to M^r *Parkinson*. *Prosper Alpinus* proues this to be the true *Rha* of the Antients, described by *Dioscorides*, *Lib. 3. cap. 2.* yet neither he nor any other (that I know of) haue obserued a fault, which I more than probably suspect to bee in the text of *Dioscorides* in that place, which is in the word *μύλαρα*, which I iudge should be *μύλινον*, that is, yellow, and not blacke, as *Ruellius* and others haue translated it: now *μύλινον* is a word frequently vsed by *Dioscorides*, as may appeare by the Chapters of *Hieracium magnum* & *parvum*, *Conyza*, *Pencedanum*, *Ranunculus*, and diuers others, and I suspect the like fault may bee found in some other places of the same Authour. But I will no further insist vpon this, seeing the thing it selfe in all other respects, as also in yellownesse shewes it selfe to be that described by *Dioscorides*, and that my coniecture must therefore be true. And besides, the root wherto he compares it is *καρπούβη*, that is *Rubescens*, or rather *ex flavo rubescens*, as any versed in reading *Dioscorides* may easily gather by diuers places in him. Now I here omit his words, because they are in the next description alledged by our Authour, as also the description of our ordinarily vsed Rubarb, for that it is sufficiently described vnder the following title of the choise thereof. M^r *Parkinson* is of opinion that this is the true Rubarbe vsed in shops, onely lesse heauy, bitter, and strong in working, by reason of the diuersity of our climat from that whereas the dried Rubarb brought vs usually grows. This his opinion is very probable, and if you compare the roots together, you may easily bee induced to be of the same beleefe. ‡

† 4 The Ponticke Rubarbe is lesfer and slenderer than that of Barbarie. Touching Ponticke Rubarbe *Dioscorides* writeth thus: *Rha* that diuers call *Rheon*, which groweth in those places that are beyond Bosphorus, from whence it is brought, hath yellow roots like to the great Centorie, but lesfer and redder, *ἄσπερος*, that is to say, without smell (*Dodonæus* thinkes it should bee *ἰσχυρὸν*, that is, well smelling) spongie, and something light. That is the best which is not worne-eaten, and tasted is somewhat viscid with a light astringtion, and chewed becomes of a yellow or Saffron colour.

¶ The Place.

It is brought out of the Countrey of Sina (commonly called China) which is toward the East in the vpper part of India, and that India which is without the riuer Ganges: and not at all *Ex Scenitarum provincia*, (as many do vnaduisedly thinke) which is in Arabia the Happie, and far from China: it groweth on the sides of the riuer *Rha* now called Volga, as *Amianus Marcellus* saith, which riuer springeth out of the Hyperborean mountaines, and running through Muscouia, falleth into the Caspian or Hircan sea.

‡ The *Rha* of the Antients growes naturally, as *Alpinus* saith, vpon the hill Rhodope in Thrace, now called Romania. It growes also as I haue been informed vpon some mountaines in Hungarie. It is also to be found growing in some of our choise gardens. ‡

The choise of Rubarbe.

The best Rubarbe is that which is brought from China fresh and new, of a light purplish red, with certaine veines and branches, of an vncertaine varietie of colour, commonly whitish: but when it is old the colour becommeth ill fauored by turning yellowish or pale, but more, if it bee worne eaten: being chewed in the mouth it is somewhat gluie and clammie, and of a saffron colour, which being rubbed vpon paper or some white thing sheweth the colour more plainely: the substance thereof is neither hard or closely compacted, nor yet heauy, but something light, and as it were in a middle betweene hard and loose and something spongie: it hath also a pleasing smell. The second in goodnesse is that which commeth from Barbarie. The last and worst from Bosphorus and Pontus.

¶ The Names.

It is commonly called in Latine *Rha Barbarum*, or *Rha Barbaricum*: of diuers, *Rheu Barbarum*: the Moores and Arabians doe more truely name it *Raued Seni*, a *Sinensi provincia*; from whence it is brought into Persia and Arabia, and afterwards into Europe: and likewise from Tanguth, through the land of Cataia into the land of the Persians, whereof the Sophie is the ruler, and from thence into Ægypt, and afterwards into Europe. It is called of the Arabians and the people of China, and the parts adiacent, *Rauend Cini*, *Raued Seni*, and *Raued Sceni*: in shops, *Rhabarbarum*: in English, Rubarb, and Rewbarbe.

¶ The

4 *Rha Ponticum Siccatum.*
Rubarb of Pontus dried.

¶ The Temperature.

Rubarb is of a mixt substance, temperature and faculties: some of the parts thereof are earthy, binding and drying: others thin, airious, hot, and purging.

¶ The Vertues.

Rubarb is commended by *Dioscorides* a. A
gainst windiness, weaknesse of the stomach, and all griefes thereof, convulsions, diseases of the spleene; liuer, and kidnies, gripings and inward gnawings of the guts, infirmities of the bladder and chest, swelling about the heart, diseases of the matrix, paine in the huckle bones, spitting of blood, shortnesse of breath, yexing, or the hicket, the bloudie flux, the laske proceeding of raw humors, fits in Agues, and against the bitings of venomous beasts.

Moreover he saith, that it taketh away B
blacke and blew spots, and tetter or Ringwormes, if it be mixed with vinegar, and the place anointed therewith.

Galen affirms it to be good for burstings, C
cramps, and convulsions, and for those, that are short winded, and that spit blood.

But touching the purging facultie, neither *Dioscorides* nor *Galen* hath written any D
thing, because it was not vsed in those daies to purge with. *Galen* held opinion, that the

thinne airious parts doe make the binding qualitie of more force; not because it doth resist the cold and earthy substance, but by reason that it carrieth the same, and maketh it deeply to pierce, and thereby to worke the greater effect; the dry and thinne essence containing in it selfe a purging force and qualitie to open obstructions, but helped and made more facile by the subtil and airious parts. *Paulus Aegineta* seemeth to be the first that made triall of the purging facultie of Rubarb; for in his first booke, Chap. 43. he maketh mention thereof, where he reckoneth vp Turpentine among those medicines which make the bodies of such as are in health soluble: But when we purpose, saith he, to make the turpentine more strong, we adde vnto it a little Rubarb. The Arabians that followed him brought it to a further vse in physicke, as chiefly purging downward choler, and oftentimes flegme.

The purgation which is made with Rubarb is profitable and fit for all such as be troubled with E
choler, and for those that are sicke of sharpe and tertian feuers, or haue the yellow jaundice, or bad liuers.

It is a good medicine against the pleurisie, inflammation of the lungs, the squinancie or Squin- F
cie, madnesse, frensie, inflammation of the kidnies, bladder, and all the inward parts, and especially against S. Anthonies fire, as well outwardly as inwardly taken.

Rubarb is vndoubtedly an especiall good medicine for the liuer and infirmities of the gall; for G
besides that it purgeth forth cholericke and naughty humors, it remoueth stoppings out of the conduits.

It also mightily strengthneth the intrals themselves: insomuch as Rubarb is iustly termed of H
diuers the life of the liuer; for *Galen* in his eleuenth booke of the method or manner of curing, affirmeth that such kinde of medicines are most fit and profitable for the liuer, as haue ioyned with a purging and opening qualitie an astringent or binding power. The quantitie that is to be giuen is from one dram to two; and the infusion from one and a halfe to three.

It is giuen or steeped, and that in hot diseases, with the infusion or distilled water of Succory, I
Endiue, or some other of the like nature; and likewise in Whay; and if there be no heate it may be giuen in Wine.

It

K It is also oftentimes giuen being dried at the fire, but so, that the least or no part thereof at all be burned; and being so vsed it is a remedie for the bloudy flux, and for all kindes of laskes: for it both purgeth away naughty and corrupt humors, and likewise withall stoppeth the belly.

L The same being dried after the same manner doth also stay the ouermuch flowing of the monthly sicknesse, and stoppeth bloud in any part of the body, especially that which commeth thorough the bladder, but it should be giuen in a little quantitie, and mixed with some other binding thing.

M Mesues saith, That Rubarb is an harmelesse medicine, and good at all times, and for all ages, and likewise for children and women with childe.

‡ My friend M^r. Sampson Johnson Fellow of Magdalen Colledge in Oxford assures me, That the Physitions of Vienna in Austria vse scarce any other at this day than the Rubarb of the Antients, which grows in Hungary not far from thence: and they prefer it before the dried Rubarb brought out of Persia and the East Indies, because it hath not so strong a binding facultie as it, neither doth it heate so much; onely it must be vsed in somewhat a larger quantitie. ‡

CHAP. 84.

Of Sorrell.

¶ The Kindes.

T Here be diuers kindes of Sorrell, differing in many points, some of the garden, others wilde; some great, and some lesser.

1 *Oxalis, sine Acetosa.*
Sorrell.

2 *Oxalis tuberosa.*
Knobbed Sorrell.

¶ The Description.

T Hough Dioscorides hath not expressed the *Oxalides* by that name, yet none ought to doubt but that they were taken and accounted as the fourth kinde of *Lapathum*. For though some like

like it not well that the seed should be said to be *Drimus*; yet that is to be vnderstood according to the common phrase, when acride things are confounded with those which be sharpe and soure; else we might accuse him of such ignorance as is not amongst the simplest women. Moreouer, the word *Oxys* doth not onely signifie the lease, but the saour and tartnesse, which by a figure drawne from the sharpnesse of kniues edges is therefore called sharpe: for *oxys* signifieth a sharpe or soure iuyce which pierceth the tongue like a sharpe knife: whereupon also *Lapathum* may be called *Oxalis*, as it is indeed. The leaues of this are thinner, tenderer, and more vnctuous than those of *Lapathum acutum*, broader next to the stem, horned and crested like Spinage and *Atriplex*. The stalke is much streaked, reddish, and full of iuyce: the root is yellow and fibrous; the seed sharpe, cornered and shining, growing in chaffie huskes like the other Docks.

2 The second kinde of *Oxalis* or Sorrell hath large leaues like Patience, confusedly growing together vpon a great tall stalke, at the top whereof grow tufts of a chaffie substance. The root is tuberous, much like the Peonie, or rather Filipendula, fastned to the lower part of the stem with small long strings and laces.

3 The third kinde of Sorrell groweth very small, branching hither and thither, taking hold (by new shoots) of the ground where it groweth, whereby it disperseth it selfe far abroad. The leaues are little and thin, hauing two small leaues like eares fastned thereto, in shew like the herbe *Sagittaria*: the seed in taste is like the other of his kinde.

4 The fourth kinde of Sorrell hath leaues somewhat round and cornered, of a whiter colour than the ordinarie, and hauing two short eares annexed vnto the same. The seed and root in taste is like the other Sorrels.

3 *Oxalis tenuifolia.*
Sheepes Sorrell.

4 *Oxalis Franca seu Romana.*
Round leaved, or French Sorrel.

5 This kinde of curled Sorrell is a stranger in England, and hath very long leaues, in shape like the garden Sorrell, but curled and crumpled about the edges as is the curled Colewort. The stalke riseth vp among the leaues, set here and there with the like leaues, but lesser. The floures, seeds, and roots are like the common Sorrell or soure Docks.

6 The small Sorrell that groweth vpon dry barren sandy ditch-banks, hath small grassy leaues somewhat forked or crossed ouer like the crosse hilt of a rapier. The stalkes rise vp amongst the leaues, small, weake, and tender, of the same soure taste that the leaues are of. The floure, seed, and root is like the other Sorrels, but altogether lesser.

6 *Oxalis minor*.
Small Sorrell.

7 The smallest sort of Sorrell is like vnto the precedent, sauing that the lowest leaues that ly vpon the ground be somewhat round, and without the little eares that the other hath, which setteth forth the difference.

‡ 8 There is also kept in some gardens a verie large sorrel, hauing leaues thicke, whitish, and as large as an ordinarie Docke, yet shaped like Sorrell, and of the same acide taste. The stalkes and seed are like those of the ordinary, yet whiter coloured. ‡

¶ The Place.

† The common Sorrell groweth for the most part in moist meadowes and gardens. The second by watersides, but not in this kingdome that I know of. The fourth also is a garden plant with vs, as also the fifth: but the third and last grow vpon grauelly and sandie barren ground and ditch banks. †

¶ The Time.

They flourish at that time when as the other kinds of Docks do floure.

¶ The Names.

Garden Sorrell is called in Greeke *οξυς*, and *αμαρυς*: of *Galen*, *οξυδακτυλος*: that is to say, *Acidum lapathum*, or *Acidus rumex*, foure Docke: and in shops commonly *Acetosa*: in the Germane Tongue, *Satzampffer*: in low-Dutch, *Surckele*, and *Surinck*: the Spaniards, *Azederas*, *Agrelles*, and *Azedas*: in French, *Ozeille*, and *Surelle*, *Aigrette*: in English, Garden Sorrell.

The second is called of the later Herbarists *Tuberosa acetosa*, and *Tuberosum lapathum*: in English Bunched or Knobbed Sorrell.

The third is called in English Sheepes Sorrell: in Dutch, *Schap Surkel*.

The fourth, Romane Sorrell, or round leaued Sorrell.

The fifth, Curled Sorrell.

The sixth and seuenth, Barren Sorrell, or Dwarfe Sheepes Sorrell.

‡ The eighth is called *Oxalis*, or *Acetosa maxima latifolia*, Great broad leaued Sorrell. ‡

¶ The Nature.

The Sorrels are moderately cold and dry.

¶ The Vertues.

- A Sorrell doth vndoubtedly coole and mightily dry; but because it is foure it likewise cutteth tough humors.
- B The iuyce hereof in Sommer time is a profitable sauce in many meats, and pleasant to the taste: it cooleth an hot stomacke, moueth appetite to meate, tempereth the heate of the liuer, and openeth the stoppings thereof.
- C The leaues are with good successe added to decoctions which are vsed in Agues.
- D The leaues of Sorrell taken in good quantitie, stamped and strained into some Ale, and a posset made thereof, cooleth the sicke body, quencheth the thirst, and allayeth the heate of such as are troubled with a pestilent feuer, hot ague, or any great inflammation within.
- E The leaues sodden, and eaten in manner of a Spinach tart, or eaten as meate, softneth and loosneth the belly, and doth attemper and coole the bloud exceedingly,
- F The seed of Sorrell drunke in grosse red wine stoppeth the laske and bloudy flux.

CHAP. 85. Of Bistort or Snake-weed.

¶ The Description.

1 **T**he great Bistort hath long leaues much like Patience, but smaller, and more wrinkled or crumpled, on the vpper side of a darke greene, and vnderneath of a blewish greene colour, much like Woad. The stalke is long, smooth, and tender, hauing at the top a spiked knap or eare, set full of small whitish floures declining to carnation. The root is all in a lumpe, without fashion; within of a reddish colour like vnto flesh, in taste like the kernell of an Acorne.

2 The small Bistort hath leaues about three inches long, and of the bredth of a mans naile; the vpper side is of a greene colour, and vnderneath of an ouerworne greenish colour: amongst the which riseth vp a stalke of the height of a spanne, full of ioynts or knees, bearing at the top such floures as the great Bistort beareth; which being fallen, the seeds appeare of the bignes of a tare, reddish of colour, euery seed hauing one small greene leafe fastned thereunto, with many such leaues thrust in among the whole bunch of floures and seed. The root is tuberous like the other, but smaller, and not so much crooked.

1 *Bistorta major.*
Snake-weed.

2 *Bistorta minor.*
Small Snake-weed.

3 Broad leaued Snake-weed hath many large vneuen leaues, smooth and very greene; among which rise vp small brittle stalkes of two hands high, bearing at the top a faire spike of floures like vnto the great Bistort. The root is knobby or bunched, crookedly turned or wrythed this way and that way, whereof it tooke his name *Bistorta*. ‡ It differs from the first onely in that the root is somewhat more twined in, and the leaues broader and more crumpled. ‡

¶ The Place.

1 The great Bistort groweth in moist and waterie places, and in the darke shadowie Woods, and is very common in most gardens.

2 The

2 The small Bistort groweth in great abundance in Westmerland, at Crosby, Rauenswaith, at the head of a Parke belonging to one M^r. Pickering: from whence it hath beene dispersed into many gardens; as also sent vnto me from thence for my garden.

¶ The Time.

They floure in May, and the seed is ripe in Iune.

¶ The Names.

Bistorta is called in English Snake-weed: in some places, Oisterloit: in Cheshire, Passions, and Snake-weed, and there vsed for an excellent Pot-herbe. It is called *Bistorta* of his wrythed roots, and also *Colubrina*, *Serpentaria*, *Brittanica*, *Dracontion*, *Plinij*; *Dracunculus*, *Dodonai*; and *Limonium Gesneri*.

¶ The Nature.

Bistort doth coole and dry in the third degree.

¶ The Vertues.

- A The iuyce of Bistort put into the nose preuaileth much against the Disease called *Polypus*, and the biting of Serpents or any venomous beast, being drunke in Wine or the water of Angelica.
- B The root boyled in wine and drunke, stoppeth the laske and bloody flux; it stayeth also the overmuch flowing of womens monethly sicknesses.
- C The root taken as aforefaid stayeth vomiting, and healeth the inflammation and soreness of the mouth and throat: it likewise fastneth loose teeth, being holden in the mouth for a certaine space, and at sundry times.

CHAP. 86. Of Scuruy-Grasse, or Spoon-wort.

¶ The Description.

1 **R**ound leaved Scuruy-Grasse is a low or base herbe: it bringeth forth leaues vpon small stems or foot-stalks of a meane length, comming immediately from the root, very many in number, of a shining greene colour, somewhat broad, thicke, hollow like a little spoone, but of no great depth, vneuen, or cornered about the edges: among which leaues spring vp small stalkes of a spanne high, whereon doe grow many little white floures: after which commeth the seed, small and reddish, contained in little round pouches or seed-vessels: the roots be small, white, and threddy. The whole plant is of a hot and spicie taste.

2 The common Scuruy-grasse or Spooone-wort hath leaues somewhat like a spoone, hollow in the middle, but altogether vnlike the former: the leaues hereof are bluntly toothed about the edges, sharpe pointed, and somewhat long: the stalkes rise vp among the leaues, of the length of halfe a foot; whereon do grow white floures with some yellownesse in the middle: which being past, there succeed small seed-vessels like vnto a pouch, not vnlike to those of Shepherds purse, greene at the first, next yellowish, and lastly when they be ripe, of a browne colour, or like a filberd nut. The root is small and tender, compact of a number of threddy strings very thicke thrust together in manner of a little turfe.

¶ The Place.

The first groweth by the sea side at Hull, at Boston, and Lynne, and in many other places of Lincolnshire neere vnto the sea; as in Whaploade and Holbecke Marshes in Holland in the same County. It hath beene found of late growing many miles from the sea side, vpon a great hill in Lancashire called Ingleborough hill; which may seeme strange vnto those that do not know that it will be content with any soile, place, or clyme whatsoever: for prooffe whereof, my selfe haue sowne the seeds of it in my garden, and giuen them vnto others, with whom they floure, flourish, and bring forth their seed, as naturally as by the sea side; and likewise retaine the same hot spicie taste: which proueth that they refuse no culture, contrary to many other sea-plants.

The second, which is our common scurue grasse, groweth in diuers places vpon the brimmes of the famous riuer Thames, as at Woolwich, Erith, Greenhithe, Grauesend, as well on the Essex shore as the Kentish; at Portsmouth, Bristow, and many other places alongst the Western coast: but toward the North I haue not heard that any of this kinde hath growne.

¶ The

¶ The Time.

It floureth and flourisheth in May. The seed is ripe in June.

2 *Cochlearia rotundifolia.*

Round leaved Scuruie grasse.

2 *Cochlearia Britannica.*

Common English Scuruie grasse.

¶ The Names.

† We are not ignorant that in low Germany, this hath seemed to some of the best learned to be the true *Britannica*, and namely to those next the Ocean in Friesland and Holland. The Germanes call it **Leffelkraut**: that is, *Cochlearia* or Spoonwort, by reason of the compassed roundnes and hollownes of the leaues, like a spoone; and haue thought it to be *Plinie's Britannica*, because they finde it in the same place growing, and endued with the same qualities. Which excellent plant *Casars* soldiers (when they remooued their camps beyond the Rhene) found to preuaile (as the Frisians had taught it them) against that plague and hurtfull disease of the teeth, gums, and finewes, called the Scuruie, being a depriuation of all good bloud and moisture, in the whole bodie, called *Scorbutum*; in English, the Scuruie, and Scurby, a disease happening at the sea among Fishermen, and fresh-water souldiers, and such as delight to sit still without labour and exercise of their bodies; and especially about the rest of the causes, when they make not cleane their bisket bread from the floure or mealines that is vpon the same, which doth spoile many. But sith this agrees not with *Plinie's* description, and that there be many other water plants, as *Nasturtium*, *Sium*, *Cardamine*, and such others, like in taste, and not vnlike in proportion and vertues, which are remedies against the diseases aforesaid, there can be no certaine argument drawne therefrom to prooue it to be *Britannica*. For the leaues at their first comming forth are somewhat long like *Pyrola* or Adders tongue, soone after somewhat thicker, and hollow like a nauell, after the manner of Sun-dew, but in greatnesse like *Soldanella*, in the compasse somewhat cornered, in fashion somewhat like a spoone: the floures white, and in shape like the Cuckow floures: the seed reddish, like the seed of *Thlaspi*, which is not to be seen in *Britannica*, which is rather holden to be Bistort or garden Patience, than Scuruie grasse. In English it is called Spoonewort, Scurby grasse, and Scuruie grasse.

¶ The Temperature.

Scuruie grasse is euidently hot and drie, very like in taste and qualitie to the garden Cresses, of an aromaticke or spicie taste.

¶ The Vertues.

- A The juice of Spoonewoort giuen to drinke in Ale or Beere, is a singular medicine against the corrupt and rotten vlcers, and stench of the mouth: it perfectly cureth the disease called of *Hippocrates*, *Voluulus Hematites*: Of *Pliny*, *Stomacace*: of *Marcellus*, *Oscedo*: and of the later writers, *Scorbustum*: of the Hollanders and Frisians, *Scuerbuyck*: in English, the Scuruie: either giuing the juice in drinke as aforesaid, or putting six great handfuls to steepe, with long pepper, graines, annise-seede, and liquorice, of each one ounce, the spices being braied, and the herbes brused with your hands, and so put into a pot, such as is before mentioned in the chapter of bastard Rubarbe, and vsed in like maner; or boiled in milke or wine and drunke for certaine daies together it worketh the like effect.
- B The juice drunke once in a day fasting in any liquor, ale, beere, or wine, doth cause the foresaid medicine more speedily to worke his effect in curing this filthy, lothsome, heauy, and dull disease, which is very troublesome, and of long continuance. The gums are loosed, swolne, and exulcerate; the mouth greuously stinking; the thighes and legs are withall very often full of blew spots, not much vnlike those that come of bruises: the face and the rest of the body is oftentimes of a pale colour: and the feet are swolne, as in a dropsie.
- C There is a disease (saith *Olaus magnus* in his historie of the Northerne regions) haunting the campos, which vexeth them that are besieged and pinned vp: and it seemeth to come by eating of salt meates, which is increased and cherished with the cold vapors of the stone walls. The Germanes call this disease (as we haue said) *Scorbuck*, the symptome or passion which hapneth to the mouth, is called of *Pliny* *Stomacace*: and that which belongeth to the thighes *Marcellus* an old writer nameth the infirmities of the mouth *Oscedo*: which disease commeth of a grosse cold and tough bloud, such as malancholy juice is, not by adustion, but of such a bloud as is the feculent or drossie part thereof: which is gathered in the body by ill diet, slothfulnesse to worke, laifinesse (as we terme it) much sleepe and rest on ship-board, and not looking to make cleane the bisquet from the mealinesse, and vncleane keeping their bodies, which are the causes of this disease called the scuruie or scyrby; which disease doth not onely touch the outward parts, but the inward also: for the liuer oftentimes, but most commonly the spleene, is filled with this kinde of thicke, cold and tough juice, and is swolne by reason that the substance thereof is slacke, spungie and porous, very apt to receiue such kinde of thick and cold humors. Which thing also *Hippocrates* hath written of in the second booke of his *Prorrhethikes*: their gums (saith he) are infected, and their mouthes stinke that haue great spleenes or milts: and whosoever haue great milts and vse not to bleed, can hardly be cured of this malladie, especially of the vlcers in the legs, and blacke spots. The same is affirmed by *Paulus Agineta* in his third booke, 49. chapter, where you may easily see the difference between this disease and the black jaunders; which many times are so confounded together, that the distinction or difference is hard to be known, but by the expert chirurgion: who oftentimes seruing in the ships, as wel her Maiesties as merchants, are greatly pestered with the curing thereof: it shall be requisite to carrie with them the herbe dried: the water distilled, and the juice put into a bottle with a narrow mouth, full almost to the necke, and the rest filled vp with oile oliue, to keep it from putrifaction: the which preparations discretely vsed, will stand them in great stead for the disease aforesaid.
- D The herbe stamped and laid vpon spots and blemishes of the face, will take them away within six houres, but the place must be washed after with water wherein bran hath been sodden.

CHAP. 87. Of Twayblade, or herbe Bifoile.

¶ The Description.

1 **H**Erbe Byfoile hath many small fibres or threddy strings, fastened vnto a small knot or root, from which riseth vp a slender stem or stalke, tender, fat, and full of juice; in the middle whereof are placed in comely order two broad leaues, ribbed and chamfered, in shape like the leaues of *Plantaine*: vpon the top of the stalke groweth a slender greenish spike made of many small floures, each little floure resembling a gnat, or little gosling newly hatched, very like those of the third sort of *Serapias* stones.

2 *Ophris Trifolia*, or Trefoile Twaiblade, hath roots, tender stalkes, and a bush of flours like the precedent; but differeth in that, that this plant hath three leaues which do clip or embrace the stalke

stalke about; and the other hath but two, and neuer more, wherein especially consisteth the difference: although in truth I thinke it a degenerate kinde, and hath gotten a third leafe *per accidens*, as doth sometimes chance vnto the Adders Tongue, as shall be declared in the Chapter that followeth.

‡ 3 This kind of Twaiblade, first described in the last edition of *Dodonæus*, hath leaues, floures, and stalkes like to the ordinarie, but at the bottome of the stalke aboue the fibrous roots it hath a bulbe greenish within, and couered with two or three skins: it growes in moist and wet low places of Holland. ‡

1 *Ophris bifolia*.
Twaiblade.

‡ 3 *Ophris bifolia bulbosa*.
Bulbous Twaiblade.

¶ The Place.

The first groweth in moist medowes, fenny grounds, and shadowie places. I haue sonnd it in many places, as at Southfleet in Kent, in a Wood of Master *Sidleys* by Long-field Downes, in a Wood by London called Hampstead Wood, in the fields by High-gate, in the Woods by Ouen-den neere to Clare in Essex, and in the Woods by Dunmow in Essex. The second sort is seldome seene.

¶ The Time.

They floure in May and Iune.

¶ The Names.

It is called of the later Herbarists, *Bifolium*, and *Ophris*.

¶ The Nature and Vertues.

These are reported of the Herbarists of our time to be good for greene wounds, burstings, and ruptures; whereof I haue in my vnguent and Balsams for greene wounds had great experience, and good successe.

CHAP. 88. Of Adders-Tongue.

¶ The Description.

1 **O**phioglosson, or *Lingua Serpentis* (called in English Adders tongue; of some, Adders Grasse, though vnproperly) riseth forth of the ground, hauing one leafe and no more, fat or oleous in substance, of a finger long, and very like the yong and tender leaues of Marigolds: from the bottome of which leafe springeth out a small and tender stalke one finger and a halfe long, on the end whereof doth grow a long small tongue not vnlike the tongue of a serpent, whereof it tooke the name.

2 I haue scene another like the former in root, stalke, and leafe; and differeth, in that this plant hath two, and sometimes more crooked tongues, yet of the same fashion, which if my iudgment faile not chanceth *per accidens*, euen as we see children borne with two thumbes vpon one hand: which moueth me so to thinke, for that in gathering twenty bushels of the leaues a man shall hardly finde one of this fashion.

1 *Ophioglosson.*
Adders-Tongue.

‡ 2 *Ophioglosson abortivum.*
Mis-shapen Adders-Tongue.

¶ The Place.

Adders-Tongue groweth in moist meadows throughout most parts of England; as in a Meadow neere the preaching Spittle adioyning to London; in the Mantels by London, in the meadows by Cole-brooke, in the fields in Waltham Forrest, and many other places.

¶ The Time.

They are to be found in Aprill and May; but in Iune they are quite vanished and gone.

¶ The Names.

Ophioglossum is called in shops *Lingua serpentis*, *Linguace*, and *Lingualace*: it is also called *Lancea Christi*, *Enephyllon*, and *Lingua vulneraria*: in English, Adders tongue, or Serpents tongue: in Dutch, *Patertonguen*: of the Germanes, *Patertzungelin*.

¶ The

¶ The Nature.

Adders-tongue is dry in the third degree.

¶ The Vertues.

The leaues of Adders tongue stamped in a stone mortar, and boyled in Oile Oliue vnto the consumption of the iuyce, and vntill the herbes be dry and partched, and then strained, will yeeld a most excellent greene oyle, or rather a balsam for greene wounds, comparable vnto oyle of S. Johns wort, if it do not farre surpasse it by many degrees: whose beauty is such, that very many Artists haue thought the same to be mixed with Verdigrease.

CHAP. 89.

Of One-berry, or Herbe True-loue, and Moone-wort.

1 *Herba Paris.*

One-Berry, or Herbe True-loue.

2 *Lunaria minor.*

Small Moone-wort.

¶ The Description.

1 **H**erbe Paris riseth vp with one small tender stalke two hands high; at the very top whereof come forth foure leaues directly set one against another in manner of a Burgundian Crosse or True-loue knot: for which cause among the Antients it hath bin called Herbe True-loue. In the midst of the said leafe comes forth a star-like floure of an herby or grassie colour; out of the middest whereof there ariseth vp a blackish browne berrie: the root is long and tender, creeping vnder the earth, and dispersing it selfe hither and thither.

2 The small Lunary springeth forth of the ground with one leafe like Adders-tongue, jagged or cut on both sides into five or six deepe cuts or notches, not much vnlike the leaues of *Scolopendria*, or *Ceterach*, of a greene colour; whereupon doth grow a small naked stem of a finger long, bearing at the top many little seeds clustering together; which being gathered and laid in a platter or such like thing for the space of three weekes, there will fall from the same a fine dust or meale of a whitish colour, which is the seed if it bring forth any. The root is slender, and compact of many small threddy strings.

‡ In England (saith *Camerarius*) there growes a certaine kinde of *Lunaria*, which hath many leaues, and sometimes also sundry branches; which therefore I haue caused to be delineated, that other Herbarists might also take notice hereof. Thus much *Camerarius*, *Epit. Mat. p. 644.* where he giues an elegant figure of a varietie hauing more leaues and branches than the ordinary, otherwise not differing from it.

3 Besides this varietie there is another kinde set forth by *Clusius*; whose figure and description I thinke good here to set downe. This hath a root consisting of many fibres somewhat thicker than those of the common kinde: from which arise one or two winged leaues, that is, many leaues set to one stalke; and these are like the leaues of the other *Lunaria*, but that they are longer, thicker, and more diuided, and of a yellowish Greene colour. Amongst these leaues there comes vp a stalke fat and iuycie, bearing a greater tuft of floures or seeds (for I know not whether to cal them) than the ordinarie, but otherwise very like thereto. It groweth in the mountaines of Silesia, and in some places of Austria. ‡

‡ 3 *Lunaria minor ramosa.*
Small branched Moon-wort.

¶ The Place.

Herba Paris groweth plentifully in all these places following; that is to say, in Chalkney wood neere to wakes Coulnes, feuen miles from Colchester in Essex, and in the wood by Robinhoods well, neere to Nottingham; in the parsonage orchard at Radwinter in Essex, neere to Saffron Walden; in Blackburne at a place called Merton in Lancashire; in the Moore by Canturbury called the Clapper; in Dingley wood, six miles from Preston in Aundernesse; in Bocking parke by Braintree in Essex; at Hefset in Lancashire, and in Cotting wood in the North of England; as that excellent painefull and diligent Physition Mr. Doctor *Turner* of late memorie doth record in his Herbal.

Lunaria or small Moone-wort groweth vpon dry and barren mountaines and heaths. I haue found it growing in these places following; that is to say, about Bathe in Somersetshire in many places, especially at a place called Carey, two miles from Bruton, in the next Close vnto the Church-yard; on Cockes Heath betweene Lowse and Linton, three miles from Maidstone in Kent: it groweth also in the ruines of an old bricke-kilne by Colchester, in the ground of Mr. *George Sayer*, called Miles end: it groweth like-

wise vpon the side of Blacke-heath, neere vnto the stile that leadeth vnto Eltham house, about an hundred paces from the stile: also in Lancashire neere vnto a Wood called Fairest, by Latham: moreouer, in Nottinghamshire by the West wood at Gringley, and at Weston in the Ley field by the West side of the towne; and in the Bishops field at Yorke, neere vnto Wakefield, in the Close where Sir *George Sawill* his house standeth, called the Heath Hall, by the relation of a learned Doctor in Physicke called Mr. *John Merse* of Cambridge, and many other places.

¶ The Time.

Herba Paris floureth in Aprill, and the berry is ripe in the end of May.

Lunaria or small Moone-wort is to be seene in the moneth of May.

¶ The Names.

One-berry is also called Herbe True-loue, and Herbe Paris: in Latine, *Herba Paris*, and *Solanum tetraphyllum* by *Gesner* and *Lobel*.

Lunaria minor is called in English Small Lunarie, and Moon-wort.

¶ The Nature.

Herbe Paris is exceeding cold; whereby it represses the rage and force of poison.

Lunaria minor is cold and dry of temperature.

¶ The Vertues.

The berries of Herbe Paris giuen by the space of twentie daies, are excellent good against A poison, or the powder of the herbe drunke in like manner halfe a spoonfull at a time in the morning fasting.

The same is ministred with great successe vnto such as are become peeuishe, or without vnder- B standing, being ministred as is aforesaid, euery morning by the space of twentie daies, as *Baptista Sardus*, and *Matthiolus* haue recorded. Since which time there hath been further experience made thereof against poison, and put in practice in the citie of Paris, in Louaine, and at the bathis in Heluetia, by the right excellent Herbarists *Matthias de L'obel*, and *Petrus Pena*, who hauing often read, that it was one of the Aconites, called *Pardalianches*, and so by consequence of a poisoning quality, they gaue it vnto dogs and lambes, who receiued no hurt by the same: wherefore they further prosecuted the experience thereof, and gaue vnto two dogs fast bound or coupled together, a dram of Arsenicke, and one dram of Mercurie sublimate mixed with flesh († in the *Aduersaria* it is but of each halfe a dram, and there pag. 105. you may finde this Historie more largely set downe. †) which the dogs would not willingly eat, and therefore they had it crammed downe their throats: vnto one of these dogs they gaue this Antidote following in a little red wine, whereby he recouered his former health againe within a few houres: but the other dog which had none of the medicine, died incontinently.

This is the receipt.

R. *utriusque Angelica (innuit) domesticam, & syluestrem, Vicetoxici, Valeriana domestica, Polipodij querni, radicum Althea, & Vrtica, ana 3. iij, Corticis Mezerei Germanici, 3. ij. granorum herbae Parisidis, N. 24. foliorum eiusdem cum toto, Num. 36. Ex maceratis in aceto radicibus, & siccatis fit omnium pulvis.*

The people in Germany do vse the leaues of Herbe Paris in greene wounds, for the which it is C very good, as *Ioachimus Camerarius* reporteth; who likewise saith, that the powder of the roots giuen to drink, doth speedily cease the gripings and paine of the Collicke.

Small Moonewoort is singular to heale greene and fresh wounds: it staieth the bloody flux. It D hath beene vsed among the Alchymistes and witches to doe wonders withall, who say, that it will loose lockes, and make them to fall from the feet of horses that graze where it doth grow, and hath beene called of them *Martagon*, whereas in truth they are all but drowsie dreames and illusions; but it is singular for wounds as aforesaid.

CHAP. 90. Of Winter-Greene.

¶ The Description.

1 **P***yrrola* hath many tender and verie greene leaues, almost like the leaues of Beete, but rather in my opinion like to the leaues of a Peare-tree, whereof it tooke his name *Pyrola*, for that it is *Pyriformis*. Among these leaues commeth vp a stalke garnished with prettie white floures, of a verie pleasant sweet smell, like *Lillium Conuallium*, or the Lillie of the Valley. The root is small and threddie, creeping farre abroad vnder the ground.

2 This differs from the last described in the slenderesse of the stalkes, and smalnesse of the leaues and floures: for the leaues of this are not so thicke and substantiall, but very thinne, sharpe pointed, and very finely snipt about the edges, blacker, and resembling a Peare-tree leafe. The floures are like those of the former, yet smaller and more in number: to which succeed fve cornered seed vessels with a long pointell as in the precedent: the root also creepes no lesse than that of the former, and here and there puts vp new stalkes vnder the mosse. It growes vpon the Austrian and Styrian Alpes, and floures in Iune and Iuly.

3 This is an elegant plant, and sometimes becomes shrubbie, for the new and short branches growing vp each yeare, doe remaine firme and greene for some yeares, and grow straight vp, vntill at length borne downe by their owne weight they fall downe and hide themselves in the mosse. It hath commonly at each place where new branches growe forth, two, three, or foure thicke verie greene and shining leaues, almost in forme and magnitude like to the leaues of *Laureola*, yet snipt about the edges, of a very drying taste, and then bitterish. From among these leaues at the Spring of the yeare new branches shoot vp, hauing small leaues like scales vpon them, and at their toppes grow

1 *Pyrola*.
Winter Greene.

2 *Pyrola 2 tenerior* Clus.
The smaller Winter-Greene.

3 *Pyrola 3 fruticans* Clus.
Shrubby Winter-Greene.

4 *Pyrola 4 minima* Clus.
Round leaved Winter Greene.

5 *Monophyllon*.
One Blade.

grow floures like to those of the first described, yet somewhat larger, of a whitish purple colour, which fading, are succeeded by five cornered seed vessels containing a very small seed; the roots are long & creeping. It growes a little from Vienna in Austria in the woods of Entzestorf, and in diuers places of Bohemia and Silesia.

4 This from creeping roots sends vp short stalkes, set at certaine spaces with small, round, and thin leaues, also snipt about the edges, amongst which vpon a naked stem growes a floure of a pretty big-nes, consisting of five white sharpsish pointed leaues with ten threds, and a long pointell in the midst. The seed is contained in such heads as the former, and it is very small. This growes in the shadowie places of the Alpes of Sneberge, Hochbergerin, Duffrenstaine, towards the roots of these great mountaines. *Clus. †*

5 *Monophyllon*, or *Vnifolium*, hath a leafe not much vnlike the greatest leafe of Iuie, with many ribs or sinewes like the Plan-

taine leafe; which single leafe doth alwaies spring forth of the earth alone, but when the stalke riseth vp, it bringeth vpon his sides two leaues, in fashion like the former; at the top of which slender stalke come forth fine small floures like *Pyrola*, which being vaded, there succeed small red berries. The roote is small, tender, and creeping farre abroad vnder the vpper face of the earth.

¶ *The Place.*

1 *Pyrola* groweth in Lansdale, and Crauen, in the North part of England, especially in a close called Crag-close.

2 *Monophyllon* groweth in Lancashire in Dingley wood, six miles from Preston in Aunder-ness; and in Harwood, neere to Blackburne likewise.

¶ *The Time.*

1 *Pyrola* floureth in Iune and Iuly, and groweth winter and sommer.

2 *Monophyllon* floureth in May, and the fruit is ripe in September.

¶ *The Names.*

1 *Pyrola* is called in English Winter-greene: it hath beene called *Limonium* of diuers, but vnruly.

2 *Monophyllon*, according to the etymologie of the word, is called in Latine *Vnifolium*: in English, One-blade, or One-leafe.

¶ *The Nature.*

1 *Pyrola* is cold in the second degree, and drie in the third.

2 *Monophyllon* is hot and dry of complexion.

¶ *The Vertues.*

Pyrola is a most singular wound-hearbe, either giuen inwardly, or applied outwardly: the leaues whereof stamped and strained, and the iuice made into an vnguent, or healing salve, with waxe, oile, and turpentine, doth cure wounds, vlcers, and fistulaes, that are mundified from the callous & rough matter, which keepeth the same from healing.

The decoction hereof made with wine, is commended to close vp and heale wounds of the entrailes, and inward parts: it is also good for vlcers of the kidneies, especially made with water, and the roots of Comfrey added thereto.

The leaues of *Monophyllon*, or *Vnifolium*, are of the same force in wounds with *Pyrola*, especially in wounds among the nerues and sinewes. Moreouer, it is esteemed of some late writers a most perfect medicine against the pestilence, and all poisons, if a dram of the root be giuen in vineger mixed with wine or water, and the sicke go to bed and sweat vpon it.

CHAP. 91. Of Lilly in the valley, or May Lilly.

1 *Lilium conuallium.*
Conuall Lillies.

2 *Lilium conuallium floribus suau. rubentibus.*
Red Conuall Lillies.

¶ The Description.

1 **T**HE Conuall Lillie, or Lilly of the Vally, hath many leaues like the smallest leaues of Water Plantaine, among which riseth vp a naked stalke halfe a foot high, garnished with many white floures like little bels, with blunt and turned edges, of a strong saour, yet pleasant enough, which being past, there come small red berries, much like the berries of *Asparagus*, wherein the seed is contained. The root is small and slender, creeping far abroad in the ground.

2 The second kinde of May Lillies, is like the former in euery respect; and herein varieth or differeth, in that this kinde hath reddish floures, and is thought to haue the sweeter smell.

¶ The Place.

1 The first groweth on Hampsted heath, foure miles from London, in great abundance: neere to Lee in Essex, and vpon Bushie heath, thirteene miles from London, and many other places.

2 That other kind with the red floure is a stranger in England: howbeit I haue the same growing in my garden.

¶ The Time.

They floure in May, and their fruit is ripe in September.

¶ The Names.

The Latines haue named it *Lilium Conuallium*: Gesner doth thinke it to be *Callionymum*: in the Germane tongue, *Heyen blumen*: the low Dutch, *Heyen bloemkens*: in French, *Muguet*: yet there is likewise another herbe which they call *Muguet*, commonly named in English, Woodroof. It is called in English Lillie of the Valley, or the Conuall Lillie, and May Lillies, and in some places Liriconfancie.

¶ The Nature.

They are hot and drie of complexion.

¶ The

¶ The Vertues.

The floures of the Valley Lillie distilled with wine, and drunke the quantitie of a spoonfull, restoreth speech vnto those that haue the dum pallsie and that are falne into the Apoplexie, and is good against the gout, and comforteth the heart. A

The water aforesaid doth strengthen the memorie that is weakened and diminished, it helpeth also the inflammation of the eies, being dropped thereinto. B

The floures of May Lillies put into a glasse, and set in a hill of antes close stopped for the space of a moneth and then taken out, therein you shall find a liquour, that appeaseth the paine & grieve of the gout, being outwardly applied, which is commended to be most excellent. C

CHAP. 92. Of Sea Lauander.

1 *Limonium*.
Sea Lauander.

2 *Limonium parvum*.
Rocke Lauander.

¶ The Description.

1 **T**Here hath beene among writers from time to time, great contention about this plant *Limonium*, no one authour agreeing with another: for some haue called this herbe *Limonium*; some another herb by this name; & some in remouing the rock, haue mired themfelues in the mud, as *Matthiolus*, who described two kindes, but made no distinction of them, nor yet expressed which was the true *Limonium*; but as a man heerein ignorant, hee speakes not a word of them. Now then to leaue controuersies and cauilling, the true *Limonium* is that which hath faire leaues, like the Limon or Orenge tree, but of a darke greene colour, somewhat fatter, and a lit-

tle crumpled: amongst which leaues riseth vp an hard and brittle naked stalke of a foot high, diuided at the top into sundry other small branches, which grow for the most part vpon the one side, full of little blewish floures, in shew like Lauander, with long red seed, and a thicke root like vnto the small Docke.

2 There is a kinde of *Limonium* like the first in each respect, but lesser, which groweth vpon rockes and chalkie cliffes.

3 Besides these two here described, there is another elegant Plant by *Clusius* and others referred to this kindred: the description thereof is thus; from a long slender root come forth long greene leaues lying spred vpon the ground, being also deeply sinuated on both sides, and somewhat roughish. Amongst these leaues grow vp the stalkes welted with slender indented skinned, and towards their tops they are diuided into sundry branches after the manner of the ordinarie one; but these branches are also winged, and at their tops they carry floures some foure or fife

clu-

clustering together, consisting of one thin crispe or crumpled leafe of a light blew colour (which continues long, if you gather them in their perfect vigour, and so drie them) and in the middest of this blew comes vp little white floures, consisting of five little round leaues with some white threds in their middles. This plant was first obserued by *Rauwolfius* at Ioppa in Syria: but it growes also vpon the coasts of Barbarie, and at Malacca and Cadiz in Spaine: I haue seene it growing with many other rare plants, in the Garden of my kinde friend M^r. *John Tradescant* at South Lambeth.

4 *Clusius* in the end of his fourth Booke *Historia Plantarum*, sets forth this, and saith, hee receiued this figure with one dried leafe of the plant sent him from Paris from *Claude Gonier* an Apothecarie of that citie, who receiued it (as you see it here exprest) from Lisbone. Now *Clusius* describes the leafe that it was hard, and as if it had been a piece of leather, open on the vpper side, and distinguished with many large purple veines on the inside, &c. for the rest of his description was onely taken from the figure (as he himselfe saith) which I hold impertinent to set downe, seeing I heere giue you the same figure, which by no meanes I could omit, for the strangeness thereof, but hope that some or other that trauell into forraine parts may finde this elegant plant, and know it by this small expression, and bring it home with them, that so we may come to a perfecter knowledge thereof. ‡

‡ 3 *Limonium folio sinuato.*

Sea-Lauander with the indented leafe.

‡ 4 *Limonio congener, Clus.*

Hollow leaued Sea-Lauander.

¶ The Place.

1 The first groweth in great plentie vpon the walls of the fort against Grauesend: but abundantly on the bankes of the Riuer below the same towne, as also below the Kings Store-house at Chartam: and fast by the Kings Ferrey going into the Isle of Shepey: in the salt marshes by Lee in Essex: in the Marsh by Harwich, and many other places.

2 The

The small kinde I could neuer finde in any other place but vpon the chalky cliffe going from the towne of Margate downe to the sea side, vpon the left hand.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

It shall be needlesse to trouble you with any other Latine name than is exprest in their titles: the people neere the sea side where it groweth do call it Marsh Lauander, and sea Lauander.

¶ This cannot be the *Limonium* of *Dioscorides*, for the leaues are not longer than a Beet, nor the stalke so tall as that of a Lillie, but you shall finde more hereafter concerning this in the Chapter of water Plantaine. I cannot better refer this to any plant described by the Antients than to *Britannica* described by *Dioscorides*, lib. 4. cap. 2. ¶

¶ The Nature.

The seed of *Limonium* is very astringent or binding.

¶ The Vertues.

The seed beaten into pouder, and drunke in wine, helpeth the collicke, strangurie, and Dysenteria. A

The seed taken as aforesaid, staieth the ouermuch flowing of womens termes, and all other fluxes of blood. B

CHAP. 93.

Of *Serapias Turbith*, or Sea Starwort.

1 *Tripolium vulgare majus*.
Great Sea Starwort.

2 *Tripolium vulgare minus*.
Small Sea Starwort.

¶ The Description.

1 The first kinde of *Tripolium* hath long and large leaues somewhat hollow or furrowed, of a shining Greene colour declining to blewnesse, like the leaues of Woade: among which riseth vp a stalke of two cubits high, and more, which toward the top is diuided into many small branches garnished with many floures like Camomill, yellow in the middle, set about

M m

or

or bordered with small blewish leaues, like a pale, as in the floures of Camomill, which grow into a whitish rough downe, that flieth away with the winde. The root is long and threddy.

2 There is another kinde of *Tripolium* like the first, but much smaller, wherein consisteth the difference.

¶ The Place.

These herbs grow plentifully alongst the English coasts in many places, as by the fort against Grauesend, in the Ile of Shepey in sundry places, in a marsh which is vnder the towne walls of Harwich, in the marsh by Lee in Essex, in a marsh which is between the Ile of Shepey and Sandwich, especially where it ebbeth and floweth: being brought into gardens, it flourisheth a long time, but there it waxeth huge, great, and ranke, and changeth the great roots into strings.

¶ The Time.

These herbs do floure in May and Iune.

¶ The Names.

It is reported by men of great fame and learning, that this plant was called *Tripolium*, because it doth change the colour of his floures thrice in a day. This rumour we may beleue, and it may be true, for that we see and perceiue things of as great and greater wonder to proceed out of the earth. This herbe I planted in my garden, whither (in his season) I did repaire to finde out the truth hereof, but I could not espie any such variableness herein; yet thus much I may say, that as the heate of the sunne doth change the colour of diuers floures, so it fell out with this, which in the morning was very faire, but afterward of a pale or wan colour. Which prooueth that to be but a fable which *Dioscorides* saith is reported by some, that in one day it changeth the colour of his floures thrice: that is to say, in the morning it is white, at noone purple, and in the euening ^{or crimson}. But it is not vntue, that there may be found three colours of the floures in one day, by reason that the floures are not all perfected together (as before I partly touched) but one after another by little and little. And there may easily be obserued three colours in them, which is to be vnderstood of them that are beginning to floure, that are perfectly floured, and those that are falling away. For they that are blowing and be not wide open and perfect, are of a purplish colour, and those that are perfect and wide open, of a whitish blew; and such as haue fallen away haue a white down: which changing hapneth vnto sundry other plants. This herbe is called of *Serapio*, *Turbith*: women that dwell by the sea side, call it in English, blew Daiesies, or blew Camomill; and about Harwich it is called Hogs beanes, for that the swine do greatly desire to feed thereon: as also for that the knobs about the roots doe somewhat resemble the Garden Beane. It is called in Greeke *σέρπιλλιον*: and diuers others *πύρα*: it may be fitly called *Aster Marinus*, or *Amellus Marinus*: in English, Sea Starwort, Serapio's Turbith: of some, Blew Daiesies. The Arabian *Serapio*, doth call Sea Starwort, Turbith, and after him, *Avicen*: yet *Actuarius* the Grecian doth thinke that Turbith is the root of *Alypum*: *Mesues* iudged it to be the root of an herbe like fennell. The Historie of Turbith of the shops shall be discoursed vpon in his proper place.

¶ The Nature.

Tripolium is hot in the third degree, as *Galen* saith.

¶ The Vertues.

- A The root of *Tripolium* taken in wine by the quantitie of two drams, driueth forth by siege waterish and grosse humors, for which cause it is often giuen to them that haue the dropie.
- B It is an excellent herbe against poison, and comparable with *Pyrola*, if not of greater efficacy in healing of wounds either outward or inward.

CHAP. 94. Of Turbith of Antioch.

¶ The Description.

Garcias a Portugal Physition saith that Turbith is a plant hauing a root which is neither great nor long: the stalke is of two spans long, sometimes much longer, a finger thicke, which creepeth in the ground like Iuie, and bringeth forth leaues like those of the marsh Mallow. The floures be also like those of the Mallow, of a reddish white colour: the lower part of the stalke only, which is next to the root and gummie, is that which is profitable in medicine, and is the same that is vsed in shops: they chuse that for the best which is hollow, and round like a reed, brittle, and with a smooth barke, as also that whereunto doth cleaue a congealed gum, which is said to be *gummosum*, or gummy, and somewhat white. But, as *Garcias* saith, it is not alwaies gummie

gummie of his owne nature, but the Indians because they see that our merchants note the best Turbith by the gumminesse, are wont before they gather the same, either to writhe or else lightly to bruse them, that the sap or liquor may issue out, which root being once hardned, they picke out from the rest to sell at a greater price. It is likewise made white, as the said Author sheweth, being dried in the sunne: for if it be dried in the shadow it waxeth blacke, which notwithstanding may be as good as the white which is dried in the Sunne.

Turbith Alexandrinum officinarum.

Turpetum, or Turbith of the shops.

¶ *The Place.*

It groweth by the sea side, but yet not so neere that the wash or water of the sea may come to it, but neere about, and that for two or three miles in vntilled grounds, rather moist than drie. It is found in Cambaya, Surrate, in the Ile Dion, Bazaim, and in places hard adjoining; also in Guzarate, where it groweth plentifully, from whence great abundance of it is brought into Persia, Arabia, Asia the lesse, and also into Portingale and other parts of Europe: but that is preferred which groweth in Cambaya.

¶ *The Names.*

It is called of the Arabians, Persians, and Turkes *Turbith*: and in Guzarata *Barcaman*: in the prouince Canara, in which is the city Goa, *Tiguar*: likewise in Europe the learned call it diuersly, according to their severall fancies, which hath bred sundry controuersies, as it hath fallen out aswell in Hermodactyls, as in Turbith; the vse and possession of which we cannot seeme to want: but which plant is the true Turbith, we haue great cause to doubt. Some haue thought our *Tripolium maritimum*, described in the former chapter, to be Turbith: others haue suppo-

sed it to be one of the *Tithymales*, but which kinde they know not: *Guilandinus* saith, that the root of *Tithymalus myrsinitis* is the true Turbith; which caused *Lobelius* and *Pena* to plucke vp by the roots all the kindes of *Tithymales*, and drie them very curiously; which when they had beheld, and thoroughly tried, they found it nothing so. The Arabians and halfe Moores that dwell in the East parts haue giuen diuers names vnto this plant: and as their words are diuers, so haue they diuers significations; but this name Turbith they seeme to interpret to be any milky root which doth strongly purge flegme, as this plant doth. So that as men haue thought good, pleasing themselves, they haue made many and diuers constiutions which haue troubled many excellent learned men to know what root is the true Turbith. But briefly to set downe my opinion, not varying from the iudgment of men which are of great experience; I thinke assuredly that the root of Scammony of Antioch is the true and vndoubted Turbith, one reason especially that moueth me so to thinke is, for that I haue taken vp the roots of Scammony which grew in my garden, and compared them with the roots of Turbith, between which I found little or no difference at all.

¶ Through all Spain (as *Clusius* in his notes vpon *Garcias* testifies) they vse the roots of *Thapsia* for Turbith which also haue been brought hither, and I keepe some of them by me, but they purge little or nothing at all being drie, though it may be the green root or juice may haue some purging faculty. ¶

¶ *The Temperature and Vertues.*

The Indian physitions vse it to purge flegme, to which if there be no feuer they adde ginger, otherwise they giue it without in the broth of a chicken, and sometimes in faire water. A

Mesues writeth, that Turbith is hot in the third degree; and that it voideth thicke rough flegme out of the stomacke, chest, sinewes, and out of the furthest parts of the body: but (as he saith) it is slow in working, and troubleth and ouerturneth the stomacke: and therefore ginger, masticke, and other spices are to be mixed with it; also oile of sweet almondes, or almondes themselves, or sugar, least the body with the vse herof should pine and fall away. Others tem- B

per it with Dates, sweet Almonds, and certaine other things, making thereof a composition (that the Apothecaries call an Electuarie) which is named *ῥιζομαχάριον*: common in shops, and in continuall vse among expert Physitions.

C There is giuen at one time of this Turbith one dram (more or lesse) two at the most: but in the decoction, or in the infusion three or foure.

CHAP. 95. Of Arrow-head, or Water-archer.

1 *Sagittaria maior.*
Great Arrow-head.

2 *Sagittaria minor.*
Small Arrow-head.

¶ The Description.

1 **T**HE first kinde of Water-archer or Arrow-head, hath large and long leaues, in shape like the signe *Sagittarius*, or rather like a bearded broad Arrow head. Among which riseth vp a fat and thicke stalke, two or three foot long, hauing at the top many prettie white floures, declining to a light carnation, compact of three small leaues: which being past, there come after great rough knops or burres wherein is the seed. The root consisteth of many strings.

2 The second is like the first, and differeth in that this kinde hath smaller leaues and floures, and greater burres and roots.

3 The third kinde of Arrow-head hath leaues in shape like the broad Arrow-head, standing vpon the ends of tender foot stalkes a cubit long: among which rise vp long naked smooth stalks of a greenish colour, from the middle whereof to the top doe grow floures like to the precedent. The root is small and threddie.

¶ The Place.

These herbes doe grow in the watrie ditches by Saint George his field neere vnto London; in the Tower ditch at London; in the ditches neere the wals of Oxford; by Chelmesford in Essex, and many other places, as namely in the ditch neere the place of execution, called Saint Thomas Waterings not far from London.

¶ The Time.

They floure in May and Iune.

¶ The

¶ The Names.

Sagittaria, may be called in English the Water-archer, or Arrow-head. ‡ Some would haue it the *Phleum* of *Theophrastus*; and it is the *Pistana Magonis*, and *Sagitta* of *Pliny*, lib. 21. cap. 17.

¶ The Nature and Vertues.

I finde not any thing extant in writing either concerning their vertues or temperament, but doubtlesse they are cold and drie in qualitie, and are like Plantaine in facultie and temperament.

CHAP. 96. Of Water Plantaine.

1 *Plantago aquatica maior.*

Great Water Plantaine.

2 *Plantago aquatica minor stellata.*

Starry headed small Water Plantaine.

3 *Plantago aquatica humilis.* Dwarf water Plantaine.

¶ The Description.

1 The first kinde of water Plantaine hath faire great large leaues like the land Plantaine, but smother, and full of ribs or sinewes: among which riseth vp a tall stemme foure foot high, diuiding it selfe into many slender branches, garnished with infinit small white floures,

which being past there appeare triangle huskes or buttons wherein is the seed. The root is as it were a great tuft of threds or thrums.

‡ 2 This plant in his roots and leaues is like the last described, as also in the stalke, but much lesse in each of them, the stalke being about some foot high; at the top whereof stand many pretty starre-like skinny seed-vessels, containing a yellowish seed. ‡

3 The second kinde hath long, little, and narrow leaues, much like the Plantaine called Ribwoort: among which rise vp small and feeble stalks branched at the top, whereon are placed white floures, consisting of three slender leaues; which being fallen, there come to your view round knobs, or rough burs: the root is threddy.

¶ The Place.

1 This herbe growes about the brinckes of riuers, ponds and ditches almost euery where.

‡ 2 3 These are more rare. I found the second a little beyond Ilford, in the way to Rumford, and Mr. Goodyer found it also growing vpon Hounslow heath. I found the third in the Company of Mr. William Broad, and Mr. Leonard Buckner, in a ditch on this side Margate in the Isle of Tenet. ‡

¶ The Time.

They floure from Iune till August.

¶ The Names.

The first kinde is called *Plantago aquatica*, that is, water Plantaine. ‡ The second Lobell calls *Alisma pusillum Angustifolium muricatum*, and in the *Hist. Lugd.* it is called *Damasonium stellatum*. ‡ The third is named *Plantago aquatica humilis*, that is, the low water Plantaine.

‡ I thinke it fit here to restore this plant to his antient dignitie, that is, his names and titles wherewith he was anciently dignified by *Dioscorides* and *Pliny*. The former whereof calls it by sundry names, and all very significant and proper, as *λεμονιον*, *παραμυρην*, *νευροειδης*, *αλγυρις*: thus many are Greek, and therefore ought not to be reiected, as they haue been by some without either reason or authoritie. For the barbarous names we can say nothing; now it is said to be called *Limonium*, because *αλμασι φυεται*: it growes in wet or ouerflowen medowes: it is called *Neuroides*, because the leafe is composed of diuers strings or fibres running from the one end thereof to the other, as in Plantain, which therefore by *Dioscorides* is termed by the same reason *παραμυρην*: Also it may be as fitly termed *Lonchitis* for the similitude which the leafe hath to the top or head of a lance which *αλγυρις* properly signifies, as that other plant described by *Diosc. lib. 3. cap. 161.* for that the seed (a lesse eminent part) resembles the same thing. And for *Potamogeton* which signifies a neighbour to the Riuer or water, I thinke it loues the water as well, and is as neere a neighbour to it as that which takes its name from thence, and is described by *Dioscorides, lib. 4. cap. 101.* Now to come to *Pliny, lib. 20. cap. 8.* he calls it, *Beta silvestris*, *Limonion*, and *Neuroides*: the two later names are out of *Dioscorides*, and I shall shew you where also you shall finde the former in him. Thus much I thinke might serue for the vindication of my assertion, for I dare boldly affirme that no late writer can fit all these names to any other plant, and that makes me more to wonder that all our late Herbarists as *Matthiolus*, *Dodonaeus*, *Fuchsius*, *Casalpinus*, *Daleschampsius*, but aboue all *Pena* and *Lobell*, who *Aduers. pag. 126.* call it to question, should not allow this plant to be *Limonium*, especially seing that *Anguillara* had before or in their time asserted it so to be; but whether he gaue any reasons or no for his assertion, I cannot tell, because I could neuer by any meanes get his Opinions, but only finde by *Bauhine* his *Pinax* that such was his opinion hereof. But to returne from whence I digrest, I will giue you *Dioscorides* his description, and a brieue explanation thereof, and so desist; it is thus: It hath leaues like a Beet, thinner and larger, 10. or more; a stalke slender, straight, and as tall as that of a Lilly, and full of seeds of an astringent taste. The leaues of this you see are larger than those of a Beet, and thin, and as I formerly told you in the names, neruous; which to be so may be plainly gathered by *Dioscorides* his words in the description of white Hellebore, whose leaues he compares to the leaues of Plantaine and the wilde Beet: now there is no wild Beet mentioned by any of the Antients, but only this by *Pliny* in the place formerly quoted, nor no leafe more fit to compare those of white Hellebore to, than those of water Plantaine, especially for the nerues and fibres that run alongst the leaues, the stalke also of this is but slender considering the height, and it growes straight, and as high as that of a Lilly, with the top plentifully stored with astringent seed; so that no one note is wanting in this, nor scarce any to be found in the other plants that many haue of late set forth for *Limonium*. ‡

¶ The Nature.

Water Plantaine is cold and dry of temperature.

¶ The

¶ The Vertues.

The leaues of water Plantaine, as some Authors report, are good to be laid vpon the legs of such A
as are troubled with the Dropſie, and hath the ſame propertie that the land Plantaine hath.

‡ *Dioſcorides* and *Galen* commend the ſeed hereof giuen in Wine, againſt Fluxes, Dyſenteries, B
the ſpitting of blood, and ouermuch flowing of womens termes.

Pliny ſaith, the leaues are good againſt burnes. ‡ C

CHAP. 97. Of Land Plantaine.

1 *Plantago latifolia.*

Broad leaued Plantaine.

2 *Plantago incana.*

Hoarie Plantaine.

¶ The Description.

1 AS the Greekes haue called ſome kindes of Herbes Serpents tongue, Dogs tongue, and Oxe tongue, ſo haue they termed a kind of Plantaine *Arnogloſſon*, which is as if you ſhould ſay Lambes tongue, very well knowne vnto all, by reaſon of the great commoditie and plenty thereof growing euery where, and therefore it is needleſſe to ſpend time about them. The greatneſſe and faſhion of the leaues hath been the cauſe of the varieties and diuerſities of their names

2 The ſecond is like the firſt kinde, and differeth in that, that this kinde of Plantaine hath greater, but ſhorter ſpikes or knaps: and the leaues are of an hoarie or ouerworne greene colour: the ſtalkeſ are likewiſe hoary and hairy.

3 The ſmall Plantaine hath many tender leaues ribbed like vnto the great Plantaine, and is very like in each reſpect vnto it, ſauing that it is altogether leſſer.

4 The ſpiked Roſe Plantaine hath very few leaues, narrower than the leaues of the ſecond kinde of Plantaine, ſharper at the ends, and further growing one from another. It beareth a very double floure vpon a ſhort ſtem like a roſe, of a greeniſh colour tending to yellowneſſe. The ſeed groweth vpon a ſpikie tuft aboue the higheſt part of the plant; notwithstanding it is but very low in reſpect of the other Plantaines aboue mentioned.

5 The

4 *Plantago Rosea spicata.*
Spiked Rose Plantaine.

‡ 6 *Plantago panniculis sparsis.*
Plantaine with spoky tufts.

5 *Plantago Rosea exotica.*
Strange Rose Plantaine.

5 The fifth kinde of Plantaine hath beene a stranger in England and elsewhere, vntill the impression hereof. The cause why I say so is, the want of consideration of the beauty which is in this plant, wherein it excelleth all the other. Moreouer, because that it hath not bin written of or recorded before this present time, though plants of lesser moment haue beene very curiously set forth. This plant hath leaues like vnto them of the former, and more orderly spred vpon the ground like a Rose: among which rise vp many small stalks like the other plantaines, hauing at the top of euery one a fine double Rose altogether vnlike the former, of an hoary or rusty Greene colour.

‡ I take this set forth by our Author to be the same with that which *Clusius* receiued from *Iames Garret* the yonger, from London; and therefore I giue you the figure thereof in this place, together with this addition to the historie out of *Clusius*: That some of the heads are like those of the former Rose Plantaine; other some are spike fashion, and some haue a spike growing as it were out of the midst of the Rose, and some heads are otherwise shaped: also the whole plant is more hoary than the common Rose Plantaine.

6 This plantain must not here be forgot, though it be somewhat hard to be found: his leaues, roots, and stalkes are like those of the ordinarie, but in stead of a compact spike it hath one much diuided after the manner as you see it here expressed in the figure, and the colour thereof is greenish. ‡

¶ The

¶ The Place.

The greater Plantaines do grow almost euery where.

The lesser Plantaine is found on the sea coasts and bankes of great riuers; which are sometimes washed with brackish water.

† The Rose Plantaines grow with vs in gardens; and the sixth with spokie tufts groweth in some places in the Isle of Tenet, where I first found it, being in company with M^r. Thomas Hickes, M^r. Leonard Buckner; and other London Apothecaries, Anno 1632. †

¶ The Time.

They are to be seene from Aprill vnto September.

¶ The Names.

Plantaine is called in Latine *Plantago*, and in Greeke *ἀπλόγλωσσα*, and *Arnoglossa*; that is to say, Lambes tongue: the Apothecaries keepe the Latine name: in Italian, *Plantagine*, and *Plantagine*: in Spanish, *Lbantem*: the Germanes, *Megrich*: in Low-Dutch, *wechbye*: in English, *Plantain*, and *Weybred*: in French, *Plantain*.

¶ The Temperature.

Plantaine (as *Galen* saith) is of a mixt temperature; for it hath in it a certaine waterie coldnesse, with a little harshnesse, earthy, dry, and cold: therefore they are cold and dry in the second degree. To be briefe, they are dry without biting, and cold without benumbing. The root is of like temperature, but drier, and not so cold. The seed is of subtile parts, and of temperature lesse cold.

¶ The Vertues.

Plantaine is good for vlcers that are of hard curation, for fluxes, issues, rheumes, and rottennesse, and for the bloody flux: it stayeth bleeding, it heales vp hollow fores and vlcers, as well old as new. Of all the Plantaines the greatest is the best, and excelleth the rest in facultie and vertue.

The iuyce or decoction of Plantaine drunken stoppeth the bloody flux and all other fluxes of the belly, stoppeth the pissing of blood, spitting of blood, and all other issues of blood in man or woman, and the desire to vomit.

Plantaine leaues stamped and made into a Tanfie, with the yelkes of egges, stayeth the inordinate flux of the termes, although it haue continued many yeares.

The root of Plantaine with the seed boyled in white Wine and drunke, openeth the conduits or passages of the liuer and kidnies, cures the jaundice, and vlcérations of the kidnies and bladder.

The iuyce dropped in the eyes doth coole the heat and inflammation thereof. I finde in ancient Writers many good-morrowes, which I thinke not meet to bring into your memorie againe; as that three roots will cure one griete, foure another disease, six hanged about the necke are good for another maladie, &c. all which are but ridiculous toys.

The leaues are singular good to make a water to wash a fore throat or mouth, or the priuy parts of a man or woman.

The leaues of Plantaine stamped and put into Oyle Oliue, and set in the hot Sun for a moneth together, and after boyled in a kettle of seething water (which we doe call *Balneum Mariae*) and then strained, preuaileth against the paines in the eares, the yard, or matrix, (being dropped into the eares, or cast with a syringe into the other parts before rehearsed) or the paines of the fundament, proued by a learned Gentleman M^r. William Godowrus Sergeant Surgeon to the Queenes Maiestie.

CHAP. 98. Of Rib-wort.

¶ The Description.

1 **R**ib-wort or small Plantaine hath many leaues flat spread vpon the ground, narrow, sharp pointed, and ribbed for the most part with five nerues or sinewes, and therefore it was called *Quinque-neruia*; in the middle of which leaues riseth vp a crested or ribbed stalke, bearing at the top a darke or dusky knap, set with a few such white floures as are the floures of wheat. The root and other parts are like the other Plantaines.

† There is another lesse kinde of this Rib-wort, which differs not from the last mentioned in any thing but the smallnesse thereof. †

2 Rose Rib-wort hath many broad and long leaues of a darke greene colour, sharpe pointed, and ribbed with five nerues or sinewes like the common Rib-wort; amongst which rise vp naked stalkes furrowed, chamfered, or crested with certaine sharpe edges: at the top whereof groweth a great and large tuft of such leaues as those are that grow next the ground, making one entire tuft

or umbel, in shape resembling the rose (wherof I thought good to giue it his syname Rose) which is from his floure.

‡ This also I think differs not from that of *Clusius*; wherefore I giue his figure in the place of that set forth by our Author. ‡

1 *Plantago quinqueneruia.*
Ribwort Plantaine.

2 *Plantago quinqueneruia rosea.*
Rose Ribwort.

¶ *The Place.*

Ribwort groweth almost euery where in the borders of path-ways and fertile fields.

Rose Ribwort is not very common in any place, notwithstanding it groweth in my garden, and wilde also in the North parts of England; and in a field neere London by a village called Hogsdon, found by a learned merchant of London M^r. *James Cole*, a louer of plants, and very skilfull in the knowledge of them.

¶ *The Time.*

They floure and flourish when the other Plantaines do.

¶ *The Names.*

Ribwort is called in Greeke, *Αμύραντις*; and of some, *πενταφυλλον*; in Latine, *Plantago minor*, *Quinqueneruia*, and *Lanceola*, or *Lanceolata*; in high Dutch, *Spitziger wegrich*; in French, *Lanceole*; in Low-Dutch, *Hondts ribbe*; that is to say in Latine, *Costa canina*, or Dogs rib: in English, Ribwort, and Ribwort Plantaine.

The second I haue thought meet to cal Rose Ribwort in English, and *Quinqueneruia rosea* in Latine.

¶ *The Temperature.*

Ribwort is cold and dry in the second degree, as are the Plantains.

¶ *The Vertues.*

The vertues are referred to the kindes of Plantaines.

CHAP. 99. Of Sea Plantaines.

1 *Holosteum Salamanticum.*
Flouring sea Plantaine.

2 *Holosteum parvum.*
Small sea Plantaine.

3 *Plantago marina.*
Sea Plantaine.

¶ The Description.

1 **C**AROLUS CLUSIUS that excellent Herbarist hath referred these two sorts of *Holosteum* vnto the kindes of Sea Plantaine. The first hath long leaues like the common Rib-wort, but narrower, couered with some hairinesse or wollinesse: among which there riseth vp a stalke, bearing at the top a spike like the kindes of Plantaine, beset with many small floures of an herby colour, declining to whitenesse. The seed is like that of the Plantaine: the root is long and woody. This floures in Aprill or May.

2 The second is like the former, but smaller, and not so gray or hoary: the floures are like to *Coronopus*, or the lesser Ribwort. This floures at the same time as the former.

3 The

3 The third kinde, which is the sea Plantaine, hath small and narrow leaues like Bucks-horn, but without any manifest incisure, cuttings or notches vpon the one side: among which riseth vp a spikie stalke, like the common kinde, but smaller.

‡ 4 *Holosteum, sine Leontopodium Creticum.*
Candy Lyons foot.

‡ 5 *Holosteum, sine Leontopod. Cret. alterum.*
The other Candy Lyons foot.

‡ 4 These two following Plants are by *Clusius* and *Bauhine* referred to this Tribe; wherefore I thinke it fitting to place them here. The former of them from a reddish, and as it were scaly root growing lesse by lirt'e and little, and diuided into fibres, sends forth many leaues, narrow, hoary, an handfull long, and hauing three nerues or ribbes running alongst each of them: amongst these come forth diuers foot-stalkes, couered with a soft reddish downe, and being some two or three inches long, hauing heads somewhat thicke and reddish: the floures are whitish, with a blackish middle, which makes it seeme as if it were perforated or holed. Now when the plant growes old, and withers, the stalkes becomming more thicke and stiffe, bend downe their heads towards the root, so that in some sort they resemble the foot of a Lyon.

5 This Plant which is figured in the vpper place (for I take the lower to be an exacter figure of the last described) hath leaues like to the small sea Plantaine, but tenderer, and standing vpright; and amongst these on little foot-stalkes grow heads like those of *Psyllium*, but prettier, and of a whitish red colour. ‡

¶ The Place.

The two first grow in most of the kingdomes of Spaine. *Carolus Clusius* writeth, that hee neuer saw greater or whiter than neere to Valentia a city of Spaine, by the high-waies. Since, they haue beene found at Bastable in the isle of Wight, and in the isles of Gernsey and Iarsey.

The third doth grow neere vnto the sea in all the places about England where I haue trauelled, especially by the sorts on both the sides of the water at Grauesend; at Erith neere London; at Lee in Essex; at Rie in Kent; at West-Chester, and at Bristow.

‡ The fourth and fifth grow in Candy, from whence they haue been sent to Padua and diuers other places. ‡

¶ The

¶ The Names.

Holosteum is also called by *Dodonæus*, *Plantago angustifolia albida*, or *Plantago Hispaniensis*: in English, Spanish hairy small Plantaine, or flouring sea Plantaine.

† The fourth is called by *Clusius*, *Leontopodium Creticum*: by some it hath beene thought to be *Catanance* of *Dioscorides*: the which *Honorius Bellus* will not allow of: *Bauhine* calls it *Holosteum*, *sive Leontopodium Creticum*.

The fifth is *Leontopodium Creticum alterum* of *Clusius*; the *Habbures* of *Camerarius*; and the *Holosteum Creticum alterum* of *Bauhine*. ‡

¶ The Temperature and Vertues,

Galen saith, That *Holosteum* is of a binding and drying facultie.

Galen, *Dioscorides*, and *Pliny* haue proued it to be such an excellent wound herbe, that it presently closeth or shutteth vp a wound, though it be very great and large: and by the same authority I speake it, that if it be put into a pot where many pieces of flesh are boyling, it will soder them together.

These herbes haue the same faculties and vertues that the other Plantains haue, and are thought to be the best of all the kindes.

† That which was formerly in the fourth place of this chapter, vnder the name of *Holosteum petraeum*, you shall finde hereafter vnder the title of *Muscina corniculatus*; for vnder that name our Author also gaue another figure thereof, with a description; and I iudge it more fitly placed in that place, than here amongst the Plantaines.

CHAP. 100. Of Sea Buck-horne Plantaines.

1 *Coronopus*.

Sea Buck-horne.

2 *Coronopus, sive Serpentina minor*.

Small Sea Buck-horne.

¶ The Description.

THE new Writers following as it were by tradition those that haue written long agoe, haue beene content to heare themselues speake and set downe certainties by vncertaine speeches; which hath wrought such confusion and corruption of writings, that so many Writers, so many seuerall opinions; as may most euidently appeare in these plants and in others: And my selfe am content rather to suffer this scar to passe, than by correcting the error, to renew the old wound. But for mine owne opinion thus I thinke, the plant which is reckoned for a kinde of *Coronopus* is doubtlesse a kinde of *Holosteum*: my reason is, because it hath grassie leaues, or rather leaues like *Veronica syluestris* or wilde Pinks, a root like those of *Garyophyllata* or Auens, and the spikie eare of *Holosteum* or Sea Plantaine: which are certaine arguments that these writers haue neuer seene the Plant, but onely the picture thereof, and so haue set downe their opinions by heare-say.

This plant likewise hath beene altogether vnkowne vnto the old Writers. It groweth most plentifully vpon the cliffes and rocks and the tops of the barren mountains of Auergne in France, and in many places of Italy.

2 The second sort of wilde sea Plantaine or *Serpentina* differeth not from the former but onely in quantitie and slenderesse of his stalkes, and the smallnesse of his leaues, which exceed not the height of two inches. It groweth on the hills and rockes neere the washings of the sea at Massilia in great plenty almost euery where among the *Tragacanthum*, hauing a most thicke and spreading cluster of leaues after the manner of *Sedum minimum saxum montanum*, somewhat like *Pinaster*, or the wilde Pine, as well in manner of growing, as stiffnesse, and great increase of his slender branches. It hath the small seed of Plantaine, or *Serpentina vulgaris*, contained within his spiky eares. The root is somewhat long, woody, and thicke, in taste somewhat hot and aromaticall.

3 *Coronopus siue Serpentina minima.*
Small Buck-horne Plantaine.

4 *Cauda Muris.*
Moufe-taile.

3 This small sea plant is likewise one of the kindes of sea Plantaine, participating as well of Buck-horne as of *Holostium*, being as it were a degenerate kinde of sea Plantaine. It hath many grassie leaues very like vnto the herbe Thrift, but much smaller; among which come forth little tender foot-stalkes, whereon do grow small spikie knops like those of sea Plantaine. The root is tough and threddy.

4 Moufe-taile or *Cauda muris* resembleth the last kinde of wilde *Coronopus* or sea Plantaine, in small spikie knops, leaues, and stalkes, that I know no reason to the contrarie, but that I may as well place this small herbe among the kindes of *Coronopus* or Bucks horne, as other Writers haue placed kindes of *Holostium* in the same section: and if that be pardonable in them, I trust this may be tolerated in me, considering that without controuersie this little and base herbe is a kinde of *Holostium*, hauing many small short grassie leaues spred on the ground, an inch long or somewhat more: among which do rise small tender naked stalkes of two inches long, bearing at the top a little blackish torch or spikie knop in shape like that of the Plantaines, resembling very notably the taile of a Moufe, whereof it tooke his name. The root is small and threddy.

¶ The Place.

The first and second of these plants are strangers in England; notwithstanding I haue heard say that they grow vpon the rocks in Silley, Garnsey, and the Isle of man.

Moufe-taile groweth vpon a barren ditch banke neere vnto a gate leading into a pasture on the right hand of the way, as ye go from London to a village called Hampstead; in a field as you goe from Edmonton (a village neere London) vnto a house thereby called Pims, by the foot-paths sides; in Woodford Row in Waltham Forrest, and in the Orchard belonging to Mr. Francis Whetstone in Essex, and in other places.

¶ The

¶ The Time.

They floure and flourish in May and Iune.

¶ The Names.

Matthiolus writeth, That the people of *Goritia* do commonly call these two former plants *Serpentaria* and *Serpentina*; but vnproperly, for that there be other plants which may better be called *Serpentina* than these two: we may cal them in English wild sea Plantaine, whereof doubtlesse they are kindes.

Moufe-taile is called in Latine *Cauda muris*, and *Cauda murina*: in Greeke, *μωσσοεις*, or *μωσσοεις*. *Myosuros* is called of the French-men *Queue de souris*: in English, Bloud-strange, and Moufe-taile.

¶ The Temperature.

Coronopus is cold and dry much like vnto the Plantaine. Moufe-taile is cold and somthing drying, with a kinde of astringion or binding qualitie.

¶ The Vertues.

Their faculties in working are referred vnto the Plantaines and Harts-horne.

CHAP. 101.

Of Bucke-horne Plantaines, or Harts-horne.

1 *Cornu Ceruinum*.
Harts-horne.

2 *Coronopus Ruellij*.
Swines Cressles, or Bucks-horne.

¶ The Description.

1 Bucks-horne or Harts-horne hath long narrow hoary leaues, cut on both the sides with three or foure short starts or knags, resembling the branches of a harts horne, spreading it selfe on the ground like a star: from the middle whereof spring vp small round naked hairy stalks; at the top whereof do grow little knops or spikie torches like those of the smal Plantaines. The root is slender and threddy.

² *Ruellius* Bucks-horne or Swines Cresses hath many smal and weake stragling branches, trailing here and there vpon the ground, set with many small cut or iagged leaues, somewhat like the former, but smaller, and nothing at all hairy as is the other. The floures grow among the leaues, in small rough clusters, of an herby greenish colour: which being past, there come in place little flat pouches broad and rough, in which the seed is contained. The root is white, threddy, and in taste like the garden Cresses.

¶ *The Place.*

They grow in barren plaines, and vntilled places, and sandy grounds; as in Touthill field neere vnto Westminster, at Waltham twelue miles from London, and vpon Blacke-heath also neere London.

¶ *The Time.*

They floure and flourish when the Plantaines doe, whereof these haue beene taken to be kindes.

¶ *The Names.*

Bucks-horne is called in Latine *Cornu Ceruinum*, or Harts-horne: diuers name it *Herba stella*, or *Stellaria*, although there be another herbe so called: in low-Dutch, *Hertzhooren*: in Spanish, *Guiabella*: in French, *Corne de Cerf*: It is thought to *Dioscorides* his *καρνιόπους*, which doth signifie *cornicis pedem*, a Crowes foot. It is called also by certaine bastard names, as *Harenarea*, *Sanguinaria*: and of many, *Herbe luy*, or *herbe Eue*.

¶ *The Temperature.*

Bucks-horne is like in temperature to the common Plantaine, in that it bindeth, cooleth, and drieth.

¶ *The Vertues.*

A The leaues of Buckes-horne boyled in drinke, and giuen morning and euening for certaine dayes together, helpeth most wonderfully those that haue sore eyes, waterie or blasted, and most of the griefes that happen vnto the eyes; experimented by a learned Physition of Colchester called Master *Duke*; and the like by an excellent Apothecarie of the same Towne called M^r. *Buckstone*.

B The leaues and roots stamped with Bay salt, and tied to the wrists of the armes, take away fits of the Ague: and it is reported to worke the like effect being hanged about the necke of the Patient in a certaine number, as vnto men nine plants, roots and all; and vnto women and children seuen.

CHAP. 102. Of *Saracens* Consound.

¶ *The Description.*

¹ *S*aracens Consound hath many long narrow leaues cut or sleightly snipt about the edges: among which rise vp faire browne hollow stalkes of the height of foure cubits; along which euen from the bottome to the top it is set with long and pretty large leaues like them of the Peach tree: at the top of the stalkes grow faire starre-like yellow floures, which turne into downe, and are carried away with the winde. The root is very fibrous or threddy.

¶ *The Place.*

Saracens Consound groweth by a wood as ye ride from great Dunmow in Essex, vnto a place called Clare in the said countrey; from whence I brought some plants into my garden.

‡ I formerly in the twenty fourth Chapter of this second booke told you what plant our Author tooke for *Saracens* Consound, and (as I haue been credibly informed) kept in his garden for it. Now the true *Solidago* here described and figured was found Anno 1632, by my kinde Friends M^r. *George Bowles* and M^r. *William Coot*, in Shropshire in Wales, in a hedge in the way as one goeth from Dudson in the parish of Cherbery to Guarthlow. ‡

¶ *The Time.*

It floureth in Iuly, and the seed is ripe in August.

¶ *The Names.*

Saracens Consound is called in Latine *Solidago Saracenica*, or *Saracens* Comfrey, and *Consolida Saracenica*: in Dutch, *Heidinisck wondtkraut*: of some, *Herba fortis*: in English, *Saracens* Consound, or *Saracens* Wound-wort.

¶ *The*

† *Solidago Saracenica.*
Saracens Confound.

¶ *The Nature.*

Saracens Confound is dry in the third degree, with some manifest heate.

¶ *The Vertues.*

Saracens Confound is not inferiour to **A** any of the wound-herbes whatsoeuer, being inwardly ministred, or outwardly applied in ointments or oyles. With it I cured Master *Cartwright* a Gentleman of *Graves* Inne, who was grievously wounded into the lungs, and that by Gods permission in short space.

The leaues boyled in water and drunke, **B** doth restraîne and stay the wasting of the liuer, taketh away the oppilation and stopping of the same, and profiteth against the laundice and Feuers of long continuance.

The decoction of the leaues made in **C** water is excellent against the forenesse of the throat, if it be therewith gargarised: it increaseth also the vertue and force of lotion or washing waters, appropriate for priuy maimes, sore mouthes, and such like, if it be mixed therewith.

† The figure that was formerly in this place was of *Consolida palustris* of *Tabernaemontanus*; and the true figure belonging to this historie was in the next chapter saue one, vnder the title of *Herba Dorea Lobelii*.

CHAP. 103. Of Golden Rod.

¶ *The Description.*

1 Golden Rod hath long broad leaues somewhat hoary and sharpe pointed; among which rise vp browne stalkes two foot high, diuiding themselves toward the top into sundry branches, charged or loden with small yellow floures; which when they be ripe turne into downe which is carried away with the winde. The root is threddy and browne of colour. † *Lobel* makes this with vnshipt leaues to be that of *Arnoldus de villa noua*. †

2 The second sort of Golden Rod hath small thin leaues broader than those of the first described, smooth, with some few cuts or nicks about the edges, and sharpe pointed, of a hot and harsh taste in the throat being chewed, which leaues are set vpon a faire reddish stalke. It tooke his name from the floures which grow at the top of a gold yellow colour: which floures turne into Downe, which is carried away with the winde, as is the former. The root is small, compact of many strings or threds.

¶ *The Place.*

They both grow plentifully in Hampstead Wood, neere vnto the gate that leadeth out of the wood vnto a Village called Kentish towne, not far from London; in a wood by Rayleigh in Essex, hard by a Gentlemans house called Mr. *Leonard*, dwelling vpon Dawes heath; in Southfleet and in Swainescombe wood also, neere vnto Grauesend.

¶ *The Time.*

They floure and flourish in the end of August.

¶ *The Names.*

It is called in English Golden Rod: in Latine, *Virga aurea*, because the branches are like a golden rod: in Dutch, *Gulden roede*: in French, *verge d'or*.

1 *Virga aurea.*
Golden Rod.

2 *Virga aurea Arnoldi Villanovani.*
Arnold of the new towne his Golden rod.

¶ The Temperature.

Golden Rod is hot and dry in the second degree : it clenseth, with a certaine astringent or binding qualitie.

¶ The Vertues.

A Golden Rod prouoketh vrine, waſteth away the ſtones in the kidnies, and expelleth them, and withall bringeth downe tough and raw ſlegmatick humors ſticking in the vrine veſſels, which now and then do hinder the coming away of the ſtones, and cauſeth the grauell or ſand which is brittle to be gathered together into one ſtone. And therefore *Arnoldus Villanovani* by good reaſon hath commended it againſt the ſtone and paine of the kidnies.

B It is of the number of thoſe plants that ſerue for wound-drinks, and is reported that it can fully performe all thoſe things that *Saracens Confound* can; and in my praſtiſe ſhall be placed in the formoſt ranke.

C *Arnoldus* writeth, That the diſtilled water drunke with wine for ſome few dayes together, worketh the ſame effect, that is, for the ſtone and grauell in the kidnies.

D It is extolled aboue all other herbes for the ſtopping of bloud in ſanguinolent vlcers and bleeding wounds; and hath in times paſt beene had in greater eſtimation and regard than in theſe dayes: for in my remembrance I haue knowne the dry herbe which came from beyond the ſea ſold in Bucklers Bury in London for halfe a crowne an ounce. But ſince it was found in Hampſtead wood, euen as it were at our townes end, no man will giue halfe a crowne for an hundred weight of it: which plainly ſetteth forth our inſtancie and ſudden mutabilitie, eſteeming no longer of any thing, how pretious ſoever it be, than whileſt it is ſtrange and rare. This veriſieth our Engliſh prouerbe, Far fetcht and deare bought is beſt for Ladies. Yet it may be more truly ſaid of phantaſticall Phyſitions, who when they haue found an approued medicine and perfect remedie neere home againſt any diſeaſe; yet not content therewith, they wil ſeek for a new farther off, and by that meanes many times hurt more than they helpe. Thus much I haue ſpoken to bring theſe new fangled fellows backe againe to eſteeme better of this admirable plant than they haue done, which no doubt hath the ſame vertue now that then it had, although it growes ſo neere our owne homes in neuer ſo great quantitie.

CHAP. 103. Of Captaine Andreas Dorias his Wound-woort.

† *Herba Doria L'obelij.*
Dorias Woundwoort.

¶ The Description.

THIS plant hath long and large thicke and fat leaues, sharp pointed, of a blewish Greene like unto Woad, which being broken with the hands hath a prettie spicie smell. Among these leaues riseth vp a stalk of the height of a tal man, diuided at the top into many other branches, whereupon grow small yellowish floures, which turneth into downe that flieth away with the wind. The root is thick almost like *Helleborus albus*.

Of which kinde there is another like the former, but that the leaues are rougher, somewhat bluntly indented at the edges, and not so fat and grosse.

‡ *Herba Doria altera.*

This herbe growes vp with a green round brittle stalke, very much chambered, sinewed, or furrowed, about foure or fve foot high, full of white pith like that of Elder, and sendeth forth small branches: the leaues grow on the stalk out of order, & are smooth, sharpe pointed, in shape like those of *Herba Doria*, but much shorter & narrower, the broadest and longest sel-

dome being aboute ten or eleuen inches long, and scarce two inches broad, and are more finely and smally nickt or indented about the edges, their smell being nothing pleasant, but rather when together with the stalke they are broken and rubbed yeeld forth a smell hauing a small touch of the smell of Hemlocke. Out of the bosomes of these leaues spring other smaller leaues or branches. The floures are many, and grow on small branches at the tops of the stalkes like those of *Herba Doria*, but more like those of *Iacobaea*, of a yellow colour, as well the middle button, as the small leaues that stand round about, euery floure hauing commonly eight of those small leaues. Which beeing past the button turneth into downe and containeth very small long seedes which flie away with the winde. The root is nothing else but an infinite of small strings which most hurtfully spread in the ground, and by their infinite increasing destroyeth and starueth other herbes that grow neere it. Its naturall place of growing I know not, for I had it from Mr. *John Coys*, and yet keep it growing in my garden. *John Goodyer.* ‡

¶ The Place.

These plants grow naturally about the borders or brinkes of riuers neere to Narbone in France, from whence they were brought into England, and are contented to be made denizons in my garden, where they flourish to the height aforesaid.

¶ The Time.

They floured in my garden about the twelfth of Iune.

¶ The Nature.

The roots are sweet in smell, and hot in the third degree.

¶ The Vertues.

Two drams of the roots of *Herba Doria* boiled in wine and giuen to drinke, draweth downe watery humors, and prouoketh vrine.

The same is with good successe vsed in medicines that expell poison.

‡ All

‡ All these Plants mentioned in the three last Chapters, to wit, *Solidago*, *Virga aurea* and this *Herba Dorea*, are by *Bauhine* fitly comprehended vnder the title of *Virga aurea*; because they are much alike in shape, and for that they are all of the same facultie in medicine. ‡

† The figure that was here was of *Solidago Saracemica*.

CHAP. 105. Of Felwoort, or Baldmoney.

¶ The Kindes.

There be diuers sorts of Gentians or Felwoorts, whereof some be of our owne countrey, others more strange and brought further off: and also some not before this time remembred, either of the antient or later writers, as shall be set forth in this present chapter.

¶ The Description.

The first kinde of Felwoort hath great large leaues, not vnlike to those of Plantaine, very well resembling the leaues of the white Hellebore: among which riseth vp a round hollow stalke as thicke as a mans thumbe, full of ioints or knees, with two leaues at each of them, and towards the top euery ioint or knot is set round about with small yellow starre-like floures, like a coronet or garland: at the bottome of the plant next the ground the leaues do spread themselves abroad, embracing or clipping the stalke in that place round about, set together by couples one opposite against another. The seede is small, browne, flat, and smooth like the seeds of the Stocke Gillo-floure. The roote is a finger thicke. The whole Plant is of a bitter taste.

1 *Gentiana maior*.
Great Felwoort.

‡ 2 *Gentiana maior purpurea*, 1. *Clusij*.
Great Purple Felwoort.

3 *Gentiana maior ij. caruleo flore Clusj.*
Blew floured Felwoort.

4 *Gentiana minor Cruciata.*
Crossewoort Gentian.

5 *Gentiana Pennae minor.*
Spotted Gentian of Dr. Pennic.

‡ 2 This described by *Clusius*, hath leaues and stalkes like the precedent; these stalkes are some cubite and halfe or two cubits high, and towards the toppes they are ingirt with two or three coronets of faire purple floures, which are not star-fashioned, like those of the former, but long and hollow, diuided as it were into some five or six parts or leaues, which towards the bottome on the inside are spotted with deepe purple spots: these floures are without smell, & haue so many chiues as they haue iaggies, and these chiues compass the head, which is parted into two cells, and contains store of a smooth, chaffie, reddish seed. The root is large, yellow on the outside, and white within, very bitter, & it sends forth euery yere new shoots. It growes in diuers places of the Alps; it floures in August, and the seeds are ripe in September. ‡

3 *Carolus Clusius* also setteth forth another sort of a great Gentian, rising forth of the ground with a stiffe, firme or solide stalke, set with leaues like vnto *Aselepias*, by couples one opposite against another, euen from the bottome to the top in certaine distances: from the bosome of the leaues

leaves there shoot forth set vpon slender foot-stalkes certaine long hollow floures like bells, the mouth whereof endeth in five sharpe corners. The whole floure changeth many times his colour according to the soile and climate; now and then purple or blew, sometimes whitish, and often of an ashe colour. The root and seed is like the precedent.

4 Crosse-woort Gentian hath many ribbed leaves spread vpon the ground, like vnto the leaves of Sopewoort, but of a blacker greene colour: among which rise vp weake iointed stalkes trailing or leaning toward the ground. The floures grow at the top in bundles thicke thrust together, like those of sweet Williams, of a light blew colour. The root is thicke, and creepeth in the ground far abroad, whereby it greatly increaseth.

5 *Carolus Clusius* hath set forth in his Pannonicke historie a kinde of Gentian, which he receiued from M^r. *Thomas Pennie* of London, D^r. in Phisicke, of famous memorie, and a second *Dioscorides* for his singular knowledge in Plants: which *Tabernamontanus* hath set forth in his Dutch booke for the seuenth of *Clusius*, wherein he greatly deceiued himselfe, and hath with a false description wronged others.

This twelfth sort or kinde of Gentian after *Clusius*, hath a round stiffe stalke, firme and solide, somewhat reddish at the bottome, iointed or kneed like vnto Crossewoort Gentian. The leaves are broad, smooth, full of ribbes or sinewes, set about the stalkes by couples, one opposite against another. The floures grow vpon small tender stalkes, compact of five slender blewish leaves, spotted very curiously with many blacke spots and little lines; hauing in the middle five yellow chiuies. The seed is small like sand: the root is little, garnished with a few strings of a yellowish colour.

¶ The Place.

Gentian groweth in shadowie woods, and the mountains of Italie, Sclauonia, Germany, France, and Burgundie; from whence M^r. *Isaac de Laune* a learned Phisition sent me plants for the increase of my garden. Crossewoort Gentian groweth in a pasture at the West end of little Rayne in Essex on the North side of the way leading from Braintree to Much-Dunmow; and in the horse way by the same close.

¶ The Time.

They floure and flourish in August, and the seed is ripe in September.

¶ The Names.

Gentius King of Illyria was the first finder of this herbe, and the first that vsed it in medicine, for which cause it was called Gentian after his owne name: in Greeke γέντιον: which name also the Apothecaries retaine vnto this day, and call it *Gentiana*: it is named in English Felwoort Gentian, Bitterwoort; Baldmoyne, and Baldmoney.

- 1 This by most Writers is called *Gentiana*, and *Gentiana maior Lutea*.
- 2 *Gesner* calleth this *Gentiana punicea*; *Clusius*, *Gentiana maior flore purpureo*.
- 3 This is *Gentiana folijs hirundinaria* of *Gesner*: and *Gentiana Asclepiadis folio* of *Clusius*.
- 4 This, *Cruciata*, or *Gentiana Cruciata*, of *Tragus*, *Fuchsius*, *Dodon*, *Gesner* and others: it is the *Gentiana minor* of *Matthiolus*.

- 5 *Clusius* calls this *Gentiana maior pallida punctis distincta*.

¶ The Temperature.

The root of Felwoort is hot, as *Dioscorides* saith, clensing or scouring: diuers copies haue, that it is likewise binding, and of a bitter taste.

¶ The Vertues.

- A It is excellent good, as *Galen* saith, when there is need of attenuating, purging, clensing, and removing of obstructions, which qualitie it taketh of his extreme bitternesse.
- B It is reported to be good for those that are troubled with crampes and convulsions; for such as are burst, or haue falne from some high place: for such as haue euill liuers and bad stomacks. It is put into Counterpoisons, as into the composition named *Theriaca diateffaron*: which *Actius* calleth *Mysterium*, a myserie or hid secret.
- C This is of such force and vertue, saith *Pliny*, that it helpeth cattell which are not onely troubled with the cough, but are also broken winded.
- D The root of Gentian giuen in powder the quantitie of a dramme, with a little pepper and herbe Grace mixed therewith, is profitable for them that are bitten or stung with any manner of venomous beast or mad dog: or for any that hath taken poison.
- E The decoction drunke is good against the stoppings of the liuer, and cruditie of the stomacke, helpeth digestion, dissolueth and scattereth congealed blood, and is good against all cold diseases of the inward parts.

CHAP. 106. Of English Felwoort.

¶ The Description.

Hollow leaved Felwoort or English Gentian hath many long tough roots, disperfed hither and thither within the vpper crust of the earth; from which immediatly riseth a fat thicke stalke, jointed or kneed by certaine distances, set at euery knot with one leafe, and sometimes moe, keeping no certaine number: which leaues doe at the first inclose the stalkes round about, being one whole and entire leafe without any incisure at all, as it were a hollow trunke; which after it is growne to his fulnesse, breaketh in one side or other, and becommeth a flat ribbed leafe, like vnto the great Gentian or Plantaine. The floures come forth of the bosome of the vpper leaues, set vpon tender foot stalkes, in shape like those of the small Bindweed, or rather the floures of Soperwoort, of a whitish colour, washt about the brims with a little light carnation. Then followeth the seed, which as yet I haue not obserued.

Gentiana concava.

Hollow Felwoort.

¶ The Place.

I found this strange kind of Gentian in a small groue of a wood called the Spinie, neere vnto a small village in Northampton shire called Lichbarrow: elsewhere I haue not heard of it.

¶ The Time.

It springeth forth of the ground in April, and bringeth forth his floures and seed in the end of August.

¶ The Names.

I haue thought good to giue vnto this plant, in English, the name Gentian, being doubtlesse a kinde therof. The which hath not been set forth, nor remembered by any that haue written of plants vntil this time. In Latine we may call it *Gentiana concava*, of the hollow leaues. It may be called also hollow leaued Felwoort.

¶ The Temperature and Vertues.

Of the faculties of this plant as yet I can say nothing, referring it vnto the other Gentians, vntill time shall disclose that which yet is secret and vnknowne.

‡ *Bauhine* receiued this plant with the figure thereof from Doctor *Lister* one of his Maiesties Physitions, and he referres it

vnto *Saponaria*, calling it *Saponaria concava Anglica*; and (as farre as I can coniecture) hath a good description thereof in his *Prodrom.* pag. 103. Now both by our Authour and *Bauhines* Description, I gather, that the roote in this Figure is not rightly expressed, for that it should bee long, thicke, and creeping, with few fibers adhering thereunto; when as this figure expresseth an annuall woody root. But not hauing as yet seene the plant, I can affirme nothing of certaintie, ‡

CHAP.

† CHAP. 107. Of Bastard Felwoort.

¶ The Description.

† Ovr Authour in this Chapter so confounded all, that I knew not well how, handsomely to set all right; for his descriptions they were so barren, that little might be gathered by them, and the figures agreed with their titles, but the place contradicts all; for the first figured is found in England; and the second is not that euer I could learne: also the second floures in the spring, according to *Clusius* and all others that haue written thereof, and also by our Authours owne title, truely put ouer the figure: yet he said they both floure and flourish from August to the end of September. These things considered, I thought it fitter both for the Readers benefit, and my owne credit to giue you this chapter wholly new with additions, rather than mangled and confused, as otherwise of necessitie it must haue beene. †

† 1 This elegant *Gentianella* hath a small yellowish creeping root, from which arise many Greene smooth thicke hard and sharpe pointed leaues like those of the broad leaued Myrtle, yet larger, and hauing the veines running alongst the leaues as in Plantaine. Amongst the leaues come vp short stalkes, bearing very large floures one vpon a stalke; and these floures are hollow like a Bel-floure, and end in fise sharpe points with two little eares betweene each diuision, and their colour is an exquisite blew. After the floure is past there follows a sharpe pointed longish vessell, which opening it selfe into two equall parts, shewes a small crested darke coloured feede.

† 1 *Gentianella verna maior.*
Spring large floured Gentian.

2 *Gentianella Alpina verna.*
Alpes Felwoort of the spring time.

2 This second rises vp with a single slender and purplish stalke, set at certaine spaces with six or eight little ribbed leaues, standing by couples one against another. At the top stands a cup, out whereof comes one long floure without smell, and as it were diuided at the top into fise parts; and it is of so elegant a colour, that it seemes to exceed blewnesse it selfe; each of the foldes or little leaues of the floure hath a whitish line at the side, and other fise as it were pointed leaues or appendices set betweene them: and in the middest of

the floure are certaine pale coloured chiues: a longish sharpe pointed vessell succeeds the floure which contains a small hard round feed. The root is small, yellowish and creeping, putting vp here and there stalkes bearing floures, and in other places onely leaues lying orderly spred vpon the ground.

3 *Gentianella fugax minor.*
Bastard or Dwarfed Felwoort.

3 Besides these two whose roots last long and increase every yeare, there are diuers other Dwarfed or Bastard Gentians which are annuall, and wholly perish every yeare as soone as they haue perfected their seed; and therefore by *Clusius* they are fitly called *Gentiana fugaces*. Of these I haue onely obserued two kinds (or rather varieties) in this Kingdome, which I wil here describe vnto you. The first of these, which is the lesser, & whose figure we here giue you, is a proper plant some two or three inches high, diuided immediatly from the root into three or foure or more branches, set at certaine spaces with little longish leaues, being broadest at the setting on, and so growing narrower or sharper pointed. The tops of these stalkes are beautified with long, hollow, and pretty large floures, considering the magnitude of the plant, and these floures are of a darke purplish colour, and at their tops diuided into five parts. The root is yellowish, small, and wooddy. The seed which is small

and round is contained in longish vessels. The stalkes and leaues are commonly of a darke green, or else of a brownish colour.

4 This from a root like, yet a little larger than the former, sends vp a pretty stiffe round stalke of some span high; which at certaine spaces is set with such leaues as the last described, but larger: and out of the bosomes of these leaues from the bottome to the top of the stalke come forth little foot stalkes, which vsually carry three floures a piece; two set one against another, and the third vpon a stalke somewhat higher; and sometimes there comes forth a single floure at the root of these foot stalkes. The floures in their shape, magnitude and colour, are like those of the last mentioned, and also the seed and seed vessels. The manner of growing of this is very well presented by the figure of the third Gentian, formerly described in the Chapter last saue one aforegoing.

¶ The Place.

1 2 These grow not wilde in England that I know of, but the former is to bee found in most of our choice Gardens. As with Mr. *Parkinson*, Master *Tradescant*, and Master *Tugge*, &c.

3 4 These are found in diuers places, as in the Chalke-dale at Dartford in Kent, and according to our Authour (for I know he meant these) in Waterdowne Forest in Suffex, in the way that leadeth from Charlwoods lodge, vnto the house of the Lord of Abergauenie, called Eridge house by a brooke side there, especially vpon a Heath by Colbrooke neere London: on the Plain of Salisbury, hard by the turning from the said Plaine, vnto the right Honourable the Lord of Pembrookes house at Wilton, and vpon a Chalkie banke in the high way betweene Saint Albons and Goramberrie.

¶ The Time.

1 2 These two floure in Aprill and May. The other from August vnto the end of October.

¶ The Names.

1 This is the *Gentiana* 4. of *Tragus*. The *Gentianella Alpina* of *Gesner*. *Gentianella campanuliflora* and *Heluetica* of *Lobel*; the *Gentiana* 5. or *Gentianella maior verna* of *Clusius*.

2 *Gesner* called this *Calathiana verna*: *Lobel*, *Gentianella Alpina*: and *Clusius*, *Gentiana* 6. and *Gentianella minor verna*.

3 This is the *Calathiana vera* of *Daleschampsius*: and the *Gentiana fugax* 5. or *Gentiana* 11. *minima* of *Clusius*.

4 I take this to bee *Clusius* his *Gentiana fugax* 4. or *Gentiana* 10. We may call this in English, Small Autumne Gentian.

¶ *Their Temperature and Vertues.*

These by their taste and forme should be much like to the greater Gentians in their operation and working, yet not altogether so effectually. ‡

CHAP. 106. Of Calathian Violet, or Autumne Bel-floure.

¶ *The Description.*

AMong the number of the base Gentians there is a smal plant, which is late before it commeth up, hauing stalks a span high, and sometimes higher, narrow leaues like vnto Time, set by couples about the stalkes by certaine distances: long hollow floures growing at the top of the stalks, like a cup called a Beaker, wide at the top, and narrower toward the bottome, of a deepe blew colour tending to purple, with certain white threds or chiues in the bottome: the floure at the mouth or brim is five cornered before it be opened, but when it is opened it appeareth with five cliffs or pleats. The whole plant is of a bitter taste, which plainly sheweth it to be a kinde of wilde Gentian. The root is small, and perisheth when it hath perfected his seed, and recouereth it selfe by falling of the same.

Pneumonanthe.
Calathian Violet.

¶ *The Place.*

It is found sometimes in Meadows, oftentimes in vntilled places. It groweth vpon Long-field downes in Kent, neere vnto a village called Longfield by Grauesend, vpon the chalkie cliffes neere Greene-Hythe and Cobham in Kent, and many other places. It likewise groweth as you ride from Sugar-loafe hill vnto Bathe, in the West countrey.

‡ This plant I neuer found but once, and that was on a wet Moorish ground in Lincolnshire, 2. or 3. miles on this side Caster, and as I remember, the place is called Netleton Moore. Now I suspect that our Authour knew it not; first, because he describes it with leaues like vnto Time, when as this hath long narrow leaues more like to Hyssop or Rosemary. Secondly, for that he saith the root is small & perisheth when as it hath perfected the seed: whereas this hath a liuing, stringie and creeping root. Besides, this seldome or neuer growes on chalkie cliffes, but on wet Moorish grounds and Heaths: wherefore I suspect our Authour tooke the small Autumne Gentian (described by me in the fourth place of the last Chapter) for this here treated of. ‡

¶ *The Time.*

The gallant floures hereof be in their brauerie about the end of August, and in September.

¶ *The Names.*

‡ This is thought to be *Viola Calathiana* of *Ruellius*, yet not that of *Pliny*; and those that desire to know more of this may haue recourse to the twelfth chapter of the first booke of the 2. *Pempt.* of *Dodon.* his Latine Herball, whence our Authour tooke those words that were formerly in this place, though he did not well vnderstand nor expresse them ‡. It is called *Viola Autumnalis*, or Autumne Violet, and seemeth to bee the same that *Valerius Cordus* doth call *Pneumonanthe*, which he saith is named in the Germane tongue *Lungenblumen*, or Lung-floure: in English, Autumne Bel-floures, Calathian Violets, and of some, Haruest-bels.

¶ *The Temperature.*

This wilde Felwoort or Violet is in Temperature hot, somewhat like in facultie to Gentian, whereof it is a kinde, but far weaker in operation.

¶ *The Vertues.*

A The latter Physitions hold it to be effectually against pestilent diseases, and the bitings & stings of venomous beasts.

CHAP. 109. Of Venus Looking-glasse.

¶ The Description.

1 BESIDES the former Bel-floures, there is likewise a certaine other, which is low and little; the stalkes whereof are tender, two spans long, diuided into many branches most commonly lying vpon the ground. The leaues about the stalks are little, sleightly nicked in the edges. The floures are small, of a bright purple colour tending to blewnes, very beautifull, with wide mouths like broad bells, hauing a white chiue or thred in the middle. The floures in the day time are wide open, and about the setting of the Sun are shut vp and closed fast together, in five corners, as they are before their first opening, and as the other Bel-floures are. The roots be verie slender, and perish when they haue perfected their seed.

‡ 2 There is another which from a small and woody root sendeth vp a straight stalk, sometimes but two or three inches, yet otherwhiles a foot high, when as it lights into good ground. This stalke is crested and hollow, hauing little longish leaues crumpled or sinuated about the edges set thereon: and out of the bosomes of those leaues towards the top of the stalke and sometimes lower, come little branches bearing little winged cods, at the tops of which in the middest of five little greene leaues stand small purple floures, of little or no beauty; which being past the cods become much larger, and containe in them a small yellowish seed, and they still retaine at their tops the five longish greene leaues that incompassed the floure. This plant is an annuall like as the former. ‡

1 *Speculum Veneris.*
Venus Looking-glasse.

‡ 2 *Speculum Veneris minus.*
Codded come violet.

¶ The Place.

It groweth in ploughed fields among the corne, in a plentiful and fruitfull soile. I found it in a field among the corne by Greene-hithe, as I went from thence toward Dartford in Kent, and in many other places thereabout, but not elsewhere: from whence I brought of the seeds for my Garden, where they come vp of themselves from yeare to yeare by falling of the seed.

‡ That which is here figured and described in the first place I neuer found growing in Eng-

land, I haue seene only some branches of it brought from Leiden by my friend M^r. William Parker. The other of my description I haue diuers times found growing among the corn in Chelsey field, and also haue had it brought me from other places by M^r. George Bowls, & M^r. Leonard Buckner. ‡

¶ The Time.

It floureth in Iune and Iuly, and the seed is ripe in the end of August.

¶ The Names.

It is called *Campana Aruensis*, and of some *Onobrychis*, but vnproperly, of other *Cariophyllus segetum*, or corne Gillofloure, or Corne pinke, and *Speculum Veneris*, or Ladies glasse The Brabanders in their tongue call it *Urowen Spiegel*.

‡ *Tabernamontanus* hath two figures thereof, the one vnder the name of *Viola aruensis*, and the other by the title of *Viola Pentagonia*, because the floure hath five folds or corners. 2 This of my description is not mentioned by any Authour; wherefore I am content to follow that name which is giuen to the former, and terme it in Latine *Speculum Veneris minus*: and from the colour of the floure and codded seed vessell, to call it in English, Codded Corne Violet.

¶ The Temperature and Vertues.

We haue not found any thing written either of his vertue or temperature, of the antient or late Writers.

CHAP. II. Of Neesing root, or Neesewoort.

1 *Helleborus albus*.
White Hellebor.

2 *Helleborus albus pracox*.
Timely white Hellebor.

¶ The Description.

The first kinde of white Hellebor hath leaues like vnto great Gentian, but much broader, and not vnlike the leaues of the great Plantaine, folded into pleats like a garment pleated to bee laied vp in a chest; amongst these leaues riseth vp a stalke a cubite long, set towards

towards the top full of little starre-like floures, of an herbie green colour tending to whitenesse, which being past there come small huskes containing the seed. The roote is great and thicke, with many small threds hanging thereat.

2 The second kinde is very like the first, and differeth in that, that this hath blacke reddish floures, and commeth to flourishing before the other kinde, and seldome in my garden commeth to seeding.

¶ *The Place.*

The white Hellebor groweth on the Alps, and such like mountains where Gentian doth grow. It was reported vnto me by the bishop of Norwich, that white Hellebor groweth in a wood of his owne neere to his house at Norwich. Some say likewise that it doth grow vpon the Mountaines of Wales. I speake this vpon report, yet I thinke not, but that it may be true. Howbeit I dare assure you, that they grow in my garden at London, where the first kinde floureth and seedeth very well.

¶ *The Time.*

The first floureth in Iune, and the second in May.

¶ *The Names.*

Neefewoort is called in Greeke *ιακκωρος λευκος*: in Latine, *Veratrum Album*, *Helleborus albus*, and *Sanguis Hercules*. The Germans call it *Weiß-nieswurt*: the Dutchmen, *Nieswortel*: the Italians, *Elleboro bianco*: The Spaniards, *Verde gambre blanco*: the French, *Elleboro blanche*: and we of England call it white Hellebor, Nieswoort, Lingwoort, and the roote Neefing pouder.

¶ *The Temperature.*

The roote of white Hellebor, is hot and drie in the third degree.

¶ *The Vertues.*

The roote of white Hellebor procureth vomite mightily, wherein consisteth his chiefe vertue, A and by that means voideth all superfluous slime and naughtie humors. It is good against the falling sicknesse, phrensies, sciatica, dropfies, poison, and against all cold diseases that bee of hard curation, and will not yeeld to any gentle medicine.

This strong medicine made of white Hellebor, ought not to be giuen inwardly vnto delicate B bodies without great correction, but it may more safely be giuen vnto Country people which feed grossely, and haue hard, tough, and strong bodies.

The roote of Hellebor cut in small pieces, such as may aptly and conueniently be conueied into C the Fistulaes doth mundifie them, and taketh away the callous matter which hindereth curation, and afterward they may be healed vp with some incarnatiue vnguent, fit for the purpose. † This facultie by *Dioscorides* is attributed to the blacke Hellebor, and not to this. †

The pouder drawne vp into the nose causeth sneefing, and purgeth the braine from grosse and D slimie humors.

The roote giuen to drinke in the weight of two pence, taketh away the fits of agues, killeth Mice E and rats being made vp with honie and floure of wheat: *Pliny* addeth that it is a medicine against the Loufie euill.

CHAP. III. Of Wilde white Hellebor.

¶ *The Description.*

1 **H**elleborine is like vnto white Hellebor, and for that cause we haue giuen it the name of Helleborine. It hath a straight stalke of a foot high, set from the bottome to the tuft of floures, with faire leaues, ribbed and chamfered like those of white Hellebor, but nothing neere so large, of a darke greene colour. The floures bee orderly placed from the middle to the top of the stalke, hollow within, and white of colour, straked here and there with a dash of purple, in shape like the floures of *Satyrion*. The seed is small like dust or motes in the Sun. The roote is small, full of iuice, and bitter in taste.

2 The second is like vnto the first, but altogether greater, and the floures white, without any mixture at all, wherein consisteth the difference.

3 The third kind of Helleborine, being the 6. after *Clusius* account, hath leaues like the first descri- bed,

bed, but smaller and narrower. The stalke riseth vp to the height of two spans; at the top whereof grow faire shining purple coloured floures, consisting of six little leaues, within or among which lieth hid things like small helmets. The plant in proportion is like the othet of this kinde. The root is small, and creepeth in the ground.

1 *Helleborine.*

Wilde white Hellebore.

3 *Helleborine angustifolia* 6. *Clusij.*
Narrow leaved wilde Neefewoort.

¶ *The Place.*

They bee found in dankish and shadowie places; the first was found growing in the woods by Digges well pastures, halfe a mile from Welwen in Hartfordshire: it groweth in a wood five miles from London, neere vnto a bridge called Lockbridge: by Nottingham neere Robinhoods well, where my friend Mr. *Steuens Bredwell* a learned Physition found the same: in the woods by Dunmowe in Essex: by Southfleet in Kent; in a little groue of Iuniper, and in a wood by Clare in Essex.

¶ *The Time.*

They floure in May and Iune, and perfect their seed in August.

¶ *The Names.*

The likenesse that it hath with white Hellebor, doth shew it may not vnproperly bee named *Helleborine*, or wilde white Hellebor, which is also called of *Dioscorides* and *Pliny* *anemone*, or *Epipactis*; But from whence that name came it is not apparant: it is also named *anemone*.

¶ *The Temperature.*

They are thought to be hot and drie of nature.

¶ *The Vertues.*

A The faculties of these wilde Hellebors are referred vnto the white Neefewoort, whereof they are kinde.

B It is reported that the decoction of wilde Hellebor drunken, openeth the stoppings of the Liver, and helpeth any imperfections of the same.

CHAP. 112. Of our Ladies Slipper.

¶ The Description.

1 **O**ur Ladies Shoo or Slipper hath a thicke knobbed root, with certaine marks or notes vpon the same, such as the roots of Solomons Seale haue, but much lesser, creeping within the vpper crust of the earth: from which riseth vp a stiffe and hairy stalke a foot high; set by certaine spaces with faire broad leaues, ribbed with the like sinewes or nerues as those of the Plantaine. At the top of the stalke groweth one single floure, seldome two, fashioned on the one side like an egge; on the other side it is open, empty, and hollow, and of the forme of a shoo or slipper, whereof it tooke his name; of a yellow colour on the outside, and of a shining deepe yellow on the inside. The middle part is compassed about with foure leaues of a bright purple colour, often of a light red or obscure crimson, and sometimes yellow as in the middle part, which in shape is like an egge, as aforesaid.

‡ 2 This other differs not from the former, vnlesse in the colour of the floure; which in this hath the foure long leaues white, and the hollow leafe or slipper of a purple colour. ‡

1 *Calceolus Mariae.*

Our Ladies Slipper.

‡ 2 *Calceolus Mariae alter.*

The other Ladies Slipper.

¶ The Place.

Ladies Slipper groweth vpon the mountains of Germany, Hungary, and Poland. I haue a plant thereof in my garden, which I receiued from M^r. Garret Apothecary, my very good friend.

‡ It is also reported to grow in the North parts of this kingdome; and I saw it in floure with M^r. Tradescant the last Sommer. ‡

¶ The Time.

It floureth about the midst of Iune.

¶ The Names.

It is commonly called *Calceolus D. Mariae*, and *Marianus*: of some, *Calceolus Sacerdotis*: of some, *Alisma*, but vnproperly: in English, Our Ladies shoo or slipper: in the Germane tongue, *Blaffen Schueth*, *Dapen scoeu*: and of some, *Damasonium not hurni*.

¶ The

¶ The Temperature and Vertues.

Touching the faculties of our Ladies Shoo we haue nothing to write, it being not sufficiently knowne to the old Writers, no nor to the new.

CHAP. 113. Of Sope-wort.

¶ The Description.

THe stalkes of Sope-wort are slipperie, slender, round, ioynted, a cubit high or higher: the leaues are broad, set with veins very like broad leaued Plantaine, but yet lesser, standing out of euery ioynt by couples for the most part, and especially those that are the neereſt the roots bowing backwards. The floures in the top of the stalkes and about the vppermost ioynts are many, well smelling, sometimes of a beautifull red colour like a Rose; other-while of a light purple or white, which grow out of long cups conſiſting of ſiue leaues, in the middle of which are certaine little threds. The roots are thicke, long, creeping aſlope, hauing certaine ſtrings hanging out of them like to the roots of blacke Hellebor: and if they haue once taken good and ſure rooting in any ground it is impoſſible to deſtroy them.

‡ There is kept in ſome of our gardens a varietie of this, which differs from it in that the floures are double and ſomewhat larger: in other reſpects it is altogether like the precedent. ‡

I Saponaria.

Sope-wort, or Bruſe-wort.

¶ The Place.

It is planted in gardens for the floures ſake, to the decking vp of houſes, for the which purpoſe it chiefly ſerueth. It groweth wild of it ſelfe neere to riuers and running brookes in ſunny places.

¶ The Time.

It floureth in Iune and Iuly.

¶ The Names.

It is commonly called *Saponaria*, of the great ſcouring qualitie that the leaues haue: for they yeeld out of themſelues a certaine iuyce when they are bruised, which ſcoureth almoſt as well as Sope: although *Ruellius* deſcribe a certaine other Sopewort. Of ſome it is called *Alisma*, or *Damaſonium*: of others, *Saponaria Gentiana*, whereof doubtleſſe it is a kinde: in Engliſh it is called Sopewort, and of ſome Bruiſe-wort.

¶ The Temperature and Vertues.

It is hot and dry, and not a little ſcouring withall, hauing no vſe in phyſicke ſet downe by any Author of credit.

‡ Although our Authour and ſuch as before him haue written of Plants were ignorant of the facultie of this herbe, yet hath the induſtrie of ſome later men found out the vertue thereof: and *Septalius* reports that it was one *Zapata* a Spaniſh Empericke. Since whoſe time it hath beene written of by *Rudius*, lib. 5.

de morbis occult. & venenar. cap. 18. And by *Cesar Claudinus, de ingreſſu ad infirmos, pag. 411. & pag. 417.* But principally by *Ludonicus Septalius, Animaduverſ. med. lib. 7. num. 214.* where treating of decoctions in vſe againſt the French Poxes, he mentions the ſingular effect of this herb againſt that filthy diſeaſe. His words are theſe: I muſt not in this place omit the vſe of another Alexi-pharmicall decoction, being very effectuell and vſefull for the poorer ſort; namely that which is made of Sope-wort, an herbe common and knowne to all. Moreouer, I haue ſometimes vſed it with happy ſucceſſe in the moſt contumacious diſeaſe: but it is of ſomewhat an vngratefull taſte, and

and therefore it must be reserved for the poorer sort. The decoction is thus made: *R. Saponaria virid. M. ij. infundantur per noctem in lib. viij. aqua mox excoquantur ad cocturam Saponaria: deinde libra una cum dimidia aqua cum herba iam cocta excoletur cum expressione, quae reservetur pro potione matutina ad sudores proliciendos sumendo 3 vij. aut viij, quod vero superest dulcoretur cum passulis aut saccharo pro potu cum cibis: astate & biliosis naturis addi poterit aut Sonchi, aut Cymbalaria M. j. Valet & pro mulieribus ad menstrua alba absumenda cum M. 3. Cymbalaria, & addito tantundem Philipendula.* Thus much *Septalius*, who saith that he had used it *sæpe ac sæpius*, often and often againe.

Some haue commended it to be very good to be applied to greene wounds, to hinder inflammation, and speedily to heale them. ‡

CHAP. 114. Of Arsmart or Water-Pepper.

The Description.

A Rsmart bringeth forth stalkes a cubit high, round, smooth, ioyned or kneed, diuiding themselues into sundry branches; whereon grow leaues like those of the Peach or of the Sallow tree. The floures grow in clusters vpon long stems, out of the bosome of the branches and leaues, and likewise vpon the stalkes themselues, of a white colour tending to a bright purple: after which cometh forth little seeds somewhat broad, of a reddish yellow, and sometimes blackish, of an hot and biting taste, as is all the rest of the Plant, and like vnto pepper, whereof it tooke his name; yet hath it no smell at all.

1 *Hydropiper.*
Arsmart.

2 *Persicaria maculosa.*
Dead or spotted Arsmart.

2 Dead Arsmart is like vnto the precedent in stalkes, clustering floures, roots and seed, and differeth in that, that this plant hath certaine spots or marks vpon the leaues, in fashion of a halfe moone, of a darke blackish colour. The whole plant hath no sharpe or biting taste, as the other hath, but as it were a little soure smacke vpon the tongue. The root is likewise full of strings or threds, creeping vp and downe in the ground.

‡ 3 This

‡ 3 This in roots, leaues, and manner of growing is very like the first described, but lesser by much in all these parts: the floures also are of a whitish, and sometimes of a purplish colour: it growes in barren grauelly and wet places.

4 I haue thought good to omit the impertinent description of our Author fitted to this plant, and to giue one somewhat more to the purpose: the stalkes of this are some two foot high, tender, Greene, and sometimes purplish, hollow, smooth, succulent and transparent, with large and eminent ioynts, from whence proceed leaues like those of French Mercurie, a little bigger, and broader toward their stalkes, and thereabout also cut in with deeper notches: from the bosomes of each of these leaues come forth long stalkes hanging downewards, and diuided into three or foure branches, vpon which hang floures yellow, and much gaping, with crooked spurs or heeles, and spotted also with red or sanguine spots: after these are past succeed the cods, which containe the seed, and they are commonly two inches long, slender, knotted, and of a whitish Greene colour, crested with greenish lines; and as soone as the seed begins to be ripe, they are so impatient that they will by no meanes be touched, but presently the seed will fly out of them into your face. And this is the cause that *Lobel* and others haue called this Plant *Noli me tangere*. As for the like reason some of late haue imposed the same name vpon the *Sium minimum* of *Alpinus*, formerly described by me in the seuenth place of the eighteenth chapter of this booke, pag. 260. ‡

‡ 3 *Persicaria pusilla repens*.
Small creeping Arsmart.

4 *Persicaria filiquosa*.
Codded Arsmart.

¶ The Place and Time.

They grow very common almost euery where in moist and waterish plashes, and neere vnto the brims of riuers, ditches, and running brookes. They floure from Iune to August.

‡ The codded or impatient Arsmart was first found to grow in this kingdome by the industrie of my good friend Mr. *George Bowles*, who found it at these places: first in Shropshire, on the banks of the riuer Kemlet at Marington in the parish of Cherberry, vnder a Gentlemans house called Mr. *Lloyd*; but especially at Guerndee in the parish of Cherstocke, halfe a mile from the foresaid Riuer, amongst great Alder trees in the highway. ‡

¶ The Names.

1. Arsmart is called in Greeke *Hydropiper*: of the Latines, *Hydropiper*, or *Piper aquaticum*, or *Aquatile*, or water Pepper: in high-Dutch, *Wasser Pfeffer*: in low-Dutch, *water peper*: in French, *Curage*,

Curage, or *Culrage*: in Spanish, *Pimenta aquatica*: in English, Water-Pepper, Culrage, and Arse-smart, according to the operation and effect when it is vsed in the absterfion of that part.

2 Dead Arsmart is called *Perficaria*, or Peach-wort, of the likenesse that the leaues haue with those of the Peach tree. It hath beene called *Plumbago* of the leaden coloured markes which are seene vpon it: but *Pliny* would haue *Plumbago* not to be so called of the colour, but rather of the effect, by reason that it helpeth the infirmitie of the eyes called *Plumbum*. Yet there is another *Plumbago* which is rather thought to be that of *Plinies* description, as shal be shewed in his proper place. In English we may call it Peach-wort, and dead Arsmart, because it doth not bite those places as the other doth.

† 3 This is by *Lobel* set forth, and called *Perficaria pusilla repens*: of *Tabernamontanus*, *Perficaria pumila*.

4 No plant I thinke hath found more varietie of names than this: for *Tragus* calls it *Mercurialis sylvestris altera*; and he also calls it *Esula*: *Leonicerus* calls it *Tithymalus sylvestris*: *Gesner*, *Camerrinus*, and others, *Noli me tangere*: *Dodonaus*, *Impatiens herba*: *Cesalpinus*, *Catanance altera*: in the *Hist. Lugd.* (where it is some three times ouer) it is called besides the names giuen it by others, *Chrysea*: *Lobel*, *Thalius*, and others call it *Perficaria siliquosa*: yet none of these well pleasing *Columna*, he hath accurately described and figured it by the name of *Balsamita altera*: and since him *Bauhine* hath named it *Balsamina lutea*: yet both these and most of the other keepe the title of *Noli me tangere*. †

¶ The Temperature.

Arsmart is hot and dry, yet not so hot as Pepper, according to *Galen*.

Dead Arsmart is of temperature cold, and something dry.

¶ The Vertues.

The leaues and seed of Arsmart do waste and consume all cold swellings, dissolue and scatter A congealed bloud that commeth of bruifings or stripes.

The same bruised and bound vpon an impostume in the ioynts of the fingers (called among the B vulgar sort a fellon or vncome) for the space of an houre, taketh away the paine: but (saith the Author) it must be first buried vnder a stone before it be applied; which doth somewhat discredit the medicine.

The leaues rubbed vpon a tyred jades backe, and a good handfull or two laid vnder the saddle, C and the same set on againe, wonderfully refresheth the wearied horse, and causeth him to trauell much the better.

It is reported that Dead Arsmart is good against inflammations and hot swellings, being ap- D plied in the beginning: and for greene wounds, if it be stamped and boyled with oyle Oliue, waxe, and Turpentine.

† The faculties of the fourth are not yet knowne. *Lobel* saith it hath a venenate qualitie: and E *Tragus* saith a vomitorie: yet neither of them seemes to affirme any thing of certaintie, but rather by heare-say. †

CHAP. 115. Of Bell-Floures.

¶ The Description.

1 C Ouentry-Bells haue broad leaues rough and hairy, not vnlike to those of the Garden Buglosse, of a swart greene colour: among which do rise vp stiffe hairie stalks the second year after the sowing of the seed: which stalkes diuide themselues into sundry branches, whereupon grow many faire and pleasant bell-floures, long, hollow, and cut on the brim with fiae sleight gashes, ending in fiae corners toward night, when the floure shutteth it selfe vp, as do most of the Bell-floures: in the middle of the floures be three or foure whitish chiues, as also much downy haire, such as is in the eares of a Dog or such like beast. The whole floure is of a blew purple colour: which being past, there succeed great square or cornered seed-vessels, diuided on the inside into diuers cels or chambers, wherein doe lie scatteringly many small browne flat seeds. The root is long and great like a Parsenep, garnished with many threddy strings, which perissheth when it hath perfected his seed, which is in the second year after his sowing, and recouereth it selfe againe by the falling of the seed.

2 The second agreeth with the first in each respect, as well in leaues, stalkes, or roots, and differeth in that, that this plant bringeth forth milke-white floures, and the other not so.

¶ The

Viola Mariana. Blew Couentry-Bells.¶ *The Place and Time.*

They grow in woods, mountaines, and darke vallies, & vnder hedges among the bushes, especially about Couentry, where they grow very plentifully abroad in the fields, & are there called Couentry-bells; and of some about London Canturbury-bells, but vnproperly, for that there is another kinde of Bell-floure growing in Kent about Canturbury, which may more fitly be called Canturbury-bells, because they grow there more plentifully than in any other Country. These pleasant Bel-floures we haue in our London gardens especially for the beauty of their floure, although they be kinde of Rampions, and the roots eaten as Rampions are.

They floure in Iune, Iuly, and August; the seed waxeth ripe in the meane time; for these plants bring not forth their floures all at once; but when one floureth another seedeth.

¶ *The Names.*

Couentry bells are called in Latine *Viola Mariana*: in English, Mercuries violets, or Couentry Rapes; and of some, Mariets. It hath bin taken to be *Medium*, but vnfitly: of some it is called *Rapū syluestre*: which the Greeks call *ρωςάν ἀγρία*.

¶ *The Temperature and Vertues.*

The root is cold and somewhat binding, and not vsed in physicke, but only for a sallet root boyled and eaten with oyle, vineger, and pepper.

CHAP. 116. Of Throat-wort, or Canturbury-Bells.

1 *Trachelium majus.*
Blew Canturbury-Bells.3 *Trachel. majus Belg. sive Giganteum.* Gyant Throatwort.

The Description.

1 The first of the Canterbury bells hath rough and hairy brittle stalkes, crested into a certaine squarenesse, diuiding themselves into diuers branches, whereupon do grow very rough sharpe pointed leaues, cut about the edges like the teeth of a sawe; and so like the leaues of nettles, that it is hard to know the one from the other, but by touching them. The floures are hollow, hairy within, and of a perfect blew colour, bell fashion, not vnlike to the Couentry bells. The root is white, thicke, and long lasting. ‡ There is also in some Gardens kept a variety hereof hauing double floures. ‡

2 The white Canterbury bells are so like the precedent, that it is not possible to distinguish them, but by the colour of the floures; which of this plant is a milke white colour, and of the other a blew, which setteth forth the difference.

4 *Trachelium minus.*

Small Canterbury bells.

5 *Trachelium majus petraeum.*

Great Stone Throtewort.

‡ Our Author much mistaking in this place (as in many other) did againe figure and describe the third and fourth, and of them made a fift and sixt, calling the first *Trachelium Giganteum*, and the next *Viola Calathiana*; yet the figures were such as *Bauhine* could not coniecture what was meant by them, and therefore in his *Pinax*, he saith, *Trachelium Giganteum*, & *Viola Calathiana apud Gerardum*, quid? but the descriptions were better, wherefore I haue omitted the former description and here giuen you the later. ‡

3 Giants Throtewort hath very large leaues of an ouerworne greene colour, hollowed in the middle like the Moscouites spoone, and very rough, slightly indented about the edges. The stalke is two cubits high, whereon those leaues are set from the bottome to the top; from the bottom of each leafe commeth forth one slender footestalke, whereon doth grow a faire and large floure fashioned like a bell, of a whitish colour tending to purple. The pointed corners of each floure turne themselves backe like a scrole, or the Dalmatian cap; in the middle whereof commeth forth a sharpe stile or clapper of a yellow colour. The root is thicke, with certaine strings annexed thereto.

4 The smaller kinde of Throtewort hath stalkes and leaues very like vnto the great Throtewort,

woort, but altogether lesser, and not so hairy : from the bosome of which leaues shoot forth very beautifull floures bell fashion, of a bright purple colour, with a small pestle or clapper in the middle, and in other respects is like the precedent.

‡ 5 This from a wooddy and wrinkled root of a pale purple colour sends forth many rough crested stalkes of some cubit high, which are vnorderly set with leaues, long, rough, and snipt lightly about their edges, being of a darke colour on the vpper side, and of a whitish on their vnder part. At the tops of the stalkes grow the floures, being many, and thicke thrust together, white of colour, and diuided into five or seuen parts, each floure hauing yellowish threds, and a pointall in their middles. It floures in August, and was first set forth and described by *Pona* in his description of Mount Baldus. ‡

¶ The Place.

The first described and sometimes the second growes very plentifully in the low woods and hedge-rows of Kent, about Canterbury, Sittingborne, Grauesend, Southfleet, and Greenehyth, especially vnder Cobham Parke-pale in the way leading from Southfleet to Rochester, at Eltham about the parke there not farre from Greenwich ; in most of the pastures about Watford and Buthy, fiftene miles from London.

‡ 3 The third was kept by our Author in his Garden, as it is also at this day preserued in the garden of M^r. *Parkinson* : yet in the yeere 1626 I found it in great plenty growing wilde vpon the bankes of the Riuer Ouse in Yorkshire, as I went from Yorke to visite Selby the place whereas I was borne, being ten miles from thence. ‡

The fourth groweth in the meadow next vnto Ditton ferrie as you goe to Windfore, vpon the chalky hills about Greenehithe in Kent, and in a field by the highway as you go from thence to Dartford ; in Henningham parke in Essex, and in Sion meadow neere to Brandford, eight miles from London.

The fifth growes on Mount Baldus in Italy.

¶ The Time.

All the kindes of bell floures do floure and flourish from May vntill the beginning of August, except the last, which is the plant that hath been taken generally for the Calathian violet, which floureth in the later end of September ; notwithstanding the Calathian violet or Autumne violet is of a most bright and pleasant blew or azure colour, as those are of this kinde, although this plant sometimes changeth his colour from blew to whitenesse by some one accident or other.

¶ The Names.

1 2 Throtewoort is called in Latine *Ceruicaria*, and *Ceruicaria major* : in Greeke, *παραλιν* : of most, *Vuularia* : of *Fuchsius*, *Campanula* : in Dutch, *Halscrup* : in English, Canterbury bells, Haskewoorte, Throtewoort, or *Vuula* woort, of the vertue it hath against the paine and swelling thereof.

‡ 3 This is the *Trachelium majus Belgarum* of *Lobell*, and the same (as I before noted) that our Author formerly set forth by the name of *Trachelium Giganteum*, so that I haue put them, as you may see, together in the title of the plant.

4 This is the *Trachelium maius* of *Dodoneus*, *Lobell*, and others : the *Ceruicaria minor* of *Taberna-montanus*, and *Vuularia exigua* of *Tragus* : Our Author gaue this also another figure and description by the name of *Viola Calathiana*, not knowing that it was the last saue one which he had described by the name of *Trachelium minus*. ‡

¶ The Temperature.

These plants are cold and dry, as are most of the Bell floures.

¶ The Vertues.

A The Antients for any thing that we know haue not mentioned, and therefore not set downe any thing concerning the vertues of these Bell floures : notwithstanding we haue found in the later writers, as also of our owne experience, that they are excellent good against the inflammation of the throte and *Vuula* or almonds, and all manner of cankers and vlcérations in the mouth, if the mouth and throte be gargarized and washed with the decoction of them : and they are of all other herbes the chiefe and principall to be put into lotions, or washing waters, to inie& into the priuy parts of man or woman being boiled with hony and Allom in water, with some whitewine.

CHAP. II 7. Of Peach-bells and Steeple-bells.

¶ The Description.

1 **T**He Peach-leaved Bell-floure hath a great number of small and long leaues, rising in a great bush out of the ground, like the leaues of the Peach tree: among which riseth vp a stalke two cubits high: alongst the stalke grow many floures like bells, sometime white, and for the most part of a faire blew colour; but the bells are nothing so deepe as they of the other kindes; and these also are more dilated or spread abroad than any of the rest. The seed is small like Rampions, and the root a tuft of laces or small strings.

2 The second kinde of Bell-floure hath a great number of faire blewish or Watchet floures, like the other last before mentioned, growing vpon goodly tall stems two cubits and a halfe high, which are garnished from the top of the plant vnto the ground with leaues like Beets, disorderly placed. This whole plant is exceeding full of milke, insomuch as if you do but breake one leafe of the plant, many drops of a milky iuyce will fall vpon the ground. The root is very great, and full of milk also: likewise the knops wherein the seed should be are empty and void of seed, so that the whole plant is altogether barren, and must be increased with slipping of his root.

1 *Campanula persicifolia.*

Peach-leaved Bell-floure.

2 *Campanula lactescens pyramidalis.*

Steeple milky Bell-floure.

3 The small Bell-floure hath many round leaues very like those of the common field Violet, spread vpon the ground; among which rise vp small slender stems, disorderly set with many grassie narrow leaues like those of flax. The small stem is diuided at the top into sundry little branches, whereon do grow pretty blew floures bell-fashion. The root is small and threddy.

4 The yellow Bell-floure is a very beautifull plant of an handfull high, bearing at the top of his weake and tender stalkes most pleasant floures bel-fashion, of a faire and bright yellow colour. The leaues and roots are like the precedent, sauing that the leaues that grow next to the ground of this plant are not so round as the former. † Certainly our Author in this place meant to set forth the *Campanula lutea linifolia flore volubilis*, described in the *Advers.* pag. 177. and therefore I haue giuen you the figure thereof. †

3 *Campanula rotundifolia.*
Round leaved Bell-floure.

5 *Campanula minor alba, sine purpurea.*
Little white or purple Bel-floure.

† 4 *Campanula lutea linifolia.*
Yellow Bell-floure.

5 The little white Bell-floure is a kinde of wilde Rampions, as is that which followeth, and also the last saue one before described. This small plant hath a slender root of the bignesse of a small straw, with some few strings annexed thereto. The leaues are somewhat long, smooth, and of a perfect Greene colour, lying flat vpon the ground: from thence rise vp small tender stalkes, set heere and there with a few leaues. The floures grow at the top, of a milke white colour.

6 The other small Bell-floure or wilde Rampion differeth not from the precedent but onely in colour of the floures; for as the others are white, these are of a bright purple colour, which sets forth the difference.

‡ 7 Besides these here described, there is another very small and rare Bell-floure, which hath not beene set forth by any but onely by *Bauhine*, in his *Prodrom.* vnder the title of *Campanula Cymbalariae folijs*, and that fitly; for it hath thinne and small cornered leaues much after the manner of *Cymbalaria*, and these are set without order on very small weake and tender stalkes some handfull long; and at the tops of the branches grow little small and tender Bell-floures of a blew colour. The root, like as the whole plant, is very small and threddy. This pretty plant was first discouered to grow in England by Master *George Bowles*, Anno 1632. who found it in Montgomerie shire, on the dry bankes in the high-way as one rideth from *Dolgegg* a Worshipfull Gentlemans house called *M^r. Francis Herbert*, vnto a market towne called *Mahuntleth*, and in all the way from thence to the sea side. It may be called in English, The tender Bell-floure. ‡

¶ *The Place.*

The two first grow in our London gardens, and not wilde in England.

The rest, except that small one with yellow floures, do grow wilde in most places of England; especially vpon barren sandy heaths and such like grounds.

¶ *The Time.*

These Bell-floures do flourish from May vnto August.

¶ *The Names.*

Their seuerall titles set forth their names in English and Latine, which is as much as hath been said of them.

¶ *The Temperature and Vertues.*

These Bell-floures, especially the foure last mentioned, are cold and dry, and of the nature of Rampions, whereof they be kindes.

† The figure in the fourth place was of *Rapunculus nemorosus* 3. of *Tabern.* whereof you shall finde mention in the following chapter.

CHAP. 118. Of Rampions, or wilde Bell-floures.

1 *Rapuntium majus.*
Great Rampion.

2 *Rapuntium parvum.*
Small Rampion.

¶ *The Description.*

1 **T**he great Rampion being one of the Bell-floures, hath leaues which appeare or come forth at the beginning somewhat large and broad, smooth and plaine, not vnlike to the leaues of the smallest Beet. Among which rise vp stemmes one cubit high, set with such like leaues as those are of the first springing vp, but smaller, bearing at the top of the stalke a great thicke bushy eare full of little long floures closely thrust together like a Fox-tail: which small floures before their opening are like little crooked hornes, and being wide opened they are small blew-bells, sometimes white, or sometimes purple. The root is white, and as thicke, as a mans thumbe.

2 The second kind being likewise one of the bel-floures, and yet a wild kind of Rampion, hath leaues at his first comming vp like vnto the garden Bell-floure. The leaues which spring vp afterward for the decking vp of the stalke are somewhat longer and narrower. The floures grow at the top of tender and brittle stalkes like vnto little bells, of a bright blew colour, sometimes white or purple. The root is small, long, and somewhat thicke.

3 This is a wilde Rampion that growes in woods: it hath small leaues spred vpon the ground, bluntly indented about the edges: among which riseth vp a straight stem of the height of a cubit, fet from the bottome to the top with longer and narrower leaues than those next the ground: at the top of the stalkes grow small Bell-floures of a watchet blewish colour. The root is thicke and tough, with some few strings anexed thereto.

† There is another varietie of this, whose figure was formerly by our Author set forth in the fourth place of the last chapter: it differs from this last onely in that the floures and other parts of the plant are lesser a little than those of the last described. †

3 *Rapunculus nemorosus.*
Wood Rampions.

† 4 *Rapunculus Alpinus Corniculatus.*
Horned Rampions of the Alpes.

† 4 This which growes amongst the rockes in the highest Alpes hath a woody and verie wrinckled root an handfull and halfe long, from which arise many leaues set on pretty long stalks, somewhat round, and diuided with reasonable deepe gashes, hauing many veines, and being of a darke greene colour: amongst these grow vp little stalkes, hauing one leafe about their middles, and three or foure set about the floure, being narrower and longer than the bottome leaues. The floures grow as in an vmbell, and are shaped like that Chymicall vessell we vsually call a Retort, being big at their bottomes, and so becomming smaller towards their tops, and hauing many threds in them, whereof one is longer than the rest, and comes forth in the middle of the floure: it floures in August. Pona was the first that described this, vnder the name of *Trachelium petraeum minus*.

5 The roots of this other kinde of horned Rampion grow after an vnusuall manner; for first or lowermost is a root like to that of a Rampion, but slenderer, and from the top of that commeth forth as it were another root or two, being smallest about that place whereas they are fastned to the vnder root, and all these haue small fibres comming from them. The leaues which first grow vp are smooth, and almost like those of a Rampion, yet rounder, and made somewhat after the maner of a violet leafe, but nothing so big: at the bottome of the stalk come forth 7 or eight long narrow leaues

leaves snipt about the edges, and sharpe pointed, and vpon the rest of the stalke grow also three or foure narrow sharp pointed leaues. The floures which are of a purple colour, at first resemble those of the last described; but afterwards parte themselues into fve slender strings with threds in the middles; which decaying, they are succeeded by little cups ending in fve little pointels, and containing a small yellow seed. This is described by *Fabius Columna*, vnder the name of *Rapuntium Corniculatum montanum*: And I receiued seeds and roots hereof from M^r. *Goodyer*, who found it growing plentifully wilde in the inclosed chalkie hilly grounds by Maple-Durham neere Peterfield in Hampshire.

6 This which is described in *Clusius* his *Cura poster.* by the name of *Pyramidalis*, and was first found and sent to him by *Gregory de Reggio* a Capuchine Frier, is also of this kindred; wherefore I will giue you a brieue description thereof. The root is white, and long lasting; from which come diuers round hairie and writhen stalkes, about a span long more or lesse. At the top of these stalks and all amongst the leaues, grow many elegant blew floures, which are succeeded by seed vessels like those of the lesser *Trachelium*, being full of a small seed. The whole plant yeelds milke like as the rest of this kinde, and the leaues as well in shape as hoarinesse on their vnder sides, well resemble those of the second French or Golden Lungwoort of my description. It was first found growing in the chinkes of hard rockes about the mouthes of Caues, in the mountaines of Brescia in Italy by the foresaid Frier. ‡

‡ 5 *Rapunculus Corniculatus montanus.*
Mountaine horned Rampions.

‡ 6 *Rapunculus saxatilis, sive Pyramidalis alter.*
Rocke Rampion.

¶ The Place.

The first is sowne and set in Gardens, especially because the rootes are eaten in Sallads.
The second groweth in woods and shadowie places, in fat and clayie soiles.

¶ The Time.

They floure in May, Iune, and Iuly.

¶ The Names.

Rampions by a generall name are called *Rapuntium* and *Rapunculus*; and the first by reason of the long spokie tusse of floures is called *Rapuntium maius Alopecuri comoso flore* by *Lobell* and *Pena*: *Rapunculum sylvestre*, and *Rapunculus sylvestris spicatus* by others. The second, which

[is

is the ordinary Rampion is called *Rapunculus*, and *Rapuntium minus*; Lobell thinks it the *Pes Locustæ* of *Auicē*; and *Columna* iudges it to be *Erinus* of *Nicander* and *Dioscorides*. The third is the *Rapunculus nemorosus secundus* of *Tabernamontanus*; & the varietie of it is *Rapunculus nemorosus tertius*. The names of the rest are shewen in their descriptions. ‡

¶ The Temperature.

The roots of these are of a cold temperature, and something binding.

¶ The Vertues.

- A The roots are especially vsed in fallads, being boiled and eaten with oile, vinegar, and pepper.
B Some affirme, that the decoction of the roots are good for all inflammations of the mouth, and Almonds of the throte, and other diseases happening in the mouth and throte, as the other Throte-woorts.

CHAP. liij. Of Wall-floures, or yellow Stocke-Gillo-floures.

¶ The Kindes.

‡ These plants which wee terme commonly in English, Wal-floures and Stocke Gilloures are comprehended vnder one generall name of *Leucoion*, (i) *Viola alba*, White Violet, *Viola* signifying white, and *ion* a Violet; which as some would haue it is not from the whitenesse of the floure, for that the most and most vsuall of them are of other colours, but from the whitenesse or hoarinesse of the leaues, which is proper rather to the Stocke Gilloures than to the wal-floures, I therefore thinke it fit to distinguish them into *Leucoia folijs viridibus*, that is VVal-floures; and *Leucoia folijs incanis*, Stocke Gilloures. Now these againe are distinguished into seuerall species, as you may finde by the following Chapters. Moreouer you must remember there is another *Viola alba* or *Leucoion* (which is thought to be that of *Theophrastus* and whereof we haue treated in the first booke) which is far different from this, and for distinction sake called *Leucoium bulbosum*. ‡

1 *Viola Lutea.*
VVal-floure.

2 *Viola lutea multiplex.*
Double VVal-floure.

† 4 *Leucoium sylvestre.*
Wilde wall floure.

¶ The Description.

1 The stalks of the Wall floure are full of greene branches, the leaues are long, narrow, smooth, slippery, of a blackish greene colour; and lesser than the leaues of stocke Gillofloures. The floures are small, yellow, very sweete of smell, and made of foure little leaues, which being past, there succeed long slender cods, in which is contained flat reddish seed. The whole plant is shrubby, of a wooddie substance, and can easily endure the colde of winter.

2 The double Wall floure hath long leaues greene and smooth, set vpon stiffe branches, of a wooddie substance: whereupon do grow most pleasant sweet yellow flours very double, which plant is so well knowne to all, that it shall be needlesse to spend much time about the description.

3 Of this double kinde we haue another sort that bringeth his floures open all at once, whereas the other doth floure by degrees, by meanes whereof it is long in flouring.

† 4 This plant which was formerly seated in the fourth place of the following chapter, I haue brought to enjoy the same place in this, for that by reason of the greenesse of his leaues and other things he comes nearest to these here described, also I wil describe it anew, because the former was almost wholly false: It

hath many greene leaues at the top of the root like to these of the wall floure, but narrower, and bitter of taste, among which rise vp one or more stalks of a foot or more in height, crested and set with carinated leaues. The floures grow at the tops of the stalkes many together, consisting of foure yellow leaues a piece, lesser than those of the ordinary wall floures; there floures are succeeded by long cods containing a flat seed. The root is long and whitish, with many fibres.

5 Besides these, there is in some gardens kept another wall-floure differing from the first in the bignesse of the whole plant, but especially of the floure, which is yellow and single, yet very large and beautifull.

6 Also there is another with very greene leaues, and pure white and well smelling floures. †

¶ The Place.

The first groweth vpon bricke and stone walls, in the corners of churches euery where, as also among rubbish and such other stony places.

The double Wall-floure groweth in most gardens of England.

¶ The Time.

They floure for the most part all the yeere long, but especially in winter, whereupon the people in Cheshire do call them Winter-Gillofloures.

¶ The Names.

The Wallfloure is called in Greeke *ῥανδίων*: in Latine, *Viola lutea*, and *Leucoium luteum*: in the Arabicke tongue, *Keyri*: in Spanish, *Violetta Amarilla*: in Dutch, *Violieren*: in French, *Girofflees jaunes*, *Violieres des murailles*: in English, Wall-Gillofloure, Wall-floure, yellow stocke Gillofloure, and Winter-Gillofloure.

¶ The Temperature.

All the whole shrub of Wall-Gillofloures, as Galen saith, is of a clensing faculty, and of thinne parts.

¶ The Vertues.

Dioscorides writeth that the yellow Wall-floure is most vsed in physicke, and more than the rest of stocke-Gillofloures, whereof this is holden to be a kinde: which hath mooued me to preferre it vnto the first place. He saith, that the iuice mixed with some vnctuous or oilie thing, and boiled to the forme of a lymiment, helpeth the chops or rifts of the fundament.

The

- B The herbe boiled with white wine, honie, and a little allom, doth cure hot vlcers, and cankers of the mouth.
- C The leaues stamped with a little bay salt, and bound about the wrists of the hands, taketh away the shaking fits of the Ague.
- D ‡ A decoction of the floures together with the leaues, is vsed with good successe to mollifie Schirrous tumors.
- E The oile also made with these is good to be vsed to anoint a Paralyticke, as also a goutie part to mitigate paine.
- F Also a strong decoction of the floures drunke, moueth the Courses, and expelleth the dead childe. ‡

CHAP. 120. Of Stocke Gillofloures.

1 *Leucoium album, siue purpureum, siue violaceum.*
White, purple, or Violet coloured Stocke Gillofloure.

‡ 2 *Leucoium flore multiplici.*
Double Stocke Gillofloure.

¶ The Description.

THe stalke of the great stocke Gillofloure is two foot high or higher, round, and parted into diuers branches. The leaues are long, white, soft, and hauing vpon them as it were a downe like vnto the leaues of willowe, but softer: the floures consist of foure little leaues growing all along the vpper part of the branches, of a white colour, exceeding sweet of smell: in their places come vp long and narrow cods, in which is contained broad, flat, and round seed. The root is of a wooddy substance, as is the stalke also.

The purple stocke Gillofloure is like the precedent in each respect, sauing that the floures of this plant are of a pleasant purple colour, and the others white, which setteth forth the difference: of which kinde we haue some that beare double floures, which are of diuers colours, greatly esteemed for the beautie of their floures, and pleasant sweet smell.

This

3 *Leucoium spinosum Creticum.*
Thornie Stocke Gillouers.

This kinde of Stocke Gillouere that beareth floures of the colour of a Violet, that is to say of a blew tending to a purple colour, which setteth forth the difference betwixt this plant & the other stocke Gilloueres, in euery other respect is like the precedent.

2 ‡ There were formerly 3 figures of the single Stocks, which differ in nothing but the colour of their floures, wherefore we haue made them content with one, & haue giuen (which was formerly wanting) a figure of the double Stock, of which there are many and prettie varieties kept in the garden of my kinde friend M^r. *Ralph Tugge* at VVestminster, and set forth in the booke of such as purposely treat of floures and their varieties. ‡

‡ 3 To these I thinke it not amisse to adde that plant which *Clusius* hath set forth vnder the name of *Leucoium spinosum Creticum*. It growes some foot or more high, bringing forth many stalkes which are of a grayish colour, and armed at the top with many and strong thorny prickles: the leaues which adorne these stalkes are like those of the stocke Gillouer, yet lesse and somewhat hoary; the floures are like those of Mulleine, of a

whitish yellow colour, with some purple threds in their middles; the cods which succede the floures are small and round, containing a little seed in them. They vse, saith *Honorius Bellus*, to heat ovens therewith in Candy, where it plentifully growes; and by reason of the similitude which the prickles hereof haue with *Stæbe* and the white colour, they cal it *Gala Strivida*, or *Galastivida*, and not because it yeelds milke, which *Gala* signifies.

¶ The Place.

1. 2. These kindes of Stocke Gilloueres do grow in most Gardens throughout England.

¶ The Time.

They floure in the beginning of the Spring, and continue flourishing all the Sommer long.

¶ The Names.

The Stocke Gillouere is called in Greeke *λευκοιανθος*; in Latine, *Viola alba*; in Italian, *Viola bianca*; in Spanish, *Violetas blancas*; in English, Stocke Gillouere, Garnsey Violet, and Castle Gillouere.

¶ The Temperature and Vertues.

They are referred vnto the VVal-floure, although in vertue much inferiour, yet are they not vsed A in Physicke, except amongst certaine Empericks and Quacksaluers, about loue and lust matters, which for modestie I omit.

Ioachim *Camerarius* reporteth, that a conserue made of the floures of Stocke Gillouere, and B often giuen with the distilled water thereof, preserueth from the Apoplexy, and helpeth the palsie,

CHAP. 121.

Of Sea Stocke Gilloueres.

¶ The Kindes.

OF Stocke Gilloueres that grow neere vnto the Sea there bee diuers and sundrie sorts, differing as well in leaues as floures, which shall bee comprehended in this Chapter next following.

1 *Leucoium marinum flore candido* L'obelij.
White Sea Stocke Gillofloures.

3 *Leucoium marinum latifolium*.
Broad leaved sea stocke Gillofloure.

2 *Leucoium marinum purpureum* L'obelij.
Purple sea Stocke Gillofloures.

¶ The Description.

1 **T**He Sea stocke Gillōfloure hath a small woody root very threddie; from which riseth vp an hoarie white stalke of two foot high, diuided into diuers small branches, whereon are placed confusedly many narrow leaues of a soft hoarie substance. The floures grow at the top of the branches, of a whitish colour, made of foure little leaues, which being past, there follow long coddess and seed, like vnto the garden stocke Gillofloure.

¶ 2 The purple stocke Gillofloure hath a very long tough root, thrusting it selfe deepe into the ground; from which rise vp thicke, fat, soft, and hoarie stalkes. The leaues come forth of the stalkes next the ground, long, soft, thicke, full of iuice, couered ouer with a certaine downie hoarinesse, and sinuated somewhat deepe on both sides, after the manner you may see exprest in the figure of the fourth described in this Chapter. The stalke is set here and there with the like leaues, but lesser. The floures grow at the top of the stalkes, compact of foure small leaues, of a light purple colour. The seede is contained in long crooked cods like the garden stocke Gillofloure.

¶ The figure of *Lobels* which here we giue you was taken of a dried plant, and therefore the leaues are not exprest so sinuate as they should be. ¶

3 This sea stock Gillofloure hath many broad leaues spred vpon the ground, somewhat snipt or cut on the edges; amongst which rise vp small naked stalkes, bearing at the top many little floures of a blew colour tending to a purple. The seede is in long cods like the others of his kinde.

4 The great Sea stock Gillofloure hath many broad leaues, growing in a great tuft, sleightly indented about the edges. The floures grow at the top of the stalkes, of a gold yellow colour. The root is small and single.

5 The small yellow Sea stocke Gillofloure hath many smooth, hoary, and soft leaues, set vpon a branched stalke: on the top whereof grow pretty sweet smelling yellow floures, bringing his seed in little long cods. The root is small and threddy. ‡ The Floures of this are sometimes of a red, or purplish colour. ‡

4 *Leucoium marinum luteum maius Clusij & L'obelij.*
The yellow Sea stocke Gillofloure.

5 *Leucoium marinum minus L'obelij & Clusij.*
Small yellow Sea stocke Gillofloure.

¶ The Place.

These plants do grow neere vnto the sea side, about Colchester, in the Isle of Man, neere Preston in Aunderneshe, and about Westchester.

‡ I haue not hard of any of these wilde on our coasts but onely the second, which it may bee growes in these places here set downe; for it was gathered by Mr. George Bowles vpon the Rocks at Aberdovye in Merioneth shire. ‡

¶ The Time.

They flourish from Aprill to the end of August.

¶ The Names.

There is little to bee said as touching the names, more than hath been touched in their seuerall titles.

¶ The Temperature and Vertues.

There is no vse of these in Physicke, but they are esteemed for the beauty of their floures.

CHAP. 122. Of Dames Violets, or Queenes Gillofloures.

¶ The Description.

1 DAMES Violets or Queenes Gillofloures, haue great large leaues of a darke greene colour, somewhat snipt about the edges: among which spring vp stalkes of the height of

two cubits, set with such like leaues: the floures come forth at the tops of the branches, of a faire purple colour, verie like those of the stocke Gillofloures, of a very sweet smell, after which come vp long cods, wherein is contained small long blackish seed. The root is slender and threddie.

The Queenes white Gillofloures are like the last before remembred, sauing that this plant bringeth forth faire white floures, and the other purple.

¶ 2 By the industrie of some of our Florists, within this two or three yeares hath beene brought to our knowledge a very beautifull kinde of these Dame Violets, hauing very faire double white floures, the leaues, stalks and roots, are like to the other plants before described. ¶

1 *Viola Matronalis flore purpureo, sive albo.*
Purple, or white Dames Violets.

¶ 3 *Viola matronalis flore obsoleto.*
Russet Dames Violets.

¶ 3 This plant hath a stalke a cubit high, and is diuided into many branches, vpon which in a confused order grow leaues like those of the Dame Violet, yet a little broader and thicker, being first of somewhat an acide, and afterwards of an acride taste; at the tops of the branches in long cups grow floures like those of the Dames violet, consisting of foure leaues, which stand not faire open, but are twined aside, and are of a ouerworn russet colour, composed as it were of a yellow and browne with a number of blacke purple veines diuarcated ouer them. Their smell on the day time is little or none, but in the euening very pleasing and sweet. The floures are succeeded by long, and here and there swolne cods, which are almost quadrangular and containe a reddish seed like that of the common kinde. The root is fibrous, and vsually liues not aboue two yeares, for after it hath borne seed it dies; yet if you cut it downe and keepe it from feeding, it sometimes puts forth shouts whereby it may bee increased. I very much suspect that this figure and description which I here giue you taken out of *Clusius*, is no other plant than that which is kept in some of our gardens, and set forth in the *Hortus Eystettensis* by the name of *Leucoium Melancholicum*: now I iudge the occasion of this error to haue come from the figure of *Clusius* which we here present you with, for it is in many particulars different from the description: first in that it expresse not many branches: secondly, in that the leaues are not snipt & diuided: thirdly, in that the Floures are not exprest wrested or twined: fourthly, the veins are not rightly exprest in the floure; & lastly, the cods are omitted. Now the *Leucoium melancholicum* hath a hairy stalke diuided into sundry branches of the height formerly mentioned, and the leaues about the middle of the stalke are somewhat sinuated or deeply or vnequally cut in; the shape and colour of the floure is the same with that now described,

‡ 4 *Leucoium melancholicum.*
The Melancholly floure.

described, and the seed vessels the same, as far as I remember: for I must confesse, I did not in writing take any particular note of them though I haue diuers times seene them, neither did I euer compare them with this description of *Clusius*; onely I tooke some yeares agoe an exact figure of a branch with the vpper leaues and floures, whereof one is exprest as they vsually grow twining backe, and the rest faire open, the better to set forth the veines that are spred ouer it. There are also exprest a eod or seede vessell, and one of the leaues that grow about the middle of the stalke; all which are agreeable to *Clusius* description in mine opinion; wherefore I onely giue you the figure that I then drew, with the title that I had it by. ‡

¶ The Place.

They are sown in gardens for the beauty of their floures.

¶ The Time.

They especially floure in Maie and Iune, the second yeare after they are sowne.

¶ The Names.

Dames Violet is ealled in Latine *Viola matronalis*, and *Viola Hyemalis*, or Winter Violets, and *Viola Damascena*: It is thought to be the *Hesperis* of *Pliny*, lib. 21. cap. 7. so called, for that it smells more, & more pleasantly in the euening or night, than at any other time. They are called in French *Violettes des Dames*, & *de domas*, and *Giroffles des dames*, or *Matrones Violettes*: in English, Damaske Violets, winter Gillofloures, Rogues Gillofloures, and close Sciences.

¶ The Temperatue.

The leaues of Dames Violers are in taste sharpe and hot, very like in taste and facultie to *Eruca* or Rocket, and seemeth to be a kinde thereof.

¶ The Vertues.

The distilled water of the floures hereof is counted to be a most effectuall thing to procure A sweat.

CHAP. 123. Of White Sattin floure.

¶ The Description.

1 **B**olbonac or the Sattin floure hath hard and round stalkes, diuiding themselues into many Bother small branches, beset with leaues like Dames Violets, or Queenes Gillofloures, somewhat broad, and snipt about the edges, and in fashion almost like Sauce alone, or Iacke by the hedge, but that they are longer and sharper pointed. The stalkes are charged or loden with many floures like the common stocke Gillofloure, of a purple colour, which being salne, the feed

seed commeth forth contained in a flat thin cod, with a sharp point or prick at one end, in fashion of the Moone, and somewhat blackish. This cod is composed of three filmes or skins, whereof the two outmost are of an ouerworne ash colour, and the innermost, or that in the middle, whereon the seed doth hang or cleave, is thin and cleere shining, like a shred of white Sattin newly cut from the peece. The whole plant dieth the same yeare that it hath borne seed, & must be sowne yearely. The root is compact of many tuberous parts like key clogs, or like the great Asphodill.

2 The second kind of *Bolbonac* or white Sattin hath many great and broad leaues, almost like those of the great burre Docke: among which riseth vp a very tall stem of the height of foure cubits, stiffe, and of a whitish Greene colour, set with the like leaues, but smaller. The floures grow vpon the slender branches, of a purple colour, compact of foure small leaues like those of the stocke Gillofloure; after which come thin long cods of the same substance and colour of the former. The root is thicke, whereunto are fastened an infinite number of long threddie strings: which roote dieth not euery yeare as the other doth, but multiplieth it selfe as well by falling of the seede, as by new shoots of the root.

1 *Viola Lunarise sive Bolbonac.*
White Sattin.

2 *Viola Lunarise longioribus siliquis.*
Long codded white Sattin.

¶ The Place.

These plants are set and sowne in gardens; notwithstanding the first hath been found wilde in the woods about Pinner, and Harrow on the hill, twelue miles from London; and in Essex likewise about Horn-church.

The second groweth about Watford, fiftene miles from London.

¶ The Time.

They floure in Aprill the next yeare after they be sowne.

¶ The Names.

They are commonly called *Bolbonac* by a barbarous name: we had rather call it with *Dodonæus* & *Clusius*, *Viola latifolia*, and *Viola lunarise*, or as it pleaseth most Herbarists, *Viola peregrina*: the Brabanders name it *Penninck bloemen*, of the fashion of the coddles, like after a sort to a groat or testerne, and *Daetsch bloemen*, because it alwaies floureth neere about the Feast of Easter: most of the later Herbarists doe call it *Lunaria*: Others, *Lunaria Græca*, either of the fashion of the seed, or of the siluer brightnesse that it hath, or of the middle skinne of the cods, when the two outmost skinnies or huskes and seedes likewise are false away. We call this herbe in English Penny floure, or Money floure, Siluer Plate, Pricke-songwoort, in Norfolke, Sattin, and White Sattin,

Sattin, and among our women it is called Honestie: it seemeth to be the old Herbarists *Thlaspi alterum*, or second Treacle mustard, and that which *Cratenas* describeth, called of diuers *Sinapi Persicum*; for as *Dioscorides* saith, *Cratenas* maketh mention of a certaine *Thlaspi* or Treacle Mustard, with broad leaues and bigge roots, and such this Violet hath, which we surname *Latifolia* or broad leaved: generally taken of all to be the great *Lunaria*, or Moonwoort.

¶ *Their Temperature and Vertues.*

The seed of Bolbonac is of Temperature hot and drie, and sharpe of taste, and is like in taste and force to the seed of Treacle Mustard; the roots likewise are somewhat of a biting qualitie, but not much: they are eaten with fallads as certaine other roots are.

A certaine Chirurgian of the Heluetians composed a most singular vnguent for wounds of the leaues of Bolbonac and Sanicle stamped together, adding thereto oile and wax. The seed is greatly commended against the falling sicknesse.

CHAP. 124. Of Galen and Dioscorides Moonwoorts or Madwoorts.

1 *Alyssum Galeni.*
Galen's Madwoort.

† 2 *Alyssum Dioscoridis.*
Dioscorides Moonwoort or Madwoort.

¶ *The Description.*

1 **T**His might be one of the number of the Horehounds, but that *Galen* vsed it not for a kind thereof, but for *Alysson*, or Madwoort: it is like in forme and shew vnto Horehound, and also in the number of the stalks, but the leaues thereof are lesser, more curled, more hoary, & whiter, without any manifest smell at all. The little coronets or spokie whurles that compass the stalkes round about are full of sharpe prickles: out of which grow floures of a blewish purple colour like to those of Horehound. The root is hard, woody, and diuersly parted.

2 I haue one growing in my garden, which is thought to be the true & right Lunary or Moonwoort of *Dioscorides* description, hauing his first leaues somewhat round, and afterward more long, whitish, and rough, or somewhat woolly in handling: among which rise vp rough brittle stalkes, some cubite high, diuided into many branches, whereupon doe growe many little yellow floures:

floures; the which being past, there follow flat and rough huskes, of a whitish colour, in sh ape like little targets or bucklers, wherein is contained flat seed, like to the seeds of stock Gillofloures, but bigger. The whole huske is of the same substance, fashion, and colour that those are of the white Sattin.

¶ The Place.

These Plants are sowne now and then in Gardens, especially for the rarenesse of the m; the seede beeing brought out of Spaine and Italy, from whence I receiued some for my Garden.

¶ The Time.

They floure and flourish in May; the seede is ripe in August, the second yeare after their sowing.

¶ The Names.

Madwoort, or Moonwoort is called of the Græcians *ἑλυσσός* or *ἀλυσσός*: of the Latines *Alyssum*: in English, *Galens* Madwoort: of some, Heale-dog: and it hath the name thereof, because it is a present remedy for them that are bitten of a mad dogge, as *Galen* writeth; who in his second booke *De Antidotis*, in *Antoninus Celsus* his composition describeth it in these words: Madwoort is an herbe very like to Horehound, but rougher, and more full of prickles about the floures: it beareth a floure tending to blew.

† The second by *Dodonæus*, *Lobell*, *Camerarius* and others, is reputed to bee the *Alysson* of *Dioscorides*; *Gesner* names it *Lunaria aspera*; and *Columna*, *Leucoium Montanum Lunatum*. †

¶ The Temperature and Vertues.

A *Galen* saith it is giuen vnto such as are intraged by the biting of a mad dogge, which thereby are perfectly cured, as is knowne by experience, without any artificiall application or method at all. The which experiment if any shall proue, he shall finde in the working thereof. It is of temperature meanly drie, digesteth and something scoureth withall: for this cause it taketh away the morpew and Sun-burning, as the same Authour affirmeth.

† That which was formerly described in the second place, being a kinde of *Sideritis*, I haue here omitted, that I may giue you it more sily amongst the rest of that name and kindred hereafter.

CHAP. 125. Of Rose Campion.

Lychuis Chalcedonica.

Floure of Constantinople.

¶ The Kindes.

There be diuers sorts of Rose Campions; some of the Garden, and others of the Field: the which shall be diuided into seuerall chapters: and first of the Campion of Constantinople.

¶ The Description.

The Campion of Constantinople hath sundry vp-right stalks, two cubits high and full of ioynts, with a certaine roughnesse; and at euery ioynt two large leaues, of a browne Greene colour. The floures grow at the top like Sweet-Williams, or rather like Dames violets, of the colour of red lead, or Orange tawny. The root is somewhat sharpe in taste.

† There are diuers varieties of this, as with white and bluish coloured floures, as also a double kinde with very large, double and beautiful floures of a Vermilion colour like as the single one here described. †

¶ The Place.

The floure of Constantinople is planted in Gardens, and is very common almost eueriewhere.

† The white and bluish single, and the double one are more rare, and not to be found but in the Gardens of our prime Florists. †

¶ The Time.

It floureth in Iune and Iuly, the second yeare after it is planted, and many yeares after; for it consisteth

consisteth of a root full of life; and endureth long, and can away with the cold of our clymate.

¶ The Names.

It is called *Constantinopolitanus flos*, and *Lychnis Chalcedonica*: of *Alārouandus*; *Flos Creticus*, or Floure of Candy: of the Germans, *flos Hierosolymitanus*, or Floure of Ierusalem: in English, Floure of Constantinople; of some, Floure of Bristow, or None-such.

¶ The Temperature and Vertues.

Floure of Constantinople, besides that grace and beauty which it hath in gardens and garlands, is, for ought we know, of no vse, the vertues thereof being not as yet found out.

CHAP. 126. Of Rose-Campion.

1 *Lychnis Coronaria rubra*.

Red Rose-Campion.

2 *Lychnis Coronaria alba*.

White Rose-Campion.

¶ The Description.

1 The first kinde of Rose-Campion hath round stalks very knotty and woolly, and at euery knot or ioynr there do stand two woolly soft leaues like Mulleine, but lesser, and much narrower. The floures grow at the top of the stalke, of a perfect red colour; which being past, there follow round cods full of blackish seed. The root is long and threddy.

2 The second Rose-Campion differs not from the precedent in stalkes, leaues, or fashion of the floures: the onely difference consisteth in the colour; for the floures of this plant are of a milke white colour, and the other red.

3 This also in stalks, roots, leaues, and manner of growing differs not from the former, but the floures are much more beautifull, being composed of some three or foure rankes or orders of leaues lying each aboue other.

¶ The

‡ 3 *Lychnis coronaria multiplex.*
Double Rose Campion.

¶ The Place.

The Rose Campion growes plentifully in most gardens.

¶ The Time.

They floure from Iune to the end of August.

¶ The Names.

The Rose Campion is called in Latine *Dominarum Rosa*, *Mariana Rosa*, *Cæli Rosa*, *Cæli flos*: of *Dioscorides*, *λυχνὶς στεφανοειδής*: that is, *Lychnis Coronaria*, or *Satua*: *Γαζα* translateth *λυχνὶς*, *Lucernula*, because the leaues thereof be soft, and fit to make weekes for candles, according to the testimonie of *Dioscorides*: it was called *Lychnis*, or *Lychnides*, that is, a torch, or such like light; according to the signification of the word, cleere, bright, and light-giuing floures: and therefore they were called the Gardeners Delight, or the Gardeners Eye: in Dutch, *Chyistes eie*: in French, *Oeillets*, & *Oeillets Dieu*: in high-Dutch, *Marien roszlin*, and *Himmel roszlin*.

¶ The Temperature.

The seed of Rose-Campion, saith *Galen*, is hot and dry after a sort in the second degree.

¶ The Vertues.

A The seed drunken in wine is a remedie for them that are stung with a Scorpion, as *Dioscorides* testifieth.

CHAP. 127. Of wilde Rose-Campions.

¶ The Description.

1 **T**He wilde Rose-Campion hath many rough broad leaues somewhat hoary and woolly; among which rise vp long soft and hairy stalkes branched into many armes, set with the like leaues, but lesser. The floures grow at the top of the stalkes, compact of fiew leaues of a reddish colour: the root is thicke and large, with some threds annexed thereto.

‡ There also growes commonly wilde with vs another of this kinde, with white floures, as also another that hath them of a light blush colour. ‡

2 The sea Rose Campion is a small herbe, set about with many greene leaues from the lower part vpward; which leaues are thicke, somewhat lesser and narrower than the leaues of sea Purslane. It hath many crooked stalkes spred vpon the ground, a foot long; in the vpper part whereof there is a small white floure, in fashion and shape like a little cup or box, after the likenesse of *Behen album*, or Spatling Poppy, hauing within the said floure little threds of a blacke colour, in taste salt, yet not vnpleasant.

It is reported vnto me by a Gentleman one M^r. *Tho. Heskett*, that by the sea side in Lancashire, from whence this plant came, there is another sort hereof with red floures.

‡ 3 This brings many stalkes from one root, round, long, and weaker than those of the first described, lying vsually vpon the ground: the leaues grow by couples at each ioynt, long, soft, and hairy; amongst which alternately grow the floures, about the bignesse of those of the first described, and of a blush colour; and they are also succeeded by such seed-vessels, containing a reddish seed. The root is thicke and fibrous, yet commonly outliues not the second year.

† 1 *Lychnis*

† 1 *Lychnis sylvestris rubello flore.*
Red wilde Champion.

2 *Lychnis marina Anglica.*
English Sea Champion.

3 *Lychnis sylvestris hirta, 5. Clusij.*
Wilde hairy Champion.

4 *Lychnis sylvestris 8. Clusij.*
Hoary wilde Champion.

5 *Lychnis hirta minima*, 6. Clus.
Small Hairy Campion.

† 6 *Lychnis sylvestris incana*, Lob.
Ouerworne Campion.

7 *Lychnis calliculis striatis* 2. Clusij.
Spatling Campion.

† 8 *Lychnis sylvestris alba* 9. Clus.
Whitewilde Campion.

4 The fourth kinde of wilde Campions hath long and slender stems; diuiding themselues into sundry other branches, which are full of ioynts, hauing many small and narrow leaues proceeding from the said ioynts, and those of a whitish Greene colour. The floures do grow at the top of the stalke, of a whitish colour on the inner side, and purplish on the outer side, consisting of five small leaues, euery leafe hauing a cut in the end, which maketh it of the shape of a forke: the seed is like the wilde Poppy; the root somewhat grosse and thicke, which also perisheth the second yeare.

5 The fifth kinde of wilde Campion hath three or foure soft leaues somewhat downy, lying flat vpon the ground; among which riseth vp an hairy ash-coloured stalke, diuided into diuers branches; whereupon do grow at certaine spaces, euen in the setting together of the stalke and branches, small and grasse-like leaues, hairy, and of an ouerborne dusky colour, as is all the rest of the Plant. The floures grow at the top of the branches, composed of five small forked leaues of a bright shining red colour. The root is small, and of a woody substance.

6 The sixth kinde of wilde Campion hath many long thicke fat and hoary leaues spread vpon the ground, in shape and substance like those of the garden Campion, but of a very dusty overborne colour: among which rise vp small and tender stalkes set at certaine distances by couples; with such like leaues as the other, but smaller. The floures do grow at the top of the stalks in little tufts like those of sweet Williams, of a red colour. The root is small, with many threddy strings fastned to it.

7 This growes some cubit high, with stalkes distinguished with sundry ioynts, at each whereof are set two leaues, Greene, sharpe pointed, and somewhat stiffe: the floures grow at the tops of the branches, like to those of *Muscipula* or Catch-fly, yet somewhat bigger, and of a darke red: which past, the seed (which is ash-coloured, and somewhat large) is contained in great cups or vessels couered with a hard and very much crested skin or filme; whence it is called *Lychnis talleculis striatis*, and not *Cauliculis striatis*, as it is falsly printed in *Lobels Icones*, which some as foolishly haue followed. The root is single, and not large, and dies euery yeare.

8 That which our Author figured in this place had Greene leaues and red floures, which no way sorted with his description: wherefore I haue in lieu thereof giuen you one out of *Clusius*, which may fitly carry the title. This at the top of the large fibrous and liuing root sendeth forth many leaues somewhat Greene, and of some fingers length, growing broader by degrees, and at last ending againe in a sharpe point. The stalkes are some cubit high, set at each ioynt with two leaues as it were embracing it with their foot-stalkes; which leaues are lesse and lesse as they are higher vp, and more sharpe pointed. At the tops of the branches grow the floures, consisting of five white leaues deeply cut in almost to the middle of the floure, and haue two sharpe pointed appendices at the bottome of each of them, and five chiues or threds come forth of their middles; thefwhen they fade contract and twine themselues vp, and are succeeded by thicke and sharpe pointed seed-vessels, containing a small round Ash-coloured seed. I coniecture that the figure of the *Lychnis plumaria*, which was formerly here in the ninth place out of *Tabern.* might be of this plant, as well as of that which *Bauhine* refers it to, and which you shall finde mentioned in the end of the chapter. †

¶ The Place.

They grow of themselues neere to the borders of plowed fields, medowes, and ditch banks, common in many places. † I haue obserued none of these, the first and second excepted, growing wilde with vs. †

The sea Campion groweth by the sea side in Lancashire, at a place called Lytham, five miles from Wygan, from whence I had seeds sent me by Mr. *Thomas Hesketh*; who hath heard it reported, that in the same place doth grow of the same kinde some with red floures, which are very rare to be seene. † This plant (in my last Kentish Simpling voyage, 1632, with Mr. *Thomas Hickes*, Mr. *Broad*, &c.) I found growing in great plenty in the low marish ground in Tenet that lieth directly opposite to the towne of Sandwich. †

¶ The Time.

They floure and flourish most part of the Sommer euen vnto Autumne.

¶ The Names.

The wilde Campion is called in Greeke *Λυχνίς αγρια*: in Latine, *Lychnis sylvestris*: in English, wilde Rose Campion.

¶ The Temperature.

The temperature of these wilde Campions are referred vnto those of the garden.

¶ The Vertues.

The weight of two drammes of the seed of Wilde Campion beaten to powder and drunke, A doth

doth purge choler by the stoole, and it is good for them that are stung or bitten of any venomous beast.

† The figure that was in the first place, and was intended for our ordinary wilde Campion, is that which you see here in the eighth place; and those that were in the sixth and eighth places you shall hereafter finde with *Muscipula* or Catch-fly, whereto they are of affinity. That figure which was in the ninth place, out of *Tabern.* vnder the title of *Lychnis plumaria*, as also the description, I haue omitted as impertinent: for the figure *Bauhine* himselfe (who corrected and againe set forth the Workes of *Tabernamontanus*) could not tell what to make thereof; but questions, *Quid sit? an Muscipula flore muscosa?* Which if it be, you shall finde that plant hereafter described, vnder the title of *Sesamoides magnum Salmaticum*: for our Authors description it is not worth the speaking of, being framed onely from imagination.

† CHAP. 128. Of diuers other wilde Campions.

¶ The Description.

† 1 **T**He first of these which we here giue you is like in leaues, stalkes, roots, and manner of growing vnto the ordinarie wilde Campion described in the first place of the precedent Chapter; but the floures are very double, composed of a great many red leaues thicke packt together, and they are commonly set in a short and broken huske or cod. Now the similitude that these floures haue to the iagged cloath buttons anciently worne in this kingdome gaue occasion to our Gentlewomen and other louers of floures in those times to call them Bachelors Buttons.

2 This differs not in shape from the last described, but only in the colour of the floures, which in this plant are white.

† 1 *Lychnis syl. multiplex purpurea.*
Red Bachelors Buttons.

† 2 *Lychnis syl. alba multiplex.*
White Bachelors Buttons.

3 Neither in roots, leaues, or stalkes is there any difference betweene this either degenerate or accidentall varietie of Bachelors buttons, from the two last mentioned; onely the floures hereof are of a greenish colour, and sometimes through the middest of them they send vp stalkes, bearing also tufts of the like double floures.

4 This (saith *Clusius*) hath fibrous roots like to those of Primroses; out of which come leaues of

‡ 3 *Lychnis abortiva flore multiplici viridi.*
Degenerate Bachelors Buttons with Greene floures.

‡ 5 *Lychnis syl. latifolia Clus.*
Broad leaved wilde Campion.

‡ 5 *Lychnis montana repens.*
Creeping mountaine Campion.

of a sufficient magnitude, not much vnlike those of the great yellow Beares-eare, yet whiter, more downy, thicke, and iuycie. The next yeare after the sowing thereof it sends vp a stalke of two or three cubits high, here and there sending forth a viscous and glutinous iuyce, which detaines and holds fast flies and such insects as do chance to light thereon. At the top of the branches it yeeldeth many floures set as it were in an vmbel, euen sometimes an hundred; yet sufficiently small, considering the magnitude of the plant; and each of these consists of fve little yellowish Greene forked leaues.

5 The stalkes of this are slender, ioynted, and creeping like to those of the greater Chickweed, and at each ioynt grow two leaues like those of the myrtle, or of Knot-grasse yet somewhat broader. The floures grow in such long cups like as those of *Saponaria*, and are much lesse, yet of the same colour. The root is small.

¶ The Place.

1. 2. These are kept in many Gardens of this kingdome for their beauty, especially the first, which is the more common.

The fourth growes naturally in Candy, and the fifth by riuulets in the mountainous places of Sauoy.

¶ The Time.

These floure in Iune and Iuly with the other wild Campions,

Rr

¶ The

¶ The Names.

- 1 The first of these is *Lychnis agrestis multiflora* of Lobel; and *Ocymoides flore pleno* of Camerarius.
- 2 The second is by Pena and Lobel also called *Lychnis sylvestris multiflora*: it is the *Ocymastrum multiflorum* of Tabernamontanus; by which title our Author also had it in the former edition, p. 551.
- 3 Lobel hath this by the name of *Lychnis agrestis abortiva multiplici viride flore*.
- 4 Clusius calls this *Lychnis sylvestris latifolia*; and he saith he had the seed from Joseph de Casa Bona, by the name of *Muscipula auriculæ vrsi facie*: Bauhine hath it by the name of *Lychnis auriculæ vrsi facie*.
- 5 This (according to Bauhine) was set forth by Matthiolus, by the name of *Cneoron aliud Theophrasti*: it is the *Ocymoides repens polygonifolia flore Saponaria*, in the *Aduersaria*: and *Saponaria minor Dalechampij*, in the *Hist. Lugd.* It is also *Ocymoides Alpinum*, of Gesner; and *Ocymoides repens*, of Camerarius.

¶ The Nature and Vertues.

The natures and vertues of these, as of many others, lie hid as yet, and so may continue, if chance, or a more curious generation than yet is in being do not finde them out. ‡

CHAP. 129. Of Willow-herbe, or Loose-strife.

1 *Lyfimachia lutea*.
Yellow Willow-herbe.

‡ 2 *Lyfimachia lutea minor*.
Small yellow Willow-herbe.

¶ The Description.

1 THE first kinde of Willow-herbe hath long and narrow leaues of a grayish Greene colour, in shape like the Willow or Sallow leaues, standing three or foure one against another at seuerall distances round about the stalke; which toward the top diuideth it selfe into many other branches, on the tops whereof grow tufts of faire yellow floures, consisting of fve leaues apiece, without smell: which being past, there commeth forth seed like Coriander. The root is long and slender.

‡ 2 This

‡ 2 This lesser of *Clusius* his description hath a stalke a cubit high, and sometimes higher firme, hard, and downy; about which at certaine distances grow commonly foure leaues together, yet sometimes but three, and they are soft and somewhat downy, lesser than those of the former, being first of an acide taste, and then of an acride; and they are vsually marked on their lower sides with blacke spots. About the top of the stalke, out of the bosomes of each leafe come forth little branches bearing some few floures, or else foot-stalkes carrying single floures, which is more vsuall towards the top of the stalke. The floures are yellow, with somewhat a strong smell, consisting of five sharpe pointed yellow leaues, with so many yellow threds in their middle. The root is ioynted, or creeping here and there, putting vp new shouts.

‡ 3 *Lysimachia lutea flore globoso.*
Yellow Willow-herbe with bunched floures.

‡ 4 *Lysimachia lutea Virginiana.*
Tree Primrose.

3 This also may fitly be referred to the former. The stalke is a cubit high, straight, and as it were ioynted, naked oft times below by the falling away of the leaues; but from the middle to the top set with two leaues at a ioynt, like those of the former; and out of their bosoms on short stalks grow round tufts of small yellow floures as in bunches: the root which creepes sends forth many small fibres at each ioynt. This was set forth by *Lobel* vnder the title of *Lysimachia lutea altera*, or *Lysimachia salicaria*: *Dodonæus* hath it by the name of *Lysimachium aquatile*: and *Clusius* calls it *Lysimachia lutea tertia, sive minor*.

4 This Virginian hath beene described and figured onely by *Prosper Alpinus*, vnder the title of *Hyoscyamus Virginianus*: and by *M. Parkinson*, by the name of *Lysimachia lutea siliquosa Virginiana*: Also *Bauhine* in the Appendix of his *Pinax* hath a large description thereof, by the name of *Lysimachia lutea corniculata*. The root hereof is longish, white, about the thickeffe of ones thumb, from whence growes vp a tall stalke diuided into many branches of an ouerworne colour, and a little hairie: the leaues are like those of the former, but somewhat sinuated alongst their edges, and hauing their middle veine of a whitish colour: toward the tops of the branches amongst the leaues come vp pretty thicke cods, which growing smaller on their tops sustaine pretty large yellow floures consisting of foure leaues, with a pestill in the middle vpon which stand foure yellowish thrums

in fashion of a crosse; and there are also eight threds with their pointals in the middles of them. These floures haue somewhat the smell of a Primrose (whence *M^r. Parkinson* gaue it the English name, which I haue also here giuen you:) after the floures are fallen, the cods grow to be some two inches long, being thicker below, and sharper at the top, and somewhat twined, which in fine open themselues into foure parts to shatter their seed, which is blacke and small; and sowne, it growes not the first yeare into a stalke, but sends vp many large leaues lying handsomely one vpon another Rose-fashion. It floures in Iune, and ripens the seed in August. ‡

5 The second kinde of Willow-herbe in stalks and leaues is like the first, but that the leaues are longer, narrower, and greener. The floures grow along the stalke toward the top, spike-fashion, of a faire purple colour: which being withered turne into downe, which is carried away with the winde.

5 *Lysimachia purpurea spicata.*
Spiked Willow-herbe.

6 *Lysimachia filiquosa.*
Codded Willow-herbe.

6 This *Lysimachia* hath leaues and stalks like vnto the former. The floure groweth at the top of the stalke, comming out of the end of a small long cod, of a purple colour, in shape like a stocke Gillofloure, and is called of many *Filius ante Patrem* (that is, The Sonne before the Father) because that the cod commeth forth first, hauing seeds therein, before the floure doth shew it selfe abroad. ‡ The leaues of this are more soft, large, and hairy than any of the former: they are also snipt about the edges, and the floure is large, wherein it differs from the twelfth, hereafter described; and from the eleuenth in the hairinesse of the leaues, and largenesse of the floures also, as you shall finde hereafter. ‡

7 This being thought by some to be a bastard kinde, is (as I do esteeme it) of all the rest the most goodly and stately plant, hauing leaues like the greatest Willow or Ozier. The branches come out of the ground in great numbers, growing to the height of six foot, garnished with braue floures of great beauty, consisting of foure leaues a piece, of an orient purple colour, hauing some threds in the middle of a yellow colour. The cod is long like the last spoken of, and full of downy matter, which flieth away with the winde when the cod is opened.

‡ 8 This also, which is the *Chamanerion* of *Gesner*, as also his *Epilobion*, quasi *ἐπιλόβιον*, a Violet or floure vpon a cod, may iustly challenge the next place. *Dodoneus* calls it *Pseudolysimachium purpureum*

† 7 *Chamenerion*.
Rose bay Willow-herbe.

‡ 8 *Chamenerion alternum angustifolium*.
Narrow leaved Willow-floure.

‡ 9 *Lysimachia caerulea*.
Blew Loose-strife.

‡ 10 *Lysimachia galericulata*.
Hooded Loose-strife.

11 *Lysimachia campestris*.
Wilde Willow-herbe.

purpureum minus : and it is in the *Histor. Lugdun.* vnder the name of *Linaria rubra*. It groweth vp with stalkes some foot high, set with many narrow leaues like those of Toad-flax, of a grayish colour, and the stalke is parted into diuers branches, which at their tops vpon long cods carrie purple floures consisting of foure leaues apiece. The root is long, yellowish, and wooddy. ‡

9 There is another bastard Loose-strife or Willow-herbe hauing stalkes like the other of his kinde. whereon are placed long leaues snipt about the edges, in shape like the great *Veronica* or herbe *Fluellen*. The floures grow along the stalkes, spike-fashion, of a blew colour; after which succeed small cods or pouches. The root is small and fibrous: it may be called *Lysimachia caerulea*, or blew Willow-herbe.

10 We haue likewise another Willow-herbe that groweth neere vnto the banks of riuers and water-courses. This I found in a waterie lane leading from the Lord Treasurer his house called Theobalds, vnto the backside of his slaughter-house, and in other places, as shall be declared hereafter. Which *Lobel* hath called *Lysimachia galericulata*, or hooded Willow-herbe. It hath many small tender stalkes trailing vpon the ground, beset with diuers leaues somewhat snipt about the edges, of a deep green colour, like to the leaues of *Scordium* or water Germander: among which are placed sundrie small blew floures fashioned like a little hood, in shape resembling those of Ale-hoofe. The root is small and fibrous, dispersing it selfe vnder the earth farre abroad, whereby it greatly increaseth.

11 The wilde Willow-Herbe hath fraile and very brittle stalkes, slender, commonly about the height of a cubit, and sometimes higher; whereupon doe grow sharpe pointed leaues somewhat snipt about the edges, and set together by couples. There come forth at the first long slender coddies, wherein is contained small seed, wrapped in a cottony or downy wooll, which is carried away with the winde when the seed is ripe: at the end of which commeth forth a small floure of a purplish colour; whereupon it was called *Filius ante Patrem*, because the floure doth not appeare vntill the cod be filled with his seed. But there is another Sonne before the Father, as hath beene declared in the Chapter of Meadow-Saffron. The root is small and thred-die. ‡ This differeth from the sixth onely in that the leaues are lesse, and lesse hairy, and the floure is smaller. ‡

12 The Wood Willow-herbe hath a slender stalke diuided into other smaller branches, whereon are set long leaues rough and sharpe pointed, of an ouerworne greene colour. The floures grow at the tops of the branches, consisting of foure or fve small leaues, of a pale purplish colour tending to whitenesse: after which come long cods, wherein are little seeds wrapped in a certaine white Downe that is carried away with the winde. The root is threddie. ‡ This differs from the sixth in that it hath lesser floures. There is also a lesser sort of this hairie *Lysimachia* with small floures.

There are two more varieties of these coddied Willow-herbes; the one of which is of a middle growth, somewhat like to that which is described in the eleuenth place, but lesse, with the leaues also snipped about the edges, smooth, and not hairie: and it may fitly be called *Lysimachia siliquosa glabra media*, or *minor*, The lesser smooth-leaved Willow-herbe. The other is also smooth leaved, but they are lesser and narrower: wherefore it may in Latine be termed, *Lysimachia siliquosa glabra minor angustifolia*: in English, The lesser smooth and narrow leaved Willow-herbe.

‡ 13 This lesser purple Loose-strife of *Clusius*, hath stalkes seldome exceeding the height of a cubit, they are also slender, weake and quadrangular, towards the top, diuided into branches growing

growing one against another, the leaues are lesse and narrower than the common purple kinde, and growing by couples, vnlesse at the top of the stalkes and branches, whereas they keepe no certaine order; and amongst these come here and there cornered cups containing floures composed of six little red leaues with threds in their middles. The root is hard, woody, and not creeping, as in others of this kinde, yet it endures all the yeere, and sends forth new shoots. It floures in Iune and Iuly, and was found by *Clusius* in diuers wet medowes in Austria. ‡

¶ The Place.

The first yellow *Lysimachia* groweth plentifully in moist medowes, especially along the medowes as you go from Lambeth to Battersey neere London, and in many other places throughout England.

‡ 13 *Lysimachia purpurea minor* *Clus.*
Small purple Willow herbe.

‡ The second and third I haue not yet seene.

The fourth groweth in many gardens. ‡

The fift groweth in places of greater moisture, yea almost in the running streames and standing waters, or hard by them. It groweth vnder the Bishops house wall at Lambeth, neere the water of Thames, and in moist ditches in most places of England.

The sixth groweth neere the waters (and in the waters) in all places for the most part.

The seuenth groweth in Yorkshire in a place called the Hooke, neer vnto a close called a Cow pasture; from whence I had these plants, which doe grow in my garden very goodly to behold, for the decking vp of houses and gardens.

‡ The eighth I haue not yet found growing.

The ninth growes wild in some places of this kingdome, but I haue seene it only in Gardens.

The tenth growes by the ponds and waters sides in Saint Iames his Parke, in Tuthill fields and many other places. ‡

The eleuenth groweth hard by the Thames, as you goe from a place called the Diuels Neck, kerchiefe to Redresse, neere vnto a stile that standeth in your way vpon the Thames banke, among the planks that doe hold vp the same banke. It groweth also in a ditch side not farre from the place of execution, called Saint Thomas Waterings.

‡ The other varieties of this grow in wet places, about ditches, and in woods and such like moist grounds. ‡

¶ The Time.

These herbes floure in Iune and Iuly, and oftentimes vntill August.

¶ The Names.

Lysimachia, as *Dioscorides* and *Pliny* write, tooke his name of a speciall vertue that it hath in appeasing the strife and vnruinesse which falleth out among oxen at the plough, if it bee put about their yokes: but it rather retaineth and keepeth the name *Lysimachia*, of King *Lysimachus* the sonne of *Agathocles*, the first finder out of the nature and vertues of this herb, as *Pliny* saith in his 25. book chap. 7. which retaineth the name of him vnto this day, and was made famous by *Erastistratus*. *Ruellius* writeth, that it is called in French *Cornelle* and *Corneola*: in Greeke, *λυσιμαχία*: of the Latines, *Lysimachium*: of *Pliny*, *Lysimachia*: of the later Writers, *Salicaria*: in high Dutch, *uoderick*: in English, Willow herbe, or herbe Willow, and Loose strife.

Chamenerium is called of *Gesner*, *Epilobion*: in English, Bay Willow, or bay yellow herbe.

‡ The

‡ The names of such as I haue added haue been sufficiently set forth in their titles and Histories. ‡

¶ The Nature.

The yellow *Lyfimachia*, which is the chiefe and best for Physicke vses, is cold and drie, and very astringent.

¶ The Vertues.

- A The iuice, according to *Dioscorides*, is good against the bloody flux, being taken either by potion or Clister.
- B It is excellent good for greene wounds, and stancheth the blood: being also put into the nostrils, it stoppeth the bleeding at the nose.
- C The smoke of the burned herbe driueth away serpents, and killeth flies and gnats in a house; which *Pliny* speaketh of in his 25. book, chap. 8. Snakes, saith he, craull away at the smell of Loofstrife. The same Authour affirmeth in his 26 booke, last chap. that it dieth haire yellow, which is not very vnlike to be done by reason the floures are yellow.
- D The others haue not been experimented, wherefore vntill some matter worthy the noting doth offer it selfe vnto our consideration, I will omit further to discourse her eof.
- E The iuice of yellow *Lyfimachia* taken inwardly, stoppeth all fluxe of blood, and the Dysenteria or bloody flux.
- F The iuice put into the nose, stoppeth the bleeding of the same, and the bleeding of wounds, and mightily closeth and healeth them, being made into an vnguent or salve.
- G The same taken in a mother suppositorie of wooll or cotton, bound vp with threds (as the manner thereof is, well knowne to women) staieth the inordinate flux or ouermuch flowing of womens termes.
- H It is reported, that the fume or smoke of the herbe burned, doth driue away flies and gnats, and all manner of venomous beasts.

CHAP. 130. Of Barren-woort.

Epimedium.

Barren Woort.

¶ The Description.

THIS rare and strange plant was sent to me from the French Kings Herbarist *Robinus*, dwelling in Paris at the signe of the blacke head, in the street called *Du bout du Monde*, in English, The end of the world. This herbe I planted in my garden, & in the beginning of May it came forth of the ground, with small, hard & woodie crooked stalks: whereupon grow rough & sharpe pointed leaues, almost like *Alliaria*, that is to say, Sauce alone, or lacke by the hedge. *Lobel* and *Dod.* say, that the leaues are somewhat like *Iuie*; but in my iudgement they are rather like *Alliaria*, somewhat snipt about the edges, and turning themselves flat vpright, as a man turneth his hand vpwads when hee receiueth money. Vpon the same stalkes come forth small floures, consisting of foure leaues, whose outsides are purple, the edges on the inner side red, the bottome yellow, & the middle part of a bright red colour, and the whole floure somewhat hollow. The root is smal, and creepeth almost vpon the vppermost face of the earth. It beareth his seed in very small cods like *Saracens* Confound, (‡ to wit that of our Authour formerly

merly described, pag. 274. †) but shorter : which came not to ripeness in my garden, by reason that it was dried away with the extreme and vnaccustomed heat of the Sun, which happened in the yeare 1598. since which time from yeare to yeare it bringeth seed to perfection. Further, *Dioscorides* and *Pliny* do report, that it is without floure or seed.

¶ The Place.

† It groweth in the moist meadowes of Italie about Bononia and Vincentia: it groweth in the garden of my friend Mr. *John Milion* in Old-street, and some other gardens about towne.

¶ The Time.

It floureth in Aprill and May, when it hath taken fast hold and settled it selfe in the earth a yeare before.

¶ The Names.

It is called *Epimedium* : I haue thought good to call it Barren woort in English ; not because that *Dioscorides* saith it is barren both of floures and seeds, but because (as some authors affirme) being drunke it is an enemie to conception.

¶ The Temperature and Vertues.

Galen affirmeth that it is moderately cold, with a waterie moisture : we haue as yet no vse hereof in Physicke.

† CHAP. 131. Of Fleabane.

† 1 *Conyza maior*.

Great Fleawoort.

† 2 *Conyza minor vera*.

Small Fleabane.

† THE smalnesse of the number of these plants here formerly mentioned, the confusion notwithstanding in the figures, their nominations & historie, not one agreeing with another, hath caused me wholly to omit the descriptions of our Authour, and to giue you new, agreeable to the figures ; together with an addition of diuers other plants belonging to this kindred. Besides there is one thing I must aduertise you of, which is, that our Authour in the

first place described the *Baccharis Monspeliensium* of *Lobel*, or *Conyza maior* of *Matthiolum*, & it is that which grows in Kent and Essex on chalkie hills; yet he gaue no figure of it, but as it were forgetting what he had don, allotted it a particular chap. afterwards, where also another figure was put for it, but there you shall now finde it, though I must confesse that this is as fit or a fitter place for it, but I will follow the course of my Authour, whose matter, not method I indeauour to amend.

¶ The

The Description.
 1 **T**His great Fleawoort or Fleabane, from a thick long liuing fibrous root sends forth many stalkes of some yard high or more; hard, wooddy, rough, fat, and of an ouerwoine colour: the leaues are many, without order, and alternately embrace the stalkes, twice as big as those of the Oliue tree, rough and fat, being as it were besmeared with a gumminesse or fattinesse, and of a yellowish Greene colour: the floures grow after a sort spoke fashion, standing at the ends of footstalkes comming out of the bosomes of the leaues, and they are yellow and round almost like to Groundswell, and flie away in downe like as they doe; the seed is small and ash coloured. The whole plant is fattie and glutinous, with a strong, yet not altogether vnpleasant smell. This growes not that I know of in these cold Countries, vnlesse sowne in gardens. *Clusius* found it by Lisbone, and in diuers places of Spaine. He, as also *Dodonaeus*, *Lobel*, and others, call this *Conyza maior*, and it is thought to be the *Conyza mas* of *Theophrastus*, and *Conyza maior* of *Dioscorides*.

2 The lesser seldome sends vp more than one stalke, and that of a cubit high, yet vsually not so much: it is diuided into little branches, and also rough and glutinous as the precedent, but more Greene. The leaues are three times lesse than those of the former, somewhat shaped like those of Toad-flax, yet hairy and vnctious; the tops of the branches as in the bigger, carrie lesse, and lesse shining and sightly floures, vanishing in like sort into downe. The root is single and annuall, and the whole plant more smelling than the former. This is iudged the *Conyza femina* of *Theophrastus*; and *Con. minor* of *Dioscorides*; it is the *Con. minor* of *Gesner*, *Lobel*, *Clusius* and others. It growes in diuers parts of Spaine and Prouince in France, but not here, vnlesse in Gardens.

† 3 *Conyza media*.
 Middle Fleawoort.

† 4 *Conyza minima*.
 Dwarfed Fleabane.

3 The root of this middle kinde is prettie large and fibrous, from whence ariseth a branched stalke of some cubite high, engirt at certaine spaces with thicke, rough, grayish Greene leaues: at the tops of the branches grow pretty faire yellow floures of the bignes of a little Marigold; which fading turne to downe, and are carried away with the winde. This floures in Iuly and August, and may be found growing in most places about riuers and pond sides, as in S. James his Parke, Tuthill fields, &c. This is *Conyza media* of *Matthiolus*, *Dodonaeus*, and others. Some haue referred it vnto the Mints

Mints, as *Fuchsius*, who makes it *Calamintha* 3. genus; and *Lonicerus*, who calls it *Mentha Lutea*. In Cheape-side the herbe-women call it Herbe Christopher, and sell it to Empericks, who with it (as they say) make Medicines for the eyes, but against what affect of them, or with what successe I know not.

4 In like places, or rather such as are plashy in winter this may be plentifully found growing. The roots are small and fibrous; from whence ariseth a branched stalke some foot high, set with small longish leaues somewhat roundish pointed, soft also and woolly, with a smell not altogether vnpleasant, like as the last described: the floures are composed of many yellowish threds like to the middle part of Camomill floures, or those of Tansey: and as the former, turne into downe, and are carried away with the winde; it floures in Iuly and August. This is the *Conyza minor* of *Tragus*, *Matthiolus*, and others: *Lobel* and *Dodon.* call it *Conyza minima*.

5 This cut leaved Fleabane hath small fibrous roots, from which arise thicke, crested, & hollow stalks, diuided towards the tops into sundry branches: the leaues that incompasse the stalke are gashed, or else onely sinuated on the edges: the floures are star fashion and yellow, and also flie away in downe; the whole plant is couered ouer with a soft and tender downe, and hath somewhat the smell of Honie. This is a varietie of the third, and is called by *Dodon.* *Conyza media species altera*, *Lobel* names it *Conyza helenitis folijs laciniatis*.

6 The figure which you haue in this sixth place was formerly vnfitly giuen by our Authour for *Solidago Saracenic*; it hath a large root which sends forth many fibres, and a crested hollow stalke some two cubites or more high, which is vnorderly set, with long, yet narrow snipt leaues somewhat hairie and sharpe pointed: the toppe is diuided into branches, which beare prettie large yellow floures, made after the manner of those of Ragwort, and like as they, are also carried away with the winde. This *Thalys* calls *Conyza maxima serratifolia*. It is the *Lingua maior* of *Daleschampsius*, and the *Consolida palustris* of *Tabernamontanus*. It groweth neere water sides, and floures towards the latter end of Sommer: I haue not yet heard that it doth grow wilde amongst vs.

‡ 5 *Conyza folijs laciniatis*.
Great iagged leaved Fleabane.

‡ 6 *Conyza palustris serratifolia*.
Water snipt Fleabane.

‡ 7 *Conyza Austriaca Clusij.*
Austrian Fleabane.

‡ 8 *Conyza incana.*
Hoary Fleabane.

‡ 9 *Conyza Alpina pilosissima.*
Hairie Fleabane of the Alpes.

‡ 10 *Conyza Cerulea acris.*
Blew floured Fleabane.

7 The stalkes of this are about a foot high, straight, stiffe, hard, and couered with a whitish downe: the leaues at the root grow vpon long stalkes, and are soft and hairie; but those which are higher vp, haue a short, or else no stalke at all, and rubbed, they yeeld no vnpleasant smell, and tasted, they are somewhat bitter and acride. The floures that grow vpon the tops of the branches are large, and fashioned like those of Elecampane, and are of the same yellow color. The root is long, slender and blackish, creeping and putting vp new stalkes; it hath many white fibres and a resinous smell. *Clusius* found it growing on dry hilly places in Austria, and calls it *Conyza* 3. *Austriaca*.

8 This which *Lobel* sets forth vnder the title of *Conyza helentis mellita incana*, I take to be the same Plant that I last figured and described out of *Clusius*, onely the root is better exprest in *Clusius* his figure; otherwise by the figures I cannot find any difference, though *Bauhine* reckon it vp in his *Pinax*, as differing therefrom.

9 This also seemes not much to differ from the last mentioned, but onely in the hairinesse of the leaues and stalkes, and that the floures are smaller. This *Lobel* calls *Conyza Helenitis mellita incana*: *Helenitis*, because the floures and leaues haue some semblance of Elecampane, and *Mellita*, for that they smell somewhat like Honie. These last grow vpon mountaines, but none of them with vs in England that I can yet heare of.

10 This hath a small fibrous and yellowish root, of a very hot and biting taste, which sends vp diuers longish leaues about the head thereof; the stalke is some foot and halfe high, and set alternately with twined, longish, narrow and somewhat rough leaues of an ouerborne greene colour; the top of the stalke and branches are adorned with floures set in longish scaly heads like those of *Hieracium*: the outer little leaues are of a faint blew colour, and the inner threds are yellow. It floures in August, and the floures quickly turne into downe, and are carried away with the wind. It grows in many Chalkie hils, and I first obserued it in the company of Mr. *George Bowles*, Mr. *John Bugs* and others, close by Farmingham in Kent; and the last yeare Mr. *William Broad* found it growing at the Blockehouse at Grauesend. *Tragus* calls it *Tinctorius flos alter*: *Dodonaeus* because the floure quickly turns to downe makes it *Erigeron quartum*: and *Gesner* for that the root is hot, and drawes rheume like as Pellitorie of Spaine, which therefore is vsed against the Tooth-ache, names it *Dentelaria*: he also calls it *Conyza muralis*, and *Conyzoides Carulea*: *Tabernamontanus* also calls it *Conyza carulea*: and lastly, *Fabius Columna* hath it by the name of *Amellus Montanus*, to which kinde it may in mine opinion be as fitly referred, as to these *Conyza's*. Our Authour had the figure hereof in the third place in this Chapter.

¶ The Place, Time, and Names.

All these haue beene sufficiently shewne in their particular Titles and Descriptions. ‡

¶ The Nature.

Conyza is hot and drie in the third degree.

¶ The Vertues.

The leaues and floures be good against the strangurie, the iaundise, and the gnawing or griping A of the bellie.

The same taken with Vineger, helpeth the Epilepsie or falling sicknesse. B

If Women doe sit ouer the decoction thereof, it greatly easeth their paines of the Mo- C ther.

The Herbe burned, where flies, Gnats, fleas, or any venemous things are, doth driue them D away.

‡ The first was formerly of *Conyza media*; the second was of *Conyza minima*; and the third of *Conyza Carulea acris*.

CHAP. 132. Of Starre-woort.

¶ The Description.

1 The first kinde of *Aster* or *Inguinalis*, hath large broad leaues like *Verbascum Saluifolium* or the great *Conyza*: among which riseth vp a stalke foure or fve handfuls high, hard, rough and hairie, beset with leaues like Rose Campions, of a darke greene colour. At the top of the said stalkes come forth floures, of a shining and glistering golden colour; and vnderneath about these floures grow fve or six long leaues, sharpe pointed and rough, not much in

Shape

shape vnlike the fish called *Stella marina*. The floures turne into downe, and are carried away with the winde. The root is fibrous, of a binding and sharpe taste.

‡ 2 The second called Italian Starrewoort hath leaues not much vnlike Marigolds, but of a darke Greene colour, and rough, and they are somewhat round at the vpper end: the stalkes are many, and grow some cubite high; and at their tops are diuided into fundry branches, which beare faire blewish purple floures, yellow in their middles, and shaped like Marigolds, and almost of the same bignesse, whence some haue called them blew Marigolds. ‡

3 The third kinde hath leaues so like Italian Starwort, that a man can scarcely at the sudden distinguish the one from the other. The single stalke is a cubit long, vpright and slender; on the top whereof grow faire yellow floures, like those of *Enula Campana*, and they fly away in downe: the root is small and threddie.

4 The fourth kinde in talnesse and floure is not much vnlike that last before specified, but in stalke and leaues more hairie, and longer, somewhat like our small Houndstongue, and the rootes are lesse fibrous or threddie than the former.

5 There is another sort that hath a browne stalke, with leaues like the small *Coniza*. The floures are of a darke yellow, which turne into downe that flieth away with the wind like *Conyza*. The root is full of threds or strings.

6 There is also another that hath leaues like the great Campion, somewhat hairie; amongst which come vp crooked crambling stalkes, leaning lamely many waies. Whereupon doe grow faire yellow floures, Starre-fashion; which past, the cups become so hard, that they will scarcely be broken with ones nailes to take forth the seed. The root is long and straight as a finger, with some few strings annexed vnto the vppermost part thereof. It groweth wilde in some parts of Spaine.

1 After Atticus.
Starrewoort.

‡ 2 After Italarum.
Italian Starrewoort.

7 There groweth another kinde of Starrewoort, which hath many leaues like Scabious, but thinner, and of a more Greene colour, covered with a woollie hairinesse, sharpe and bitter in taste; amongst which springeth vp a round stalke more than a cubite high; often growing vnto a red-dish

dish colour; set with the like leaues, but smaller and sharper pointed, diuiding it selfe toward the top into some few branches; whereon doe grow large yellow floures like *Doronicum* or *Sonchus*. The root is thicke and crooked. ‡ This is *Aster Pannonicus maior*, sive *tertius* of *Clus.* and his *Austriacus primus*.

8 Wee haue seene growing vpon wilde Mountaines another sort, which hath leaues much lesser than the former, somewhat like to the leaues of Willow, of a faire Greene colour, which doe adorne and decke vp the stalke euen to the top; whereupon doe grow yellow floures starre fashion, like vnto the former. The root is small and tender, creeping farre abroad, whereby it mightily increaseth. ‡ This is *Aster Pannonicus salignis folijs*: sive *Aster 4. Austriacus 2. of Clusius*. It is *Bubonium luteum* of *Tabern.* And our Authour gaue the Figure heereof for *Aster Italo-rum*. ‡

9 *Clusius* hath set forth a kinde that hath an vpright stalke, somewhat hairy, two cubits high, beset with leaues somewhat woollie like to those of the Sallow, hauing at the top of the stalke faire yellow floures like *Enula Campana*, which turne into down that is carried away with the wind. the root is thicke, with some haire or threds fastened thereto. ‡ This is *Aster lanuginoso folio*, sive 5. of *Clusius*. Our Authour gaue the figure hereof vnder the title of *Aster Hirsutus*: it is *Aster flore Luteo* of *Tabern.*

10 Hee hath likewise described another sort, that hath leaues, stalks, floures, and roots like the ninth, but neuer groweth to the height of one cubite. ‡ It bringeth forth many stalkes, and the leaues that grow disorderly vpon them are narrower, blacker, harder and sharper pointed than the former, not vnlike those of the common *Parmica*, yet not snipt about the edges: the floures are yellow and like those of the last described, but lesse. This is the *Aster angustifolius* sive *sextus* of *Clusius*. ‡

11 There is likewise set forth in his Pannonicke obseruation, a kind of *Aster* that hath many small hairie leaues like the common great Daisie: among which riseth vp an hairy stalke of a foot high, hauing at the top faire blew floures inclining to purple, with their middle yellow, which turne (in the time of seeding) into a woollie downe, that flieth away with the winde. The whole plant hath a drying, binding, and bitter taste. The root is threddie like the common Daisie, or that of Scabious. ‡ This is *Aster Alpinus caruleo flore*, sive 7. of *Clusius*. ‡

3 *Aster montanus flore amplo.* 4 *Aster hirsutus.*
Mountaine Starwoort. 2 Hairie Starwoort.

‡ 5 *Aster Conyzoides Gesneri.*
Fleabane Starrewoort.

‡ 6 *Aster Luteus supinus Clusij.*
Creeping Starwoort.

‡ 7 *Aster luteus foliis Succisa.*
Scabious leaved Starwoort.

‡ 8 *Aster Salicis folio.*
Willow leaved Starwoort.

‡ 9 *Aster Austriacus, 5 Clus.*
Sallow leaved Starwoort.

‡ 12 There are kept in the Gardens of Mr. Tradescant, Mr. Tugge, and others, two Starwoorts different much from all these formerly mentioned: the first of them is to be esteemed, for that it floures in October and Nouember when as few other floures are to be found: the root is large and liuing, which sends vp many small stalks some two cubits high, wooddy, slender, and not hollow, and towards the top they are diuided into aboumdance of small twiggie branches: the leaues that grow alternately vpon the stalkes, are long, narrow, and sharpe pointed, hauing foure or fixe scarce discernable nicks on their edges: the floures which plentifully grow on small branches much after the manner of those of *Virga aurea*, consist of twelue white leaues set in a ring, with many threds in their middles, which being young are yellow, but becomming elder and larger they are of a reddish colour, and at length turne into downe. I haue thought fit to call this plant, not yet described by any that I know of, being reported to be a Virginian, by the name of *Aster Virginianus fruticosus*, Shrubbie Starwoort.

13 This which in gardens floures some moneth before the former, growes not so high, neither are the stalkes so straight, but often crooked, yet are they diuided into many branches which beare small blewish floures like those of the former: the leaues are longish and narrow. This also is said to haue come from Canada or Virginia; and it may be called *Aster fruticosus minor*, Small shrubby Starwoort. ‡

‡ 10 *Aster 6. Clusij.*
Narrow leaued Starwoort.

‡ 11 *Aster 7. Clusij.*
Dwarfe Daisie leaued Starwoort.

¶ The Place.

The kindes of Starwoort grow vpon mountaines and hillie places, and sometimes in woods and medowes lying by riuers sides.

The two first kindes doe grow vpon Hampstead heath foure miles from London, in Kent vpon Southfleet Downes, and in many other such downie places. ‡ I could neuer yet finde nor heare of any of these Starfloures to grow wilde in this kingdome, but haue often seene the Italian Starwort growing in gardens. These two kindes that our Authour mentions to grow on Hampstead heath and in Kent, are no other than two *Hieracia*, or Hauke-weedes, which are much differing from these. ‡

¶ The Time.

They floure from Iuly to the end of August.

¶ The Names.

This herbe is called in Greeke *ἀστέρις*, and also *ἐσπερίον*: in Latine, *Aster Atticus*, *Butonium*, and *Inguinalis*: of some, *Asterion*, *Asteriscus*, and *Hyophthalmus*: in high Dutch, *Hegetkraut*: in Spanish, *Bobas*: in French, *Estrille*, and *Aster goutte menne*: in English, *Starwoort* and *Sharewoort*.

¶ The Nature.

It is of a meane temperature in cooling and drying. *Galen* saith it doth moderately waste and consume, especially while it is yet soft and new gathered.

That with the blew floure or purple, is thought to be that, which is of *Virgil* called *flos Amellus*: of which he maketh mention in the fourth booke of his *Georgickes*.

Est etiam flos in pratis, cui nomen Amello

Fecere agricola: facilis quarentibus herba;

Namque uno ingentem tollit de cespite sylvam:

Aureus ipse, sed in folijs, quæ plurima circum

Funduntur, viola subluet purpura nigra.

In English thus.

In Meades there is a floure *Amello* nam'd,
By him that seekes it easie to be found,
For that it seemes by many branches fram'd
Into a little Wood: like gold the ground
Thereof appeares, but leaues that it beset
Shine in the colour of the Violet.

¶ The Vertues.

A The leaues of *Aster* or *Inguinalis* stamped, and applied vnto botches, imposthumes, and venereous bubones (which for the most part happen in *Inguine*, that is, the flanke or share) doth mightily mature and suppurate them, whereof this herbe *Aster* tooke the name *Inguinalis*.

B It helpeth and preuaileth against the inflammation of the fundament, and the falling forth of the gut called *Saccus ventris*.

C The floures are good to be giuen vnto children against the Squinancie, and the falling sicknes.

† That figure which formerly was in the second place vnder the title of *Aster Atticus*, was of the eighth here described; also in the third place formerly were these two figures which we here giue you, whereof the former is of *Aster montanus*, and the latter of *Aster hirsutus*; and that which was vnder the title of *Aster hirsutus* in the fourth place, belongs to the ninth description.

CHAP. 133. Of Woade.

¶ The Description.

1 *Glastum* or Garden Woad hath long leaues of a blewish Greene colour. The stalk groweth two cubits high, set about with a great number of such leaues as come vp first, but smaller, branching it selfe at the top into many little twigs, whereupon do grow many small yellow floures: which being past, the seed commeth forth like little blackish tongues: the root is white and single.

2 There is a wilde kinde of VVoad very like vnto the former in stalks, leaues, and fashion, sauing that the stalke is tenderer, smaller, and browner, and the leaues and little tongues narrower; otherwise there is no difference betwixt them.

¶ The Place.

The tame or garden VVoad groweth in fertile fields, where it is sowne: the wilde kind growes where the tame kinde hath been sowne.

¶ The Time.

They floure from Iune to September.

¶ The Names.

VVoad is called in Greeke *ισάτις*: in Latine, *Isatis*, and *Glastum*: *Cesar* in his fifth booke of the French wars saith, that all the Brittons do colour themselues with VVoad, which giueth a blew colour: the which thing also *Pliny* in his 22. booke, chap. 1. doth testifie: in France they call it *Glastum* which is like vnto Plantaine, wherewith the Brittish wiues and their daughters are coloured all ouer, and go naked in some kinde of sacrifices. It is likewise called of diuers *Guadum*: of the Italians, *Guado*; a word as it seemeth, wrung out of the word *Glastum*. in Spanish and French, *Pastel*: in Dutch, *Heet*: in English, VVoad, and VVade.

¶ The

1 *Glaſtum ſativum.*
Garden Woade.† 2 *Glaſtum ſylveſtre.*
Wilde Woade.

¶ The Nature.

Garden Woade is dry without sharpenesse; the wilde Woade drieth more, and is more sharpe and biting.

¶ The Vertues.

The decoction of Woade drunken is good for such as have any stopping or hardnesse in the milt or spleene, and is also good for wounds or vlcers in bodies of a strong constitution, as of country people, and such as are accustomed to great labour and hard course fare. A

It serueth well to dye and colour cloath, profitable to some few; and hurtfull to many. B

CHAP. 134. Of Cow-Basill.

¶ The Description.

1 **T**His kinde of wilde Woade hath fat long leaues like *Valeriana rubra Dodocæi*, Or *Behen rubrum*: the stalke is small and tender, hauing thereupon little purple floures consisting of foure leaues; which being past, there come square cornered huskes full of round blacke seed like Coleworts. The whole plant is couered ouer with a clammy substance like Bird-lime, so that in hot weather the leaues thereof will take flies by the wings (as *Muscipula* doth) in such manner that they cannot escape away.

2 *Ephemerum Matthioli* hath long fat and large leaues like vnto Woad, but much lesse; among which riseth vp a round stalke a cubit high, diuiding it selfe into many branches at the top, the which are set with many small white floures consisting of siue leaues; which being past, there follow little round bullets containing the seed. The root is small and full of fibres.

¶ The Place.

Cow-Basill groweth in my garden: but *Ephemerum* is a stranger as yet in England.

¶ The Time.

They floure in May and Iune.

¶ The

1 *Vaccaria*.
Cow-Basill.

2 *Ephemerum Matthioli*.
Quicke-fading floure.

† ¶ The Names.

1 Cow-Basill is by *Cordus* called *Thamecnemon*: by some, according to *Gesner*, *Lychnis* & *Perfoliatarubra*: *Lobel* termes it *Isatis sylvestris*, and *Vaccaria*: the last of which names is retained by most late Writers.

2 This by *Lobel* is said to be *Ephemerum* of *Matthiolus*; yet I thinke *Matthiolus* his figure, (which was in this place formerly) was but a counterfeit, and so also doe *Columna* and *Bauhinus* iudge of it; and *Bauhine* thinks this of *Lobel* to be some kinde of *Lyssimachia*. †

¶ The Nature and Vertues.

I finde not any thing extant concerning the Nature and Vertues of *Vaccaria* or Cow-Basill.

A *Ephemerum* (as *Dioscorides* writeth) boyled in wine, and the mouth washed with the decoction thereof, taketh away the tooth-ache.

CHAP. 135.

Of *Sesamoides*, or Bastard Weld or Woade.

¶ The Description.

1 **T**He great *Sesamoides* hath very long leaues and many, slender toward the stalk, and broader by degrees toward the end, placed confusedly vpon a thicke stiffe stalke: on the top whereof grow little foolish or idle white floures: which being past, there follow small seeds like vnto Canarie seed that birds are fed withall. The root is thicke, and of a wooddy substance.

† 2 This lesser *Sesamoides* of *Salamanca*, from a long living, white, hard, and prettie thicke root sends vp many little stalks set thicke with small leaues like those of *Line*; and from the middle to the top of the stalke grow many floures, at first of a greenish purple, and then putting forth yellowish threds; out of the midst of which appeare as it were foure greene graines, which when the floure is fallen grow into little cods full of a small blackish seed. It growes in a stony soile vpon the hills neere *Salamanca*, where it floures in May, and shortly after perfects his seed. †

3 Our

1 *Sesamoides Salamanticum magnum.*
Great bastard Woade.

2 *Sesamoides Salamanticum parvum.*
Small Bastard Woade.

3 *Sesamoides parvum Matthioli.*
Bucks-horne Gum-Succorie.

‡ 3 Our Author formerly in the Chapter of *Chondrilla* spoke (in *Dodonæus* his words) against the making of this plant a *Sesamoides*; for of this plant were the words of *Dodonæus*; which are these: *Diuers* (saith he) haue taken the plant with blew floures to be *Sesamoides parvum*; but without any reason; for that *Sesamoides* hath borrowed his name from the likenesse it hath with *Sesamum*: but this herbe is not like to *Sesamum* in any one point, and therefore I thinke it better referred vnto the Gum Succories; for the floures haue the form and colour of Gum Succory, and it yeeldeth the like milky iuyce. Our Authour it seemes was either forgetfull or ignorant of what he had said; for here hee made it one, and described it meerly by the figure and his fancie. Now I following his tract, haue (though vnfitly) put it here, because there was no historie nor figure of it formerly there, but both here, though false and vnperfect. This plant hath a root somewhat like that of Goats-beard; from which arise leaues rough and hairy, diuided or cut in on both sides after the manner of Bucks-horne, and larger than they. The stalke is some foot high, diuided into branches, which on their tops carry floures of a faire blew colour like those of Succorie, which stand in rough scaly heads like those of Knapweed. ‡

¶ The Place.

These do grow in rough and stony places, but are all strangers in England.

¶ The Time.

These floure in May and Iune, and shortly after ripen their seed.

‡ ¶ The Names.

‡ 1 I thinke none of these to be the *Sesamoides* of the Antients : The first is set forth by *Clusius* vnder the name we here giue you : it is the *Muscipula altera muscosa flore* of *Lobel* : *Viscago maior* of *Camerarius*.

2 This also *Clusius* and *Lobel* haue set forth by the same name as we giue you them.

3 *Matthiolus*, *Camerarius*, and others haue set this forth for *Sesamoides paruum* : in the *Historia Lugd.* it is called *Catanance quorundam* : but most fitly by *Dodon. Chondrilla species tertia*, The third kinde of Gum-Succory. ‡

¶ The Temperature.

Galen affirmeth that the seed containeth in it selfe a bitter qualitie, and saith that it heateth, breaketh, and scoureth.

¶ The Vertues.

A *Dioscorides* affirmeth, that the weight of an halfe-penny of the seed drunke with Meade or honied water purgeth flegme and choler by the stoole.

B The same being applied doth waste hard knots and swellings.

† That which here formerly enjoyed the third place, by the title of *Sesamoides minus Scaligeri*, was no other than the plant that is hereafter described by the name of *Tarton-Raire Gallo* province, where you may finde both the figure and description.

CHAP. 136. Of Dyers Weed.

Luteola. Dyers weed or yellow weed.

¶ The Description.

Dyers weed hath long narrow and greenish yellow leaues, not much vnlike to woad, but a great deale smaller and narrower; from among which commeth vp a stalke two cubits high, beset with little narrow leaues : euen to the top of the stalke come forth small pale yellow floures, closely clustering together one aboue another, which doe turne into small buttons, cut as it were crosse-wise, wherein the seed is contained. The root is very long and single.

¶ The Place.

Dyers weed groweth of it selfe in moist, barren, and vntilled places, in and about Villages almost euery where.

¶ The Names.

Pliny, lib. 33. cap. 5. maketh mention by the way of this herbe, and calleth it *Lutea* : *Vitruvius* in his seuenth booke, *Lutum* : it is the *Anticarhinum* of *Tragus* : & *Pseudostruthium* of *Matthiolus* : *Virgill*, in his *Bucolickes*, Eglog 4. calls it also *Lutum* : in English, Welde; or Dyers weed.

¶ The Time.

This herbe flourisheth in Iune and Iuly.

¶ The Nature.

It is hot and dry of temperature.

‡ ¶ The Vertues.

A The root as also the whole herbe heates and dries in the third degree : it cuts, attenuates, resoluth, opens, digests. Some also commend it against the punctures and bites of venomous creatures,

tures, not onely outwardly applied to the wound, but also taken inwardly in drinke.

Also it is commended against the infection of the Plague: some for these reasons terme it *The-riacaria*; Mat. ‡

CHAP. 137. Of Staues-acre.

Staphis-agria. Staues-acre.

¶ The Description.

Staues-acre hath straight stalkes of a browne colour, with leaues cloven or cut into sundry sections, almost like the leaues of the wilde Vine. The floures do grow vpon short stems, fashioned somewhat like vnto our common Monks hood, of a perfect blew colour; which being past, there succeed welted huskes like those of VVolfsbane, wherein is contained triangular brownish rough seed. The root is of a woody substance, and perisheth when it hath perfected his seed.

¶ The Place.

It is with great difficultie preserved in our cold countries, albeit in some milde VVinters I haue kept it couered ouer with a little Ferrie, to defend it from the iniury of the March winde, which doth more harme vnto plants that come forth of hot Countries, than doth the greatest frosts.

¶ The Time.

It floureth in Iune, and the seed is ripe the second yeare of his sowing.

¶ The Names.

It is called in Greeke *σταφισάγρια*: in Latine, *Herba Pedicularis*, and *Peduncularia*, as *Marcellus* reporteth. *Pliny* in his 26 Booke, chap. 13. seemeth to name it *Vua Taminia*: of some, *Pituitaria*, and *Passula montana*: in shops, *Staphis-agria*: in Spanish, *Yerva piolente*: in French, *Herbe aux pouls*: in high-Dutch, *Leng kraut*: in low-Dutch, *Lupscruit*: in English, *Staues-acre*, *Louse-wort*, and *Louse-pouder*.

¶ The Temperature.

The seeds of Staues-acre are extreame hot, almost in the fourth degree, of a biting and burning qualitie

¶ The Vertues.

Fifteene seeds of Staues-acre taken with honied water, will cause one to vomit grosse flegme and slimie matter, but with great violence, and therefore those that haue taken them ought to walke without staying, and to drinke honied water, because it bringeth danger of choking and burning the throat, as *Dioscorides* noteth. And for this cause they are reiected, and not vsed of the physicians, either in prouoking vomit, or else in mixing them with other inward medicines.

The seed mingled with oyle or grease, driueth away lice from the head, beard, and all other parts of the body, and cureth all scuruy itch and manginess.

The same boyled in Vineger, and holden in the mouth, asswageth the tooth-ache.

The same chewed in the mouth draweth forth much moisture from the head, and cleanseth the braine, especially if a little of the root of Pellitorie of Spaine be added thereto.

The same tempered with vineger is good to be rubbed vpon lousie apparell, to destroy and driue away Lice.

The seeds hereof are perillous to be taken inwardly without good aduice, and correction of the same: and therefore I aduise the ignorant not to be ouer-bold to meddle with it, sith it is so dangerous that many times death ensueth vpon the taking of it.

CHAP. 138. Of Palma Christi.

¶ The Description.

Ricinus, Palma Christi, or Kik hath a great round hollow stalke five cubits high, of a browne colour, died with a blewish purple vpon Greene. The leaues are great and large, parted into sundry sections or diuisions, fashioned like the leaues of a fig-tree, but greater, spread or wide open like the hand of a man; and hath toward the top a bunch of floures clustering together like a bunch of grapes, whereof the lowest are of a pale yellow colour, and wither away without bearing any fruit; and the vppermost are reddish, bringing forth three cornered huskes which containe seed as big as a kidney beane, of the colour and shape of a certaine vermine which haunteth cattell, called a Tik.

2 This Palma Christi of America growes vp to the height and bignesse of a small tree or hedge shrub, of a woody substance, whose fruit is expressed by the figure, being of the bignes of a great beane, somewhat long, and of a blackish colour, rough and scaly.

1 Ricinus.
Palma Christi.

2 Ricinus Americanus.
Palma Christi of America.

¶ The Place.

The first kinde of Ricinus or Palma Christi groweth in my garden, and in many other gardens likewise.

¶ The Time.

Ricinus or Kik is sowne in Aprill, and the seed is ripe in the end of August.

¶ The Name, and cause thereof.

Ricinus (whereof mention is made in the fourth chapter and sixt verse of the prophecie of Ionas) was

was called of the Talmudists, *Kik*, for in the Talmud we reade thus, *וְהָאֵלֶּה בְּשֵׁם כִּיק Velo beschemen Kik*: that is, in English, And not with the oile of *Kik*: which oile is called in the Arabian tongue, *Alkerua*, as *Rabbi Samuel* the sonne of *Hophni* testifieth. Moreouer, a certaine Rab bine moueth a question, saying, what is *Kik*? Hereunto *Resch Lachish* maketh answer in *Ghemara*, saying, *Kik* is nothing else but *Ionas* his *Kikaijon*. And that this is true, it appeareth by that name *Kik*: which the ancient Greeke Physitions, and the Egyptians vsed; which Greeke word commeth of the Hebrew word *Kik*. Hereby it appeareth, that the old writers long agoe called this plant by the true and proper name. But the old Latine writers knew it by the name *Cucurbita*, which evidently is manifested by an history which *Saint Augustine* recordeth in his Epistle to *Saint Ierome*, where in effect he writeth thus; That name *Kikaijon* is of small moment, yet so small a matter caused a great tumult in Africa. For on a time a certaine Bishop hauing an occasion to intreat of this which is mentioned in the fourth chapter of *Ionas* his prophecie (in a collation or sermon, which he made in his cathedrall church or place of assembly) said, that this plant was called *Cucurbita*, a Gourde, because it encreased vnto so great a quantitie, in so short a space, or else (saith he) it is called *Hederá*. Vpon the nouelty and vntruth of this his doctrine, the people were greatly offended, and thereof suddenly arose a tumult and hurly burly; so that the Bishop was inforced to goe to the Iewes, to aske their iudgment as touching the name of this plant. And when he had receiued of them the true name, which was *Kikaijon*: he made his open recantation, and confessed his error, & was iustly accused for a falsifier of the holy scripture. † The Greeks called this plant also *ῥικινος*: i. *Ricinus*, by reason of the similitude that the seed hath with that insect, to wit, a *Tik*. †

¶ The Nature.

The seed of Palma Christi, or rather *Kik*, is hot and dry in the third degree.

¶ The Vertues.

Ricinus his seed taken inwardly, openeth the belly, and causeth vomit, drawing slimy flegme A and choler from the places possessed therewith.

The broth of the meate supped vp, wherein the seed hath been sodden, is good for the collicke and B the gout, and against the paine in the hips called *Sciatica*: it preuaileth also against the jaundise and dropfie.

The oile that is made or drawne from the seed is called *Oleum Cicinum*: in shops it is called C *Oleum de Cherna*: it heateth and drieth, as was said before, and is good to anoint and rub all rough hardnesse and scuruienesse gotten by itch.

This oile, as *Rabbi David Chimchi* writeth, is good against extreme coldnesse of the body. D

CHAP. 139.

Of Spurge.

¶ The Description.

1 THE first kinde of Sea Spurge riseth forth of the sands, or baich of the sea, with sundry reddish stems or stalkes growing vpon one single roote, of a woody substance: and the stalkes are beset with small, fat, and narrow leaues like vnto the leaues of Flaxe. The floures are yellowish, and grow out of little dishes or saucers like the common kinde of Spurge. After the floures come triangle seeds, as in the other Tithymales.

2 The second kinde (called *Helioscopius*, or *Solisequius*: and in English, according to his Greek name, Sunne Spurge, or time Tithymale, of turning or keeping timewith the sunne) hath sundry reddish stalkes of a foot high: the leaues are like vnto Purslane, not so great nor thicke, but snipt about the edges: the floures are yellowish, and growing in little platters.

3 The third kinde hath thicke, fat, and slender branches trailing vpon the ground, beset with leaues like Knee-holme, or the great Myrtle tree. The seed and floures are like vnto the other of his kinde.

4 The fourth is like the last before mentioned, but it is altogether lesser, and the leaues are narrower, it groweth more vpright, otherwise alike.

5 Cypres Tithymale hath round reddish stalkes a foot high, long and narrow like those of Flaxe, and growing bushie, thicke together like as those of the Cypres tree. The floures, seed, and root, are like the former, sometimes yellow, oftentimes red.

6 The sixt is like the former, in floures, stalkes, rootes, and seedes, and differeth in that, this kinde hath leaues narrower, and much smaller, growing after the fashion of those of the Pine tree, otherwise it is like.

7 There is another kinde that groweth to the height of a man; the stalke is like the last mentioned

T t

1 *Tithymalus paralius.*
Sea Spurge.

2 *Tithymalus Helioscopius.*
Sunne Spurge.

3 *Tithymalus Myrtifolius latifolius.*
Broad leaved Myrtle Spurge.

4 *Tithymalus Myrsinitis angustifolius.*
Narrow leaved myrtle Spurge.

5 *Tithymalus Cupressinus.*
Cypresse Spurge.

6 *Tithymalus Pineus.*
Pine Spurge.

† 7 *Tithymalus Myrsinitis arborescens.*
Tree Myrtle Spurge.

† 8 *Tithymalus Characias Monspek.*
Sweet wood Spurge.

† 9 *Tithymalus Characias Amygdaloides.*
Vnsauorie Wood-spurge.

‡ 10 *Tithymalus Characias angustifolius.*
Narrow leaved Wood-spurge.

‡ 11 *Tithymalus Characias serratifolius.*
Cut leaved Wood-spurge.

12 *Tithymalus platyphyllos.*
Broad leaved Spurge.

mentioned, but diuided into sundry branches a finger thicke, and somewhat hairy, not red as the others, but white: the leaues be long and narrow, whitish, and a little downy: the floures are yellow, but in other points like to the rest of this kinde.

8 The eighth kinde riseth vp with one round reddish stalke two cubits high, set about with long thin and broad leaues like the leaues of the Almond tree: the floures come forth at the top like the others, and of a yellow colour. The seed and root resemble the other of his kinde.

9 The ninth (which is the common kinde growing in most woods) is like the former, but his leaues be shorter and lesse, yet like to the leaues of an Almond tree: the floures are also yellow, and the seed contained in three cornered seed-vessels.

† 10 This fourth kinde of *Tithymalus Characias*, or Valley Tithymale (for so the name imports) hath long, yet somewhat narrower leaues than the former, whitish also, yet not hoary; the vmbels or tufts of floures are of a greenish yellow, which before they be opened do represent the shape of a longish fruit, as an Almond, yet in colour it is like the rest of the leaues: the floures and seeds are like those of the former, and the root descends deepe into the ground.

11 The fifth *Characias* hath also long leaues sharpe pointed, and broader at their setting on, and of a light Greene colour, and snipt or cut about the edges like the teeth of a saw. The vmbels are smaller, yet carry such floures and seeds as the former. †

12 This kinde hath great broad leaues like the yong leaues of Woad, set round about a stalk of a foot high, in good order: on the top whereof grow the floures in small platters like the common kinde, of a yellow colour declining to purple. The whole plant is full of milke, as are all the rest before specified.

† 13 *Tithymalus Dendroides ex Cod. Casareo.*
Great Tree Tithymal.

14 *Efula maior Germanica.*
Quackfaluers Turbith.

13 There is another kinde of Tithymale, whose figure was taken forth of a Manuscript of the Emperors by *Dodonæus*; that hath a stalke of the bignesse of a mans thigh, growing like a tree vnto the height of two tall men, diuiding it selfe into sundry armes or branches toward the top, of a red colour. The leaues are small and tender, much like vnto the leaues of *Myrtus*: the seed is like vnto that of wood Tithymale, or *Characias*, according to the authority of *Peter Bellone*.

14 There is a kinde of Tithymale called *Efula maior*, which *Martinus Rulandus* had in great

reuerence,

eneration, as by his extraction which he vsed for many infirmities may and doth appeare at large, in his bookes entituled *Centurie curationum Empiricarum*, dedicated vnto the duke of Bauaria. This plant of *Rulandus* hath very great and many roots couered ouer with a thicke barke, plaited as it were with many furculous sprigs; from which arise sundry strong and large stemmes of a fingers thicknesse, in height two cubits, beset with many pretty large and long leaues like *Lathyrus*, but that they are not so thicke: the seed and floure are not vnlike the other Tithymales.

15 This is like the fifth, saue that it hath smaller and more feeble branches; and the whole plant is altogether lesser, growing but some span or foot high; and the floures are of a red or else a greene colour.

16 There is another rare and strange kinde of *Esula*, in alliance and likenesse neere vnto *Esula minor*, that is the small *Esula* or *Pityusa* vsed among the Physitions and Apothecaries of Venice as a kind of *Esula*, in the Confection of their *Benedicta* and Catharticke pills, in stead of the true *Esula*: It yeeldeth a fungous, rough, and browne stalke two cubits high, diuiding it selfe into sundry branches, furnished with stiffe and fat leaues like Licorice, growing together by couples. The floures are pendulous, hanging downe their heads like small bells, of a purple colour, and within they are of a darke colour like *Aristolochia rotunda*.

† 15 *Esula minor*, seu *Pityusa*.
Small *Esula*.

† 16 *Esula Veneta maritima*.
Venetian Sea-Spurge.

† 17 There growes in many chalkie grounds and such dry hilly places, among corne, a small Spurge which seldome growes to two handfuls high; the root is small, and such also are the stalks and leaues, which grow pretty thicke thereon; which oft times are not sharpe, but flat pointed: the seed-vessels and floures are very small, yet fashioned like those of the other Tithymales. It is to be found in corne fields in Iuly and August. †

18 The bigger *Cataputia* or the common garden Spurge is best knowne of all the rest, and most vsed; wherefore I will not spend time about his description.

The small kinde of *Cataputia* is like vnto the former, but lesser, whereby it may easily be distinguished; being likewise so well knowne vnto all, that I shall not need to describe it.

† These two (I meane the bigger and lesser *Cataputia* of our Author) differ not but by reason of their age, and the fertilenesse and barrenesse of the soile, whence the leaues are sometime broader, and otherwhiles narrower. †

‡ 17 *Esula exigua* Tragi.
Dwarfe Esula.

18 *Lathyrus seu Cataputia minor*.
Garden Spurge.

19 *Peplus, five Esula rotunda*.
Pettie Spurge.

20 *Peplis*.
Ifope Spurge.

21 *Chamaesyce*.
Spurge Time.

22 *Apios vera*.
Knobbed Spurge.

‡ 23 *Apios radice oblonga*.
Long knottie rooted Spurge.

19 The fifteenth kinde called *Peplus*, hath a small, and fibrous root, bringing forth many fruitfull branches two handfulls long, but little and tender, with leaues like the Sun Tithymale, but rounder and much smaller: it hath also small yellow floures: which being past there appeareth a slender pouchet, three cornered like the other Tithymales, hauing within it a very medullous whitish seed like Poppie, the whole plant yeelding a milky iuice, which argueth it to be a kinde of Tithymale.

20 As in name so in shape this twentieth resembleth *Peplus*, and commeth in likelihood neerer the signification of *Peplum*, or *Flammeolum* than the other; therefore *Dioscorides* affirmeth it to be *Thamnos amphylaphes*, for that it bringeth forth a greater plentie of branches, more closely knit and wound together, with shining twists and claspers an handfull and a halfe long. The leaues are lesser than those of *Peplus*, of an indifferent likenesse and resemblance betweene *Chamaesyce* and wilde Purslane. The seed is great, and likethat of *Peplus*: the root is small and single.

21 The one and twentieth kinde may be easily knowne from the two last before mentioned, although they be verie like. It hath

hath many branches and leaues creeping on the ground of a pale Greene colour, not vnlike to *Herniaria*, but giuing milke as all the other Tithymales doe, bearing the like seed, pouch, and floures, but smaller in each respect.

22 The two and twentieth kinde of Tithymale hath a round root like a small Turnep, as euery Authour doth report: yet my selfe haue the same plant in my garden which doth greatly increase, of which I haue giuen diuers vnto my friends, whereby I haue often viewed the roots, which do appeare vnto me somewhat tuberous, and therein nothing answering the descriptions which *Dioscorides*, *Pena*, and others haue expressed and set forth. This argueth, that either they were deceiued, and described the same by heare-say, or else the plant doth degenerate being brought from his native soile. The leaues are set all alongst a small rib like *Fraxinella*, somewhat round, Greene aboue, and reddish vnderneath. The seed groweth among the leaues like the seed of *Peplus*. The whole plant is full of milke like the other Tithymales.

† Our Authour here wrongfully taxes other Writers of plants, & *Dioscorides* & *Pena* by name, which shewes that he either neuer read, or else vnderstood not what they writ, for neither of them (nor any other that I know of) resembles the root of this to a Turnep, but say it hath a tuberous peare fashioned root, &c. as you may see in *Diosc. lib. 4. cap. 177.* and in the *Aduersaria*, pag. 204. The leaues also grow not by couples one against another, as in *Fraxinella*, but rather alternately, or else without any certaine order, as in other Tithymales. †

† 23 This, saith *Clusius*, hath also a tuberous root, but not peare fashioned like as the former, but almost euery where of an equall thickeesse, beeing about an inch and sometimes two inches long, and the lower part thereof is diuided into foure other roots, or thicke fibers, growing smaller by little and little, and sending forth some few fibers: it is blacke without, and white within, & full of a milkie iuice: the stalkes are short and weake, set with little leaues like those of the former: the floures are of a yellowish red colour, and the seede is contained in such vessels as the other Tithymales. This is *Tithymalus tuberosus*, or *Ischas altera* of *Clusius*. †

¶ The Place.

The first kinde of Spurge groweth by the Sea side vpon the rowling Sand and Baich, as at Lee in Essex, at Lang-tree point right against Harwich, at Whitstable in Kent, and in many other places.

The second groweth in grounds that lie waste, and in barren earable soile, almost euery where.

The third and fourth, as also the foureteenth and eighteenth, grow in gardens, but not wilde in England.

The ninth Spurge called *Characias* groweth in most Woods of England that are drie and warme.

The eighteenth and nineteenth grow in salt marshes neere the sea, as in the isle of Thanet by the sea side, betwixt Reculvers and Margate in great plentie.

¶ The Time.

These plants floure from Iune to the end of Iuly.

¶ The Names.

Sea Spurge is called in Latine *Tithymalus paralius*: in Spanish, *Leche tresna*: in high Dutch, **Wolfer milch**, that is to say *Lupinum lac*, or Wolfes milke. Wood Spurge is called *Tithymalus characias*. The first is called in English Sea Spurge, or Sea VVartwoort. The second, Sun Spurge; the third and fourth, Mirtle Spurge: the fifth Cypress Spurge; or among women, VVelcome to our house; the sixth Pine Spurge; the seuenth shrub Spurge, and tree Mirtle Spurge; the eighth and ninth VVood Spurge; the twelfth Broad leaved Spurge: the thirteenth Great Tree Spurge; the foureteenth and fifteenth Quacksaluers Spurge; the sixteenth Venice Spurge, the seuenteenth Dwarf Spurge; the eighteenth common Spurge; the nineteenth and twentieth Petie Spurge; the one and twentieth Spurge Time: The two and twentieth, True *Apios* or the knobbed Spurge.

¶ The Temperature.

All the kinds of Tithymales or Spurges are hot and drie almost in the fourth degree, of a sharp A and biting qualitie, fretting or consuming. First the milke and sap is in speciall vse, then the fruit and leaues, but the root is of least strength. The strongest kinde of Tithymale, and of greatest force is that of the sea.

Some write by report of others, that it inflameth exceedingly, but my selfe speak by experience; B for walking along the sea coast at Lee in Essex, with a Gentleman called Mr. Rich, dwelling in the same towne, I tooke but one drop of it into my mouth; which neuertheless did so inflame and swell in my throte that I hardly escaped with my life. And in like case was the gentleman, which caused vs to take our horses, and poste for our liues vnto the next farne house to drinke some milke to quench the extremitie of our heate, which then ceased.

¶ The

¶ The Vertues.

- A** The iuice of Tithymale, I do not meane sea Tithymale, is a strong medicine to open the bellie, and causing vomite, bringeth vp tough flegme and cholericke humours. Like vertue is in the seed and root, which is good for such as fall into the dropsie, being ministred with discretion and good aduice of some excellent Physition, and prepared with his Correctories by some honest Apothecarie.
- B** The iuice mixed with honie, causeth haire to fall from that place which is anointed therewith, if it be done in the Sun.
- C** The iuice or milke is good to stop hollow teeth, being put into them warily, so that you touch neither the gums, nor any of the other teeth in the mouth with the said medicine.
- D** The same cureth all roughnesse of the skin, manginess, leproie, scurfe, and running scabs, and the white scurfe of the head. It taketh away all manner of warts, knobs, and the hard callousnesse of Fistulaes, hot swellings and Carbuncles.
- E** It killeth fish, being mixed with any thing that they will eat.
- F** These herbes by mine aduise would not be receiued into the bodie, considering that there be so many other good and wholesome potions to be made with other herbes, that may bee taken without perill.

† The seventh figure was formerly of *Tithymalus myrsinites* 3. *angustifolius* of *Tabernaemontanus*. The 8. and 9. were both of the same plant: the 12. was the figure of the *Ephedra exigua* Tragi, whose historie I haue giuen you in the 17. place.

CHAP. 140. Of Herbe Terrible.

1 *Alypum montis Ceti.*
Herbe Terrible.

2 *Tarton-Raire Gallo-Prouincia.*
Gutwoort.

¶ The Description.

1 **H**erbe Terrible is a small shrub two or three cubits high, branched with many small twigges, hauing a thin rinde first browne, then purple, with many little and thinne leaues like Myrtle. The floures are rough like the middle of Scabious floures, of a blew purple colour. The root is two fingers thicke, browne of colour, and of a wooddie substance: the whole plant very bitter, and of an vnpleasant taste like *Chamelæa*, yea somewhat stronger.

2 **Tartonraire**, called in English Gutwoort, groweth by the sea, and is Catharticall, and a stranger with vs. In the mother tongue of the Massilians, it is called Tartonraire, of that abundant and

and vnbridled facultie of purging, which many times doth cause *Dysenteria*, and such like immoderate fluxes, especially when one not skilfull in the vse thereof shall administer the powder of the leaues, mixed with any liquor. This plant groweth in manner of a shrub, like *Chamelæa*, and bringeth forth many smal, tough, and pliant twigs, set about with a thin and cottony hairinesse, & hath many leaues of a glistering siluer colour, growing from the lowest part euen to the top, altogether like *Alypum* before mentioned: and vpon these tough and thick branches (if my memory faile not) do grow small floures, first white, afterward of a pale yellow: the seed is of a russet colour: theroot hard and woody, not very hot in the mouth, leauing vpon the tongue some of his inbred heat and taste, somewhat resembling common Turbith, and altogether without milke.

¶ The Place.

These plants do grow vpon the mountains in France, and other places in the grauelly grounds, and are as yet strangers in England.

¶ The Time.

They flourish in August and September. ‡ The first *Clusius* found flowering in diuers parts of Spaine, in Februarie and March; and I coniecture the other floures about the same time, yet I can finde nothing said thereof in such as haue deliuered the historie of it. ‡

¶ The Names.

There are not any other names appropriate to these plants more than are set forth in the titles. ‡ The first of these is the *Alypum montis Ceti*, & *Herba terribilis* of *Lobel*; *Clus.* calls it *Hippoglossum Valentinum*, & in *Hist. Lugd.* it is named *Alypum Pena*, & *Empetrum Phacoides*. The second is the *Tartonaire Galloprovincia Massiliensium*, in the *Aduersaria*; *Sesamoides maius multorum* of *Dalec.* & the *Sesamoides maius Scalegeri* of *Tabern.* by which title our Author also gaue his figure, in the 397. pag. of the former Edition. ‡

¶ The Temperature and Vertues.

There is nothing either of their nature or vertues, more than is set forth in the Descriptions.

‡ Both these plants haue a strong purging faculty like as the *Tithymales*; but the latter is far more powerfull, and comes neere to the qualitie of *Mezerion*; wherefore the vse of it is dangerous, by reason of the violence and great heat thereof. ‡

CHAP. 141. Of Herbe Aloe, or Sea Housleeke.

‡ 1 *Aloe vulgaris*, sive *Sempervivum maritimum*.
Common Aloe, or Sea-Housleeke.

‡ 2 *Aloe folio mucronato*.
Prickly herbe Aloe, or Sea Housleeke.

¶ The

¶ The Description.

Hearbe Alloebath leaues like those of sea Onion, very long, broad, smooth, thick, bending backwards, notched in the edges, set with certaine little blunt prickles, full of tough and clammie iuice like the leaues of Housleeke. The stalke, as *Dioscorides* saith, is like to the stalke of Affodill: the floure is whitish; the seed like that of Affodill; the root is single, of the fashion of a thicke pile thrust into the ground. The whole herbe is extreme bitter, so is the iuice also that is gathered thereof.

† 2 There is another herbe Aloe that groweth likewise in diuers prouinces of America; the leaues are two cubits long, also thicker, broader, greater, and sharper pointed than the former, and it hath on the edges far harder prickles. The stalke is three cubits high, and a finger thicke, the which in long cups beares violet coloured floures. †

¶ The Place.

This plant groweth very plentifully in India, and in Arabia, Coelosyria, & Egypt, from whence the iuice put into skins is brought into Europe. It groweth also, as *Dioscorides* writeth, in Asia, on the sea coasts, and in Andros, but not verie fit for iuice to be drawne out. It is likewise found in Apulia, and in diuers places of Granado and Andalusia, in Spaine, but not far from the sea: the iuice of this is also vnprofitable.

¶ The Time.

The herbe is alwaies greene, and likewise sendeth forth branches, though it remaine out of the earth, especially if the root be couered with lome, and now and then watered: for so being hanged on the feelings and vpper posts of dining roomes, it doth not onely continue a long time greene, but it also groweth and bringeth forth new leaues: for it must haue a warme place in winter time, by reason it pineth away if it be frozen.

¶ The Names.

The herbe is called in Greeke *αλόη*: in Latine, and in shops also, *Aloe*: and so is likewise the iuice. The plant also is named *αλοειδής*, *απλός*, *απλός*, *απλός*: but they are bastard words: it is called *απλός* because it liueth not onely in the earth, but also out of the earth. It is named in French, *Poroquet*: in Spanish, *Azenar*, and *Yerua banosa*: in English, *Aloes*; herbe *Aloes*, Sea Housleeke, Sea Aigrene.

The hearbe is called of the latter Herbarists oftentimes *Sempervivum*, and *Sempervivum Marinum*, because it lasteth long after the manner of Housleeke. It seemeth also that *Columella* in his tenth booke nameth it *Sedum*, where he setteth downe remedies against the canker-wormes in trees.

*Profuit & plantis latices infundere amarus
Marrubij, multoque Sedi contingere succo.*

In English thus:

Liquours of Horehound profit much being pour'd on trees:
The same effect Sea Housleeke works as well as these.

For he reciteth the iuice of *Sedum* or Housleeke among the bitter iuices, and there is none of the Housleekes bitter but this.

¶ The Temperature.

Aloë, that is to say, the iuice which is vsed in Physicke, is good for many things. It is hot, and that in the first or second degree, but drie in the third, extreme bitter, yet without biting. It is also of an emplastricke or clammie qualitie, and something binding, externally applied.

¶ The Vertues.

A It purgeth the belly, and is withall a wholesome and conuenient medicine for the stomacke, if any at all bee wholesome. For as *Paulus Aegineta* writeth, when all purging medicines are hurtfull to the stomacke, *Aloës* onely is comfortable. And it purgeth more effectually if it be not washed: and if it be, it then strengtheneth the stomacke the more.

B It bringeth forth choler, but especially it purgeth such excrements as be in the stomacke, the first veines, and in the neere passages. For it is of the number of those medicines, which the Græcians call *καταρκτηνικά*, of the voiding away of the Ordure; and of such whose purging force passeth not far beyond the stomacke. Furthermore *Aloës* is an enemy to all kindes of putrefactions; and defendeth the body from all manner of corruption. It also preserveth dead carcases from putrifying;
it

it killeth and purgeth away all manner of wormes of the belly. It is good against a stinking breath proceeding from the imperfection of the stomacke: it openeth the piles or hemorrhoides of the fundament; and being taken in a small quantity, it bringeth down the monthly course: it is thought to be good and profitable against obstructions and stoppings in the rest of the intrals. Yet some there be who thinke, that it is not conuenient for the liuer.

One dramme thereof giuen, is sufficient to purge. Now and then halfe a dramme or little more is enough.

It healeth vp grenewounds and deepe sores, clenseth vlcers, and cureth such sores as are hardly to bee helped, especially in the fundament and secret parts. It is with good successe mixed with *emulsiue*, or medicines which stanch bleeding, and with plaisters that be applied to bloudy wounds; for it helpeth them by reason of his emplastricke qualitie and substance. It is profitably put into medicines for the eies, forasmuch as it clenseth and drieth without biting.

Dioscorides saith, that it must be torrified or parched at the fire, in a cleane and red hot vessell, and continually stirred with a *Spatula*, or Iron Ladle, till it bee torrified in all the parts alike: and that it must also bee washed, to the end that the vnprofitable and sandie drosse may sinke downe vnto the bottome, and that which is smooth and most perfect bee taken and reserved.

The same Authour also teacheth, that mixed with honie it taketh away blacke and blew spots, which come of stripes: that it helpeth the inward ruggednesse of the eye-lids, and itching in the corners of the eies: it remedieth the head-ache, if the temples and forehead bee annointed therewith, being mixed with vinegar and oile of Roses: being tempered with wine, it staideth the falling off of the haire, if the head be washed therewith: and mixed with wine and honie, it is a remedie for the swelling of the Vuula, and swelling of the Almonds of the throte, for the gums & all vlcers of the mouth.

The iuice of this herbe *Aloe*: (whereof is made that excellent and most familiar purger, called *Aloe Succotrina*, the best is that which is cleere and shining, of a browne yellowish colour) it openeth the bellie, purging cold, flegmaticke, and cholericke humours, especially in those bodies that are surcharged with surfetting, either of meat or drinke, and whose bodies are fully repleat with humours, faining daintily, and wanting exercise. This *Aloes* I say, taken in a small quantitie after supper (or rather before) in a stewed prune, or in water the quantitie of two drammes in the morning, is a most soueraigne medicine to comfort the stomacke, and to clense and driue forth all superfluous humours. Some vse to mixe the same with Cinnamon, Ginger, and Mace, for the purpose aboue said; and for the laundies, spitting of blood, and all extraordinarie issues of blood.

The same vsed in vlcers, especially those of the secret parts or fundament, or made into powder, and strawed on fresh wounds, staideth the blood, and healeth the same, as those vlcers before spoken of.

The same taken inwardly causeth the Hemorrhoids to bleed, and being laid thereon it causeth them to cease bleeding.

CHAP. 142. Of Housleeke or Sengreene.

¶ The Kindes.

Sengreene, as *Dioscorides* writeth, is of three sorts, the one is great, the other small, and the third is that which is called *Illecebra*, biting Stone-crop, or VVall pepper.

¶ The Description.

The great Sengreene, which in Latine is commonly called *Iouis Barba*, Iupiters beard, bringeth forth leaues hard adioyning to the ground and root, thicke, fat, full of tough iuice, sharpe pointed, growing close and hard together, set in a circle in fashion of an eye, and bringing forth very many such circles, spreading it selfe out all abroad: it oftentimes also sendeth forth small strings, by which it spreadeth farther, and maketh new circles; there riseth vp oftentimes in the middle of these an vpright stalke about a foot high, couered with leaues growing lesse and lesse toward the points, parted at the top into certaine wings or branches, about which are floures orderly placed, of a darke purplish colour: the root is all of strings.

2 There is also another great Housleek or Sengreen (synamed tree Housleeke) that bringeth forth a stalke a cubit high, sometimes higher, and often two; which is thicke, hard, woody, tough, and that can hardly be broken, parted into diuers branches, and covered with a thicke grosse barke, which in the lower part referueth certaine prints or impressed markes of the leaues that are fallen away. The leaues are fat, well bodied, full of juice, an inch long and somewhat more, like little tongues, very curiously minced in the edges, standing vpon the tops of the branches, hauing in them the shape of an eye. The floures grow out of the branches, which are diuided into many springs; which floures are slender, yellow, and spred like a star; in their places commeth vp very fine feed, the springs withering away: the root is parted into many off-springs. This plant is alwaies greene, neither is it hurt by the cold in winter, growing in his natie soile; whereupon it is named *Sempervivum*, and *Sempervivum*, or Sengreene.

1 *Sempervivum maius.*
Great Housleeke.

2 *Sedum maius arborescens.*
Tree Housleeke.

3 There is also another of this kinde, the circles whereof are answerable in bignesse to those of the former, but with lesser leaues, moe in number, and closely set, hauing standing on the edges very fine haire as it were like soft prickles. This is somewhat of a deeper greene: the stalke is shorter, and the floures are of a pale yellow. ‡ This is the third of *Dodonaus* description, *Pemptad. l. lib. 5. cap. 8.* ‡

4 There is likewise a third to be referred hereunto: the leaues hereof be of a whitish greene, and are very curiously nicked round about. ‡ The floure is great, consisting of six white leaues; This is that described by *Dodonaus* in the 4. place: and it is the *Cotyledon altera secunda* of *Clusius*. ‡

5 There is also a fourth, the circles whereof are lesser, the leaues sharpe pointed, very closely set, of a darke red colour on the top, and hairy in the edges: the floures on the sprigs are of a gallant purple colour. ‡ This is the fift of *Dodonaus*, and the *Cotyledon altera tertia* of *Clusius*. ‡

¶ The Place.

1 The great Sengreen is well knowne not onely in Italy, but also in France, Germany, Bohemia, and the Lowe-Countries. It groweth on stones in mountaines, vpon old walls, and ancient buildings, especially vpon the tops of houses. The forme hereof doth differ according to the nature of the soile, for in some places the leaues are narrower and lesser, but moe in number, and haue one onely circle; in some they are fewer, thicker, and broader: they are greene, and of a deeper greene

greene in some places; and in others of a lighter greene: for those which we haue described grow not in one place, but in diuers and sundry.

† 5 *Sedum maius angustifolium.*

Great narrow leaued Housleeke.

2 Great Sengreene is found growing of it selfe on the tops of houses, old walls, and such like places in very many prouinces of the East, and of Greece: and also in the Islands of the Mediterranean sea; as in Crete, which now is called Candy, Rhodes, Zant, & others; neither is Spaine without it: for (as *Carolus Clusius* witnesseth) it groweth in many places of Portingale; otherwise it is cherished in earthen pots. In cold countries, and such as lie Northward, as in both the Germanies, it neither groweth of it selfe, nor yet lasteth long; though it be carefully planted, and diligently looked vnto, but through the extremitie of the weather, and the ouermuch cold of winter it perisheth.

¶ The Time.

The stalke of the first doth at length floure after the Summer Solstice, which is in Iune about Saint *Barnabies* day, and now and than in the moneth of August; but in Aprill, that is to say, after the æquinoctiall in the spring, which is about a moneth after the spring is begun, there grow out of this among the leaues small strings, which are the ground-work of the circles, by which being at length full growne, it spreadeth it selfe into very many circles.

2 Housleeke that groweth like a tree, doth floure in Portingale at the beginning of the yeere presently after the winter Solstice, which is December, about *S. Lucies* day.

¶ The Names.

The first is commonly called *Iouis barba*, or Iupiters beard, and also *Sedum maius vulgare*: the Germanes call it *Hanszwurtz*, *Grosz Wonderbaer*: they of the Low-countries, *Donderbaert*: the Hollanders, *Huyfloock*: the French-men, *Ioubarbe*: the Italians, *Semprenino maggiore*: the Spaniards, *Siempreuina yerna pentera*: the English-men, Housleeke, and Sengreene, and Aygreene: of some, Iupiters eie, Bullocks eie, and Iupiters beard: of the Bohemians, *Netreske*. Many take it to be *Cotyledon altera Discoridis*; but we had rather haue it one of the Sengreens: for it is continually greene, and alwaies flourisheth, and is hardly hurt by the extremity of winter.

The other without doubt is *Dioscorides* his *αἰζων μέγα*: that is, *Semperuiuum magnum*, or *Sedum majus*, great Housleek, or Sengreen: *Apuleius* calleth it *Vitalis*, and *Semperflorium*: it is also named *ζέοφθαλμος, σερηνός, αἰζων*.

¶ The Temperature.

The great Housleeks are cold in the third degree: they are also dry, but not much, by reason of the watery essence that is in them.

¶ The Vertues.

They are good against Saint Antonies fire, the shingles, and other creeping vlcers and inflammations, as *Galen* saith, that proceed of rheumes and fluxes: and as *Dioscorides* teacheth, against the inflammations or fiery heate in the eyes: the leaues, saith *Pliny*, being applied, or the juice laid on, are a remedy for rheumatike and watering eyes.

They take away the fire in burnings and scaldings; and being applied with Barly meale dried, do take away the paine of the gout.

Dioscorides teacheth, that they are giuen to them that are troubled with a hot laske: that they likewise driue forth wormes of the belly if they be drunke with wine.

The juice put vp in a pessary do stay the fluxes in women, proceeding of a hot cause: the leaues held in the mouth do quench thirst in hot burning feauers.

The juice mixed with Barly meale and vineger preuaileth against S. Antonies fire, all hot burning and fretting vlcers, and against scaldings, burnings, and all inflammations, and also the gout comming of an hot cause.

- A The iuice of Housleeke, Garden Nightshade, and the buds of Poplar boiled in *Axungia porci*, or hogs grease, maketh the most singular Populeon that euer was vsed in Chirurgerie.
- B The iuice hereof taketh away cornes from the toes and feet, if they be washed and bathed therewith, and euery day and night as it were implastered with the skin of the same Housleeke, which certainly taketh them away without incision or such like, as hath beene experimented by my very good friend M^r. *Nicholas Belfon*, a man painefull and curious in searching forth the secrets of Nature.
- C The decoction of Housleeke, or the iuice thereof drunke, is good against the bloudie fluxe, and cooleth the inflammation of the eies being dropped thereinto, and the bruised hearbe layed vpon them.

CHAP. 143. Of the Lesser Housleekes or Prickmadams.

1 *Sedum minus hematoides*.
Pricke-madame.

2 *Sedum minus Officinum*.
White floured Prickmadam.

The Description.

1 **T**He first of these is a very little herb, creeping vpon the ground with many slender stalks, which are compassed about with a great number of leaues, that are thicke, full of ioints, little, long, sharpe pointed, inclining to a greene blew. There rise vp among these, little stalkes, a handfull high, bringing forth at the top, as it were a shadowie tuft; and in these fine yellow floures: the root is full of strings.

2 The other little Sengreene is also a small herbe, bringing forth many slender stalkes, seldom about a span high; on the tops whereof stand little floures like those of the other, in small loose

‡ 3 *Sedum minus æstivum.*
Small Sommer Sengreene.

‡ 4 *Sedum minus flore amplo.*
Small large flowered Sengreene.

‡ 5 *Sedum medum tereti folium.*
Small Prickmadam.

‡ 6 *Aizoon Scorpioides.*
Scorpion Sengreene.

‡ 7 *Sedum Portlandicum*.
Portland Sengreene.

‡ 8 *Sedum petraeum*.
Small rocke Sengreene.

loose tufts; but they are white and something lesser: the leaues about the stalkes are few and little, but long, blunt, and round, bigger than wheaten cornes, something lesser than the kernels of the Pine Apples, otherwise not vnlike; which oftentimes are something red, stalkes and all: the roote creepeth vpon the superficial or vppermost part of the earth, sending downe slender threds.

3 There is a small kinde of Stonecrop, which hath little narrow leaues, thicke, sharpe pointed, and tender stalkes, full of fattie iuice; on the top whereof doe grow small yellowe floures, Starre fashion. The roote is small, and running by the ground.

4 There is likewise another Stonecrop called Frog Stonecrop, which hath little tufts of leaues rising from small and and threddie rootes, creeping vpon the ground like vnto *Kali* or Frog-grasse; from the which tufts of leaues riseth a slender stalke, set with a few such like leaues, hauing at the top prettie large yellow floures, the smalnesse of the plant beeing considered.

‡ 5 This is like that which is described in the second place, but that the stalks are lesser, and not so tall, and the floures of this are star fashioned, and of a golden yellow colour. ‡

6 There is another Stonecrop, or Prickmadam called *Aizoon Scorpoides*, which is altogether like the great kinde of Stonecrop, and differeth in that, that this kinde of Stonecrop or Prickmadam hath his tuft of yellow floures turning again, not much vnlike the taile of a Scorpion, resembling *Myositis Scorpoides*, and the leaues somewhat thicker, and closer thrust together. The root is small and tender.

7 There is a plant called *Sedum Portlandicum*, or Portland Stonecrop, of the English Island called Portland, lying in the South coast, which hath goodly branches and a rough rinde. The leaues imitate *Laureola*, growing among the Tithymales, but thicker, shorter, more fat and tender. The stalke is of a woody substance like *Laureola*, participating of the kindes of *Crassula*, *Sempervivum*, and the Tithymales, whereof wee thinke it to bee a kinde; yet not daring to deliuer any vncertaine sentence, it shall be lesse preiudiciall to the truth, to account it as a shrubbe, degenerating from both kindes.

‡ *Pena* and *Lobel*, who first set this foorth knewe, not verie well what they should say thereof; nor any since them: wherefore I haue onely giuen you their figure put to our Authours description. ‡

8 There is a plant which hath receiued his name *Sedum Petraeum*, because it doth for the most part grow vpon the rocks, mountains, & such like stonie places, hauing very smal leaues, comming forth of the ground in tufts like *Pseudo-Moly*; that is, our common herbe called Thrift: amongst the leaues come forth slender stalkes an handfull high, loden with small yellow floures like vnto the common Prick-Madam: after which come little thicke sharpe pointed cods, which containe the seed, which is small, flat, and yellowish.

¶ The Place.

The former of these groweth in gardens in the Low-countries : in other places vpon stone wals and tops of houses in England almost euery where.

The other groweth about rnbish in the borders of fields, and in other places that lye open to the Sunne.

¶ The Time.

They floure in the Sommer moneths.

¶ The Names.

The lesser kinde is called in Greeke *δελταειν* *δελταειν* : in Latine, *Sedum*, and *Semperuiuum minus* : of the Germanes, *Kleyn Donderbaet*, and *Kleyn Hautzwurtz* : of the Italians, *Semperuino minore* : of the Frenchmen, *Tricque-madame* : of the English men, *Pricke-Madam*, *Dwarfe House-leeke*, and *small Sengreene*.

The second kinde is named in shops *Crassula minor* ; and they syname it *minor*, for difference betweene it and the other *Crassula*, which is a kinde of Orpin : it is also called *Vermicularis* : in Italian, *Pignola*, *Granellosa*, and *Grafella* : in low-Dutch, *Blader loosen* : in English, *Wilde Pricke-Madam*, *Great Stone-crop*, or *Worme-grasse*. ‡ That which is vulgarly knowne and called by the name of *Stone-crop* is the *Illecebra* described in the following chapter, and such as grow commonly with vs of these small Houseleekes mentioned in this chapter are generally named *Pricke-Madames* : but our Author hath confounded them in this and the next chapter ; which I would not alter, thinking it sufficient to giue you notice thereof. ‡

¶ The Temperature and Vertues.

All these small Sengreens are of a cooling nature like vnto the great ones, and are good for those things that the others be. The former of these is vsed in many places in fallads, in which it hath a fine relish, and a pleasant taste : it is good for the heart-burne.

‡ CHAP. 144. Of diuers other small Sengreens.

¶ The Description.

‡ 1 **T**He stalke of this small water Sengreene is some spanne long, reddish, succulent, and weake : the leaues are longish, a little rough, and full of iuyce : the floures grow vpon the tops of the stalkes, consisting of six purple or else flesh-coloured leaues ; which are succeeded by as many little cods containing a small seed : the root is small and threddy, and the whole plant hath an insipide or waterish taste. This was found by *Clusius* in some waterie places, of Germany about the end of Iune ; and he calls it *Sedum minus 3. sive palustre*.

2 This second from small fibrous and creeping roots sends vp sundry little stalkes set with leaues like those of the ordinary *Pricke-Madam*, yet lesse, thicke, and flatter, and of a more astringent taste : the floures, which are pretty large, grow at the tops of the branches, and consist of five pale yellowish leaues. It growes in diuers places of the Alps, and floures about the end of Iuly, and in August. This is the *Sedum minus 6. or Alpinum 1. of Clusius*.

3 This hath small little and thicke leaues, lying bedded, or compact close together, and are of an Ash colour inclining to blew : the stalkes are some two inches long, slender, and almost naked ; vpon which grow commonly some three floures consisting of five white leaues apiece, with some yellow threds in the middle. This mightily encreases, and will mat and couer the ground for a good space together. It floures in August, and growes vpon the craggy places of the Alps. *Clusius* calls it *Sedum minus nonum, sive Alpinum 3.*

4 The leaues of this are somewhat larger and longer, yet thicke, and somewhat hairy about their edges ; at first also of an acide taste, but afterwards bitterish and hor : it also sendeth forth shoots, and in the midst of the leaues it puts forth stalkes some two inches high, which at the top as in an umbel carry some six little floures consisting of five leaues apiece, hauing their botomes of a yellowish colour. It is found in the like places, and floures at the same time as the former. *Clusius* makes it his *Sedum minus 10. Alpinum 4. and in the Hist. Lugd. It is called Iasme montana.*

‡ 1 *Sedum minus palustre.*
Small water Sengreene.

‡ 2 *Sedum Alpinum* 1. *Clusij.*
Small Sengreene of the Alps.

‡ *Sedum Alpinum* 2. *Clusij.*
White Sengreene of the Alpes.

‡ 4 *Sedum Alpinum* 4. *Clusij.*
Hairy Sengreene of the Alpes.

‡ 5 *Sedum petraeum Bupleurifolio.*
Long leaved Rocke Sengreene.

For these foure last described we are beholden to *Clusius*; and for this fifth to *Pona*, who thus describes it: It hath one thicke and large root with few or no fibres, but som knots bunching out here and there: it is couered with a thicke barke, and is of a blackish red colour on the outside: the leaues are many, long and narrow, lying spread vpon the ground; the stalke grows some foot high, and is round and naked, and at the top carries floures consisting of 7 sharpe pointed pale yellow leaues; which are succeeded by seeds like those of *Bupleurum*, and of a strong smell. It floures about the middle of Iuly, and the seed is ripe about the middle of August. *Pona*, who first obserued this growing vpon Mount Baldus in Italy, sets it forth by the name of *Sedum petraeum Bupleurifolio*. *Bauhine* hath it by the name of *Perfoliata Alpina Gramineo folio*, and *Bupleuron angustifolium Alpinum*.

¶ The Temper and Vertues.

The three first described without doubt **A** are cold, and partake in vertues with the other small Sengreens; but the two last are rather of an hot and attenuating facultie. None of them are commonly knowne or vsed in Physicke. ‡

Vermicularis sine Illecebra minor acris.
Wall-Pepper, or Stone-crop.

CHAP. 145.

Of Stone-crop, called Wall-pepper.

¶ The Description.

This is a low and little herbe: the stalks be slender and short: the leaues about these stand very thicke, and small in growth, full bodied, sharpe pointed, and full of iuyce: the floures stand on the top, and are maruelous little, of colour yellow, and of a sharp biting taste: the root is nothing but strings.

¶ The Place.

It groweth euery where in stony and dry places, and in chinks and crannies of old wals, and on the tops of houses: it is alwaies green, and therefore it is very fitly placed among the Sengreens.

¶ The Time.

It floureth in the Sommer moneths.

¶ The Names.

This is *Tertium sempervivum Dioscoridis*, or *Dioscorides* his third Sengreene, which he saith is called of the Grecians *αιδανον αγρα*, and *ταλπω*: and of the Romanes, *Illecebra*. *Pliny* also witnesseth, that the Latines name it *Illecebra*. Yet there is another *αιδανον αγρα*, and another *ταλπω*: the Germanes call this herbe *Maurpfeffer*, and *Katzen treuble*: the French men, *Pain d'oiseau*.

oiseau: the Low-countrey men, *Muer Pepper*: the English men, Stone-crop, and Stone hore, little Stone-crop, Pricket, Mouse-taile, Wall-Pepper, Countrey Pepper, and lacke of the But-
terie.

¶ *The Temperature.*

This little herbe is sharpe and biting, and very hot. Being outwardly applied it raiseth blisters, and at length exulcerateth.

¶ *The Vertues.*

- A It wasteth away hard kernels, and the Kings Euill, if it be layd vnto them, as *Dioscorides* writes.
B The iuyce hereof extracted or drawne forth, and taken with vinegar or other liquor, procureth vomit, and bringeth vp grosse and flegmaticke humors, and also cholericke; and doth thereby oftentimes cure the Quartan Ague and other Agues of long continuance: and giuen in this manner it is a remedy against poysons inwardly taken.

CHAP. 146. Of Orpyne.

¶ *The Description.*

1 **T**He Spanish Orpyne sendeth forth round stalkes, thicke, slipperie, hauing as it were little ioynts, somewhat red now and then about the root: the leaues in like manner be thicke, smooth, grosse, full of tough iuyce, sometimes sleightly nicked in the edges, broader leaved, and greater than those of Purslane; otherwise not much vnlike; which by couples are set opposit one against another vpon euery joint, couering the stalke in order by two and two: the floures in the round tufts are of a pale yellow: the root groweth full of bumes like vnto long kernels, waxing sharpe toward the point: these ketnels be white, and haue strings growing forth of them.

1 *Crassula major Hispanica.*
Spanish Orpyne.

2 *Crassula sine faba inuersa.*
Common Orpyne.

2 The second, which is our common Orpyne, doth likewise rise vp with very many round stalkes that are smooth, but not ioynted at all: the leaues are grosse or corpulent, thicke, broad, and

and oftentimes somewhat nicked in the edges, lesser than those of the former, placed out of order. The floures be either red or yellow, or else whitish: the root is white, well bodied, and full of kernels. This plant is very full of life: the stalkes set onely in clay continue greene a long time; and if they be now and then watered they also grow. We haue a wilde kinde of Orpyne growing in corne fields and shadowy woods in most places of England, in each respect like that of the garden, sauing that it is altogether lesser.

¶ *The Place.*

They prosper best in shadowie and stony places, in old walls made of lome or stone. *Oribasius* saith, That they grow in Vineyards and tilled places. The first groweth in gardens; the other euerywhere: the first is much found in Spaine and Hungarie; neither is Germanie without it; for it groweth vpon the bankes of the riuer of Rhene neere the Vineyards, in rough and stony places, nothing at all differing from that which is found in Spaine.

The second groweth plentifully both in Germany, France, Bohemia, England, and in other countries among vines, in old lomie daubed and stony walls.

¶ *The Time.*

The Orpynes floure about August or before.

¶ *The Names.*

The first is that which is called of the Grecians *πυλίσιον*, and *αειζωνάριον*: of the Latines, *Telephium*, and *Sempervivum sylvestre*, and *Illecebra*: but *Illecebra* by reason of his sharpe and biting qualitie doth much differ from it, as we haue declared in the former Chapter. Some there be that name it *πυλίσιον* Or *Portulaca sylvestris*: yet there is another *Portulaca sylvestris*, or wilde Purslane, like to that which groweth in gardens, but lesser: we may call this in English, Spanish Orpyne, Orpyne of Hungarie, or ioyned Orpyne.

The second kinde of Orpyne is called in shops *Crassula*, and *Crassula Fabaria*, and *Crassula maior*, that it may differ from that which is described in the chapter of little Housleeke: it is named also *Fabaria*: in high-Dutch, *Mundkraut*, *Knauenkraut*, *Fortzwang*, and *Fortzweyn*: in Italian, *Faba grassa*: in French, *Ioubarbe des vignes*, *Fene espesse*: in low-Dutch, *Smer wortele*, and *Hemel Sluetel*: in English, Orpyne; also Liblong, or Liue-long.

¶ *The Temperature.*

The Orpyns be cold and dry, and of thin or subtill parts.

¶ *The Vertues.*

Dioscorides saith, That being laid on with Vineger it taketh away the white morpew: *Galen* A saith the blacke also; which thing it doth by reason of the scouring or cleansing qualitie that it hath. Whereupon *Galen* attributeth vnto it an hot facultie, though the taste sheweth the contrarie: which aforesaid scouring facultie declareth, That the other two also be likewise cold. But cold things may as well cleanse, if drinesse of temperature and thinnesse of essence be ioyned together in them.

CHAP. 147. Of the smaller Orpyns.

¶ *The Description.*

1 The Orpyn with purple floures is lower and lesser than the common Orpyn: the stalkes be slenderer, and for the most part lie along vpon the ground. The leaues are also thinner and longer, and of a more blew greene, yet well bodied, standing thicker below than aboue, confusedly set together without order: the floures in the tufts at the tops of the stalks be of a pale blew tending to purple. The roots be not set with lumps or knobbed kernels, but with a multitude of hairy strings.

2 This second Orpyn, as it is knowne to few, so hath it found no name, but that some Herbarists do call it *Telephium sempervivum* or *virens*: for the stalkes of the other do wither in winter, the root remaineth greene; but the stalkes and leaues of this endure also the sharpenesse of Winter; and therefore we may call it in English, Orpyn euerlasting, or Neuer-dying Orpyn. This hath lesser and rounder leaues than any of the former: the floures are red, and the root fibrous.

3 *Clusius* receiued the seeds of this from *Ferranto Imperato* of Naples, vnder the name of *Telephium*

1 *Telephium floribus purpureis.*
Purple Orpyn.

2 *Telephium semper-virens.*
Neuer-dying Orpyn.

‡ 2 *Telephium legitimum Imperati.* Creeping Orpyn.

Telephium legitimum; and he hath thus giuen vs the history thereof: It produces from the top of the root many branches spred vpon the ground, which are about a foot long, set with many leaues, especially such as are not come to floure; for the other haue fewer: these leaues are smaller, lesse thicke also and succulent than those of the former kindes, neither are they so brittle: their colour is green, inclining a little to blew: the tops of the branches are plentifully stored with little floures growing thicke together, and composed of five little white leaues apiece: which fading, there succeed cornered seed-vessels full of a brownish seed. The root is sometimes as thicke as ones little finger, tough, white, diuided into some branches, and liuing many yeares. ‡

¶ The Place, Time, Names, Temperature, and Vertues.

The first growes not in England. The second flourishes in my garden. ‡ The third is a stranger with vs ‡. They floure when the common Orpyn doth. Their names are specified in their seuerall descriptions: and their temperature and faculties in working are referred to the common Orpyn.

Chap.

CHAP. 148.

Of Purflane.

¶ The Description.

1 **T**He stalkes of the great Purflane be round, thicke, somewhat red, full of juice, smooth, glittering, and parted into certaine branches trailing vpon the ground: the leaues be an inch long, something broad, thicke, fat, glib, somewhat Greene, whiter on the neither side: the floures are little, of a faint yellow, and grow out at the bottome of the leaues. After them springeth vp a little huske of a Greene colour, of the bignesse almost of halfe a barley corne, in which is small blacke seed: the root hath many strings.

1 *Portulaca domestica.*
Garden Purflane.

2 *Portulaca silvestris.*
Wilde Purflane.

2 The other is lesser and hath like stalkes, but smaller, and it spreadeth on the ground: the leaues be like the former in fashion, smoothnesse, and thicknesse, but farre lesser.

¶ The Place.

The former is fitly sowne in gardens, and in the waies and allies thereof being digged and dunged, it delighteth to grow in a fruitfull and fat soile not dry.

The other commeth vp of his owne accord in allies of gardens and vineyardes, and oftentimes vpon rocks: this also is delighted with watery places being once sowne, if it be let alone till the seed be ripe it doth easily spring vp afresh for certaine yeeres after.

¶ The Time.

It may be sowne in March or Aprill; it flourisheth and is Greene in Iune, and afterwards euen vntill winter.

¶ The Names.

Purflane is called in Greeke, *πορτολάνη*; in Latine, *Portulaca*: in high Dutch, *Buckelkraut*: in French, *Poupier*: in Italian, *Prochaccia*: in Spanish, *Verdolagas*: in English, Purflane, and Porcelane.

¶ *The Temperature.*

Purflane is cold, and that in the third degree, and moist in the second : but wilde Purflane is not so moist.

¶ *The Vertues.*

- A Rawe Purflane is much vsed in fallades, with oile, salt, and vineger : it cooleth an hot stomacke, and prouoketh appetite ; but the nourishment which commeth thereof is little, bad, cold, grosse, and moist : being chewed it is good for teeth that are set on edge or astonied ; the juice doth the same being held in the mouth, and also the distilled water.
- B Purflane is likewise commended against wormes in young children, and is singular good, especially if they be feuerish withall, for it both allaieth the ouermuch heate, and killeth the wormes : which thing is done through the saltnes mixed therewith, which is not only an enemy to wormes, but also to putrification.
- C The leaues of Purflane either rawe, or boiled, and eaten as fallades, are good for those that haue great heate in their stomackes and inward parts, and doe coole and temper the inflamed blood.
- D The same taken in like manner is good for the bladder and kidnies, and allaieth the outragious lust of the body : the juice also hath the same vertue.
- E The juice of Purflane stoppeth the bloody fluxe, the fluxe of the hemorroides, monthly termes, spitting of blood, and all other fluxes whatsoeuer.
- F The same thrown vp with a mother syringe, cureth the inflammations, frettings, and vlcérations of the matrix ; and put into the fundament with a clister pipe, helpeth the vlcérations and fluxe of the guts.
- G The leaues eaten rawe, take away the paine of the teeth, and fasteneth them ; and are good for teeth that are set on edge with eating of sharpe or soure things.
- H The seed being taken, killeth and driueth forth wormes, and stoppeth the laske.

CHAP. 149.

Of sea Purflane, and of the shrubby Sengreens.¶ *The Description.*

1 **S**ea Purflane is not a herbe as garden Purflane, but a little shrub : the stalkes whereof be hard and woody : the leaues fat, full of substance, like in forme to common Purflane, but much whiter and harder : the mossie purple floures stand round about the vpper parts of the stalkes, as do almost those of Blyte, or of Orach : neither is the seed vnlike, being broad and flat : the root is woody, long lasting, as is also the plant, which beareth out the winter with the losse of a few leaues.

† 2 There is another sea Purflane or *Halimus*, or after *Dodonæus*, *Portulaca marina*, which hath leaues like the former, but not altogether so white, yet are they somewhat longer and narrower, not much vnlike the leaues of the Oliue tree. The slender branches are not aboue a cubit or cubit and halfe long, and commonly lie spred vpon the ground, and the floures are of a deepe ouerworne herby colour, and after them follow feedes like those of the former, but smaller.

‡ 3 Our ordinary *Halimus* or sea Purflane hath small branches some foot or better long, lying commonly spred vpon the ground, of an ouerworne grayish colour, and sometimes purple ; the leaues are like those of the last mentioned, but more fat and thicke, yet lesse hoary. The floures grow on the tops of the branches, of an herby purple colour, which is succeeded by small seeds like to that of the second kinde. ‡

4 There is found another wilde sea Purflane, whereof I haue thought good to make mention ; which doth resemble the kindes of Aizoons. The first kinde groweth vp right, with a trunk like a small tree or shrub, hauing many vp right woody branches, of an ashe colour, with many thicke, darke, Greene leaues like the small Stone crop, called *Vermicularis* : the floures are of an herby yellowish Greene colour : the root is very hard and fibrous : the whole plant is of a salt tang taste, and the juice like that of Kaly.

5 There is another kinde like the former, and differeth in that, this strange plant is greater, the leaues more sharpe and narrower, and the whole plant more woody, and commeth neere to the forme of a tree. The floures are of a greenish colour.

¶ *The*

† 1 *Halimus latifolius*.
Tree Sea Purslane.

† 2 *Halimus angustifolius procumbens*.
Creeping Sea Purslane.

† 3 *Halimus vulgaris, sine Portulaca marina*.
Common Sea Purslane.

† 4 *Vermicularis frutex minor*.
The lesser shrubby Sengreen.

‡ 5 *Vermicularis frutex major.*
The greater Tree Stone-crop.

¶ The Place.

‡ The first and second grow vpon the Sea coasts of Spaine and other hot countries ‡: and the third groweth in the salt marishes neere the sea side, as you passe ouer the Kings ferrey vnto the isle of Shepey, going to Sherland house (belonging sometime vnto the Lord *Cheiny*, and in the yeare 1590, vnto the Worshipfull *S^t. Edward Hobby*) fast by the ditches sides of the same marish: it groweth plentifully in the isle of Thanet as you go from Margate to Sandwich, and in many other places along the coast. The other sorts grow vpon bankes and heapes of sand on the Sea coasts of Zeeland, Flanders, Holland, and in like places in other countries, as besides the Isle of Purbecke in England; and on Rauenspurne in Holderness, as I my selfe haue seene.

¶ The Time.

These flourish and floure especially in Iuly and August.

¶ The Names.

Sea Purslane is called *Portulaca Marina*: In Greeke, *ἀλμυρά*: it is also called in Latine *Halimus*: in Dutch, *Zee Porceleijne*: in English, Sea Purslane.

The bastard ground Pines are called of some, *Chamepitys vermiculata*: in English, Sea ground Pine: ‡ or more fitly, Tree Ston-crop, or Pricket, or Shrubby Sengreene. ‡

¶ The Temperature.

Sea Purslane is (as *Galen* saith) of vnlike parts, but the greater part thereof is hot in a meane, with a moisture vnconcocted, and somewhat windie.

¶ The Vertues.

- A The leaues (saith *Dioscorides*) are boyled to be eaten: a dram weight of the root being drunke with meade or honied water, is good against crampes and drawings awrie of sinewes, burstings, and gnawings of the belly: it also causeth Nurses to haue store of milke. The leaues be in the Low-countries preferued in salt or pickle as capers are, and be serued and eaten at mens tables in stead of them, and that without any mislike of taste, to which it is pleasant. *Galen* doth also report, that the yong and tender buds are wont in Cilicia to be eaten, and also laid vp in store for vse.
- B ‡ *Clusius* saith, That the learned Portugal Knight *Damianus a Goes* assured him, That the leaues of the first described boyled with bran, and so applied, mitigate the paines of the Gout proceeding of an hot cause. ‡

† The figure that was formerly giuen by our Author by the title of *Portulaca marina*, and is set forth by *Tabern.* vnder the same name, is either of none of these plants, or else it is vnperfect. *Bauhine* knowes not what to make of it, but questions, *Quid sit?*

CHAP. 150. Of Herbe-Iuy, or Ground-Pine.

¶ The Description.

THE common kinde of *Chamepitys* or Ground-Pine is a small herbe and very tender, creeping vpon the ground, hauing small and crooked branches trailing about. The leaues be small, narrow and hairy, in fauour like the Firre or Pine tree; but if my sense of smelling be perfect, me thinkes it is rather like vnto the smell of hempe. The floures be little, of a pale yellow colour, and sometimes white: the root is small and single, and of a woody substance.

‡ 2 The second hath pretty strong foure square ioynted stalkes, browne and hairy; from which grow pretty large hairy leaues much clouen or cut: the floures are of a purple colour, and grow about the stalks in roundles like the dead Nettle: the seed is black and round, and the whole plant fauoureth like the former: ‡ which sheweth this to be fitly referred to the *Chamepytis*, and not to be well called *Chamaedrys fœmina*, or Iagged Germander, as some haue named it. ‡

1 *Chamaepitys mas.*

The male ground Pine.

2 *Chamaepitys femina.*

The female ground-Pine.

3 *Chamaepitys 3. Dodon.*
Small Ground-Pine.4 *Iuamuscata Monspeliaca.*

French Herbe-Iuy or Ground-Pine.

3 This kinde of Herb-Iuy, growing for the most part about Montpelier in France, is the least of all his kind, hauing smal white and yellow floures, in smell and proportion like vnto the others, but much smaller.

† 4 There is a wilde or bastard kinde of *Chamapitys*, or ground-Pine, that hath leaues somewhat like vnto the second kinde, but not iagged in that manner, but onely snipt about the edges. The root is somewhat bigger, wooddy, whitish, and bitter, and like vnto the root of Succorie. All this herbe is very rough, and hath a strong vnpleasant sinell, not like that of the ground-Pines.

‡ 5 *Chamapitys spuria altera* Dodon.
Bastard Ground-Pine.

‡ 6 *Chamapitys Austriaca*.
Austrian Ground-Pine.

† 5 There is another kind that hath many small and tender branches beset with little leaues for the most part three together, almost like the leaues of the ordinarie ground-Pine: at the top of which branches grow slender white floures; which being turned vpside downe, or the lower part vpward, do somewhat resemble the floures of *Lamium*: the seeds grow commonly foure together in a cup, and are somewhat big and round: the root is thicke, whitish, and long lasting.

6 There groweth in Austria a kinde of *Chamapitys*, which is a most braue and rare plant, and of great beautie, yet not once remembred either of the ancient or new Writers, vntill of late that famous *Carolus Clusius* had set it forth in his *Pannonicke Obseruations*; who for his singular skil and industrie hath woon the garland from all that haue written before his time. This rare and strange plant I haue in my garden, growing with many square stalkes of halfe a foot high, beset euen from the bottome to the top with leaues so like our common Rosemary, that it is hard for him which doth not know it exactly to finde the difference; being Greene aboue, and somewhat hairy and hoarie vnderneath: among which come forth round about the stalkes (after the manner of roundles or coronets) certain small cups or chalices of a reddish colour, out of which come the floures like vnto Archangell in shape, but of a most excellent and stately mixed colour, the outside purple declining to blewnesse, and sometimes of a violet colour. The floure gapeth like the mouth of a beast, and hath as it were a white tongue, the lower and vpper iawes are white likewise, spotted with many bloudy spots: which being past, the seeds appeare very long, of a shining blacke colour, set in order in the small huskes as the *Chamapitys spuria*. The root is blacke and hard, with manie hairy strings fastned thereto.

¶ The Place.

These kindes of *Chamapitys* (except the two last) grow very plentifully in Kent, especially about Grauesend, Cobham, Southfleet, Horton, Dartford, and Sutton, and not in any other shire in England that euër I could finde.

† None of these, except the first, for any thing I know, or can learne, grow wilde in England, the second I haue often seene in Gardens. †

¶ The Time.

They floure in Iune, and often in August.

¶ The Names.

Ground Pine is called in Greeke *χουσμίς* : in Latine, *Ibiza*, *Aiuga*, and *Abiga* : in shops, *Iua Arthritica* and *Iua moschata* : in Italian, *Iua* : in Spanish, *Chamapiteos* : in High Dutch, *Bergis mich nicht* : in low Dutch, *Velt Ciippeg* : in French, *Iue moschate* : In English, *Herbe Iue*, *Forget me not*, *Ground Pine*, and *field Cypressie*.

† 1 The first of these is the *Chamapitys prima*, of *Matthiolus*, *Dodonæus* and others, and is that which is commonly vsed in shops and in Physicke.

2 This *Matthiolus* calls *Chamedrys altera* : *Lobel*, *Chamedrys Laciniatis folijs* : *Lonicerus*, *Trixago vera* : *Tabernamontanus*, *Iua moschata* ; and *Dodon*. (whom in this Chapter we chiefly follow) *Chamapitys altera*.

3 Thirdly, this is the *Chamapitys* 1. of *Fuchsius* and others; the *Chamapitys* 1. *Dioscoridis odoratio* of *Lobel*, and the *Chamapitys* 3. of *Matthiolus* and *Dodon*.

4 *Gesner* calls this *Chamapitys species Monspelijs* : *Clusius*, *Dodon*, *Anthyllis altera* ; and *Lobel*, *Anthyllis Chamapityides minor*; and *Tabern*. *Iua Moschata Monspeliensium*.

5 This is *Chamapitys adulterina* of *Lobel* : *Pseudochamapitys* and *Aiuga adulterina* of *Clusius* : and *Chamapitys spuria altera* of *Dodon*.

6 This is *Chamapitys Austriaca* of *Clusius* ; and *Chamapitys carulea* of *Camerarius*. †

¶ The Nature.

These herbes are hot in the second degree, and drie in the third.

¶ The Vertues.

The leaues of *Chamapitys* tunned vp in Ale, or infused in wine, or sodden with hony, and drunke A by the space of eight or ten daies, cureth the iaundies, the Sciatica, the stoppings of the liuer, the difficultie of making water, the stoppings of the spleene, and causeth women to haue their natural sicknesse.

Chamapitys stamped greene with honie cureth wounds, malignant and rebellious vlcers, and dis- B solueth the hardnesse of womens breasts or paps, and profitably helpeth against poison, or biting of any venomous beast.

The decoction drunke, dissolueth congealed bloud, and drunke with vineger, driueth forth the C dead childe.

It clenseth the intrals : it helpeth the infirmities of the liuer and kidneies ; it cureth the yellow D iaundies being drunke in wine : it bringeth downe the desired sicknesse, and prouoketh vrine; being boiled in Mead or honied water and drunke, it helpeth the Sciatica in fortie daies. The people of Heraclea in Pontus do vse it against Wolfes bane in stead of a counterpoison.

The pouder hereoftaken in pills with a fig, mollifieth the bellie : it wasteth away the hardnesse E of the paps: it healeth wounds, it cureth putrified vlcers being applied with hony: and these things the first ground Pine doth performe, so doth the other two : but not so effectually, as witnesseth *Dioscorides*.

Clusius of whom mention was made, hath not said any thing of the Vertues of *Chamapitys An- F striaca* : but verily I thinke it better by many degrees for the purposes afore said : my coniecture I take from the taste, smell, and comely proportion of this Hearbe, which is more pleasing and familiar vnto the nature of man, than those which wee haue plentifully in our owne Countrey growing.

CHAP. 152. Of Naueelwoort, or Penniwoort of the Wall.

¶ The Description.

† The great Naueelwoort hath round and thicke leaues, somewhat bluntly indented about the edges, and somewhat hollow in the midst on the vpper part, hauing a short tender

stem

stemme fastened to the middest of the leafe, on the lower side vnderneath the stalke, whereon the floures doe grow, is small and hollow, an handfull high and more, beset with many small floures of an ouerorne incarnate colour. The root is round like an oliue, of a white colour.

† The root is not well exprest in the figure, for it should haue been more vnequall or tuberous, with the fibers not at the bottome but top thereof. †

2 The second kinde of Wall Penniwoort or Nauelwoort hath broad thicke leaues somewhat deeply indented about the edges: and are not so round as the leaues of the former, but somewhat long towards the setting on, spred vpon the ground in manner of a tuft, set about the tender stalke, like to Sengreene or Housleeke; among which riseth vp a tender stalke whereon do grow th elike leaues. The floures stand on the top consisting of fise small leaues of a white colour, with red spots in them. The root is small and threddie. † This by some is called *Sedum Serratum*. †

† 3 This third kinde hath long thicke narrow leaues, very finely snipt or nickt on the edges, which lie spred very orderly vpon the ground; and in the midst of them rises vp a stalke some foot high, which beares at the top thereof vpon three or foure little branches, diuers white floures consisting of fise leaues apiece.

4 The leaues of this are long and thicke, yet not so finely snipt about the edges, nor so narrow as those of the former: the stalke is a foot high, set here and there with somewhat shorter and rounder leaues than those below; and towards the top thereof, out of the bossomes of these leaues come sundry little foot-stalkes, bearing on their tops pretty large floures of colour white, and spotted with red spots. The rootes are small, and here and there put vp new tufts of leaues, like as the common Housleeke. †

5 There is a kinde of Nauelwoort that groweth in waterie places, which is called of the husbandmen Sheeps bane, because it killeth sheepe that do eat thereof: it is not much vnlike the precedent, but the round edges of the leaues are not so euen as the other; and this creepeth vpon the ground, and the other vpon the stone walls.

1 *Vmbilicus Veneris*.
Wall Penniwoort.

† 2 *Vmbilicus Ven. sive Cotyledon altera*.
Iagged or Rose Penniwoort.

† 6 Because some in Italy haue vsed this for *Vmbilicus Veneris*, and othersome haue so called it, I thought it not amisse to follow *Matthiolus*, and giue you the history thereof in this place, rather than to omit it, or giue it in another which may be perhaps as vnfit, for indeed I cannot fitly ranke it

it with any other plant. *Bauhine* sets it betweene *Hedera Terrestris*, and *Nasturtium Indicum*: and *Columna* refers it to the *Linaria's*, but I must confesse I cannot referre it to any; wherefore I thinke it as proper to giue it here as in any other place. The branches of this are many, long, slender, and creeping, vpon which grow without any certaine order many little smooth thicke leaues fashioned like those of *Ivie*, and fastened to stalkes of some inch long: and together with these stalkes come forth others of the same length, that carry spur-fashioned floures, of the shape and bignesse of those of the female *Fluellen*: their outside is purple, their inside blew, with a spot of yellow in the opening. The root is small, creeping, and threddie. It floures toward the end of Sommer, and growes wilde vpon walls in *Italie*, but in gardens with vs. *Matthioli* calls it *Cymbalaria* (to which *Lobel* addes) *Italica Hederaceo folio*: *Lonicerus* termes it *Vmbilicus Veneris Officinarum*: and lastly *Columna* calls it *Linaria hederæ folio*. ‡

¶ The Place.

The first kind of Penniwoort groweth plentifully in Northampton vpon euery stone wall about the towne, at Bristow, Bathe, Wells, and most places of the West Countrey vpon stone walls. It groweth vpon Westminster Abbey, ouer the doore that leadeth from *Chaucers* tombe to the old palace. ‡ In this last place it is not now to be found. ‡

The second, third, and fourth grow vpon the Alpes neere Piedmont, and Bauier, and vpon the mountaines of Germanie: I found the third growing vpon Biefton Castle in Cheshire.

¶ The fifth growes vpon the Bogges vpon Hampstead Heath, and many such rotten grounds in other places. ‡

¶ The Time.

They are greene and flourish especially in VVinter: They floure also in the beginning of Sommer.

¶ The Names.

¶ Nauelwoort is called in Greeke *κατάλας*: in Latine, *Vmbilicus Veneris*, and *Acetabulum*: of diuers, *Herba Coxendicum*: *Iacobus Manlius* nameth it *Scatum Cæli*, and *Scatellum*: in Dutch, *Nauelcruyt*: in Italian, *Cupertouile*: in French, *Escuelles*: in Spanish, *Capadella*: of some, *Hortus Veneris*, or Venus garden, and *Terra vmbilicus*, or the Nauel of the earth: in English, Penniwoort, Wall-penniwoort, Ladies nauell, Hipwoort and Kidney-woort.

VVater Penniwoort is called in Latine *Cotyledon palustris*: in English, Sheepe-killing Pennigrasse, Penny-rot, and in the North Countrey VVhite-rot: for there is also Red-rot, which is *Rosa solis*: in Northfolke it is called Flowkwoort. ‡ *Columna* and *Bauhine* fitly refer this to the *Ranunculi*, or Crowfeet; for it hath no affinitie at all with the *Cotyledons* (but onely in the roundnesse of the leafe) the former of them calls it *Ranunculus aquaticus vmbilicatus folio*, and the later, *Ranunculus aquat. Cotyledonis folio*.

¶ The Temperature.

Nauelwoort is of a moist substance and somewhat cold, and of a certaine obscure binding qualitie: it cooleth, repelleth, or driueth backe, scourerh, and consumeth, or wasteth away, as *Galen* testifieth.

¶ The VVater Pennywoort is of an hot and vlcerating qualitie, like to the Crowfeet, whereof it is a kinde. The bastard Italian Nauelwoort seemes to partake with the true in cold and moisture. ‡

¶ The Vertues.

The iuice of VVall Pennywoort is a singular remedie against all inflammations and hot tumors, As *Erysipelas*, Saint Anthonies fire, and such like: and is good for kided heeles, being bathed therewith, and one or more of the leaues laid vpon the heele.

¶ The leaues and rootes eaten doe breake the stone, prouoke vrine, and preuaile much against the B dropfie.

¶ The ignorant Apothecaries doe vse the VVater Pennywoort in stead of this of the wall, which C they cannot doe without great error, and much danger to the patient: for husbandmen know well, that it is noisome vnto Sheepe, and other cattell that feed thereon, and for the most part bringerh death vnto them, much more to men by a stronger reason.

3 *Umbilicus Veneris minor.*
Small Naueelwoort.

4 *Cotyledon minor montana altera.*
The other small mountaine Naueelwoort.

5 *Cotyledon palustris.*
Water Penniwoort.

6 *Cymbalaria Italica.*
Italian Bastard Naueelwoort.

CHAP. 152. Of Sea Pennywoort.

1 *Androsace Matthioli.*
Sea Nauel-woort.

2 *Androsace annua spuria.*
One Sommers Nauell-woort.

¶ The Description.

1 **T**He Sea Nauel-woort hath many round thicke leaues like vnto little saucers, set vpon small & tender stalks, bright, shining, and smooth, of two inches long, for the most part growing vpon the furrowed shels of cockles or the like, euery small stem bearing vpon the end or point, one little buckler and no more, resembling a nauell; the stalke and leafe set together in the middle of the same. Whereupon the Herbarists of Montpelier haue called it *Vmbilicus Marinus*, or sea Nauel. The leaues and stalkes of this plant, whilest they are yet in the water, are of a pale ash colour, but being taken forth, they presently waxe white, as Sea Mosse, called *Corallina*, or the shel of a Cockle. It is thought to be barren of seed, and is in taste saltish.

2 The second *Androsace* hath little smooth leaues, spred vpon the ground like vnto the leaues of small Chickweed or Henbit, whereof doubtles it is a kind: among which riseth vp a slender stem, hauing at the top certaine little chaffie floures of a purplish colour. The seed is contained in small scaly husks, of a reddish colour, & a bitter taste. The whole plant perisheth when it hath perfected his seede, and must be sowne againe the next yeare: which plant was giuen to *Matthiolus* by *Cortusius*, who (as he affirmeth) receiued it from Syria; but I thinke hee said so to make *Matthiolus* more ioyfull: but surely I surmise he picked it out of one old wal or other, where it doth grow euen as the small Chickweed, or Nailewoort of the wall do.

‡ The figure that was here was that vnperfect one of *Matthiolus*; and the description of our Authour was framed by it, vnlesse the last part therof, which was taken out of the *Aduersaria* pag. 166. to amend both these, we here present you with the true figure and description, taken out of the workes of the iudicious and painfull Herbarist *Carolus Clusius*. It

hath (saith he) many leaues lying flat vpon the ground, like to those of Plantaine, but lesser and of a pale Greene colour, and toothed about the edges, soft also and iuicie, and of somewhat a biting taste. Amongst these leaues rise vp fve or six stalkes of an handfull high, commonly of a green, yet sometimes of a purple colour, naked and somewhat hairy, which at their tops carry in a circle fve roundish leaues also a little toothed and hairy; from the midst of which arise fve or more footstalks, each bearing a greenish rough or hairie, cup & parted also into fve little leaues or iags, in the midst

midst of which stands a little white floure parted also into five; after which succeed pretty large seed vessels which containe an vnequall red seed like that of Primroses, but bigger: the root is single and slender, and dies as soon as the seed is perfected. It growes naturally in diuers places of Austria, and amongst the corne about the Bathes of Baden; whereas it floures in Aprill, and ripens the seed in May and Iune. ‡

¶ The Place.

Androsace will not grow any where but in water: great store of it is about Frontignan by Montpellier in Languedoc, where euery fisherman doth know it.

The second groweth vpon old stone and mud walls: notwithstanding I haue (the more to grace *Matthiolus* great ieuell) planted it in my garden.

¶ The Time.

The bastard *Androsace* floureth in Iuly, and the seed is ripe in August.

¶ The Names.

Androsace is of some called *Vmbilicus marinus*, or sea Nauell.

‡ The second is knowne and called by the name of *Androsace altera Matthioli*. ‡

¶ The Temperature.

The sea Nauell is of a diureticke qualitie, and more drie than *Galen* thought it to be, and lesse hot than others haue deemed it: there can no moisture be found in it.

¶ The Vertues.

A Sea Nauelwoort prouoketh vrine, and digesteth the filthinesse and sliminesse gathered in the ioints.

B Two drams of it, as *Dioscorides* saith, drunke in wine, bringeth downe great store of vrine out of their bodies that haue the dropsie, and maketh a good plaister to cease the paine of the gout.

CHAP. 153. Of Rose-woort, or Roseroot.

Rhodi radix,
Rose-root.

¶ The Description.

Rosewoort hath many small, thicke, and fat stems, growing from a thicke and knobby root: the vpper end of it for the most part standeth out of the ground, and is there of a purplish colour, bunched & knobbed like the root of Orpin, with many hairy strings hanging therat, of a pleasant smell when it is broken, like the damaske rose, whereof it tooke his name. The leaues are set round about the stalks, euen from the bottome to the top, like those of the field Orpin, but narrower, and more snipt about the edges. The floures grow at the top of a faint yellow colour.

¶ The Place.

It groweth very plentifully in the North part of England, especially in a place called Ingleborough Fels, neere vnto the brookes sides, and not elsewhere that I can as yet finde out, from whence I haue had plants for my garden.

¶ The Time.

It floureth and flourisheth in Iuly, and the seed is ripe in August.

¶ The Names.

Some haue thought it hath taken the name *Rhodia* of the Island in the Mediterranean sea, called Rhodes: but doubtlesse it took his name *Rhodi radix*, of the root which smelleth like a rose: in English, Rose-root, and Rose-woort.

¶ The Vertues.

There is little extant in writing of the faculties of Rosewoort: but this I haue found, that if the root be stamped with oile of Roses and laid to the temples of the head, it easeth the paine of the head.

CHAP. 144. Of Sampier.

1 *Crithmum maritimum*.
Rocke Sampier.2 *Crithmum spinosum*.
Thornie Sampier.3 *Crithmum chrysanthemum*.
Golden Sampier.

¶ The Description.

1 **R**ocke Sampier hath many fat and thicke leaues, somewhat like those of the lesser Purslane, of a spicy taste with a certaine saltnesse; amongst which riseth vp a stalke, diuided into many smal spraes or sprigs; on the top whereof doe grow spokie tufts of white floures, like the tufts of Fenell or Dill, after that commeth the seed like the seed of Fenell, but greater. The root is thicke and knobbie, being of smell delightfull & pleasant.

2 The second Sampier called *Pastinaca marina*, or Sea Parsnep, hath long fat leaues, very much iagged or cut euen to the middle rib, sharpe or prickley pointed, which are set vpon large fat iointed stalks; on the top whereof do grow tufts of whitish, or els reddish floures. The seed is wrapped in thornie huskes. The root is thick and long, not vnlike to the Parsnep, very good and wholesome to be eaten.

3 Golden Sampier bringeth forth many stalks from one root, compassed about with a multitude of long fat leaues, set together by equall distances; at the top whereof come yellow floures. The seed is like those of the Rocke Sampier.

Y y

¶ The

¶ The Place.

Rocke Sampier groweth on the rockie cliffes at Douer, VVinchelsey, by Rie, about South-hampton, the Isle of VVight, and most rockes about the West and North-west parts about England.

The second groweth neere the Sea vpon the sands, and Bayche between Whitstable and the Isle of Thanet, by Sandwich, and by the sea neere Westchester.

The third groweth in the myrie marsh in the Isle of Shepey, as you go from the Kings Ferrie, to Sherland house.

¶ The Time.

Rocke Sampier flourisheth in May and Iune, and must be gathered to be kept in pickle in the beginning of August.

¶ The Names.

Rocke Sampier is called in Greeke *αἰθῆρας* : in Latine, *Crithmum* : and of diuers, *Bati* : in some shops, *Cretamaria* : of *Petrus Crescentius*, *Cretamum*, and *Rincum marinum* : in high Dutch, *Deer-fenchel* : which is in Latine, *Faniculum marinum*, or Sea Fenell : in Italian, *Fenocchio marino*, *Herba di San Pietro*, and hereupon diuers name it *Sampetra* : in Spanish, *Perexil de la mer*, *Hinoio marino*, *Fenolmarin* : in English, Sampier, and Rocke Sampier, and of some, Crestmarine ; and these bee the names of the Sampier generally eaten in fallads.

The other two be also *Crithma* or Sampiers, but most of the later writers would draw them to some other plant : for one calleth the second *Pastinaca marina*, or sea Parsnep, and the third *Asperatticus marinus*, and *Lobel* names it *Chrysanthemum Littoreum* : but we had rather entertaine them as *Matthiolus* doth, among the kindes of *Crithmum*, or Sampier.

¶ The Temperature.

Sampier doth drie, warme, and scoure, as *Galen* saith.

¶ The Vertues.

- A The leaues, seeds, and roots, as *Dioscorides* saith, boiled in wine and drunke, prouoke vrine, and womens sicknesse, and preuaile against the iaundies.
- B The leaues kept in pickle, and eaten in fallads with oile and vineger, is a pleasant sauce for meat, wholesome for the stoppings of the liuer, milt, kidneies and bladder : it prouoketh vrine gently ; it openeth the stoppings of the intrals, and stirreth vp an appetite to meat.
- C It is the pleasantest sauce, most familiar, and best agreeing with mans body, both for digestion of meats, breaking of the stone, and voiding of grauell in the reines and bladder.

CHAP. 155. Of Glasse Saltwoort.

¶ The Description.

1 **G**lassewoort hath many grosse, thicke and round stalkes a foot high, full of fat and thicke sprigges, set with many knots or ioints, without any leaues at all, of a reddish Greene colour. The whole Plant resembleth a branch of Corall. The root is very small and single.

2 There is another kinde of Saltwoort, which hath been taken among the antient Herbarists for a kinde of Sampier. It hath a little tender stalke a cubite high, diuided into many small branches, set full of little thicke leaues very narrow, somewhat long and sharpe pointed, yet not pricking ; amongst which commeth forth small seed, wrapped in a crooked huske, turned round like a crooked perwinkle. The stalkes are of a reddish colour. The whole plant is of a salt and biting taste. The root is small and threddie.

† 3 There is likewise another kinde of *Kali*, whereof *Lobel* maketh mention vnder the name of *Kali minus*, which is like to the last before remembred, but altogether lesser, † hauing many slender weake branches lying commonly spred vpon the ground, and set with many small round long sharpe pointed leaues, of a whitish green colour : the seed is small and shining, not much vnlike that of Sorrell : the root is slender with many fibers ; the whole plant hath a saltish taste like as the former. *Dodon.* calls this *Kali album*. †

¶ The

1 *Salicornia*, five *Kali geniculatum*.
Glasswoort, Saltwoort, or Sea-grape.

2 *Kali maris semine cochleato*.
Snail Glasswoort.

3 *Kali minus*.
Small Glasswoort.

¶ The Place.

These plants are to be found in salt marshes almost euery where.

¶ The second excepted, which grows not here, but vpon the coasts of the Mediterranean sea. ¶

¶ The Time.

They floure and flourish in the Sommer moneths.

¶ The Names.

Saltwoort is called of the Arabians *Kali*, and *Alkali*. *Auicenna*, chap. 724. describeth them vnder the name of *Vsne*, which differeth from *Vsnee*: for *Vsnee* is that which the Græcians call *Epior*: and the Latines, *Muscus*, or *Mosse* of some, as *Baptista Montanus*: it hath bin iudged to be *Empetron*.

The axen or ashes hereof are named of *Mattheus Silvaticus*, *Soda*: of most, *Sal Alkali*: diuers call it *Alumen catinum*. Others make this kind of difference betweene *Sal Kali*, and *Alumen catinum*, that *Alumen catinum* is the ashes it self: and that the salt that is made of the ashes is *Sal Alkali*.

Stones are beaten to powder, & mixed with ashes, which beeing melted together become the matter wherof glasses are made. VVhich while it is made red hot in the furnace, and is melted, becomming liquide and fit to work vp-

on, doth yeeld as it were a fat floating aloft; which, when it is cold, waxeth as hard as a stone, yet it is brittle, and quickly broken. This is commonly called *Axungia vitri*. In English, *Sandeuer*: in French, *Suin de Voirre*: in Italian, *Fior de cristallo*, (i) *Floure of Christall*. The Herbe is also called

of diuers *Kali articulatum*, or iointed Glasfe-wort: and in English, Crabbe-grasse, and Frogge-grasse.

¶ *The Temperature.*

Glasfe-wort is hot and drie: the ashes are both drier and hotter, and that euen to the fourth degree: the ashes haue a causticke or burning qualitie.

¶ *The Vertues.*

- A A little quantitie of the herbe taken inwardly, doth not onely mightily prouoke vrine, but in like sort casteth forth the dead childe. It draweth forth by siege waterish humours, and purgeth away the dropisie.
- B A great quantitie taken is mischieuous and deadly. The smell and smoke also of this hearbe being burnt doth driue away serpents.
- C The ashes are likewise tempered with those medicines that serue to take away scabs and filth off the skin: it easily consumeth proud and superfluous flesh that groweth in poisonsome vlcers, as *Awicen* and *Serapio* report.
- D Wee read in the copies of *Serapio*, that Glasfe-wort is a tree so great, that a man may stand vnder the shadow thereof: but it is very like, that this errour proceedeth rather from the interpreter, than from the Authour himselfe.
- E The floure of Christall, or (as they commonly terme it, Sandeuer) doth wonderfully drie. It easily taketh away scabbes and manginess, if the foule parts be washed and bathed with the water wherein it is boiled.

CHAP. 156. Of *Thorow Waxe.*

1 *Persoliata vulgaris.*
Common *Thorow-waxe.*

2 *Persoliata siliquosa.*
Codded *Thorow-waxe*

¶ The Description.

1 **T**horow-wax or Thorow-leafe, hath a round, slender, and brittle stalk, diuided into many small branches, which passe or goe thorow the leaues, as though they had beene drawne or thrust thorow, and to make it more plaine, euery branch doth grow thorow euery leafe, making them like hollow cups or faucers. The seed groweth in spokie tufts or rundles like Dill, long and blackish. The floures are of a faint yellow colour. The root is single, white and threddie.

2 Codded Thorow-wax reckoned by *Dodonæus* among the Brassickes or Colewoorts, and making it a kinde thereof, and calling it *Brassica sylvestris perfoliata*: though in mine opinion without reason, sith it hath neither shape, affinitie, nor likenesse with any of the Colewoorts, but altogether most vnlike, resembling very well the common Thorow-wax; whereunto I rather refer it. It hath small, tender, and brittle stalkes two foot high, bearing leaues, which wrap and inclose themselves round about, although they do not run thorow as the other do, yet they grow in such manner, that vpon the sudden view thereof, they seeme to passe thorow as the other: vpon the small branches do grow little white floures: which being past, there succeed slender and long cods like those of Turneps or Nauewes, whose leaues and cods do somewhat resemble the same, from whence it hath the name *Napifolia*, that is, Thorow-wax with leaues like vnto the Nauew. The root is long and single, and dieth when it hath brought forth his seed.

There is a wilde kinde hereof growing in Kent, in many places among the corne, like to the former in each respect, but altogether lesser: the which no doubt brought into the garden would proue the very same.

¶ The Place.

‡ The first described growes plentifully in many places about Kent, and betweene Farningham and Ainsford it growes in such quantitie (as I haue been informed by M^r. Bowles) in the corne fields on the tops of the hils, that it may well be termed the infirmitie of them.

The later growes not wilde with vs that euer I could finde, though *Lobell* seemes to affirme the contrary. ‡

They grow in the gardens of Herbarists, and in my garden likewise.

¶ The Time.

They floure in May and Iune, and their seed is ripe in August.

¶ The Names.

1 It hath beene called from the beginning *Perfoliata*, because the stalke doth passe thorow the leafe, following the signification of the same: wee call it in English, Thorow-waxe, or Thorow-leafe.

‡ 2 This by the most and best part of VVriters (though our Authour be of another opinion) is very fitly referred to the wilde Colewoorts, and called *Brassica campestris* by *Clusius* and by *Camerarius*; *Brassica agrestis* by *Tragus*: yet *Lobel* calleth it *Perfoliata Napifolia Anglorum siliquosa*. ‡

The Temperature.

Thorow-waxe is of a dry complexion.

¶ The Vertues.

The decoction of Thorow-wax made of water or wine, healeth wounds. The iuice is excellent: A for wounds made either into an oile or vnguent.

The greene leaues stamped, boiled with wax, oile, rofine and turpentine, maketh an excellent vn- B guent or salve to incarnate, or bring vp flesh in deepe wounds.

CHAP. 157. Of Honie-woort.

¶ The Description.

1 **C**Erinthe or Honie-woort riseth forth of the ground after the sowing of his seed, with two small leaues like those of Basil, betweene the which leaues commeth forth a thick fat, smooth, tender, and brittle stalk full of iuice, that diuideth it selfe into many other branches; which also are diuided in sundry other armes or branches likewise, crambling or leaning toward the ground, being not able without props to sustaine it selfe, by reason of the great weight of

1 *Cerintbe maior.*
Great Honie-woort.

‡ 2 *Cerintbe asperior flore flavo.*
Rough Honie-woort.

3 *Cerintbe minor.*
Small Honie-woort.

of leaues, branches, & much iuice, the whole plant is furcharged with; vpon which branches are placed many thicke rough leaues, fet with very sharpe prickles like the rough skinne of a Thornebacke, of a blewish green colour, spotted very notably with white strakes and spots, like those leaues of the true *Pulmonaria* or Cowslips of Ierusalem, and in shape like those of the codded Thorrow-waxe, which leaues do clip or embrace the stalkes round about: from the bosome whereof come forth small clusters of yellow floures, with a hoope or band of bright purple round about the middle of the yellow floure. The floure is hollow, fashioned like a little boxe, of the taste of honie when it is sucked, in the hollow nesse whereof are many smal chiues or threds, which being past, ther succeed round blacke seed, contained in soft skinnie husks. The root perisheth at the first approch of Winter. ‡ This varies in the colour of the floures, which are yellow, or purple, and sometimes of both commixt. ‡

‡ 2 The leaues of this other great Honie-wort (of *Clus.* description) are shaped like those last described, but that they are narrower at their setting on, and rougher; the floures are also yellow of color, but in shape & magnitude like the former, as it is also in the seeds, & all the other parts thereof. ‡

3 This

3 This other *Cerinth* or Honywort hath small long and slender branches, reeling this way and that way, as not able to sustaine it selfe, very brittle, beset with leaues not much vnlike the precedent, but lesser, neither so rough nor spotted, of a blewish Greene colour. The floures be small, hollow, and yellow. The seed is small, round, and as blacke as Iet: the root is white, with some fibres, the which dieth as the former. There is a taste as it were of new wax in the floures or leaues chewed, as the name doth seeme to import.

¶ The Place.

These plants do not grow wilde in England, yet I haue them in my garden; the seeds wherof I receiued from the right honorable the Lord *Zouch*, my honorable good friend.

¶ The Time.

They floure from May to August, and perish at the first approach of Winter, and must be sown againe the next Spring.

‡ ¶ The Names.

‡ 1 The first of these by *Gesner* is called *Cynoglossa montana* and *Cerinth*: *Dodonæus* calleth it *Maruherba*: and *Lobel* and others, *Cerinth* major.

2 The second is *Cerinth* quorundam major flauo flore of *Clusius*.

3 The third by *Dodonæus* is called *Maruherba minor*: and by *Clusius*, *Cerinth* quorundam minor flauo flore: *Lobel* also calls it *Cerinth* minor. ‡

¶ The Temperature and Vertues.

Pliny and *Auicenna* seeme to agree, that these herbes are of a cold complexion; notwithstanding there is not any experiment of their vertues worth the writing.

CHAP. 158. Of *S. Iohns wort*.

1 *Hypericum*.
S. Iohns wort.

2 *Hypericum Syriacum*.
Rew S. Iohns wort.

¶ The Description.

1 Saint Iohns wort hath brownish stalkes beset with many small and narrow leaues, which if you behold betwixt your eyes and the light do appeare as it were bored or thrust thorow in an infinite number of places with pinnes points. The branches diuide themselves into sundry small twigs, at the top whereof doe grow many yellow floures, which with the leaues bruised do yeeld a reddish iuyce of the colour of blood. The seed is contained in little sharpe pointed huskes, blacke of colour, and smelling like Rosin. The root is long, yellow, and of a woody substance.

2 The second kinde of S. Iohns wort named *Syriacum*, of those that haue not seene the fruitfull and plentifull fields of England, wherein it groweth abundantly, hauing small leaues almost like to Rew or Herbe-Grace: wherein *Dodonæus* hath failed, entituling the true *Androsæmum* by the name of *Ruta sylvestris*; whereas indeed it is no more like Rew than an Apple to an Oyster. This plant is altogether like the precedent, but smaller, wherein consisteth the difference. ‡ It had beene fitter for our Author to haue giuen vs a better and perfecter description of this plant (which as he saith growes so abundantly with vs) than so absurdly to cauill with *Dodonæus*, for calling, as he saith, the true *Androsæmum*, *Ruta sylvestris*: for if that be the true *Androsæmum* which *Dodonæus* made mention of by the foresaid name, why did not our Author figure and describe it in the next chapter saue one, for *Androsæmum*, but followed *Dodonæus* in figuring and describing *Tutsan* for it? See more hereof in the chapter of *Tutsan*. I cannot say I haue seene this plant; but *Lobel* the Author and setter forth thereof thus briefly describes it: the leaues are foure times lesser than those of ours, which grow thicke together as in rundles vpon stalkes, being a cubit high. The floures are yellow, and like those of our common kinde. ‡

3 Woolly S. Iohns wort hath many small weake branches trailing vpon the ground, beset with many little leaues, couered ouer with a certaine soft kinde of downinesse: among which commeth forth weake and tender branches charged with small pale yellow floures. The seeds and roots are like vnto the true S. Iohns wort.

‡ 3 *Hypericum tomentosum* Lobelij. Lobels woolly S. Iohns wort.

‡ The figure that our Author gaue was of that which I here giue you second in the third place, vnder the title of *Hyper. toment. Clusij*; for *Clusius* saith it was his, and blames *Lobel* for making it all one with that he found about Montpelier; whose figure also I giue you first in the third place, that you may see what difference you can obserue by them: for *Clusius* saith *Lobels* is but an handfull high; yet tells he not vs how high his growes, neither instances how they differ, neither can I gather it by *Lobels* description: but I coniecture it is thus; That of *Clusius* his description is taller, more white and hairy, and hath the floures growing along little foot-stalks, and not in manner of an umbel, as in the other.

‡ 4 Besides these two creeping hoary S. Iohns worts here described, there is another small kinde which is called by *Dodonæus*, *Hypericum minus*; and by *Lobel*, *Hypericum minimum supinum Septentrionale*. It growes some handfull or more high, with weake and slender branches set with leaues like those of the ordinarie kinde, but lesse: the floures are also like those of the first described, but fewer in number, and lesse. It is to be found in dry and barren grounds, and floures at the same time as the the former.

5 I haue obserued growing in S. Iohns wood and other places, that kinde of S. Iohn Wort which

which by *Tragus* is called *Hypericum pulchrum*; and both by him and *Lonicerus* is thought to be *Dioscorides* his *Androsæmum*; the which we in English may for distinctions sake call Vpright Saint Johns wort. It hath roots like those of the ordinarie kinde; from which arise straight slender stalks some cubit high, set at equall spaces with pretty smooth leaues, broad, and almost incompassing the stalke at their setting on, and being sometimes of a green, and otherwhiles of a reddish colour: towards the top they are parted into some few branches, which beare such yellow floures as the common kinde, but somewhat smaller. It floures about the same time as the former, or a little after. ‡

3 *Hypericum tomentosum* Clusij.
Woolly S. Johns wort of *Clusius*.

‡ 4 *Hypericum supinum glabrum*.
Small creeping S. Johns wort.

¶ The Place.

They grow very plentifully in the pastures in euery countrey.

¶ The Time.

They floure and flourish for the most part in Iuly and August.

¶ The Names.

S. Johns wort is called in Greeke *ὑπερίκον*: in Latine, *Hypericum*: in shops, *Perforata*: of diuers, *Fuga demonum*: in Dutch, *San Johans kraut*: in Italian, *Hyperico*: in Spanish, *Caracoxillo*: in French, *Mille Pertuis*: in English, S. Johns wort, or S. Johns grasse.

¶ The Temperature.

S. Johns wort (as *Galen* teacheth) is hot and dry, being of substance thinne.

¶ The Vertues.

S. Johns wort with his floures and seed boyled and drunken, prouoketh vrine, and is right good **A** against the stone in the bladder, and stoppeth the laske. The leaues stamped are good to be layd vpon burnings, scaldings, and all wounds; and also for rotten and filthy vlcers.

The leaues, floures, and seeds stamped, and put into a glasse with oyle Oliue, and set in the hot **B** Sunne for certaine weekes together, and then strained from those herbes, and the like quantitie of new put in, and sunned in like manner, doth make an oyle of the colour of bloud, which is a most precious remedy for deepe wounds, and those that are thorow the body, for sinewes that are prickt, or any wound made with a venomd weapon. I am accustomed to make a compound oyle hereof; the making of which ye shall receiue at my hands, because that I know in the world there is not a better, no not naturall balsam it selfe; for I dare vndertake to cure any such wound as absolutely in each respect, if not sooner and better, as any man whatsoeuer shall or may with naturall balsam.

Take white wine two pintes, oyle oliue foure pounds, oile of Turpentine two pounds, the leaues, **C** floures, and seeds of S. Johns wort, of each two great handfulls gently bruised; put them all together into a great double glasse, and set it in the Sunne eight or ten dayes; then boyle them in the same glasse *per balneum Mariae*, that is, in a kettle of water with some straw in the bottome, wherein the glasse must stand to boyle: which done, straine the liquor from the herbes, and do as you did before, putting in the like quantitie of herbes, floures, and seeds, but not any more wine. And so haue you a great secret for the purposes aforesaid.

Dioscorides

- E *Dioscorides* saith, That the seed drunke for the space of fourty dayes together, cureth the *Sciatica*, and all aches that happen in the hips.
- F The same Author saith, That being taken with Wine it taketh away Tertian and Quartane Agues.

CHAP. 159.

Of Saint Peters wort, or square S. Johns Grasse.

1 *Ascyron*.
S. Peters wort.

¶ The Description.

1 Saint Peters wort groweth to the height of a cubit and a halfe, hauing a straight vpright stalke somewhat browne, set by couples at certaine distances, with leaues much like those of S. Johns wort, but greater, rougher, and rounder pointed: from the bosome of which leaues come forth many smaller leaues, the which are not bored through, as those of S. Johns wort are; yet sometime there be some few so bored through. The floures grow at the top of the branches of a yellow colour: the leaues and floures when they are brui-fed do yeeld forth a bloody iuyce as doth S. Johns wort, whereof this is a kinde. The root is tough, and of a woody substance.

¶ 2 Vpon diuers boggy grounds of this kingdome is to be found growing that S. Peters Wort which *Clusius* describes in his *Auctarium*, by the name of *Ascyrum supinum*. This sends forth diuers round hairy creeping stalkes, which heere and there put out new fibres or roots, and these are set at certaine spaces with very round and hairie leaues of a whitish colour, two at a ioynt, and on the tops of these stalkes grow a few small yellow floures which consist of five leaues a piece; these stalks seldom send forth branches, vnlesse it be one or two at the tops. It may well be called in English, Round leaued S. Peters wort. ¶

¶ The Place.

S. Peters wort, or S. Johns Grasse groweth plentifully in the North part of England, especially in Landsdale and Crauen: I haue found it in many places of Kent, especially in a copse by Master *Sidleys* house neere Southfleet.

¶ The Time.

It floureth and flourisheth when S. Johns wort doth.

¶ The Names.

It is called in Greeke *ασκυρον*: the Latines haue no other name but this Greeke name *Ascyron*. It is called of some *Androsenum*: *Galen* maketh it both a kinde of Tutsan, and S. Johns Wort: and saith it is named *Ascyron*, and *Ascyroides*: in English, S. Peters wort, Square or great S. Johns grasse: and of some, Hardhay. Few know it from S. Johns wort.

¶ The Temperature.

This herbe is of temperature hot and dry.

¶ The Vertues.

A It is endued with the same vertues that S. Johns wort is endued withall. The seed, saith *Dioscorides*, being drunke in foure ounces and a halfe of Meade, doth plentifully purge by siege cholericke excrements. *Galen* doth likewise affirme the same.

CHAP.

CHAP. 160. Of Tutſan or Parke-leaues.

¶ The Description.

1 **T**He ſtalkes of Tutſan be ſtraight, round, chamfered or creſted, hard and woody, being for the moſt part two foot high. The leaues are three or foure times bigger than thoſe of S. Iohns wort, which be at the firſt greene; afterwards, and in the end of Sommer of a dark red colour: out of which is preſſed a iuyce not like blacke bloud, but Claret or Gascoigne wine. The floures are yellow, and greater than thoſe of S. Peters wort, after which riſeth vp a little round head or berry, firſt greene, afterwards red, laſt of all blacke, wherein is contained yellowiſh red ſeed. The root is hard, woody, and of long continuance.

¶ 2 This (which *Dodonæus* did not vniſtly call *Ruta ſylueſtris Hypericoides*, and which others haue ſet forth for *Androſemum*, and our Author the laſt chapter ſaue one affirmed to be the true *Androſemum*, though here it ſeemes he had either altered his minde, or forgot what he formerly wrot) may fitly ſtand in competition with the laſt deſcribed, which may paſſe in the firſt place for the *Androſemum* of the Antients; for *adhuc ſub iudice lis eſt*. I will not here inſiſt vpon the point of controuerſie, but giue you a deſcription of the plant, which is this: It ſends vp round ſlender reddiſh ſtalkes ſome two cubits high, ſet with fewer yet bigger leaues than the ordinarie S. Iohns Wort, and theſe alſo more hairy: the floures and ſeeds are like thoſe of the common S. Iohns wort, but ſomewhat larger. It growes in ſome mountainous and woody places, and in the *Aduerſaria* it is called *Androſemum excellentius, ſeu magnum*: and by *Dodonæus* (as we but now noted) *Ruta ſylueſtris Hypericoides*, thinking it to be the *Ruta ſylueſtris* which is deſcribed by *Dioſcorides*, lib. 2. cap. 48. in the old Greeke edition of *Manutius*, K. 9. v. 2. And in that of *Marcellus Virgilius* his Interpretation, in the chapter and booke but now mentioned; but reiected amongſt the *Notha* in the Paris Edition Anno 1549. You may finde the deſcription alſo in *Dodonæus*, *Pempt. prima, lib. 3. cap. 25.* whither I refer the curious, being loath here to inſiſt further vpon it. ¶

¶ *Clymenon Italarum.*

Tutſan, or Parke leaues.

¶ 2 *Androſemum Hypericoides.*

Tutſan S. Iohns wort.

¶ *The Place.*

Tutsan groweth in woods and by hedges, especially in Hampsted wood, where the Golden rod doth grow; in a wood by Railie in Essex, and many other places.

¶ *The Time.*

It floureth in Iuly and August: the seed in the meane time waxeth ripe. The leaues becom ere in Autumne; at that time is very easily pressed forth his winie iuyce.

¶ *The Names.*

It is called in Greeke *αιψοσαυον*: and the Latines also *Androsamon*: it is likewise called *Dionysias*, as *Galen* witnesseth. They are farre from the truth that take it to be *Clymenium*, and it is needlesse to finde fault with their error. It is also called *Siciliana*, and *Herba Siciliana*: in English, Tutsan, and Parke-leaues.

¶ *The Temperature*

The faculties are such as S. Peters wort, which doth sufficiently declare it to be hot and dry.

¶ *The Vertues.*

- A The seed hereof beaten to poudre, and drunke to the weight of two drams, doth purge cholericke excrements, as *Dioscorides* writeth; and is a singular remedie for the Sciatica, provided that the Patient do drinke water for a day or two after purging.
- B The herbe cureth burnings, and applied vpon new wounds it stancheth the bloud, and healeth them.
- C The leaues laid vpon broken shins and scabbed legs healeth them, and many other hurts and griefes, whereof it tooke his name Tout-saine, or Tutsane, of healing all things.

¶ CHAP. 161. Of Bastard S. Johns wort.

¶ 1 *Coris Matthioli.*

Matthiolus his bastard S. Iohns wort.

¶ 2 *Coris caerulea Monspeliaca.*

French bastard S. Iohns wort.

¶ **T**He diligence of these later times hath beene such to finde out the *Materia medica* of the Antients, that there is scarce any plant described by them, but by some or other of late there haue been two or more feuerall plants referred thereto: and thus it hath happened vnto that which

which *Dioscorides lib. 3. cap. 174.* hath set forth by the name of *Coris*; and presently describes after the kindes of *Hypericon*, and that with these words; *ἡ δὲ ἴσ' ὑπερικον καλεῖται*. Some also call this *Hypericon*; to which *Matthiolus* and others haue fitted a plant, which is indeed a kinde of *Hypericon*, as you may perceiue by the figure and description which I giue you in the first place. Some (as *Hesychius*) referre it to *Chamaepytis*, (and indeed by *Dioscorides* it is placed betweene *Androsamon* and *Chamaepytis*) and to this that which is described by *Pena* and *Lobel* in the *Aduers.* and by *Clusius* in his *Historie*, may fitly be referred: this I giue you in the second place.

¶ *The Description.*

1 **T**He first hath a woody thicke and long lasting root, which sendeth vp many branches, some foot or more high, and it is set at certaine spaces with round leaues like those of the small *Glasie-wort* or *Sea-Spurry*, but shorter: the tops of the stalkes are diuided into sundrie branches, which carry floures like those of *S. Johns wort*, of a whitish red colour, with threds in their middles hauing little yellow pendants. It growes in Italy and other hot countries, in places not far from the sea side. This is thought to be the true *Coris*, by *Matthiolus*, *Gesner*, *Lonicerus*, *Lacuna*, *Bellus*, *Pona*, and others.

2 This from a thicke root red on the outside sendeth vp sundry stalkes, some but an handfull; other some a foot or more long, stiffe, round, purplish, set thicke with leaues like those of *Heath*, but thicker, more succulent and bitter, which sometimes grow orderly, and otherwhiles out of order. The spikes or heads grow on the tops of the branches, consisting of a number of little cups, diuided into fve sharpe points, and marked with a blacke spot in each diuision: out of these cups comes a floure of a blew purple colour, of a most elegant and not fading colour; and it is composed of foure little bifide leaues, whereof the two vppermost are the larger: the seed, which is round and blackish, is contained in seed-vessels hauing points somewhat sharpe or prickly. It floures in Aprill and May, and is to be found growing in many places of Spaine, as also about *Mompelier* in France; whence *Pena* and *Lobel* called it *Coris Monspelica*; and *Clusius*, *Coris quorundam Gallorum & Hispanorum*.

¶ *The Temperature.*

These Plants seeme to be hot in the second or third degree.

¶ *The Vertues.*

Dioscorides saith, That the seed of *Coris* drunke moue the courses and vrine, are good against the biting of the Spider *Phalangium*, the *Sciatica*; and drunke in Wine, against that kinde of Convulsion which the Greekes call *Opisthotonos*, (which is when the body is drawne backwards) as also against the cold fits in Agues. It is also good anointed with oyle, against the aforesaid Convulsion. †

CHAP. 162. Of the great Centorie.

¶ *The Description.*

1 **T**He great Centory bringeth forth round smooth stalkes three cubits high: the leaues are long, diuided as it were into many parcels like to those of the Walnut tree, and of an ouerworne grayish colour, somewhat snipt about the edges like the teeth of a saw. The floures grow at the top of the stalks in scaly knaps like the great *Knapweed*, the middle thrums whereof are of a light blew or sky colour: when the seed is ripe the whole knap or head turneth into a downy substance like the head of an *Artichoke*, wherein is found a long smooth seed, bearded at one end like those of *Bastard Saffron*, called *Cartamus*, or the seed of *Cardus Benedictus*. The root is great, long, blacke on the outside, and of a sanguine colour on the inside, somewhat sweet in taste, and biting the tongue.

2 There is likewise another sort, hauing great and large leaues like those of the water Docke, somewhat snipt or toothed about the edges. The stalke is shorter than the other, but the root is more oleous or fuller of iuyce, otherwise like. The floure is of a pale yellow purplish colour, and the seed like that of the former.

1 *Centaurium magnum.*
Great Centorie.

2 *Centaurium maius alterum.*
Whole leaved great Centorie.

¶ The Place.

The great Centorie ioyeth in a fat and fruitfull soile, and in Sunny bankes full of Grasse and herbes. It groweth very plentifully, saith *Dioscorides*, in Lycia, Peloponnesus, Arcadia, and Morea: and it is also to be found vpon Baldus a mountaine in the territories of Verona, and likewise in my garden.

¶ The Time.

It floureth in Sommer, and the roots may be gathered in Autumne.

¶ The Names.

It is called in Greeke *Κενταύριον*: of *Theophrastus* also *Centauris*: in diuers shops falsly *Rha Ponticum*: for *Rha Ponticum* is *Rha* growing in the countries of Pontus, a plant differing from great Centorie. *Theophrastus* and *Pliny* set downe among the kindes of *Panaces* or All-heales, this great Centorie, and also the lesser, whereof we will write in the next chapter following. *Pliny* reciting the words of *Theophrastus*, doth in his twenty fifth booke and fourth chapter write, that they were found out by *Chiron* the Centaure, and surnamed *Centauria*. Also affirming the same thing in his sixth chapter (where he more largely expoundeth both the Centauries) hee repeateth them to be found out by *Chiron*: and thereupon he addeth, that both of them are named *Chironia*. Of some it is reported, That the said *Chiron* was cured therewith of a wound in his foot, that was made with an arrow that fell vpon it when he was entertaining *Hercules* into his house; whereupon it was called *Chironium*: or of the curing of the wounds of his souldiers, for the which purpose it is most excellent.

¶ The Temperature.

It is hot and dry in the third degree. *Galen* saith, by the taste of the root it sheweth contrarie qualities, so in the vse it performeth contrarie effects.

¶ The Vertues.

A The root taken in the quantitie of two drams is good for them that be bursten, or spit bloud; against the crampe and shrinking of sinewes, the shortnesse of wind or difficultie of breathing, the cough and gripings of the belly.

B There is not any part of the herbe but it rather worketh miracles than ordinarie cures in greene wounds; for it ioyneth together the lips of simple wounds in the flesh, according to the first intention, that is, glewing the lips together, not drawing to the place any matter at all.

The

The root of this Plant (saith *Dioscorides*) is a remedie for ruptures, convulsions, and cramps, taken in the weight of two drams, to be giuen with wine to those that are without a feuer, and vnto those that haue, with water. A

Galen saith, that the iuyce of the leaues thereof performeth those things that the root doth; B which is also vsed in stead of *Lycium*, a kinde of hard iuyce of a sharpe taste.

CHAP. 163. Of Small Centorie.

¶ The Description.

1 The lesser Centorie is a little herbe: it groweth vp with a cornered stalke halfe a foot high, with leaues in forme and bignesse of *S. Iohns wort*: the floures grow at the top in a spoky bush or rundle, of a red colour tending to purple; which in the day time and after the Sun is vp do open themselves, but towards euening shut vp againe: after them come forth small seed-vessels, of the shape of wheat cornes, in which are contained very little seeds. The root is slender, hard, and soone fading.

2 The yellow Centorie hath leaues, stalkes, and seed like the other, and is in each respect alike, sauing that the floures hereof are of a perfect yellow colour, which setteth forth the difference.

† This is of two sorts; the one with broad leaues through which the stalkes passe; and the other hath narrow leaues like those of the common Centorie. †

1 *Centaurium paruum*.
Small Centorie.

2 *Centaurium paruum luteum* Lobelij.
Yellow Centorie.

¶ The Place.

1 The first is growing in great plenty throughout all England, in most pastures and grassie fields.

2 The yellow doth grow vpon the chalkie cliffes of Greenhithe in Kent, and such like places.

¶ The Time.

They are to be gathered in their flowering time, that is in Iuly and August: of some that gather them superstitiously they are gathered betweene the two Lady dayes.

¶ The Names.

The Greekes call this *Κενταύριον μικρόν*: in Latine it is called *Centaurium minus*; yet *Pliny* nameth it *Libadion*, and by reason of his great bitternesse, *Fel terra*. The Italians in *Hetruria* call it *Biondel-la*: in Spanish, *Centoria*: in low-Dutch, *Centoye*: in English, Small, little, or common Centorie: in French, *Centoire*.

¶ The Temperature.

The small Centorie is of a bitter qualitie, and of temperature hot and dry in the second degree; and the yellow Centorie is hot and dry in the third degree.

¶ The Vertues.

- A Being boyled in water and drunke it openeth the stoppings of the liver, gall, and spleene, it helpeth the yellow jaundice, and likewise long and lingering agues: it killeth the wormes in the belly; to be briefe, it cleanseth, scoureth, and maketh thinne humors that are thicke, and doth effectually performe whatsoever bitter things can.
- B *Dioscorides*, and *Galen* after him report, that the decoction draweth downe by siege choler and thicke humors, and helpeth the Sciatica; but though wee haue vsed this often and luckily, yet could we not perceiue evidently that it purges by the stoole any thing at all, and yet it hath performed the effects aforesaid.
- C This Centorie being stamped and laid on whilest it is fresh and greene, doth heale and close vp greene wounds, cleanseth old vlcers, and perfectly cureth them.
- D The iuyce is good in medicines for the eyes; mixed with honey it cleanseth away such things as hinder the sight; and being drunke it hath a peculiar vertue against the infirmities of the sinues, as *Dioscorides* teacheth.
- E The Italian Physicians do giue the poudre of the leaues of yellow Centorie once in three daies in the quantitie of a dram, with annise or caraway seeds, in wine or other liquor, which preuaileth against the dropsie and greene sicknesse. Of the red floured, *Ioannes Postius* hath thus written:

*Flos mihi suauis rubet, sed inest quoque succus amarus,
Qui iuvat obsessum bile, aperitque jecur.*

My floure is sweet in smell, bitter my iuyce in taste,
Which purge choler, and helps liuer, that else would waste.

CHAP. 164. Of Calues snout, or Snapdragon.

¶ The Description.

1 The purple Snapdragon hath great and brittle stalks, which diuideth it selfe into many fragile branches, whereupon do grow long leaues sharpe pointed, very greene, like vnto those of wilde flax, but much greater, set by couples one opposite against another. The floures grow at the top of the stalkes, of a purple colour, fashioned like a frogs mouth, or rather a dragons mouth, from whence the women haue taken the name Snapdragon. The seed is blacke, contained in round huskes fashioned like a calues snout, (whereupon some haue called it Calues snout) or in mine opinion it is more like vnto the bones of a sheeps head that hath beene long in the water, the flesh consumed cleane away.

2 The second agreeth with the precedent in euery part, except in the colour of the floures, for this plant bringeth forth white floures, and the other purple, wherein consists the difference.

3 The yellow Snapdragon hath a long thicke woody root, with certain strings fastned thereto; from which riseth vp a brittle stalke of two cubits and a halfe high, diuided from the bottome to the top into diuers branches, whereupon doe grow long greene leaues like those of the former, but greater and longer. The floures grow at the top of the maine branches, of a pleasant yellow colour, in shape like vnto the precedent.

4 The small or wilde Snapdragon differeth not from the others but in stature: the leaues are lesser and narrower: the floures purple, but altogether smaller: the heads or seed-vessels are also like those of the former.

‡ 5 There is another kinde hereof which hath many slender branches lying oft times vpon the ground: the leaues are much smaller than these of the last described: the floures and seed-vessels are also like, but much lesser, and herein consists the onely difference. ‡

¶ The

1. 2. *Antirrhinum purpureum sine album.*
Purple or white flowered Snapdragon.

3 *Antirrhinum luteum.*
Yellow Snapdragon.

4 *Antirrhinum minus.*
Small Snapdragon.

5 *Antirrhinum minimum repens.*
Small creeping Snapdragon.

¶ The Place.

The three first grow in most gardens; but the yellow kinde groweth not common, except in the gardens of curious Herbarists.

‡ The fourth and fifth grow wilde amongst corne in diuers places. ‡

¶ The Time.

That which hath continued the whole Winter doth floure in May, and the rest of Sommer afterwards; and that which is planted later, and in the end of Sommer, floureth in the spring of the following yeare: they do hardly endure the iniurie of our cold Winter.

¶ The Names.

Snapdragon is called in Greeke *αντιρρινον*: in Latine also *Antirrhinum*: of *Apuleius*, *Canis cerebrum*, *Herba Simiana*, *Venustaminor*, *Opalis grata*, and *Orontium*: it is thought to be *Leo herba*, which *Columella*, lib. 10. reckons among the floures: yet *Gesner* hath thought that this *Leo* is *Columbine*, which for the same cause he hath called *Leontostomium*: but this name seemeth to vs to agree better with *Calues snout* than with *Columbine*; for the gaping floure of *Calues snout* is more like to *Lyons snap* than the floure of *Columbine*: it is called in Dutch *Orant*: in Spanish, *Cabeza de ternera*: in English, *Calues snout*, *Snapdragon*, and *Lyons snap*: in French, *Teste de chien*, and *Teste de Veau*.

¶ The Temperature.

They are hot and dry, and of subtile parts.

¶ The Vertues.

- A The seed of Snapdragon (as *Galen* saith) is good for nothing in the vse of physicke; and the herb it selfe is of like facultie with *Bubonium* or *Star-wort*, but not so effectually.
- B They report (saith *Dioscorides*) that the herbe being hanged about one preserueth a man from being bewitched, and that it maketh a man gracious in the sight of people.
- C *Apuleius* writeth, that the distilled water, or the decoction of the herbe and root made in water, is a speedy remedy for the watering of eyes proceeding of a hot cause, if they be bathed therewith.

CHAP. 165. Of Tode-Flax.

1 *Linaria vulgaris lutea*.
Great Tode-flax.

2 *Linaria purpurea odorata*.
Sweet purple Tode-flax.

¶ The

¶ The Description.

1 **L**inaria being a kinde of *Antyrrhinum*, hath small, slender, blackish stalkes, from which do grow many long narrow leaues like flax. The floures be yellow, with a spur hanging at the same like vnto a Larkes spur, hauing a mouth like vnto a frogs mouth, euen such as is to bee seene in the common Snapdragon; the whole plant before it come to floure so much resembleth *Esula minor*, that the one is hardly knowne from the other, but by this old verse:

Esula lactescit, sine lacte Linaria crescit.

‡ *Esula* with milke doth flow,
Toad-flax without milke doth grow. ‡

2 The second kinde of Tode-flax hath leaues like vnto *Bellis maior*, or the great Daisie, but not so broad, and somewhat iagged about the edges. The stalke is small and tender, of a cubit high, beset with many purple floures like vnto the former in shape. The root is long, with many threds hanging thereat, the floures are of a reasonable sweet sauour.

3 The third, being likewise a kinde of Tode-flax, hath small and narrow leaues like vnto the first kinde of *Linaria*: the stalke is a cubit high, beset with floures of a purple colour, in fashion like *Linaria*, but that it wanteth the taile or spur at the end of the floure which the other hath. The root is small and threddie.

† 4 *Linaria Valentina* hath leaues like the lesser Centorye, growing at the bottome of the stalke by three and three, but higher vp towards the top, without any certaine order: the stalkes are of a foot high; and it is called by *Clusius, Valentina*, for that it was found by himselfe in *Agro Valentino*, about Valentia in Spaine, where it beareth yellow floures about the top of the stalke like common *Linaria*, but the mouth of the floure is downie, or mossie, and the taile of a purple colour. It floureth at Valentia in March, and groweth in the meadowes there, and hath not as yet been seene in these Northerne parts.

5 *Osyris alba* hath great, thick, and long roots, with some threds or strings hanging at the same, from which rise vp many branches very tough and pliant, beset towards the top with floures not much vnlike the common Toad-flaxe, but of a pale whitish colour, and the inner part of the mouth somewhat more wide and open, and the leaues like the common Tode-flax.

† 3 *Linaria purpurea altera.*
Variable Tode-flax.

† 4 *Linaria Valentina Clus.*
Tode-flax of Valentia.

† 6 *Osyris*

† 5 *Osyris alba*, Lob.
White Tode-flax.

6 *Osyris purpureocarulea* is a kinde of Tode-flax that hath many small and weake branches, trailing vpon the ground, beset with many little leaues like flaxe. The floures grow at the top of the stalke like vnto the common kinde, but of a purple colour declining to blewnesse. The root is small and threddie.

† 7 This hath many small creeping branches some handfull or better high, and hath such leaues, floures, and seed, as the common kinde, but all of them much lesse, and therein consisteth the difference. It growes naturally in the dry fields about Salamanca in Spaine, and floures all Sommer long. *Lobel* calls it *Osyris flava sylvestris*; and *Clusius*, *Linaria Hispanica*.

8 The branches of this eight kind are spred vpon the ground, and of the length of those of the last described: the leaues are lesser than those of the common Tode-flax, thicke, iuicie, and of a whitish Greene colour, and they grow not disorderly vpon the stalks, but at certaine spaces sometimes three, but most vsually foure together: the floures in shape are like those of the ordinarie kinde, but of a most perfect Violet colour, and the lower lip where it gapes of a golden yellow, the taste is bitter. After the floures are past come vessels round & thick, which contain a flat black seed in two partitions or cells: the root is slender, white, and long lasting, and it floures vnto the end of Autumne. It grows naturally vpon the highest Alps. *Gesner* calls it *Linaria Alpina*: and *Clusius*, *Linaria tertia Styriaca*. †

† 6 *Osyris Purpureocarulea repens*. Purple Tode-flaxe.

† 9 Forasmuch as this plant is stalked and leaved like common Flaxe, and thought by some to be *Osyris*; the new writers haue called it *Linofyris*: it hath stalkes very stiffe and wooddie, beset with leaues like the common *Linaria*, with floures at the top of the stalkes of a faint shining yellow colour, in forme and shape somewhat like vnto *Conyza maior*. The whole plant groweth to the height of two cubits, and is in taste sharpe and clammie, or glutinous, and somewhat bitter. The root is compact of many strings, intangled one within another.

† 10 *Guilandinus* calleth this plant *Hyssopus umbellifera Dioscoridis*, that is, *Dioscorides* his *Hysope*,

sope, which beareth a tuft in all points like *Linosyris*, whereof it is a kinde, not differing from it in shew & leaves. The stalks are a cubit high, diuided aboue into many small branches, the tops whereof are garnished with tufts of small floures, each little floure being parted into fve parts with a little thred or pestell in the middle, so that it seemes full of many golden haire or thrums. The seed is long and blackish, and is carried away with the winde. † *Bauhine* in his *Pinax* makes this all one with the former, but vnfitly, especially if you marke the descriptions of their floures which are far vnlike. *Fabius Columna* hath proued this to be the *Chrysocome* described by *Diosc. lib. 4. cap. 55. †*

† 7 *Osyris flava sylvestris*. Creeping yellow Tode-flax.

† 8 *Linaria quadrifolia supina*.
Foure leaved creeping Tode-flax.

† 9 *Linosyris Nuperorum, Lob.*
Golden Star-floured Tode-flax.

10 *Linaria aurea* Tragi.
Golden Tode-flax.

11 *Scoparia sive Oxyris Gracorum.*
Bushieor Besome Tode-flax.

† 12 *Passerina linariae folio*, Lob.
Sparrowes Tode-flax.

† 13 *Passerina altera.*
Sparrow-tongue.

‡ 14 *Linaria adulterina*.
Bastard Tode-flax.

the vpper, which branches are set thicke with little narrow leaues like those of Winter Sauorie or Tyme: amongst which grow many little longish seeds of the bignesse and taste of Millet, but somewhat hotter and bitterer. The floures consist of foure small yellow leaues. *Tragus* calls this *Passerina*; *Dodonæus* makes it *Lithospermum minus*: and *Columna* hath set it forth by the name of *Linaria altera botryodes montana*. ‡

‡ 14 This which *Clusius*, hath set forth by the name of *Anonymos*, or Namelesse, is called in the *Hist. Lugd. pag. 1150. Anthyllis montana*; and by *Tabern.* *Linaria adulterina*. It hath many hard pale greene branches of some foot high, and vpon these without any order grow many hard narrow long leaues like those of flaxe, at first of a very tart, and afterwards of a bitterish taste: the tops of the stalkes are branched into sundry foot-stalkes, which carry little white floures consisting of five small leaues lying starre-fashion, with some threds in their middles: after which at length come single seeds five cornered, containing a white pith in a hard filme or skin. The root is white, diuided into sundry branches, and liues long, euery yeare sending vp many stalkes, and sometimes creeping like that of Tode-flax. It floures in May, and grows vpon mountainous places of Germany; *M^r. Goodyer* found it growing wilde on the side of a chalkie hill in an inclosure on the right hand of the way, as you goe from Droxford to Poppie hill in Hampshire. ‡

¶ The Place.

The kindes of Tode-flax grow wilde in many places, as vpon stone walls, grauelly grounds, barren medowes, and along by hedges.

‡ I do not remember that I haue seene any of these growing wilde with vs, vnlesse the first ordinary kinde, which is euery where common. ‡

¶ The Time.

They floure from Iune to the end of August.

¶ The Names.

‡ Tode-flax is called of the Herbarists of our time, *Linaria*, or Flax-weed, and *Vrinalis*: of some, *osyris*, in high Dutch, *Lynkraut*, and *Onser fraumen flach*: low Dutch, *wilt vlas*: in English, Wild-flax, Tode-flax, and Flax-weed: the eleuenth is called in Italian, *Bel-videre*, or Faire in sight. The same plant is also called *Scoparia*, and *Herba studiosorum*, because it is a fit thing to make brooms of,

‡ 11 *Scoparia*, or after *Dodonæus*, *Osyris*, which the Italians cal *Belvidere*, hath very many shoots or sprigs rising from one smal stalk, making the whole plant to resemble a Cypres tree, the branches grow so handsomely: now it growes some three foot high, and very thick and bushie, so that in some places where it naturally groweth they make besomes of it, whereof it tooke the name *Scoparia*. The leaues be small and narrow, almost like to the leaues of flax. The floures be small, and of an hearbie colour, growing among the leaues, which keep greene all the Winter. ‡ I neuer knew it here to ripen the seed, nor to out-lieue the first frost. ‡

12 This plant also for resemblance sake is referred to the Linaries, because his leaues be like *Linaria*. At the top of the small branched stalks do grow little yellowish floures, pale of colour, somewhat like the tops of *Chrysocome*. *Iohn Mouton* of Turnay taketh it to be *Chrysocome altera*. And because there hath bin no concordance among Writers, it's sufficient to set forth his description with his name *Passerina*. ‡ *Bauhine* refers it to the *Gromills*, and calls it *Lithospermum Linaria folio Monspeliacum*.

‡ 13 This which *Tabern.* calls *Lingua Passerina*, and whose figure was giuen by our Authour for the former, hath a small single whitish root, from which it sends vp a slender stalke some cubit and halfe high, naked on the lower part, but diuided into little branches on

of, wherewith schollers and students may sweepe their owne studies and closets. The particular names are expressed both in Latine and English in their severall titles, whereby they may be distinguished. † It is thought by most that this *Belvedere*, or *Scoparia* is the *Osyris* described by *Dioscorides lib. 4. cap. 143*. For besides the notes, it hath agreeing with the description: it is at this day by the Greeks called *ἀγρίον* †

¶ The Temperature.

The kindes of Tode-flax are of the same temperature with wilde Snap-dragons, whereof they are kindes.

¶ The Vertues.

- A The decoction of Tode-flax taketh away the yellownesse and deformitie of the skinne, beeing washed and bathed therewith.
- B The same drunken, openeth the stoppings of the Liuer and spleene, and is singular good against the iaundise which is of long continuance.
- C The same decoction doth also prouoke vrine, in those that pisse drop after drop, vnstoppeth the kidneies and bladder.

† The figure in this chapter were most of them false placed, as thus: The third was of *Linaria*, *Panop. 1. of Clusius*, being the *Linaria alba* of *Lobel*, described in the fifth place. The fourth was of the *Osyris flava* of *Lobel*, described here by me in the seuen place. The fifth was of *Linaria*, *Stiriaca* of *Clusius*, which you may find described by me in the eighth place. The sixth was of *Linaria aurea* minor of *Tabern.* being onely a varietie of the *Linaria aurea* set forth in the tenth place. The seventh was of the *Linaria Adulterina*, whose historie I haue giuen you in the fourteenth place. That which was formerly vnder the title of *Passerina Linaria* is with a historie fitted thereto in the thirteenth place.

CHAP. 166. Of Garden flaxe.

† 1 *Linum sativum*.
Garden flax.

The Description.

Flaxe riseth vp with slender and round stalks. The leaues thereof bee long, narrow, and sharpe pointed: on the tops of the sprigs are faire blew floures, after which spring vp little round knops or buttons, in which is contained the seed, in forme somewhat long, smooth, glib or slipperie, of a dark colour. The roots be smal and thredde.

¶ The Place.

It prospereth best in a fat and fruitfull soile, in moist and not drie places; for it requireth as *Columella* saith a very fat ground, and somewhat moist. Some, saith *Palladius*, do sow it thicke in a leane ground, & by that means the flax groweth fine. *Pliny* saith that it is to be sowne in grauelly places, especially in furrowes: *Nemagis festinare aliud*: and that it burneth the ground, and maketh it worser: which thing also *Virgil* testifieth in his *Georgickes*.

Vrit lini campum seges, vrit Avena.
Vrunt lethæo persusa papauera somno.

In English thus:

Flaxe and Otes sowne consume
The moisture of a fertile field:
The same worketh Poppie, whose
Juice a deadly sleepe doth yeeld.

¶ The

¶ The Time.

Flaxe is sowne in the spring, it floureth in Iune and Iuly. After it is cut downe (as *Pliny* in his 19. booke, first chapter saith) the stalkes are put into the water subiect to the heate of the sunne, and some weight laid on them to be steeped therein; the loosenes of the rinde is a signe when it is well steeped: then is it taken vp and dried in the sunne, and after vsed as most huswiues can tell better than my selfe.

¶ The Names.

It is called both in Greeke and Laine *λινον*: *Linum*: in high Dutch, *Flachs*: in Italian and Spanish, *Lino*: in French, *Dulin*: in low Dutch, *Ulas*: in English, Flaxe, and Lyne.

¶ The Temperature and Vertues.

Galen in his first booke of the faculties of nourishments saith, that diuers vse the seed hereof parched as a sustenacne with *Garum*, no otherwise than made salt.

They also vse it mixed with hony, some likewise put it among bread, but it is hurtfull to the stomacke, and hard of digestion, and yeeldeth to the body but little nourishment: but touching the quality which maketh the belly soluble, neither will I praise or dispraise it; yet that it hath some force to prouoke vrine, is more apparant when it is parched: but then it also stayeth the belly more.

The same author in his bookes of faculties of simple medicines saith, that Linefeed being eaten is windy although it be parched, so full is it of superfluous moisture: and it is also after a sort hot in the first degree, and in a meane betweene moist and dry. But how windy the seed is, and how full of superfluous moisture it is in euery part, might very well haue been perceiued a few yeeres since as at Middleborough in Zeland, where for want of graine and other corne, most of the Citizens were faine to eate bread and cakes made hereof with hony and oile; who were in short time after swolne in the belly below the short ribs, faces, & other parts of their bodies in such sort, that a great number were brought to their graues thereby: for these symptomes or accidents came no otherwise than by the superfluous moisture of the seed, which causeth windinesse.

Linefeed as *Dioscorides* hath written, hath the same properties that Fenugreeke hath: it wasteth away and mollifieth all inflammations or hot swellings, as well inward as outward, if it be boiled with hony, oile, and a little faire water, and made vp with clarified hony, it taketh away blemishes of the face, and the sunne burning, being raw and vnboiled; and also foule spots, if it be mixed with salt-peter and figs: it causeth rugged and ill fauoured nailes to fall off, mixed with hony and water Cresses.

It draweth forth of the chest corrupted flegme and other filthy humors, if a composition with hony be made thereof to licke on, and easeth the cough.

Being taken largely with pepper and hony made into a cake, it stirreth vp lust.

The oile which is pressed out of the seed, is profitable for many purposes in physicke and surgery; and is vsed of painters, picture makers, and other artificers.

It softeneth all hard swellings; it stretcheth forth the sinewes that are shrunke and drawne together, mitigateth paine, being applied in maner of an ointment.

Some also giue it to drinke to such as are troubled with paine in the side and collicke; but it must be fresh and newly drawne: for if it be old and ranke, it causeth aptnesse to vomit, and withall it ouermuch heateth.

Linefeed boiled in water with a little oile, and a quantity of Annise-feed impoudered and im-plastered vpon an *angina*, or any swelling in the throat, helpeth the same.

It is with good successe vsed plaisterwise, boiled in vineger, vpon the diseases called *Colliaca* and *Dysenteria*, which are bloudy fluxes and paines of the belly.

The seeds stamped with the roots of wilde Cucumbers, draweth forth splinters, thornes, broken bones, or any other thing fixed in any part of the body.

The decoction is an excellent bath for women to sit ouer for the inflammation of the secret parts, because it softeneth the hardnesse thereof, and easeth paine and aking.

The seed of Line and Fenugreek made into powder, boiled with Mallowes, violet leaues, Smal-lage, and Chickweed, vntill the herbs be soft; then stamped in a stone mortar with a little hogs grease to the forme of a cataplasme or puluise, appeaseth all maner of paine, softneth all cold tumors or swellings, mollifieth and bringeth to suppuration all apostumes; defendeth wounded members from swellings and rankling, and when they be already rankled, it taketh the same away being applied very warme euening and morning.

† The figure that was formerly in this place for the ordinary flaxe was of *Linum catharticum* 3. of *Class 4.* which is described by me in the sixth place in the ensuing Chapter.

CHAP. 167.

Of Wilde Flaxe.

¶ The Description.

THis Wilde kinde of Line or Flaxe hath leaues like those of garden Flaxe, but narrower, growing vpon round bright and shining sprigs, a foot long, and floures like the manured flaxe, but of a white colour. The root is tough and small, with some fibres annexed thereto. ‡ This is sometimes found with deep blew floures, with violet coloured floures, and sometimes with white, streaked with purple lines. ‡

1 *Linum sylvestre floribus albis.*
Wilde white flaxe.

2 *Linum sylvestre tenuifolium.*
Thin leaued wilde flaxe.

2 The narrow and thinne leafed kinde of Line is very like to the common flaxe, but in all points lesser. The floures consist of five leaues, which do soone fade and fall away, hauing many stalkes proceeding from one root, of a cubit high, beset with small leaues, yea lesser than those of *Linaria purpurea*.

‡ Our Author in the former edition gaue two figures vnder this one title of *Linum sylvestre tenuifolium*, making them the second and third; but the description of the third was of the Rough broad leaued wilde flaxe, whose figure therefore we haue put in that place. Now the two whose figures were formerly here are but varieties of one species, and differ thus; the former of them (whose figure we haue omitted as impertinent) hath fewer leaues, which therefore stand thinner vpon the stalke, and the floures are either blew or else white. The later, whose figure you may finde here set forth, hath more leaues, and these growing thicker together: the floure is of a light purple or flesh colour. ‡

3 There is a kinde of wilde flaxe which hath many hairy branches, rising vp from a very small root, which doth continue many yeeres without sowing, increasing by roots into many other plants, with stalkes amounting to the height of one cubite, beset with many rough and hairy broad leaues: at the top of the stalkes do grow many blew floures, compact of five leaues, much greater and fairer than common Line or flaxe; which being past, there succeed small sharpe pointed heads full of seeds, like Lineseed, but of a blackish shining colour.

4 *Chamelinum*

4 *Chamalinum* (of some called *Linum sylvestre perpusillum*, and may be called in English very low or Dwarfed wilde flaxe; for this word *Chama* ioined to any simple, doth signifie, that it is a low or dwarfed kinde thereof) beeing scarce an handfull high, hath pale yellow floures: but as it is in all things like vnto flaxe, so the floures, leaues, and stalkes, and all other parts thereof, are foure times lesser than *Linum*.

† 5 There is also growing wilde in this kingdome a small kinde of wilde flaxe, which I take to be the *Linacarpus* described by *Thalins*, and mentioned by *Camerarius*, by the name of *Linum sylvestre pusillum candidis floribus*. Anno 1629, when as I first found it, in a Iournall (written of such plants as we gathered) I set downe this by the name of *Linum sylvestre pusillum candidis floribus*, which my friend Mr. *John Goodyer* seeing, he told me he had long knowne the plant, and refer'd it to *Lines*: but there were some which called it in English, Mil-mountaine, and vied it to purge, and of late he hath sent me this historie of it, which you shall haue as I receiued it from him.

Linum sylvestre catharticum. Mil-mountaine.

It riseth vp from a small white threddy crooked root, sometime with one, but most commonly with fise or six or more round stalks, about a foot or nine inches high, of a browne or reddish color, euery stalk diuiding it selfe neere the top, or from the middle vpward into many parts or branches of a greener colour than the lower part of the stalke: the leaues are small, smooth, of colour green, of the bignes of Lentill leaues, and haue in the middle one rib or sinew, and no more that may bee perceiued, & grow alongst the stalke in very good order by couples, one opposite against the other: at the tops of the small branches grow the floures, of a white colour, consisting of fise small leaues apiece, the nailes whereof are yellow: in the inside are placed small short chiues also of a yellow colour, after which come vp little knobs or buttons, the top whereof when the seede is ripe diuideth it selfe into fise parts, wherein is contained small, smooth, flat, slippery, yellow seed: when the seed is ripe the herbe perisheth: the whole herbe is of a bitter taste, and herby smell. It groweth plentifully in the vnmanured inclosures of Hampshire, on chalkie downs, & on Purfleet hills in Essex, and in many other places. It riseth forth of the ground at the beginning of the Spring, and flourisheth all the Sommer.

† 3 *Linum sylvestre latifolium*.
Broad leaved Wilde flax.

4 *Chamalinum perpusillum*.
Dwarfed Wilde flax.

‡ 5 *Linum syl. catharticum.*
Mil-mountaine.

‡ 6 *Linum syl. latifolium* 3. *Clus.*
The third broad leaved Wilde flax.

‡ 7 *Linum maritimum Luteum.*
Yellow floured Wilde flax.

I came to know this herbe by the name of Mil-mountaine, and his vertue by this meanes. On the second of October 1617. going by Mr. Colsons shop an Apothecary of VVinchester in Hampshire, I saw this herbe lying on his stall, which I had seene growing long before: I desired of him to know the name of it, he told me that it was called Mill-mountaine, and he also told me that beeing at Doctour Lake his house at Saint Crosse a mile from VVinchester, seeing a man of his haue this hearbe in his hand, he desired the name, hee told him as before, and also the vse of it, which is this.

Take a handfull of Mill mountaine, the whole plant, leaues, seedes, floures and all, bruiſe it and put it in a small tunne or pipkin of a pinte filled with white VVine, and set in on the embers to infuse all night, and drinke that wine in the morning fasting, and hee said it would giue eight or tenne stooles. This Doctour Lake was afterward made Bishop of Bath and VVells, who alwaies vsed this hearbe for his purge, after the said manner, as his man affirmed, July 20. 1619. *John Goodyer.*

I haue not as yet made tryall hereof, but since in *Gesn. de Lunarijs* pag. 34. I haue found the

I haue found the like or a more purging facultie attributed to this herbe, as I thinke (for I cannot referre it to any other) where hee would haue it to be *Helleborine* of the Antients: I thinke it not amisse here to set downe his words, because the booke is not commonly to be had, being set forth Anno 1555. *Ante annos 15. aut circiter cum Anglus quidam, ex Italia rediens, me saluaret* (Turnerus is fuerit; vir excellentis tum in re medica tum alijs plerisque disciplinis doctrina, aut alijs quispian, vix satis memini) inter alias rariorum stirpium icones quas depingendas commodabat, Elleborinem quoque ostendebat pictam, herbulam fruticosam, pluribus ab una radice cauliculis quinque fere digitorum proceritate erectis, foliis perexigujs, binis per intervalla (eiusmodi ut ex aspectu genus quoddam *Alfinae* exiguum videretur) vasculis in summo exiguis, rotundis tanquam lini. Hanc aiebat crescere in pratis siccis, vel clivis Montium; inutili radice, subamara, purgare virinque & in Anglia vulgo usurpari a rusticis. Thus much for Gesner.

6 *Clusius* amongst other wilde Lines or Flaxes hath set forth this, which from a liuing, thicke, writhen root, fendeth vp many stalkes almost a cubite high, somewhat red and stiffe, set with prettie large and thicke leaues not rough and hairie, but smooth and hard; the floures grow plentifully on the tops of the stalkes, being large, and composed of five leaues of a faire yellow colour, with five threds comming forth of their middles, with as many smaller and shorter haire. The seed is contained in flatter heads than those of the first described, containing a blacke, but not shining seed. It floures in Iune and Iuly, and ripens the seed in August. It growes naturally vpon diuers hils in Germany.

7 *Matthiolus* and *Dodonaeus* haue vnder the name of *Linum sylvestre*; and *Lobel* by the name of *Linum maritimum luteum Narbonense*, set forth another yellow floured wilde flaxe. This growes with slender stalkes some cubite high, set with leaues like those of flaxe, but somewhat lesser, and fewer in number: at the tops of the stalkes grow floures smaller than those of the common Line, and yellow of colour. It growes naturally vpon the coasts of France that lie towards the Mediterranean sea, but not in England that I haue heard of. ‡

¶ The Place.

They grow generally in grauelly grounds. The first groweth in well mannured places, as in gardens and such like soiles. The second groweth by the sea side. The third and fourth grow vpon rockes and cliffes neere to the sea side. I haue seene them grow vpon the sea bankes by Lee in Essex, and in many places of the Isle of Shepey. They grow also betweene *Quinborow* and *Sherland house*.

‡ I haue not seene any of these growing wilde, but onely the fifth of my description. ‡

¶ The Time.

They floure from May to the middest of August.

¶ The Names.

Their names are sufficiently exprest in their seuerall titles.

¶ The Nature and Vertues.

The faculties of these kindes of Wilde-flax are referred vnto the manured flax, but they are seldom vsed either in Physicke or chirurgerie.

CHAP. 168. Of Blacke Saltwoort.

¶ The Description.

IN old time, say the Aurtherours of the *Aduersaria*, this plant was vsed for meat, and receiued among the *Legumina*. It was called *Glaux*, by reason of the colour of the leaues, which are of a blewish gray colour, called in Latine, *Glaucus color*, such as is in the Sallow leafe: of others it is called *Galax* or *Glax*: and *Eugalaeton*, quasi lactea or lactifica, because it is good to increase milke in the breasts of women, if it be much vsed. *Ruellius* and others haue set downe *Galega*, *Securidica*, *Polygala*, and many other plants for the true *Glaux*, which hath bred a confusion. The true *Glaux* of *Dioscorides* hath many small branches, some creeping on the ground, and some standing vpright, tender, and small, beset with many little fat leaues like *Tribulus terrestris*, or *Herniaria*, growing along the stalks by couples; betweene whom grow small purple floures, which being past, there succeed certaine little bullets or seed vessels. The root is very small and threddy, and taking hold of the vpper face of the earth, as it doth run abroad, by which meanes it doth mightily increase.

Glaux exigua maritima.
Blacke Saltwoort.

¶ The Place.

The true *Glaux* or Milkwoort groweth very plentifully in salt places & marshes neere the sea, from whence I haue brought it into my garden, where it prospereth as well as in his native soile. I found it especially betweene Whitstable and the Isle of Thanet in Kent, and by Grauesend in the same countie, by Tilbery Block-house in Essex, and in the isle of Shepey, going from Kings ferry to Sherland house.

¶ The Time.

It floureth in May, and the seed is ripe in Iune.

¶ The Names.

The names haue beene sufficiently spoken of in the description. It shall suffice to call it in English, Sea Milkwoort.

¶ The Nature.

Paulus Aegineta saith, it is hot and moist of temperature.

¶ The Vertues.

This Milkwoort taken with milke, drinke, or pottage, ingendereth store of milke, and therefore it is good to be vsed by nurses that want the same.

CHAP. 169. Of Milke-woort.

¶ The Description.

1 **T**Here haue beene many plants neerely resembling *Polygala*, and yet not the same indeed, which doth verifie the Latine saying, *Nullum simile est idem*. This neere resemblance doth rather hinder those that haue spent much time in the knowledge of simples, than increase their knowledge. And this also hath been an occasion that many haue imagined a sundry *Polygalavnto* to themselves, and so of other plants. Of which number, this (whereof I speake) is one, obtaining this name of the best writers and herbarists of our time, describing it thus. It hath many thick spreading branches, creeping on the ground: bearing leaues like them of *Herniaria*, standing in rowes like the Sea Milkwoort; among which do grow small whorles, or crowns of white floures, the root being exceeding small and threddie.

2 The second kinde of *Polygala* is a small herbe with pliant slender stems, of a wooddie substance, an handfull long, creeping by the ground; the leaues be small & narrow like to Lintels, or little Hyssope. The floures grow at the top, of a blew color, fashioned like a little bird, with wings, taile, and bodie, easie to be discerned by them that doe obserue the same: which being past, there succeed small pouches, like those of *Bursa pastoris*, but lesser. The root is small and wooddie.

3 This third kinde of *Polygala* or Milkwoort, hath leaues and stalkes like the last before mentioned, and differeth from it herein, that this kinde hath smaller branches, and the leaues are not so thicke thrust together, and the floures are like the other, but that they bee of a red or purple colour.

4 The fourth kinde is like the last spoken of in euery respect, but that it hath white floures; otherwise it is very like.

5 Purple Milkwoort differeth from the others in the colour of the floures; it bringeth forth moe branches than the precedent, and the floures are of a purple colour; wherein especially consisteth the difference.

1 *Polygala repens.*
Creeping Milke-wort.

2 *Polygala flore cœruleo.*
Blew Milke-wort.

3 *Polygala rubris floribus.*
Red Milkewort.

4 *Polygala albis floribus.*
White Milkewort.

6 The sixth Milke-wort is like unto the rest in each respect, saving that the floures are of an ouerworne ill fauoured colour, which maketh it to differ from all the other of his kinde.

5 *Polygala purpurea.*
Purple Milke-wort.

steeped all night in wine, and drunke in the morning, will purge choler effectually by stoole without any danger, as he himselfe had tried. ‡

¶ The Place.

These plants or Milke-worts grow commonly in euery wood or fertile pasture wherefoeuer I haue trauelled.

¶ The Time.

They floure from May to August.

¶ The Names.

Milke-wort is called by *Dodonaeus*, *Flos Ambarualis*; so called because it doth especially flourish in the Crosse or Gang weeke, or Rogation weeke; of which floures the maidens which vse in the countries to walke the Procession doe make themselves garlands and nosegayes: in English we may call it Crosse-floure, Procession-floure, Gang-floure, Rogation-floure, and Milkewort, of their vertues in procuring milke in the breasts of nurses. *Hieronymus Tragus*, as also *Dioscorides* calleth it *Polygalon*. ‡ *Gesner* calls this *Crucis flos*; and in his Epistles he nameth it *Amarella*: it is vulgarly knowne in Cheapside to the herbe-women by the name of Hedge-Hyslop; for they take it for *Gratiola*, or Hedge-Hyslop, and sell it to such as are ignorant for the same. ‡

¶ The Vertues.

Galen, *Dioscorides*, and *Theophrastus* doe account these for Milkeworts, and that they may without error be vsed for those purposes whereunto *Glaux* serueth.

‡ I doubt that this is not the *Polygalon* of *Dioscorides*; for *Gesner* affirms that an handful hereof

CHAP. 170. Of Knot-Grasse.

¶ The Description.

1 **T**He common male Knot-grasse creepes along vpon the ground, with long slender weake branches full of knots or ioynts, whereof it tooke his name. The leaues grow vpon the weake branches, like those of small *S. Johns wort*, but longer and narrower. The floures are maruellous little, and grow out of the knots, of an herby colour; in their places come vp triangular feed. The root is long, slender, and full of strings.

2 The second differeth not from the former, but onely that it is altogether lesser, wherein especially consisteth the difference. ‡ Because the difference is no otherwise, I haue thought good to omit the figure.

3 The Authors of the *Aduersaria* mention another larger Knot-grasse which growes in diuers places of the coast of the Mediterranean sea, hauing longer and larger branches and leaues, and those of a white shining colour. The seeds grow at the ioynts in chaffie white huskes; and the whole plant is of a salt and astringent taste. They call it *Polygonum marinum maximum*. ‡

¶ The Place.

These Knot-grasses do grow in barren and stony places almost euery where.

¶ The Time.

They are in floure and seed all the Sommer long.

¶ The

1 *Polygonum mas vulgare.*
Common Knot-grasse.

¶ The Names.

Knot-grasse is called of the Grecians, *πολύγονος ἀσπίς*: that is to say, *Polygonum mas*, or Male Knot-grasse: in Latine, *Seminalis*, *Sanguinaria*: of *Columella*, *Sanguinalis*: in shops, *Centumnodia*, and *Corrigiola*: of *Apuleius*, *Proserpinaca*: in high-Dutch, *Hoagdyt*: in low-Dutch, *Werkens gras*, and *Duisent knop*: in Italian, *Polygono*: in Spanish, *Corriola*: in French, *Renouee*: in Wallon, *Mariolaine de Cure*: in English, Knot-grasse, and Swines grasse: In the North, Birds tongue.

¶ The Temperature.

Knot-grasse (as *Galen* teacheth) is of a binding qualitie, yet is it cold in the second, if not in the beginning of the third degree.

¶ The Vertues.

The iuyce of Knot-grasse is good against the spitting of blood, the pissing of blood, and all other issues or fluxes of blood, as *Brasanolus* reporteth: and *Camerarius* saith he hath cured many with the iuyce thereof, that haue vomited blood, giuen in a little stipticke Wine. It greatly preuaileth against the *Gonorrhoea*; that is, the running of the reines, and the weaknesse of the backe comming by meanes thereof, being shred and made in tansie with egges and eaten.

The decoction of it cures the disease afore-
said in as ample manner as the iuyce: or giuen

in pouder in a reare egge it helpeth the backe very much.

The herbe boyled in wine and hony cureth the vlcers and inflammations of the secret parts of man or woman, adding thereto a little allom, and the parts washed therewith.

Dioscorides saith that it prouoketh vrine, and helpeth such as do pisse drop after drop, when the vrine is hot and sharpe.

It is giuen vnto Swine with good successe, when they are sicke and will not eate their meate; whereupon the countrey people do call it Swines grasse and Swines skir.

CHAP. 171. Of sundry sorts of Knot-Grasses.

¶ The Description.

The snowie white and least kinde of *Polygonum* or Knot-grasse, called of *Clusius*, *Paronychia Hispanica*, is a strange and worthy plant to behold, handle, and consider, although it be but small. It is seldome aboue a foot long, hauing small branches, thicke, rough, hard, and full of ioynts; out of which the leaues come forth like small teeth, lesser than the leaues of *Herniaria*, or *Thymum tenuifolium*. At the top of the stalkes stand most delicate floures framed by nature as it were, with fine parchement leaues about them, standing in their singular whitenesse and snowie colour, resembling the perfect white silke, so many in number at the top, and so thicke, that they overshadow the rest of the plant beneath. The root is slender, and of a woody substance. The seed is couered as it were with chaffe, as it were with chaffe, and is as small as dust, or the motes in the Sunne.

Anthyllis of Valentia, being likewise a kinde of Knot-grasse, hath small leaues like *Glaux exigua*, or rather like *Chamaesyce*, set orderly by couples at the ioynts: among which come floures consisting of foure little whitish purple leaues, and other small leaues like the first but altogether lesser. The root is small, blacke, and long, and of a woody substance.

Our Author, though he meant to haue giuen vs the figure of Knewell in the third place, as may be perceiued by the title, yet he described it in the fourth, and in the third place went about to

1 *Polygonum montanum*. Mountaine Knot-grasse.† 2 *Antbyllis Valentina Clusij*. Valentia Knot-grasse.† 3 *Polygonum serpillifolium*.
Small round leaved Knot-grasse.† 4 *Polygonum Selinoides, sive Knavel*.
Parsley Piert.

to describe *Polygonum Serpillifolio* of *Pena*; as may be gathered by the description which should have stood; but that I opportunely received a better from my oft mentioned friend Mr. *Goodyer*; which therefore I thought good to impart unto you.

Polygonum alterum pusillo vermiculato Serpilli foliolo Pena.

This hath many small round smooth woody branches, somewhat reddish, trailing upon the ground, nine inches or a foot long; whereon by small distances on short ioyns grow tufts of very small short blunt topped smooth Greene leaues, in a manner round, like those of the smallest *Time*, but much smaller, and without smell, diuiding themselues at the bosomes of those leaues into small branches; at the tops of which branches grow small floures, one floure on a branch, and no more, consisting of foure little round topped leaues apiece of a faint or pale purplish colour: I observed no seed. The root is woody, blackish without, very bitter, with some taste of heate, and groweth deepe into the ground. The leaues are nothing so full of iuyce as *Aizoon*. I found it flourishing the third day of September, 1621, on the ditch bankes at *Burseldon* ferrey by the sea side in *Hampshire*. *Io. Goodyer.* †

4 Among the Knot-grasses may well be suted this small plant, but lately written of, and not so commonly knowne as growing in England, being about an handfull high, and putting out from a fibrous root sundry slender stalkes full of little branches and ioyns: about which grow confusedly many narrow leaues, for the most part of an vnequall quantitie, yet here and there two longer than the rest, and much alike in greatnesse: at the outmost parts of the branches and stalks (where it hath thickest tufts) appeare out of the middest of the leaues little floures of an herby colour, which are succeeded by seed-vessels ending in five sharpe points: the whole plant is of a whitish colour. If my memorie faile me not, *Pena* means this herbewhere he speaketh of *Saxifr. Angl.* in his *Aduer.* p. 103. and also reporteth that he found this plant by the way side as he rode from London to *Bristow*, on a little hill not far from *Chipnam*: his picture doth very well resemble the kinde of Knot-grasse called among the *Germanes* *Knauel*: and calling it *Saxifraga Anglicana* causeth me to thinke, that some in the West parts where he found it do call it *Saxifrage*, as we do call sundry other herbes, especially if they serue for the stone. My friend Mr. *Stephen Bredwel*, Practitioner of physicke in those parts, heard of a simple man who did much good with a medicine that he made with *Parsley Piert* against the stone, which he ministred vnto all sorts of people. This my friend requested the poore man to shew him the herbe called *Parsley Piert*; who frankly promised it him, and the next morning brought him an handfull of the herbe, and told him the composition of his medicine withall, which you shall finde set downe in the vertues, and proued by sundry of good account to be a singular remedie for the same.

† 5 *Saxifraga Anglicana alsinesolia.*
Chick-weed Breake-stone.

‡ 6 *Saxifraga palustris alsinesolia.*
Small water Saxifrage.

‡ 4 Our Author here in the fourth place described the Knawel, and he figured it in the second place, vnder the title of *Anthyllis Valentina Clusij*: for the figure which was in the third place we here giue you in the fifth; and I coniecture it is not of Knawel, but of *Saxifraga Anglicana* of the *Aduers.* So that our Authors words are true, if he meant of the picture which he set forth by the name of *Polygonum selynoides siue Knawel*; but false if of the plant which he described. But if the coniecture of *Pena* and *Lobel* be true, who iudge their *Saxifraga Anglicana* to be *Synanchice Dalechampi*, then it is neither of *Knawel*, as our Author would haue it, nor of this which I here giue, but of a small plant which you shall finde amongst the *Rubia's*. Now this plant that I take to be the *Saxifraga Anglicana* of *Pena* and *Lobel*, is a small little herbe growing thicke, with very many branches some two or three inches high, with some stalkes standing vpright, and other some creeping: at each ioynt grow two short narrow sharpe pointed Greene leaues, out of whose bosomes come diuers lesser leaues: at the tops of the branches vpon pretty long stalkes grow vpon each stalk one round whitish scaly head, consisting commonly of foure vnder greenish leaues which make the cup, and foure grayish or whitish leaues which are the floure. Now after these come to some maturitie they appeare all of a whitish colour, and through the thinne filmes of these heads appeares the seed, which at the first view seems to be pretty large and blacke; for it lies all clustering together; but if you rub it out you shall finde it as small as sand, and of a darke reddish colour. The taste of this plant is very hot and piercing, like that of Golden rod or our common Saxifrage, and without doubt it is more effectuell to moue vrine than the former Knawel. I haue found it growing in many places about bricke and stone walls, and vpon chalky barren grounds. I called this in my Iournall Anno 1612. *Saxifraga minor altera flosculis albis semine nigro*; and questioned whether it were not *Alfine Saxifraga angustifolia minima montana* of *Colamna*. But now I thinke it rather (if the number of leaues in the floure did not disagree) the other which is described in the next place, of which I since that time haue receiued both the figure and description, as also a dry plant from Mr. *Goodyer*. He coniectures it may be this plant which I haue here described, that is set forth in the *Historia Lugd. pag. 1235.* by the name of *Alfine muscosa*.

Alfine palustris folijs tenuissimis: siue Saxifraga palustris alfinefolia.

6 This hath a great number of very small grasse-like leaues, growing from the root, about an inch long, a great deale smaller and slenderer than small pinnes; amongst which spring vp many small slender round smooth firme branches some handfull or handfull and halfe high, from which sometimes grow a few other smaller branches, whereon at certaine ioynts grow leaues like the former, and those set by couples with other shorter coming forth of their bosomes; and so by degrees they become shorter and shorter towards the top, so that toward the top this plant somewhat resembleth *Thymum durius*. The floures are great for the slenderesse of the plant, growing at the tops of the branches, each floure consisting of five smal blunt roundish topped white floures, with white chiues in the midst. The seed I obserued not. The root is small, growing in the myre with a few strings. This groweth plentifully on the boggy ground below the red Well of Wel-lingborough in Northampton shire. This hath not beene described that I finde. I obserued it at the place aforesaid, August 12. 1626. *John Goodyer.* ‡

¶ The Place.

† The first and second are strangers in England: the rest grow in places mentioned in their descriptions.

¶ The Time.

These floure for the most part from May to September.

¶ The Names.

That which hath beene said of their names in their seuerall descriptions shall suffice.

¶ The Nature.

They are cold in the second degree, and dry in the third, astringent and making thicke.

‡ These, especially the three last, are hot in the second or third degree, and of subtrill parts; but the Parsley Piert seemes not to be so hot as the other two. ‡

¶ The Vertues.

Here according to my promise I haue thought good to insert this medicin made with Knawel; A which herbe is called (as I said before) Parsley Piert, but if I might without offence it should be called *Petra pungens*: for that barbarous word Parsley Piert was giuen by some simple man (‡ as also the other, that sauiors of as much simplicitie ‡) who had not wel learned the true terme. The composition which followeth must be giuen in warme white wine, halfe a dram, two scruples, or more, according to the constitution of the body which is to receiue it.

The

The leaues of Parsley Piert, Mouf-eare, of each one ounce when the herbes be dried, bay berries, Turmericke, Cloues, the seeds of the great Burre, the seeds in the berries of Hippias, or Briertree, Fenugreeke, of each one ounce, the stone in the oxe gall, the weight of 24. Barley cornes, or halfe a dram, made together into a most fine and subtile powder, taken and drunke in maner aforesaid hath been proued most singular for the disease aforesaid.

† The fifth and sixth are of the same faculty, and may be vsed in the like cases. †

† The figure that formerly was in the second place was of Knawell, and that in the third place of *polygonum minus polycarpon* of Tabern.

CHAP. 172. Of Rupture woort.

1 *Herniaria*. Rupture woort.

† 2 *Milegrana minima*.
Dwarfe Allseed.

¶ The Description.

1 There is also a kinde of Knot-grasse commonly called in Latine *Herniaria*: in English, Rupture woort, or Rupture grasse. It is a base and low creeping herbe, hauing many small slender branches trailing vpon the ground, yet very tough, and full of little knots somewhat reddish, whereupon do grow very many small leaues like those of Time, among which come forth little yellowish floures which turne into very small seed, and great quantity thereof, considering the smallnesse of the plant, growing thicke clustering together by certaine spaces. The whole plant is of a yellowish Greene colour. The root is very slender and single.

2 There is another kinde of *Herniaria*, called *Milegrana* or All-seed, that groweth vpriht a handfull high, with many small and tender branches, set with leaues like the former, but few in number, hauing as it were two small leaues & no more. The whole plant seemeth as it were couered ouer with seeds or graines, like the seed of Panicke, but much lesser. † I haue not seen many plants of this, but all that euer I yet saw neuer attained to the height of two inches. †

¶ The Place.

1 It ioieth in barren and sandy grounds, and is likewise found in dankish places that lie wide open to the sunne: it doth grow and prosper in my garden exceedingly. † 2 I found this in Kent on a Heath not farre from Chiste-hurst, being in company with M^r. Bowles and diuers others, in Iuly, 1630.

¶ The Time.

It floureth and flourisheth in May, Iune, Iuly, and August.

¶ The Names.

It is called of the later Herbarists *Herniaria* and *Herniola*; taken from the effect in curing the disease *Hernia*: of diuers, *Herba Turca*, and *Empetron*; in French, *Boutonet*: in English, Rupture woort, and Burstwoort.

¶ The Temperature and Vertue.

A Rupturewoort doth notably drie, and throughly closeth vp together and fasteneth. It is reported that being drunke it is singular good for Ruptures, and that very many that haue been bursten, were restored to health by the vse of this herbe, also the poudre hereof taken with wine, doth make a man to pisse that hath his water stopt; it also wasteth away the stones in the kidnies, and expelleth them.

CHAP. 173. Of wilde Time.

1 *Serpillum vulgre.*
Wilde Time.3 *Serpillum majus flore purpureo.*
Great purple wilde Time.

¶ The Description.

1 Both *Dioscorides* and *Pliny* make two kindes of *Serpillum*, that is, of creeping or wilde Time; whereof the first is our common creeping Time, which is so well knowne, that it needeth no description; yet this ye shall vnderstand, that it beareth floures of a purple colour, as euery body knoweth. Of which kinde I found another sort, with floures as white as snow, and haue planted it in my garden, where it becommeth an herbe of great beauty:

2 This wilde Time that bringeth forth white floures differeth not from the other, but only in the colour of the floures, whence it may be called *Serpillum vulgare flore albo*. White floured Wilde Time.

There is another kinde of *Serpillum*, which groweth in gardens, in smell and fauour resembling Marjerome. It hath leaues like Organy, or wilde Marjerome, but somewhat whiter, putting forth many small stalkes, set full of leaues like Rue, but longer, narrower, and harder. The floures are of a biting taste, and pleasant smell. The whole plant groweth vpright, whereas the other creepeth along vpon the earth, catching hold where it growes, & spreading it selfe far abroad.

3 This great wilde Time creepeth not as the others doe, but standeth vpright, and bringeth forth little slender branches full of leaues like those of Rue; yet narrower, longer, and harder. The flours be of a purple colour, and of a twinging biting taste: it groweth vpon rocks, and is hotter than any of the others.

4 This other great one with white floures differeth not from the precedent, hauing many knaps or heads, of a milke white colour, which setteth forth the difference, and it may be called *Serpillum mains flore albo*. Great white floured wilde Time.

5 This wilde Time creepeth vpon the ground, set with many leaues by couples like those of Marjerom, but lesser, of the same smell: the flours are of a reddish color. The root is very threddy.

6 Wilde Time of Candy is like vnto the other wild Times, sauing that his leaues are narrower and longer and more in number at each joint. The smell is more aromaticall than any of the others, wherein is the difference.

7 There is a kinde of wilde Time growing vpon the mountaines of Italy, called *Serpillum Citratum*,

5 *Serpillum folijs amaraci.*
Marjerome Time.

6 *Serpillum Creticum.*
Wilde Time of Candy.

7 *Serpillum citratum.*
Limon Time.

8 *Serpillum hirsutum.*
Hoary wilde Time.

Citratum, that is, hauing the smel of a Pome Citron, or a limon, which giueth it the difference from the other wilde times. ‡ It growes in many gardens also, and (as I haue been told) wilde in diuers places of Wales.

8 This (which is the *Serpillum Pannonicum* 3. of *Clusius*) runnes or spreds it selfe far vpon the ground. For though it haue a hard and wooddy root like as the former kindes, yet the branches which lie spred round about here and there take root, which in time become as hard and wooddy as the former. The leaues and stalkes are like those of the last described, but rough and hoarie: the floures also are not vnlike those of the common kind. The whole plant hath a kinde of resinous smell. It floures in Iune with the rest, and growes vpon the like mountainous places; but whether with vs in England or no I cannot yet affirme any thing of certaintie. ‡

¶ The Place.

The first groweth vpon barren hills and vntoiled places: the second groweth in gardens. The white kinde I found at Southfleet in Kent, in a barren field belonging to one M^r. *William Swan*.

¶ The Time.

They floure from May to the end of Sommer.

¶ The Names.

Wild Time is called in Latine *Serpillum*, à *serpendo*, of creeping: in high and low-Dutch, *Quendel*, and *wilden Thymus*, and also *Onser Vrouwen bedstroo*: in Spanish, *Serpoll*: in Italian, *Serpillo*: in French, *Pillolet*: in English, Wilde Time, Puliall Mountaine, Pella mountaine, running Time, creeping Time, Mother of Time: in shops it is called *Serpyllum*; yet some call it *Pulegium montanum*: and it is euery where (saith *Dodonæus*) thought to be the *Serpyllum* of the Antients. Notwithstanding it answereth not so wel to the wilde Times as to *Dioscorides* his *Saxifraga*; for if it be diligently compared with the description of both the *Serpilla* and the *Saxifraga*, it shal be found to be little like the wilde Times, but very much like the *Saxifraga*: for (saith *Dioscorides*) *Saxifraga* is an herbe like Time, growing on rockes, where our common wilde Time is oftentimes found.

Ælianus in his ninth booke of his sundry Histories seemeth to number wilde Time among the floures. *Dionysius Iunior* (saith he) comming into the city Locris in Italy, possessed most of the houses of the city, and did strew them with roses, wild Time, and other such kindes of floures. Yet *Virgil* in the second Eclog of his Bucolicks doth most manifestly testifie that wilde Time is an herbe, in these words:

*Thestylis & rapido fessis messoribus æstu
Allia, Serpillumque, herbas contundit olentes.*

Thestylis for mowers tyrd with parching heate,
Garlicke, wilde Time, strong smelling herbes doth beate.

Out of which place it may be gathered, that common wilde time is the true and right *Serpillum*, or wilde Time, which the Grecians call *ἰπριν*. *Marcellus* an old antient Author among the Frenchmen saith it is called *Gilarum*; as *Plinius Valerianus* saith it is called of the same, *Laurio*.

¶ The Temperature.

Wilde Time is of temperature hot and dry in the third degree: it is of thin and subtile parts, cutting and much biting.

¶ The Vertues.

- A It bringeth downe the desired sicknesse, prouoketh vrine, applied in bathes and fomentations it procureth sweat: being boyled in wine, it helpeth the ague, it easeth the strangurie, it stayeth the hicket, it breaketh the stones in the bladder, it helpeth the Lethargie, frensie, and madnesse, and stayeth the vomiting of blood.
- B Wilde Time boyled in wine and drunke, is good against the wambling and gripings of the bel- lie, ruptures, convulsions, and inflammations of the liuer.
- C It helpeth against the bitings of any venomous beast, either taken in drinke, or outwardly applied.
- D *Actius* writeth, That *Serpillum* infused well in Vineger, and then sodden and mingled with rose water, is a right singular remedie to cure them that haue had a long phrensie or lethargie.
- E *Galen* prescribeth one dram of the iuyce to be giuen in vineger against the vomiting of blood, and helpeth such as are grieued with the spleene.

CHAP. 174. Of Garden Time.

¶ The Description.

- 1 The first kinde of Time is so well knowne that it needeth no description; because there is not any which are ignorant what *Thymum durius* is, I meane our common garden Time.
- 2 The second kinde of Time with broad leaues hath many woody branches rising from a threddy root, beset with leaues like *Myrtus*. The floures are set in rundles about the stalke like Horehound. The whole plant is like the common Time in taste and smell.

1 *Thymum durius*.
Hard Time.

† 2 *Thymum latifolium*.
Great or broad leaued Time.

3 Time of Candy is in all respects like vnto common Time, but differeth in that, that this kinde hath certaine knoppy tufts not much vnlike the spikes or knots of *Stacados*, but much lesser, beset with slender floures of a purple colour. The whole plant is of a more gracious smell than any of the other Times, and of another kinde of taste, as it were sauouring like spice. The root is brittle, and of a woody substance.

4 Doubtlesse that kinde of Time whereon *Epithymum* doth grow, and is called for that cause *Epithymum*, and vsed in shops, is nothing else than Dodder that growes vpon Time; and is all one with ours, though *Matthiolus* makes a controuersie and difference thereof: for *Pena* traueilling ouer the hills in Narbone neere the sea, hath seene not onely the garden Time, but the wilde Time also loden and garnished with this *Epithymum*. So that by his sight and mine owne knowledge I am assured, that it is not another kinde of Time that beareth *Epithymum*, but is common Time: for I haue often found the same in England, not onely vpon our Time, but vpon Sauorie, and other herbes also: notwithstanding thus much I may coniecture, that the clymate of those Countries doth yeeld the same forth in greater aboundance than ours, by reason of the intemperance of cold, whereunto our countrey is subiect.

† 3 *Thymum Creticum.*
Time of Candy.

4 *Epithymum Gracorum.*
Laced Time.

¶ *The Place.*

These kinds of Time grow plentifully in England in most gardens euery where, except that with broad leaues, and Time of Candy, which I haue in my garden.

¶ *The Time.*

They flourish from May vnto September.

¶ *The Names.*

The first may be called hard Time, or common garden Time: the second, Broad leaued Time: the third, Time of Candy; our English women call it Muske Time: the last may be called Dodder Time.

¶ *The Temperature.*

These kinds of Time are hot and dry in the third degree.

¶ *The Vertues.*

- A Time boyled in water and hony drunken, is good against the cough and shornes of the breath; it prouoketh vrine, expelleth the secondine or after-birth, and the dead childe, and dissolues clotred or congealed blood in the body.
- B The same drunke with vineger and salt purgeth flegme: and boyled in Mede or Methegline, it cleanseth the breast, lungs, reines, and matrix, and killeth wormes.
- C Made into pouder, and taken in the weight of three drams with Mede or honied vineger, called Oxymel, and a little salt, purgeth by stoole tough and clammie flegme, sharpe and cholericke humors, and all corruption of blood.
- D The same taken in like sort, is good against the Sciatica, the paine in the side and brest, against the winde in the side and belly, and is profitable also for such as are fearefull, melancholike, and troubled in minde.
- E It is good to be giuen vnto those that haue the falling sicknesse to smell vnto.
- F *Epithymum*, after *Galen*, is of more effectuall operation in physicke than Time, being hot and dry in the third degree, more mightily cleansing, heating, drying, and opening than *Cuscuta*, hauing right good effect to eradicat melancholy, or any other humor in the spleen, or other disease, sprung by occasion of the spleene.

It helpeth the long continued paines of the head, and besides his singular effects about splene- G
ticall matters, it helpeth the leproy, or any disease of melancholy; all quartaine agues, and such
like griefes proceeding from the spleene.

Dioscorides saith, *Epithymum* drunke with honied water, expelleth by siege, flegme, and melan- H
choly.

Of his native propertie it relieueth them which be melancholicke, swolne in the face and other I
parts, if you pound *Epithymum*, and take the fine powder thereof in the quantity of foure scruples
in the liquor which the Apothecaries call *Passum*, or with Oxymell and salt, which taketh away
all flatuous humours and ventosities.

† The second figure was of *Serpillum Citrasum* described in the seventh place of the foregoing chapter; the third was of *Marum Matthioli*, Tabern. being the *Tra-*
gorianum alterum of Lobel.

CHAP. 175. Of Sauorie.

¶ The Kindes.

Here be two Kindes of Sauorie, the one that indureth VVinter, and is of long continuance: the other an annuall or yearely plant, that perisheth at the time when it hath perfected his seed, and must be sowne againe the next yeare; which we call Sommer Sauorie, or Sauorie of a yeare. There is likewise another, which is a stranger in England, called of *Lobel Thymbra S. Iuliani*, denying it to be the right *Satureia*, or Sauorie: whether that of *Lobel*, or that we haue in our English gardens be the true winter Sauorie, is yet disputable, for we thinke that of *S. Iulians* rocke to be rather a wilde kinde than otherwise. † *Pena* and *Lobel* do not denie, but affirme it in these words, *Nullus non fatetur Satureiam veram*; that is, which none can denie to be the true *Satureia* or Sauorie. *Vid. Aduersar. pag. 182. †*

1 *Satureia hortensis*.
VVinter Sauorie.

2 *Satureia hortensis aestiva*.
Sommer Sauorie.

¶ The

¶ The Description.

1 **W**inter Sauorie is a plant resembling Hyssope, but lower, more tender, and brittle: it bringeth forth very many branches, compassed on euery side with narrow and sharpe pointed leaues, longer than those of Time; among which grow the floures from the bottome to the top, out of small husks, of colour white, tending to a light purple. The root is hard and wooddie, as is the rest of the plant.

2 Sommer Sauorie groweth vp with a slender brittle stalke of a foot high, diuided into little branches: the leaues are narrow, lesser than those of Hyssope, like the leaues of winter Sauorie, but thinner set vpon the branches. The floures stand hard to the branches, of a light purple tending to whitenesse. The root is small, full of strings, and perisheth when it hath perfected his seed.

3. *Satureia Sancti Iuliani.*
Rocke Sauorie.

¶ 4 *Satureia Cretic.*
Candie Sauorie.

3 This small kinde of Sauorie, which *Lobel* hath set forth vnder the title of *Thymbra S. Iuliani*, because it groweth plentifully vpon the rough cliffes of the Tyrhenian sea in Italie, called Saint Iulians rocke, hath tender twiggie branches an handfull high, of a wooddie substance, set ful of leaues from the bottome to the top, very thicke thrust together like vnto those of Time, sauing that they be smaller & narrower, bringing forth at the top of the sprigs a round spikie tuft of small purplish floures. The whole plant is whitish, tending to a bleake colour, and of a verie hot and sharpe taste, and also well smelling.

¶ 4 This in the opinion of *Honorius Bellus*, *Clusius*, and *Pona*, is thought, and not without good reason, to be the true *Thymbra*, or *Satureia* of *Dioscorides* and the Antients, for (besides that it agrees with their description, it is to this day called in Candie *Σάτιρι* and *Σάτιρι*.) *Clusius* describes it thus: It sends forth many branches immediately from the roote like as Tyme, and those quadrangular, rough, and of a purplish colour: vpon these growe alternately little roughish leaues much like those of the true Tyme; and out of their bosomes come little branches set with the like, but lesser leaues. The toppes of the branches are compassed with a rundle made of manie little leaues, whereout come floures of a fine purple colour, and like the floures of Tyme, beeing diuided into foure parts, whereof the lower is the broader, and hangs downe: The vpper is also broad but shorter, and the other two lesse. Out of the middle of the floure come five whitish threds, pointed with browne, and a forked stile. The seed is small and blacke like that of Tyme. The root hard and wooddie. It floured with *Clusius* (who receiued the seedes out of Candie from *Honorius Bellus*) in October and Nouember. ¶

¶ The Place.

They are sowne in Gardens, and bring forth their floures the first yeare of their sowing.

¶ The Time.

They floure in Iuly and August.

¶ The Names.

Sauorie is called in Greeke *Σάουρον*, neither hath it any other true name in Latine than *Thymbra*. The Interpreters would haue it called *Satureia*, wherein they are repugnant to *Columella* a Latine Writer, who doth shew a manifest difference betweene *Thymbra* and *Satureia*, in his tenth booke, where hee writeth, that Sauorie hath the taste of Tyme, and of *Thymbra* or the Winter Sauorie.

Et Satureia Thymi referens Thymbræq; saporem.

† Notwithstanding this assertion of *Columella*, *Pliny lib. 19. cap. 8.* makes *Satureia*, or Sauorie, to be that *Thymbra* which is called also *Cunila*. Sauorie in High Dutch is called *Kunel Saturey*, and *Sadaney*; in Low Dutch, *Centen*: which name, as it seemeth, is drawne out *Cunila*: in Italian, *Sauoreggia*: in Spanish, *Axedrea*, and *Sagorida*: in French, *Sarriette*: in English, Sauorie, Winter Sauorie, and Sommer Sauorie.

¶ The Temperature and Vertues.

Winter Sauorie is of temperature hot and drie in the third degree, it maketh thin, cutteth, it A clenseth the passages: to be briefe, it is altogether of like vertue with Time.

Sommer Sauorie is not full so hot as winter Sauorie, and therefore saith *Dioscorides*, more fit to B be used in medicine: it maketh thin, and doth maruellously preuaile against winde: therefore it is with good successe boiled and eaten with beanes, peason, and other windie pulses, yea if it be applied to the belly in a fomentation, it forthwith helpeth the affects of the mother proceeding from winde.

CAP. 176. Of Dodder.

Cuscuta sive Cassutha.
Dodder.

¶ The Description.

Cuscuta, or Dodder, is a strange herbe, altogether without leaues or root, like vnto threads very much snarled or wrapped together, confusedly winding it selfe about bushes and hedges, and sundry kindes of herbes. The threads are somewhat red: vpon which grow here & there little round heads or knops, bringing forth at the first slender white floures, afterward a small seed.

¶ The Place.

This herbe groweth vpon sundry kindes of herbes, as vpon Tyme, VVinter Sauorie, Germaner, and such like, taking his name from the herbe whereupon it doth grow, as that vpon Tyme is called *Epithymum*, vpon Line or flaxe *Epilinum*: and so of others, as *Dodonæus* setteth forth at large: yet hath he forgotten one among the rest, which groweth very pientifully in Sommer setshire vpon nettles: neither is it the least among many, either in beautie or operation, but comparable to the best *Epithymum*: following therefore the example of *Dioscorides*, I haue thought good to call it *Epiurtica*, or rather *Επιουρτικη*, and so of the rest according to the herbes whereon they do grow.

¶ The Names.

The greatest is called in shops euery where *Cuscuta*: and of diuers because it groweth vpon
Flaxe

flaxe or Lyne, *Podagra Lini*; the better learned do name it *Cassutha*, or *Casytha*: and *Gesnerius*, *αἰνιδόρου*: the Arabians, *Kessuth* and *Chasuth*: in Dutch, *Schoyfte*, and *Wanghe*: in High Dutch, *Filkraut*: in French, *Goute d'Lin*, and *Tigne de Lin*: in English, Dodder.

The lesser and slender which wrappeth it selfe vpon Tyme and Sauorie, is called of *Dioscorides* *αἰνιδόρου*: the Apothecaries keep the name *Epithymum*: others, among whom is *Actuarius*, name that *Epithymum* which groweth vpon Tyme onely, and that which groweth on Sauorie *Epithymbrum*, and that also which hangeth vpon *Stæbe*, they terme *Epistæbe*, giuing a peculiar name to euery kind.

¶ The Nature.

The nature of this herb changeth and altereth, according to the nature and qualitie of the herbs whereupon it groweth: so that by searching of the nature of the plant you may easily finde out the temperament of the laces growing vpon the same. But more particularly: it is of temperature somewhat more drie than hot, and that in the second degree: it also clenseth with a certaine astringent or binding qualitie, and especially that which is found growing vpon the bramble: for it also receiuet a certaine nature from his parents on which it groweth; for when it groweth vpon the hotter herbes, as Tyme and Sauory, it becommeth hotter and drier, and of thinner parts: that which commeth of Broome prouoketh vrine more forcibly, and maketh the belly more soluble: and that is moister which groweth vpon flaxe: that which is found vpon the bramble hath ioined with it as wee haue said a binding qualitie, which by reason of this facultie ioined with it is good to cure the infirmities of the Liuer and Milt: for seeing that it hath both a purging and binding facultie vnited to it, it is most singular good for the entrals: for *Galen* in his thirteenth Booke of the Methode of curing, doth at large declare that such Medicines are fittest of all for the Liuer and Milt.

¶ The Vertues.

- A Dodder remooueth the stoppings of the liuer and of the milt or spleene, it disburdeneth the veines of flegmaticke, cholericke, corrupt and superfluous humours: prouoketh vrine gently, and in a meane openeth the kidneies, cureth the yellow iauundise which are ioined with the stopping of the liuer and gall: it is a remedie against lingring agues, bastard and long tertians, quartains also, and properly agues in infants and young children, as *Mesues* saith in *Serapio*; who also teacheth, that the nature of Dodder is to purge choler by the stoole, and that more effectually if it haue Wormewood ioined with it; but too much vsing of it is hurtfull to the stomacke: yet *Auicenna* writeth that it doth not hurt it, but strengtheneth a weake or feeble stomacke; which opinion also we do better allow of.
- B *Epithymum*, or the Dodder which groweth vpon Tyme, is hotter and drier than the Dodder that groweth vpon flax, that is to say euen in the third degree, as *Galen* saith. It helpeth all the infirmities of the milt: it is a remedie against obstructions and hard swellings. It taketh away old headaches, the falling sicknesse, madnesse that commeth of Melancholy, and especially that which proceedeth from the spleene and parts thereabout: it is good for those that haue the French disease, and such as be troubled with contagious vlcers, the leprosie, and the scabbie euill.
- C It purgeth downewards blacke and Melancholicke humours, as *Actius*, *Actuarius*, and *Mesue* write, and also flegme, as *Dioscorides* noteth: that likewise purgeth by stoole which groweth vpon Sauorie and Scabious, but more weakly, as *Actuarius* saith.
- D *Cuscuta*, or Dodder that groweth vpon flax, boiled in water or wine and drunke, openeth the stoppings of the liuer, the bladder, the gall, the milt, the kidneies and veines, and purgeth both by siege and vrine cholericke humours.
- E It is good against the ague which hath continued a long time, and against the iauundise, I meane that Dodder especially that groweth vpon brambles.
- F *Epiurtica* or Dodder growing vpon nettles, is a most singular and effectually medicine to prouoke vrine, and to loose the obstructions of the body, and is proued oftentimes in the West parts with good successe against many maladies.

CHAP. 177. Of Hyssope.

¶ The Description.

I *Dioscorides* that gaue so many rules for the knowledge of simples, hath left Hyssope altogether without description, as beeing a plant so well knowne that it needed none: whose example I follow not onely in this plant, but in many others which bee common, to auoid tediousnesse to the Reader.

1 *Hyssopus Arabum.*

Hyssope with blew floures.

2 *Hyssopus Arabum flore rubro.*

Hyssope with reddish floures.

† 3 *Hyssopus albis floribus.*

VVhite floured Hyssope.

4 *Hyssopus tenuifolia.*

Thinne leaved Hyssope.

‡ 5. *Hyssopus parva angustis folijs.*
Dwarfe narrow leaved Hyssope.

Of which kinde we haue in our gardens moreouer another sort, whose leaues are wonderfully curled, rough, and hairie, growing thicke thrust together, making as it were a tuft of leaues, in taste and smell, and in all other things like vnto the common Hyssope.

I haue likewise in my garden another sort of Hyssope, growing to the forme of a small wooddie shrub, hauing very faire broad leaues like vnto those of *Numularia*, or Monywoort, but thicker, fuller of iuice, and of a darker Greene colour; in taste and smell like the common Hyssope.

¶ The Place.

All these kindes of Hyssope do grow in my garden, and in some others also.

¶ The Time.

They floure from Iune to the end of August.

¶ The Names.

Hyssope is called in Latine *Hyssopus*: the which name is likewise retained among the Germans, Brabanders, French-men, Italians, and Spaniards. Therefore that shall suffice which hath been set downe in their seuerall titles.

‡ This is by most Writers iudged to be Hyssope vsed by the Arabian Physitions, but not that of the Greekes, which is neerer to *Origanum* and Marietome, as this is to *Satureia* or Saurorie. ‡

¶ The Temperature and Vertues.

- A A decoction of Hyssope made with figs, and gargled in the mouth and throte, ripeneth & breaketh the tumors and imposthumes of the mouth and throte, and easeth the difficultie of swallowing, comming by cold rheumes.
- B The same made with figges, water, honie, and rue, and drunken, helpeth the inflammation of the lungs, the old cough, and shortnesse of breath, and the obstructions or stoppings of the breast.
- C The sirrup or iuice of Hyssope taken with the sirrup of vineger, purgeth by stoole tough and clammy flegme, and driueth forth wormes if it be eaten with figges.
- D The distilled water drunke, is good for those diseases before named, but not with that speed and force.

† That figure in the third place was of the *Satureia Romana*, 2. of *Tabernaemontana*.

CHAP. 178. Of Hedge Hyssope:

¶ The Description.

Hedge Hyssope is a low plant or herbe about a span long, very like vnto the common Hyssope, with many square stalkes or slender branches, beset with leaues somewhat larger than Hyssope, but very like. The floures grow betwixt the leaues vpon short stems, of a white colour declining to blewnesse. All the herbe is of a most bitter taste, like the small Centory. The root is little and threddy, dilating it selfe farre abroad; by which meanes it multiplieth greatly, and occupieth much ground where it groweth,

1 *Gratiola.*

Hedge Hyssope.

‡ 2 *Gratiola angustifolia.*

Grasse Poley.

3 *Gratiola latifolia.*

Broad leaved Hedge Hyssope.

‡ 2 Narrow leaved Hedge Hyssope from a small fibrous white root sends vp a reddish round crested stalke diuided into sundry branches, which are set with leaues like those of knot grasse of a pale Greene colour, and without any stalkes: out of the bosome of these come floures set in long cups composed of foure leaues of a pleasing blew colour, which are succeeded by longish seed-vessells conteyning a small dusky seed. The whole plant is without smell, neither hath it any bitternesse or other manifest taste. It varies in leaues, sometimes broader, and otherwhiles narrower, the plant growing sometimes but an handfull, and otherwhiles a foot high. *Gesner* called this *Gratiola minor*: and *Camerarius*, *Hyssopoides*: and *Bauhine* onely hath figured it, and that by the name of *Hyssopifolia sine Gratiola minor*. *Cordus* first mentioned it, and that by the Dutch name of Grasse Poley, which name we may also very fitly retaine in English. ‡

3 Broad leaved hedge Hyssope hath many small and tender branches, foure square, and somewhat hollow or furrowed, beset with leaues by couples one opposite against another, like vnto the former, but somewhat shorter, and much broader: among which grow the floures of a purple colour,

colour, spotted on the inside with white, and of a brighter purple than the rest of the floure, fashioned like the smallest *Antirrhinum*, or least Snapdragon; which being past, there succeed little seed vessels, fashioned like the nut of a crossebow, which containe small yellowish seed, extreame bitter of taste. The whole plant is likewise bitter, as the common or well knowne *Gratiola*. The root is compact of a great number of whitish strings, entangled one within another, which mightily encreaseth and spreadeth abroad.

‡ This plant is onely a lesser kinde of the *Lysimachia galericulata* of Lobell, which some haue called *Gratiola latifolia*: our Authors figure was very ill, wherefore I haue endeauoured by the helpe of some dried plants and my memory to present you with a better expression thereof. ‡

¶ The Place.

The first groweth in low and moist places naturally, which I haue planted in my Garden. ‡ The second was found growing by my oft mentioned friend Mr. Bomles at Dorchester in Oxfordshire, at the backe side of the enclosed grounds on the left hand of the towne, if you would ride from thence to Oxford in the grassie places of the Champion corne fields. ‡ The third groweth likewise in moist places. I found it growing vpon the bog or marish ground at the further end of Hampstead heath, and vpon the same heath towards London, neere vnto the head of the springs that were digged for water to be conueied to London, 1590. attempted by that carefull citizen John Hart Knight, Lord Major of the City of London: at which time my selfe was in his Lordships company, and viewing for my pleasure the same goodly springs, I found the said plant, not heretofore remembred.

¶ The Time.

The first floureth in May: the second in Iune and Iuly: the third in August.

¶ The Names in generall.

Hedge Hyssope is called in Latine *Gratiola*, and *Gratia Dei*, or the Grace of God, notwithstanding there is a kind of *Geranium*, or Storkes bill, called by the later name. Of *Cordus*, *Limnesum*, and *Centauroides*: of *Anguillaria* it is thought to be *Dioscorides* his *Papauer spumeum*, or Spatling Poppy: but some think *Papauer spumeum* to be that which we call *Behen album*: in Dutch it is called *Godts gratie*: in Italian, *Stanca cauallo*, because that horses when they haue eaten thereof do wax leane, and languish thereupon: and in English, *Gratia Dei*, and Hedge Hyssope. The seed hereof is called *Gelbenech*, which name the Arabians retaine vnto this day.

‡ ¶ Names in particular.

‡ 1 *Matthiolus*, *Dodonaeus* and others haue called this *Gratiola*; *Anguillara*, *Gratia Dei*; *Cordus*, *Limnesum* *Centauroides*; he also thought it but vnfitly to be the *Eupatorium* of Mesue *Gesner* thinkes it may be *Polemonium palustre amarum* of *Hippocrates*, that write of the diseases of cattell. ‡

2 *Cordus* called this Grassie Poley; *Gesner*, *Gratiola minor*; *Camerarius*, *Hyssopoides*: and *Bauhine*, *Hyssopifolia*.

3 This is not set forth by any but our Author, and it may fitly be named *Lysimachia galericulata minor*, as I haue formerly noted. ‡

¶ The Temperature.

Hedge Hyssope is hot and dry of temperature. And the first is onely vsed in medicine.

¶ The Vertues.

A Who so taketh but one scruple of *Gratiola* brused, shall perceiue evidently his effectuell operation and vertue, in purging mightely, and that in great abundance, waterish, grosse, and slimy humors. *Conradus Gesnerus* experimented this, and found it to be true, and so haue I my selfe, and many others.

B *Gratiola* boiled, and the decoction drunke or eaten with any kinde of meate, in manner of a salade, openeth the belly, and causeth notable loosenes, and to scoure freely, and by that meanes purgeth grosse flegme and cholericke humors.

C *Gratiola* or Hedge Hyssope boiled in wine and giuen to drinke, helpeth feuers of what sort soeuer, and is most excellent in dropies, and such like diseases proceeding of cold and watery causes.

D The extraction giuen with the powder of cinamon and a little of the juice of Calamint, preuaileth against tertian and quotidian feuers, set downe for most certaine by the learned *Ioachim Camerarius*.

CHAP. 179. Of Lauander Spike.

¶ The Description.

1 **L**auander Spike hath many stiffe branches of a wooddie substance, growing vp in the manner of a shrubbe, set with many long hoarie leaues, by couples for the most part; of a strong smell, and yet pleasant enough to such as doe loue strong fauours. The floures grow at the top of the branches spike fashion, of a blew colour. The roote is hard and wooddie.

2 The second differeth not from the precedent, but in the colour of the floures; For this Plant bringeth milke white floures; and the other blew, wherein especially consisteth the difference.

3 Wee haue in our English gardens a small kinde of Lauander, which is altogether lesfer than the other, ‡ and the floures are of a more purple colour and grow in much lesse and shorter heads; yet haue they a farre more gratefull smell: the leaues are also lesse and whiter than those of the ordinarie sort. This did, and I thinke yet doth grow in great plentie, in his Maiesties priuate Garden at White-hall. And this is called Spike, without addition, and sometimes Lauander Spike: and of this by distillation is made that vulgarly known and vsed oile which is termed *oleum spica*, or oile of Spike. ‡

1 *Lavandula flore caruleo.*
Common Lauander.

2 *Lavandula flore albo.*
VWhite floured Lauander.

¶ The Place.

In Spaine and Languedocke in France, most of the mountaines and desert fields, are as it were

3 *Lavendula minor, five Spica.*
Lauander Spike.

Casia fistula; and another a small shrubbie plant extant among the shrubs or hedge bushes, which some thinke to be the *Casia Poetica*, mentioned in the precedent verses.

¶ *The Temperature.*

Lauander is hot and drie, and that in the third degree, and is of a thin substance, consisting of many aerie and spirituall parts. Therefore it is good to be giuen any way against the cold diseases of the head, and especially those which haue their originall or beginning not of abundance of humours, but chiefly of a cold quality onely.

¶ *The Vertues.*

A The distilled water of Lauander smelt vnto, or the temples and forehead bathed therewith, is a refreshing to them that haue the Catalepsie, a light Migram, & to them that haue the falling sicknesse, and that vse to swoone much. But when there is abundance of humours, especially mixt with bloud, it is not then to be vsed safely, neither is the composition to be taken which is made of distilled wine: in which such kinde of herbes, floures, or seeds, and certaine spices are infused or steeped, though most men do rashly and at aduenture giue them without making any difference at all. For by vsing such hot things that fill and stuffe the head, both the disease is made greater, and the sicke man also brought into danger, especially when letting of bloud, or purging haue not gone before. Thus much by way of admonition, because that euery where some vnlearned Physitions and diuers rash and ouerbold Apothecaries, and other foolish women, do by and by giue such compositions, and others of the like kinde, not only to those that haue the Apoplexy, but also to those that are taken, or haue the Catuche or Catalepsie with a Feuer, to whom they can giue nothing worse, seeing those things do very much hurt, and oftentimes bring death it selfe.

B The floures of Lauander picked from the knaps, I meane the blew part and not the huske, mixed with Cinamon, Nutmegs, and Cloues, made into poulder, and giuen to drinke in the distilled water thereof, doth helpe the panting and passion of the heart, preuaileth against giddinesse, turning, or swimming of the braine, and members subiect to the palsie.

C Conserue made of the floures with sugar, profiteth much against the diseases aforesaid, if the quantitie of a beane be taken thereof in the morning fasting.

D It profiteth them much that haue the palsie, if they bee washed with the distilled water of the floures,

couered ouer with Lauander. In these cold count ries they are planted in gardens.

¶ *The Time.*

They floure and flourish in Iune and Iuly.

¶ *The Names.*

Lauander Spike is called in Latine *Lavendula*, and *Spica*: in Spanish, *Spigo*, and *Languda*. The first is the male, and the second the female. It is thought of some to be that sweet herbe *Casia*, whereof Virgil maketh mention in the second Eclog of his *Bucolicks*:

*Tum Casia atque alijs intexens suauibus herbis,
Mollia luteola pingit vacinia Caltha.*

(infolde)

And then slee'l Spike and such sweet herbes
And paint the Iacinth with the Marygold.

And likewise in the fourth of his *Georgicks*, where hee intreateth of choosng of seats and places for Bees, and for the ordering thereof, he saith thus:

*Hac circum Casia virides, & olentia late
Serpilla, & grauius spirantis copia Thymbra
Floreat, &c.*

About them let fresh Lauander and store
Of wild Time with strong Sauorie to floure.

Yet there is another *Casia* called in shops *Casia Ligneae*, as also *Casia nigra*, which is named

floures, or annointed with the oile made of the floures, and oile oliue, in such manner as oile of roses is, which shall be expressed in the treatise of Roses.

CHAP. 180. Of French Lauander, or Stickeadoue.

¶ The Description.

1 French Lauander hath a bodie like Lauander, short, and of a wooddie substance, but slenderer, beset with long narrow leaues, of a whitish colour, lesser than those of Lauander: it hath in the top bushy or spikie heads, well compact or thrust together; out of the which grow forth small purple floures, of a pleasant smell. The seede is small and blackish: the roote is hard and wooddie.

2 This iagged Sticadoue hath many small stiffe stalks of a wooddy substance; whereupon do grow iagged leaues in shape like vnto the leaues of Dill, but of an hoarie colour: on the top of the stalkes do grow spike floures of a blewish colour; and like vnto the common Lauander Spike: the root is likewise wooddie. ‡ This by *Clusius* who first described it, as also by *Lobel*, is called *Lavendula multifida folio*, or Lauander with the diuided leafe; the plant more resembling Lauander than Sticadoue. ‡

3 There is also a certaine kinde hereof, differing in smalnesse of the leaues onely, which are round about the edges nicked or toothed like a saw, resembling those of Lauander cotton. The root is likewise wooddie.

‡ 4 There is also another kinde of *Stæchas* which differs from the first or ordinarie kind, in that the tops of the stalkes are not set with leaues almost close to the head as in the common kinde, but are naked and wholly without leaues: also at the tops of the spike or floures (as it were to recompence their defect below) there growe larger and fairer leaues than in the other sorts. The other parts of the plant differ not from the common *Stæchas*. ‡

† 1 *Stæchas sive spica hortulana*.
Sticadoue and Sticados.

2 *Stæchas multifida*.
Iagged Sticados.

3 *Stachas folio serrato.*
Toothed Sticadoue.

† 4 *Stachas summis canaliculis nudis.*
Naked Sticadoue.

¶ *The Place.*

These herbes do grow wilde in Spaine, in Languedocke in France, and the Islands called Stœchades ouer against Massilia: we haue them in our gardens, and keepe them with great diligence from the iniurie of our cold clymate.

¶ *The Time.*

They are sowne of seed in the end of Aprill, and couered in the Winter from the cold, or els set in pots or tubs with earth, and carried into houses.

¶ *The Names.*

The Apothecaries call the floure *Stæcados*: *Dioscorides*, *stæx*: *Galen*, *stæxas*, by the diphthong *æ* in the first syllable: in Latine, *Stachas*: in High Dutch, *Stichas kraut*: in Spanish, *Thomari*, and *Cantuesso*: in English, French Lauander, Steckado, Stickadoue, Cassidonie, and some simple people imitating the same name do call it Cast me downe.

¶ *The Temperature.*

French Lauander saith *Galen* is of temperature compounded of a little cold earthie substance, by reason whereof it bindeth: it is of force to take away obstructions, to extenuate or make thinne, to scoure and clense, and to strengthen not onely all the entrails, but the whole bodie also.

¶ *The Vertues.*

Dioscorides teacheth that the decoction hereof doth helpe the diseases of the chest, and is with
A good successe mixed with counterpoisons.

The later Physitions affirme, that *Stachas*, and especially the floures of it, are most effectuall a-
B gainst paines of the head, and all diseases thereof proceeding of cold causes, and therefore they be mixed in all compositions almost which are made against head-ache of long continuance, the Apoplexie, the falling sicknesse, and such like diseases.

The decoction of the husks and floures drunke, openeth the stoppings of the liver, the lungs, the
C milt, the mother, the bladder, and in one word all other inward parts, clensing and driving forth all euill and corrupt humours, and procuring vrine.

CHAP. 181. Of Flea-wort.

¶ The Description.

1 **P***syllium*, or the common Flea-wort hath many round and tender branches, set full of long and narrow leaues somewhat hairy. The top of the stalkes are garnished with sundrie round chaffie knops, beset with small yellow floures: which being ripe containe many little shining seeds, in proportion, colour, and bignesse like vnto fleas.

2 The second kinde of *Psyllium* or Flea-wort hath long and tough branches, of a woody substance like the precedent, but longer and harder, with leaues resembling the former, but much longer and narrower. The chaffie tuft which containeth the seed is like the other, but more like the eare of *Phalaris*, which is the eare of *Alpisti*, the Canarie seed which is meate for birds that come from the Islands of Canarie. The root hereof lasteth all the Winter, and likewise keepeth his Greene leaues, whereof it tooke this addition of *Sempervirens*.

1 *Psyllium siue pulicaris herba.*
Flea-wort.

2 *Psyllium sempervirens Lobelij.*
Neuerdying Flea-wort.

¶ The Place.

These plants are not growing in our fields of England, as they doe in France and Spaine, yet I haue them growing in my garden.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

Flea-wort is called in Greeke *ψύλλιον*: in Latine, *Pulicaria*, and *Herba Pulicaris*: in shops, *Psyllium*: in English, Flea-wort; not because it killeth fleas, but because the seeds are like fleas: of some, Flea-bane, but vnproperly: in Spanish, *Zargatona*: in French, *L'herbe aux pulces*: in Dutch, *Duyls bloey-cruyt*.

¶ The Temperature.

Galen and Serapio record, that the seed of *Psyllium* (which is chiefly vsed in medicine) is cold in the second degree, and temperate in moisture and drinitesse.

¶ The

¶ *The Vertues.*

- A The seed of Flea-wort boyled in water or infused, and the decoction or infusion drunke, purgeth downewards adust and cholericke humors, cooleth the heate of the inward parts, hot feauers, burning agues, and such like diseases proceeding of heate, and quencheth drought and thirst.
- B The seed stamped, and boyled in water to the forme of a plaister, and applied, taketh away all swellings of the ioynts, especially if you boyle the same with vineger and oyle of Roses, and apply it as aforesaid.
- C The same applied in manner aforesaid vnto any burning heate, called S. Anthonies fire, or any hot and violent impostume, asswageth the same, and bringeth it to ripenesse.
- D Some hold that the herbe strowed in the chamber where many fleas be, will driue them away; for which cause it tooke the name Flea-wort: but I thinke it is rather because the seed doth resemble a flea so much, that it is hard to discerne the one from the other.

¶ *The Danger.*

Too much Flea-wort seed taken inwardly is very hurtful to mans nature: so that I wish you not to follow the minde of *Galen* and *Dioscorides* in this point, being a medicine rather bringing a maladie, than taking away the grieve: remembring the old prouerbe, A man may buy gold too deare; and the hony is too deare that is lickt from thornes.

‡ *Dioscorides* nor *Galen* mention no vse of this inwardly; but on the contrarie, *Dioscorides* in his sixth booke, which treats wholly of the curing and preuenting of poysons, mentions this in the tenth chapter for a poyson, and there sets downe the symptomes which it causes, and refers you to the foregoing chapter for the remedies. ‡

CHAP. 185.

Of ^{Cloue} ~~Stone~~ Gillofloures.

1 *Caryophyllus maximus multiplex.*
The great double Carnation.

2 *Caryophyllus multiplex.*
The double Cloue Gillofloure.

¶ *The Kindes.*

There are at this day vnder the name of *Caryophyllus* comprehended diuers and sundry sorts of plants, of such various colours, and also seuerall shapes, that a great and large volume would not

not suffice to write of every one at large in particular; considering how infinite they are, and how every year every climate and country bringeth forth new sorts, such as have not heretofore bin written of; some whereof are called Carnations, others Cloue Gillofloures, some Sops in wine, some Pagians, or Pagon colour, Horse-flesh, bluncket, purple, white, double and single Gillofloures, as also a Gillofloure with yellow floures: the which a worshipfull Merchant of London Mr. *Nicolas Lete* procured from Poland, and gaue me thereof for my garden, which before that time was neuer seene nor heard of in these countries. Likewise there be sundry sorts of Pinkes comprehended vnder the same title, which shall be described in a seuerall chapter. There be vnder the name of Gillofloures also those floures which wee call Sweet-Iohns and Sweet-Williams. And first of the great Carnation and Cloue Gillofloure.

‡ There are very many kindes both of Gillofloures, Pinkes, and the like, which differ very little in their roots, leaues, seeds, or manner of growing, though much in the colour, shape, and magnitude of their floures; wherof some are of one colour, other some of more; and of them some are striped, others spotted, &c. Now I (holding it a thing not so fit for me to insist vpon these accidentall differences of plants, hauing specifique differences enough to treat of) refer such as are addicted to these commendable and harmelesse delights to suruey the late and oft mentioned Worke of my friend Mr. *John Parkinson*, who hath accurately and plentifully treated of these varieties; and if they require further satisfaction, let them at the time of the year repaire to the garden of Mistresse *Tuggy* (the wife of my late deceased friend Mr. *Ralph Tuggy*) in Westminster, which in the excellencie and varietie of these delights exceedeth all that I haue seene: as also hee himselfe whilest he liued exceeded most, if not all of his time, in his care, industry, and skill in raising, encreasing, and preserving of these plants and some others; whose losse therefore is the more to be lamented by all those that are louers of plants. I will onely giue you the figures of some three or foure more, whereof one is of the single one, which therefore some terme a Pinke, though in mine opinion vnfitly, for that it is produced by the seed of most of the double ones, and is of different colour and shape as they are, varying from them onely in the singleness of the floures. ‡

‡ *Caryophyllus maior & minor, rubro & albo variegati.*
The white Carnation, and Pageant.

‡ *Caryophyllus purpureus profunde laciniatus.*
The blew, or deep purple Gillofloure.

¶ The Description.

THe great Carnation Gillo-floure hath a thicke round woody root, from which riseth vp many strong ioyned stalkes set with long Greene leaues by couples: on the top of the stalkes do grow very faire floures of an excellent sweet smell, and pleasant Carnation colour, whereof it tooke his name.

2 The Cloue Gillofloure differeth not from the Carnation but in greatnesse as well of the floures as leaues. The floure is exceeding well knowne, as also the Pinks and other Gillofloures; wherefore I will not stand long vpon the description.

‡ *Caryophyllus simplex maior.*
The single Gillofloure or Pinke.

¶ The Place.

These Gillofloures, especially the Carnations, are kept in pots from the extremity of our cold Winters. The Cloue Gillofloure endureth better the cold, and therefore is planted in gardens.

¶ The Time.

They flourish and floure most part of the Sommer.

¶ The Names.

The Cloue Gillofloure is called of the later Herbarists *Caryophyllus flos*, of the smell of cloues wherewith it is possessed: in Italian, *Garofoli*: in Spanish, *Clauel*: in French, *Oeillets*: in low-Dutch, *Ginoffelbloemen*: in Latine of most, *Ocellus Damascenus*, *Ocellus Barbaricus*, and *Barbarica*: in English, Carnations, and Cloue Gillofloures. Of some it is called *Vetonica*, and *Herba Tunica*. The which *Bernardus Gordonius* hath set downe for *Dioscorides* his *Polemonium*.

That worthy Herbarist and learned Physiticon of late memorie Mr. Doctor *Turner* maketh *Caryophyllus* to be *Cantabrica*; which *Pliny*, lib. 23. cap. 8. writeth to haue beene found out in Spaine about *Augustus* time, and that by those of Biscay.

Iohannes Ruellius saith, That the Gillofloure was vnknowne to the old writers: whose iudgment is very good, especially because this herbe is not like to that of *Vetonica* or *Cantabrica*. It is maruell, saith he, that such a famous

floure, so pleasant and sweet, should lie hid, and not be made knowne by the old Writers: which may be thought not inferiour to the rose in beauty, smell, and varietie.

¶ The Temperature.

The Gillofloure with the leaues and roots for the most part are temperate in heate and drinesse.

¶ The Vertues.

A The conferue made of the floures of the Cloue Gillofloure and sugar, is exceeding cordial, and wonderfully aboue measure doth comfort the heart, being eaten now and then.

B It preuaileth against hot pestilentiall feuers, expelleth the poyson and furie of the disease, and greatly comforteth the sicke, as hath of late beene found out by a learned Gentleman of Lee in Essex, called Mr. *Rich*.

CHAP. 183. Of Pinks, or wilde Gillofloures.

¶ The Description.

THe double purple Pinke hath many grassie leaues set vpon small ioyned stalkes by couples, one opposite against another, whereupon doe grow pleasant double purple floures,

1 *Caryophyllus sylvestris simplex.*
Single purple Pinks.

2 *Caryophyllus sylvestris simplex, suauerrubens.*
Single red Pinks.

3 *Caryophyllus plumarius albus.*
White jagged Pinks.

4 *Caryophyllus plumarius albus odoratior.*
Large white jagged Pinks.

floures of a most fragrant smell, not inferiour to the Cloue Gillofloure. The root is small and woody.

‡ There is also a single one of this kinde, whose figure I here giue you in stead of the double one of our Author. ‡

2 The single red Pinke hath likewise many small grassie leaues lesser than the former: The floures grow at the top of the small stalkes single, and of a sweet bright red colour.

3 The white iagged Pinke hath a tough woody root: from which rise immediately many grassie leaues, set vpon a small stalke full of ioynts or knees, at euery ioynt two one against another euen to the top; whereupon do grow faire double purple floures of a sweet and spicie smell, consisting of fve leaues, sometimes more, cut or deeply iagged on the edges, resembling a feather: whereupon I gaue it the name *Plumarius*, or feathered Pinke. The seed is soft, blackish, and like vnto Onion seed.

‡ There is another varietie of this, with the leaues somewhat larger and greener than the last mentioned: the floures also are somewhat bigger, more cut in or diuided, and of a much sweeter smell. ‡

4 This purple coloured Pinke is very like the precedent in stalkes, roots, and leaues. The floures grow at the top of the branches lesser than the last described, and not so deeply iagged; of a purple colour tending to blewnesse, wherein consisteth the difference.

There be diuers sorts of Pinks more, whereof to write particularly were to small purpose, considering they are all well knowne to the most, if not to all. Therefore these few shall serue at this time for those that we do keepe in our gardens: notwithstanding I thinke it conuenient to place these wilder sorts in this same chapter, considering their nature and vertues doe agree, and few or none of them be vsed in physicke, besides their neerenesse in kindred and neighbourhood.

4 *Caryophyllus plumarius purpureus*.
Purple jagged Pinks.

5 *Caryophyllus plumarius sylvestris albus*.
Whitewilde jagged Pinks.

5 This wilde iagged Pinke hath leaues, stalkes, and floures like vnto the white iagged Pinke of the garden, but altogether lesser, wherein they especially differ.

6 The purple mountaine or wilde Pinke hath many small grassie leaues: among which rise vp slender stalks set with the like leaues, but lesser; on the top whereof do grow small purple floures, spotted finely with white or else yellowish spots, and much lesser than any of the others before described.

6 *Caryophyllus montanus purpureus.*
Wilde Purple iagged Pinke.

7 *Caryophyllus montanus Clusij.*
Clusius mountaine Pinke.

† 8 *Caryophyllus pumilio Alpinus.*
Dwarfe Mountaine Pinke.

9 *Caryophyllus caeruleus sine Aphyllanthos.*
Leafeles Pinke, or rushy Pinke.

7 The mountaine Pinke of *Clusius* his description hath many leaues growing into a tuft like vnto those of Thrift, and of a bitter taste: amongst which rise vp small slender foot-stalkes, rather than stalkes or stems themselues, of the height of two inches; whereupon do grow such leaues as those that were next the ground, but lesser, set by couples one opposite to another: at the top of each small foot-stalke doth stand one red floure without smell, consisting of five little leaues set in a rough hairy huske or hose five cornered, of a greenish colour tending to purple. The root is tough and thicke, casting abroad many shoots, whereby it greatly encreaseth.

† 8 This for his stature may iustly take the next place; for the stalke is some inch high, set with little sharpe pointed greene grassie leaues: the floures which grow vpon these stalks are composed of five little flesh-coloured leaues a little diuided in their vpper parts: the seed is contained in blacke shining heads, and it is small and reddish, and shaped somewhat like the fashion of a kidney, whereby it comes neerer to the *Lychnides*, than to the *Caryophylli* or Pinkes. The root is long, blacke, and much spreading, whereby this little plant couers the ground a good space together like as a mosse, and makes a curious shew when the floures are blowne, which is commonly in Iune. It

Ddd

floures

10 *Caryophyllus montanus albus.*
White mountaine Pinke.

12 *Caryophyllus Virginicus.*
Maidenly Pinkes.

† 11 *Caryophyllus pratensis.*
Deptford Pinke.

† 13 *Caryophyllus montanus humilis latifolius.*
Small mountaine broad leaved Pink.

‡ 14 *Caryophyllus montanus albus.*
White mountaine Pinke.

15 *Caryophyllus Holostius.*
Wilde Sea Pinke.

16 *Caryophyllus Holostius arvensis.*
Broad leaved wilde Pinke.

‡ 17 *Caryophyl. humilis flor. cand. ameno.*
White Campion Pinke.

It growes naturally on diuers places of the Alpes. *Gesner* called it *Muscus floridus*: *Pona*, *Oci-*
moides Muscosus: and *Clusius*, *Caryophyllus pumilio Alpinus* 9. ‡

9 This leafe-lesse Pinke (as the Greeke word doth seeme to import) hath many small rushy or benty leaues rising immediately from a tough rushy root: among which rise vp stalkes like vnto rushes, of a span high, without any ioynt at all, but smooth and plaine; on the top whereof groweth a small floure of a blewish or sky colour, consisting of foure little leaues somewhat iagged in the edges, not vnlike those of wilde flax. The whole plant is very bitter, and of a hot taste.

10 The white mountaine Pinke hath a great thicke and woody root; from the which immediately rise vp very many small and narrow leaues, finer and lesser than grasse, not vnlike to the smallest rush: among which rise vp little tender stalkes, ioynted or kneed by certaine distances, set with the like leaues euen to the top by couples, one opposite against another: at the top whereof grow pretty sweet smelling floures composed of fve little white leaues. The seed is small and blackish.

11 There is a wilde creeping Pinke which groweth in our pastures neere about London, and in other places, but especially in the great field next to Detford, by the path side as you goe from Redriffe to Greenwich; which hath many small tender leaues shorter than any of the other wilde Pinkes, set vpon little tender stalkes which lie flat vpon the ground, taking hold of the same in fundry places, whereby it greatly encreaseth; whereupon grow little reddish floures. The root is small, tough, and long lasting.

12 This Virgin-like Pinke is like vnto the rest of the garden Pinkes in stalkes, leaues, and roots. The floures are of a blush colour, whereof it tooke his name, which sheweth the difference from the other.

‡ This whose figure I giue you for that small leaued one that was formerly in this place, hath slender stalkes some spanne high, set with two long narrow hard sharpe pointed leaues at each ioynt. The floures (which grow commonly but one on a stalke) consist of fve little snipt leaues of a light purple colour, rough, and deeper coloured about their middles, with two little crooked threds or hornes: the seed is chaffie and blacke: the root long, and creeping: it floures in Aprill and May, and is the *Flos caryophyllus sylvestris* 1. of *Clusius*. ‡

13 *Clusius* mentions also another whose stalkes are some three inches high: the leaues broader, softer, and greener than the former: the floures also that grow vpon the top of the stalkes are larger than the former, and also consist of fve leaues of a deeper purple than the former, with longer haire finely intermixt with purple and white.

‡ 14 This from a hard woody root sends vp such stalks as the former, which are set at the ioynts with short narrower and darker greene leaues: the floures are white, sweet-smelling, consisting of fve much diuided leaues, hauing two threds or hornes in their middle. It floures in May, and it is the *Caryophyllus sylvestris quintus* of *Clusius*. ‡

15 This wilde sea Pinke hath diuers small tender weake branches trailing vpon the ground, whereupon are set leaues like those of our smallest garden Pinke, but of an old hoary colour tending to whitenesse, as are most of the sea Plants. The floures grow at the top of the stalks in shape like those of Stitch-wort, and of a whitish colour. Neither the seeds nor seed-vessels haue I as yet obserued: the root is tough and single.

16 There is another of these wilde Pinkes which is found growing in ploughed fields, yet in such as are neere vnto the sea: it hath very many leaues spred vpon the ground of a fresh green colour; amongst which rise vp tender stalkes of the height of a foot, set with the like leaues by couples at certaine distances. The floures grow at the top many together, in manner of the Sweet-William, of a white, or sometimes a light red colour. The root is small, tough, and long lasting. ‡ This is a kinde of *Gramen Leucanthemum*, or *Holosteum Ruellij*, described in the 38. Chapter of the first booke.

17 *Clusius* makes this a *Lychnis*: and *Lobel* (whom I here follow) a Pinke, calling it *Caryophyllus minimus humilis alter exoticus flore candido amano*. This from creeping roots sendeth vp euery yeare many branches some handfull and better high, set with two long narrow greene leaues at each ioynt: the floures which grow on the tops of the branches are of a pleasing white colour, composed of fve iagged leaues without smell. After the floures are gone there succeed round blunt pointed vessels, containing a small blackish flat seed like to that of the other Pinks. This hath a viscus or clammy iuyce like as that of the *Muscipula's* or Catch-flies. *Clusius* makes this his *Lychnis sylvestris decima*. ‡

¶ The Place.

These kindes of Pinkes do grow for the most part in gardens, and likewise many other sorts, the which were ouer long to write of particularly. Those that be wilde doe grow vpon mountaines, stony rockes, and desart places. The rest are specified in their descriptions.

¶ The

¶ *The Time.*
They floure with the Clove Gillofloure, and often after.

¶ *The Names.*
The Pinke is called of *Pliny* and *Turner*, *Cantabrica* and *Stactice*: of *Fuchsius* and *Dodonæus*, *Vetonica altera*, and *Vetonica altalis*: of *Lobelius* and *Fuchsius*, *Superba*: in French, *Gyrosflees*, *Oeillets*, and *Violettes herbues*: in Italian, *Garofoli*, and *Garoni*: in Spanish, *Clavis*: in English, *Pinkes*, and *Small Honesties*.

¶ *The Temperature.*
The temperature of the Pinkes is referred vnto the Clove Gillofloures.

¶ *The Vertues.*
These are not vsed in Physicke, but esteemed for their vse in Garlands and Nosegaies. They are good to be put into Vineger, to giue it a pleasant taste and gallant colour, as *Ruellius* writeth. *Fuchsius* saith, that the roots are commended against the infection of the plague; and that the iuice thereof is profitable to waste away the stone, and to driue it forth: and likewise to cure them that haue the falling sicknesse.

CHAP. 184. Of Sweet Saint Johns and Sweet Williams.

1 *Armeria alba.*
White Iohns.

2 *Armeria alba & rubra multiplex.*
Double white and red Iohns.

¶ *The Description.*
1 Sweet Iohns haue round stalkes as haue the Gillofloures, (whereof they are a kinde) a scubit high, whereupon do grow long leaues broader than those of the Gillofloure; of a greene grassie colour: the floures grow at the top of the stalkes, very like vnto Pinkes, of a perfect white colour.

2 The second differeth not from the other but in that, that this plant hath red floures, and the other white.

We haue in our London gardens a kinde hereof bearing most fine and pleasant white floures, spotted very confusedly with reddish spots, which setteth forth the beauty thereof; and hath bin taken of some (but not rightly) to be the plant called of the later Writers *Superba Austriaca*, or the Pride of Austria. ‡ It is now commonly in most places called London-Pride. ‡

† Wee haue likewise of the same kinde bringing forth most double floures, and these either very white, or else of a deepe purple colour.

3 *Armeria rubra latifolia.*
Broad leaued Sweet-Williams.

4 *Armeria suauis rubens.*
Narrow leaued Sweet-Williams.

3 The great Sweet-William hath round ioyned stalkes thicke and fat, somewhat reddish about the lower ioyns, a cubit high, with long broad and ribbed leaues like as those of the Plantaine, of a greene grassie colour. The floures at the top of the stalkes are very like to the small Pinkes, many ioyned together in one tuft or spoky vmbel, of a deepe red colour: the root is thick and woody.

4 The narrow leaued Sweet-William groweth vp to the height of two cubits, very wel resembling the former, but lesser, and the leaues narrower: the floures are of a bright red colour, with many small sharpe pointed grassie leaues standing vp amongst them, wherein especially consisteth the difference.

‡ 5 This little fruitfull Pinke (whose figure our Author formerly gaue in the first place of the next chapter saue one) hath a small whitish woody root, which sends forth little stalks some handfull and better high; and these at each ioynt are set with two thinne narrow little leaues: at the top of each of these stalkes growes a single skinny smooth shining huske, out of which (as in other Pinkes) growes not one onely floure, but many, one still comming out as another withers; so that oft times out of one head come seuen, eight, or nine floures one after another, which as they fade leaue behinde them a little pod containing small blacke flattish seed. The floure is of a light red, and very small, standing with the head somewhat far out of the huse or huske. ‡

¶ The Place.

These plants are kept and maintained in gardens more for to please the eye, than either the nose or belly.

¶ The

‡ 5 *Armeria prolifera*, Lob.
Childing sweet Williams.

¶ The Time.

They flourish and bring forth their floures in April and May, somewhat before the Gillofloures, and after beare their floures the whole Sommer.

¶ The Names.

The sweet Iohn, and also the sweet William are both comprehended vnder one title, that is to say, *Armeria*: of some, *Superba*, and *Caryophyllus sylvestris*: of some Herbarists, *Veronica agrestis*, or *Sylvestris*: of some, *Herba tunica*: but it doth no more agree herewith than the Cloue Gillofloute doth with *Veronica altera*, or *Polemonium*: in French, *Armoires*: hereupon *Ruellius* nameth them *Armerij floures*: in Dutch, *Keykens*: as though you should say, a bundell or cluster, for in their vulgar tongue bundles of floures or nosegaies they call *Keykens*: doubtlesse they are wild kindes of Gillofloures: In English the first two are called Sweet Iohns, and the two last, Sweet Williams, Tolmeiners, and London Tufts.

¶ The Temperature and Vertues.

These plants are not vsed either in meat or medicine, but esteemed for their beauty to decke vp gardens, the bosomes of the beautiful, garlands and crownes for pleasure.

CHAP. 185. Of Crow floures, or Wilde Williams.

¶ The Description.

1 BESIDES these kindes of Pinkes before described, there is a certaine other kinde, either of the Gillofloures or else of the Sweete Williams, altogether and euery where wilde, which of some hath beene inserted amongst the wilde Campions; of others taken to be the true *Flos Cuculi*. Notwithstanding I am not of any of their mindes, but doe hold it for neither: but rather a degenerate kinde of wilde Gillofloure. The Cuckow floure I haue comprehended vnder the title of *Sisymbrium*: Englished, Ladies smocks; which plant hath been generally taken for *Flos Cuculi*. It hath stalks of a span or a foot high, wherupon the leaues do stand by couples out of euery ioint; they are small and bluntly pointed, very rough and hairy. The floures are placed on the tops of the stalkes, many in one tuft, finely and curiously snipt in the edges, lesser than those of Gillofloures, very well resembling the Sweet VWilliam (whereof no doubt it is a kinde) of a light red or Scarlet colour.

2 This female Crow-floure differeth not from the male, sauing that this plant is lesser, and the floures more finely iagged like the feathered Pinke, whereof it is a kinde.

3 Of these Crow-floures we haue in our gardens one that doth not differ from the former of the field, sauing that the plant of the garden hath many faire red double floures, and those of the field single.

¶ The Place.

These grow all about in Medowes and pastures, and dankish places.

¶ The

1 *Armoraria pratensis mas.*
The male Crow-floure.

3 *Armoraria pratensis flore pleno.*
The double Crow-floure.

¶ The Time.

They begin to floure in May, and end in June.

¶ The Names.

The Crow floure is called in Latine *Armoraria sylvestris*, and *Armoracia*: of some, *Flos Cuculi*, but not properly; it is also called *Tunix*: of some, *Armeria*, *Armerius flos primus* of Dodon. and likewise *Caryophyllus minor sylvestris folijs latioribus*: in Dutch, *Craeynbloemkens*: that is to say, *Cornicis flores*: in French, *Cuydrelles*. In English, Crow floures, wilde Williams, marsh Gillofloures, and Cockow Gillofloures.

The Temperatures and Vertues.

These are not vsed either in medicine or in nourishment: but they serue for garlands & crowns, and to decke vp gardens.

CHAP. 186. Of Catch-Flie, or Limewoort.

¶ The Description.

THIS plant, called *Viscaria*, or Lymewoort, is likewise of the stocke and kindred of the wilde Gillofloures: notwithstanding *Clusius* hath ioined it with the wilde Campions, making it a kinde thereof, but not properly. *Lobel* among the Sweet Williams, whereof doubtlesse it is a kinde. It hath many leaues rising immediately from the root like those of the Crow floure, or wilde sweet VWilliam: among which rise vp many reddish stalkes ioined or kneed at certaine spaces, set with leaues by couples one against another: at the top whereof come forth prettie red floures, which being past there commeth in place small blackish seed. The root is large with many fibres. The whole plant, as well leaues and stalkes, as also the floures, are here and there couered ouer with a most thick and clammie matter like vnto Bird-lime, which if you take in your hands,

† 1 *Viscaria, sine Muscipula.*
Limewoort.

2 *Muscipula Lobelij.*
Catch Flie.

‡ 3 *Muscipula angustifolia.*
Narrow leaved Catch-flie.

hands, the sliminess is such, that your fingers will stick and cleave together, as if your hand touched Bird-lime: and furthermore, if flies do light vpon the same, they will be so intangled with the liminess, that they cannot flie away; inso much that in some hot day or other you shal see many flies caught by that means. VWhereupon I haue called it Catch Flie, or Limewoort. ‡ This is *Lychnis syl. 3. of Clusius*; *Viscago* of *Camerarius*; and *Muscipula sine Viscaria* of *Lobel*. ‡

2 This plant hath many broad leaues like the great sweet VVilliam, but shorter (whereof it is likewise a kinde) set vpon a stiffe and brittle stalk, from the bosom of which leaues, spring forth smaller branches, clothed with the like leaues, but much lesser. The floures grow at the top of the stalkes many together tuft fashion, of a bright red colour. The whole plant is also possessed with the like liminess as the other is, but lesse in quantitie. ‡ This is *Lychnis syl. 1. of Clusius*; and *Muscipula sine Armeria altera* of *Lobel*: *Dodonaeus* calls it *Armerius flos* 3. in his first Edition: but makes it his fourth in the last Edition in *Folio*. ‡

‡ 3 There is also belonging vnto this kindred another plant which *Clusius* makes his *Lychnis syl. 4.* It comes vp commonly with one stalke a foot or more high, of a green pur-

lish

plish colour, with two long sharpe pointed thicke green leaues, set at each ioint: from the middle to the top of the stalke grow little branches, which vpon pretty long stalkes carry floures consisting of fve little round leaues, yet diuided at the tops; they are of a faire incarnate colour, with a deepe purple ring in their middles, without smell: after the floures are past succcede skinny and hard heads, smaller towards the stalkes, and thicker aboue; and in these are contained verie small darke red seeds. The root is thicke and blacke; with many fibers, putting vp new shootes and stalks after the first yeare, and not dying euery yeare like as the two last described.

¶ The Place.

These plants do grow wilde in the fields in the VVest parts of England, among the corne: wee haue them in our London gardens rather for toyes of pleasure, than any vertues they are possessed with, that hath as yet been knowne.

¶ The Time.

They floure and flourish most part of the Sommer.

¶ The Names.

Catch Flies hath beene taken for *Behen*, commonly so called, for the likenesse that it hath with *Behen rubente flore*: or with *Behen* that hath the red floure, called of some *Valeriana rubra*, or red Valerian; for it is something like vnto it in iointed stalkes and leaues, but more like in colour: of *Lobel*, *Muscipula* and *Viscaria*: of *Dodon*. *Armerius flos tertius*: of *Clusius*, *Lychnis sylvestris*, *Silene Theophrasti*, and *Behen rubrum Salamanticum*: in English, Catch Flie, and Limewoort.

¶ The Nature and Vertues.

The nature and vertues of these wilde VVilliams are referred to the Wilde Pinkes and Gillofloures.

† Our Authour certainly intended in this first place to figure and describe the *Muscipula* or *Viscaria* of *Lobel*, but the figure he here gaue in the first place was of that plant which I haue giuen you in the last Chapter saue one by the name of *Armeria prolifera Lobeli*. The figure which belonged to this place was in the Chapter of wilde Campions, vnder the title of *Lychnis sylvestris incana*.

CHAP. 187. Of Thrift, or our Ladies Cushion.

1 *Caryophyllus marinus minimus Lobelij*.
Thrift or Sea Gillofloure.

2 *Caryophyllus Mediterraneus*.
Leuant Thrift, or Sea Gillofloure.

¶ The

¶ The Description.

1 Thrift is also a kind of Gillofloure, by *Dodonæus* reckoned among grasses, which brings forth leaues in great tufts, thick thrust together, smaller, slenderer, & shorter than grasse: among which rise vp small tender stalkes of a spanne high, naked and without leaues; on the tops wherupon stand little floures in a spokie tuft, of a white colour tending to purple. The root is long and threddie.

The other kinde of Thrift, found vpon the mountaines neere vnto the Leuant or Mediterranean sea, differeth not from the precedent in leaues, stalkes, or floures, but yet is altogether greater, and the leaues are broader.

¶ The Place.

2 The first is found in the most salt marshes in England, as also in Gardens, for the bordering vp of beds and bankes, for the which it serueth very fitly. The other is a stranger in these Northerne Regions.

¶ The Time.

They floure from May, till Sommer be far spent.

¶ The Names.

Thrift is called in Latine *Gramen Polyanthemum*, of the multitude of the floures: of some, *Gramen marinum*: of *Lobel*, *Caryophyllus Marinus*: In English, Thrift, Sea-grasse, and our Ladies Cushion.

¶ The Temperature and Vertues.

Their vse in Physicke as yet is not knowne, neither doth any seeke into the Nature thereof, but esteeme them onely for their beautie and pleasure.

CHAP. 188: Of the Saxifrage of the Antients, and of that great one of Matthioli, with that of Pena and Lobel.

† This name *Saxifraga* or Saxifrage, hath of late been imposed vpon sundry plants farre different in their shapes, places of growing, & temperature, but all agreeing in this one facultie of expelling or driving the stone out of the Kidneies, though not all by one meane or manner of operation. But because almost all of them are described in their fit places by our Authour, I will not insist vpon them: yet I thinke it not amisse a little to enquire, whether any *Saxifraga* were knowne to the Antients; and if knowne, to what kinde it may probably be referred. Of the Antients, *Dioscorides*, *Paulus Aegineta*, and *Apuleius*, seeme to mention one *Saxifraga*, but *Pliny*, lib. 22. cap. 21. by the way, shewes that some called *Adiantum* by the name of *Saxifragum*: but this is nothing to the former; wherefore I will not insist vpon it, but returne to examine that the other three haue written thereof. *Diosc. lib. 4.* betweene the Chapters of *Tribulus* and *Limonium*, to wit, in the seuenteenth place hath deliuered the Historie of this plant, both in the Greeke Edition of *Aldus Manutius*, as also in that of *Marcellus Virgilius*, yet the whole Chapter in the Paris Edition, 1549, is reiected and put amongst the *Notha*. The beginning thereof (against which they chiefly except) is thus: *Σαξίφραγον, ἢ δὲ σαρξίφραγον, ἢ σαρξίφραγον, ἢ σαρξίφραγον.* (1) *Sarxi-phagon*, alij vero *Sarxi-fragon*, alij vero *Empetron*, *Romani*, *Sarxi-franga*. The first exception of *Marcellus Virgilius* against this Chapter is *Peregrina Græcis & aliena vox Saxifraga est, &c.* The second is, *Quod multo feliciores in componendis ad certiore rei alicuius significationem vocibus Græci, quam Latini, &c.* The third is, *Solum in toto hoc opere primam, & a principio propositam audiri Romanam vocem, tamque inopes in appellanda hac herba fuisse Græcos, ut nisi Romana voce eam indicassent, nulla sibi futura esset.* These are the arguments which he vses against this Chapter, yet reiects it not, but by this means hath occasioned others without shewing any reason, to doe it: Now I will set downe what my opinion is concerning this matter, and so leaue it to the iudgement of the Learned. I grant *Marcellus*, that *Saxifraga* is a strange and no Greeke word; but the name in the title, and first in the Chapter both in his owne Edition and all the Greeke Editions that I haue yet seene is *Σαξίφραγον*, which none, no not he himselfe can denie to haue a Greeke originall *ἐκ τῆς αἰτίας τοῦ γένους*. of eating the flesh: yet because there is no such facultie as this denomination imports attributed thereto by the Authour, therefore hee will not allow it to be so. But you must note that many names are imposed by the vulgar, and the reason of the name not alwaies explained by those that haue written of them, as in this same Author may be seene.

seene in the Chapters of *Catanance*, *Cynosbatos*, *Hemerocallis*, *Cratægonon*, and diuers others, which are or seeme to be significant, and to import something by their name; yet he saith nothing thereof. It maybe that which they would expresse by the name, was, that the hearbe had so piercing a facultie that it would eat into the very flesh. The second and third Argument both are answered, if this first word be Greeke, as I haue already shewed it to be; and there are not many words in Greeke that more frequently enter into such composition than *φαγω*: as *Pamphagos*, *Polyphagos*, *Opsiphagos*, and many other may shew. Moreouer, it hath beene obsurd from *Dioscorides*, or any else how simple soeuer they were, if they had knowne the first word to haue beene Latine and *Saxifraga*, to say againe presently after that the Romanes called it *Saxifraga*, or *Saxifraga*, for so it should be, and not *Saxifrangia*: but I feare that the affinitie of sounds more than of signification hath caused this confusion, especially in the middle times betweene vs and *Dioscorides*, when learning was at a very low ebbe. The chiefe reasons that induce mee to thinke this Chapter worthie to keepe his former place in *Dioscorides*, are these: First, the generall consent of all both Greeke and Latine copies (as *Marcellus* saith) how antient soeuer they be. Secondly, the mention of this herbe for the same effect in some Greeke Authours of a reasonable good antiquitie; for *Paulus Aegineta* testifieth that *Σαξίφραγας* *διουρητικόν τε ὅτι καὶ λίθον διαλύει*. Then *Trallianus* amongst other things in a *Conditum Nephriticum* mentions *Σαξίφραγας*: but *Nonius* a later Greeke calls it *Σαξίφραγας*: so that it is euident they knew and vsed some simple medicine that had both the names of *Saxiphagum* and *Saxiphragos*, which is the Latine *Saxifraga*. Now seeing they had, and knew such a simple medicine, it remaines we enquire after the shape and figure thereof. *Dioscorides* describes it to be a shrubby plant, growing vpon rockes and craggie places, like vnto *Epithymum*: boiled in wine and drunke, it hath the faculty to helpe the Strangurie and Hicket; it also breakes the stone in the bladder and prouokes vrine. This word *Epithymum* is not found in most copies, but a space left for some word or words that were wanting: But *Marcellus* saith, he found it exprest in a booke which was *Omnium vetustissimus & probatissimus*: and *Hermolaus Barbarus* saith, *Veterem in Dioscoride picturam huius herba vidi, non plus folijs quam cirris minutis per ramos ex intervallo conditis, nec frequentibus, in cacumine surculorum flocci seu arentes potius quam flosculi, subrubida radice non sine fibris*. A figure reasonable well agreeing with this description of *Hermolaus*, I lately receiued from my friend Mr. *Goodyer*, who writ to me that he had sought to know what *Saxifraga* (to wit, of the Antients) should be; and finding no antient Authour that had described it to any purpose, he sought *Apuleius*, which word *Apuleius* (saith he) is the printed title: my Manuscript acknowledgeth no Authour but *Apoliensis Plato*; there is no description neither, but the Manuscript hath a figure which I haue drawne and sent you, and all that *verbatim* that hee hath written of it, I should be glad to haue this figure cut and added to your worke, together with his words, because there hath beene so little written thereof by the Antients. This his request I thought fit to performe, and haue (for the better satisfaction of the Reader) as you see made a further enquire thereof: wherefore I will onely adde this, that the plants here described, and the *Alfine Saxifraga* of *Colum.* together with the two Chickweed *Saxifrages* formerly described Chap. 171. come neereft of any that I know to the figure and deliniation of this of the Antients.

Nomen istius herbe, Saxifraga.

Icon & descriptio ex Manuscripto vetustissimo.

Quidam dicunt eam Scolopendriam, alij Scoliomos, alij Vitis canum, quidam vero Brucos. Itali Saxifragam. Egyptij Peperem, alij Lamprocam eam nominant. Nasitur enim in Montibus & locis saxosis.

Vna cura ipsius ad calculos expellendos.

Herbam istam Saxifragam confusam calculoso potum dabis in vino. Ipse vero si febricitauerit cum aqua calida, tam presens effectum ab expertis traditum, ut eodem die perfectus cietis, etisque calculis ad sanitatem usque producit.

This first little herb, saith *Cameraarius*, hath been called *Saxifraga magna*, not from the greatnesse of his growth, but of his faculties: The stalke is wooddie, writhen

written, and below sometimes as thicke as ones little finger, from which grow many small & hard branches, and those slender ones; the leaues are little, long and sharpe pointed: the floures are white and small, and grow in cups, which are finely snipt at the top in manner of a coronet, wherein is contained a small red seed: the rootes grow so fast impect in the Rockes, that it cannot by any meanes be got out. It grows vpon diuers rocks in Italy and Germany; and it is the *Saxifraga magna* of Matthiolus, and the Italians.

† 1 *Saxifraga magna Matthioli.*

Matthiolus his great Saxifrage.

† 2 *Saxifraga Antiquorum, Lob.*

Saxifrage of the Antients, according to Lob.

2 Pena and Lobel say, this growes in great plenty in Italie, in Dolphonie in France, and England, hauing many small slender branches a foot high, intricately wrapped within one another, where they are set with many grassie ioynts: the roote is small and white with some few fibers: the leaues stand by couples at the ioynts, beeing long and narrow; of the bignesse and similitude of those of the wilde Pinks, or Rocke Sauorie: vpon each wooddie, small, capillarie, straight, and creeping little branch, growes one little floure somewhat like a Pinke, beeing finely snipt about the edges: and

in the head is contained a round small reddish seed. The foresaid Authours call this *Saxifraga*, siue *Saxifraga Antiquorum*.

The Vertues.

1 Matthiolus saith, that *Calceolarius* of Verona mightily commended this plant to him, for the singular qualitie it had to expell or driue forth the stone of the Kidneies, and that I might in verie deed beleue it, he sent me abundance of stones, whereof diuers exceeded the bignesse of a beane, which were voided by drinking of this plant by one onely Citizen of Verona, called *Hieronymo de Tortis*; but this made me most to wonder, for that there were some stones amongst them, that seemed rather to come out of the Bladder, than forth of the Kidneies.

2 This (say the Authours of the *Aduers.*) as it is the latest receiued in vse and name for Saxifrage, so is it the better & truer, especially so thought by the Italians, both for the highly commended facultie, as also for the neere affinitie which it seemes to haue with *Epithymum*, &c. †

Eee

CHAP.

CHAP. 189. Of Sneefewoort.

¶ The Description.

1 **T**He small Sneefe-woort hath many round and brittle branches, beset with long and narrow leaues, hackt about the edges like a saw; at the tops of the stalks do grow small single floures like the wilde field Daisie. The root is tender and full of strings, creeping far abroad in the earth, and in short time occupieth very much ground: the whole plant is sharpe, biting the tongue and mouth like Pellitorie of Spaine, for which cause some haue called it wilde Pellitorie. The smell of this plant procureth sneefing, whereof it tooke the name *Sternutamentoria*, that is the herbe which doth procure sneefing, or Neefewoort.

2 Double floured Sneefewoort, or *Ptarmica*, is like vnto the former in leaues, stalks, and roots, so that vnlesse you behold the floure, you cannot discern the one from the other, and it is exceeding white, and double like vnto double Fetherfew. This plant is of great beautie, and if it be cut downe in the time of his flouring, there will come within a month after a supplie or crop of floures fairer than the rest.

1 *Ptarmica*.
Sneefewoort.

2 *Ptarmica duplici flore*.
Double floured Sneefewoort.

3 There is also another kind hereof, of exceeding great beauty, hauing long leaues somewhat narrow like those of Oliue tree: the stalks are of a cubit high, on the top whereof doe growe verie beautifull floures of the bignes of a small single Marygold, consisting of fiftene or sixteene large leaues, of a bright shining red colour tending to purple; set about a ball of thrummie substance, such as is in the middle of the Daisie, in manner of a pale; which floures stand in scalie knops like those of Knapweed, or Matfellow. The root is straight, and thrusteth deepe into the ground.

† *Ptarmica Imperati*; an *Ptarmica Austriaca* species Clus. Cur. post. p. 32.

4 This riseth vp with a small hard tough cornered whitish woolly stalke, diuided into many branches,

3 *Ptarmica Austriaca*.
Sneefewoort of Austrich.

branches, and those againe diuided into other branches like those of *Cyanus* about two foot high; wherein grow long narrow whitish Cottonie leaues out of order, of a bitter taste, whiter below than aboue, of the colour of the leaues of Wormwood, hauing but one rib or sinew & that in the middle of the leafe, and commonly turne downwards: on the top of each slender branch groweth one small scalie head or knap, like that of *Cyanus*, which bringeth forth a pale purple floure without smell, containing fixe, seuen, eight, or more, smal hard drie sharp pointed leaues: in the middle whereof groweth many stiffe chiues, their tops being of the colour of the floures: these floures fall not away till the whole hearbe perisheth, but change into a rustie colour: amongst those chiues grow long flat blackish seed, with a little beard at the top. The root is small, whitish, hard and threddie, and perisheth when the seed is ripe, and soone springeth vp by the fall of the seede, and remaineth greene all the Winter, and at the Spring sendeth forth a stalke as aforesaid. The herbe touched or rubbed sendeth forth a pleasant aromaticall smell. Iuly 26. 1620. John Goodyer.†

¶ The Place.

The first kinde of Sneefewoort grows wilde in drie and barren pastures in many places, and in the three great fieldes next adioyning to a

Village neere London called Kentish towne, and in sundry fieldes in Kent about Southfleet.

† The rest grow onely in gardens.

¶ The Time.

They floure from May to the end of September.

¶ The Names.

Sneefewoort is called of some *Ptarmica*, and *Pyrethrum sylvestre*, and also *Draco sylvestris*, or *Tarcon sylvestris*: of most, *Sternutamentoria*, taken from his effect, because it procureth sneezing: of *Fragus* & *Tabern. Tanacetum acutum album*: in English, wilde Pellitorie, taking that name from his sharp and biting taste; but it is altogether vnlike in proportion to the true Pellitorie of Spaine.

¶ The Nature.

They are hot and drie in the third degree.

¶ The Vertues.

The iuice mixed with Vineger and holden in the mouth easeth much the paine of the Tooth-ache. A

The herbe chewed and holden in the mouth, bringeth mightily from the braine slimie flegme, B like Pellitorie of Spaine, and therefore from time to time it hath beene taken for a wilde kinde thereof.

CHAP. 190. Of Hares Eares.

¶ The Description.

1 N Arrow leaved Hares Eares is called in Greeke *Βαμνίσκος*, and is reputed of the late writers to be *Bupleurum Plinij*, from which the name or figure disagreeeth not: it hath the long narrow and grassie leaues of *Lachryma Iob*, or *Gladiolus*, streaked or balked as it were with sundry stiffe streakes or ribbes running along euery leafe, as *Plinie* speaketh of his

his *Heptapleurum*. The stalkes are a cubite and a halfe long, full of knots or knees, very rough or stiffe, spreading themselues into many branches: at the tops whereof grow yellow floures in round tufts or heads like Dill. The root is as big as a finger, and blacke like *Peucedanum*, whereunto it is like in taste, smell, and resemblance of seede, which doth the more persuaide me that it is the true *Bupleurum*, whereof I now speake, and by the authoritie of *Nicander* and *Pliny* confirmed.

1 *Bupleurum angustifolium* *Monspeliense*.
Narrow leaved Hares Eare.

2 *Bupleurum latifolium* *Monspeliense*.
Broad leaved Hares Eare.

2 The second kinde called broad leaved Hares Eares, in figure, tuftes, and floures, is the very same with the former kinde, save that the leaues are broader and stiffer, and more hollow in the midst: which hath caused me to call it Hares Eares, hauing in the middle of the leafe some hollownesse resembling the same. The root is greater and of a wooddie substance.

¶ The Place.

They grow among Oken woods in stony and hard grounds in Narbon. I haue found them growing naturally among the bushes vpon Biefton castle in Cheshire.

¶ The Time.

They floure and bring forth their seed in Iuly and August.

¶ The Names.

Hares Eare is called in Latine *Bupleurum*: in Greeke, *Βουπλευρον*: the Apothecaries of Montpelier in France do call it *Auricula leporis*, and therefore I terme it in English Hares-Eare: *Valerius Cordus* nameth it *Isophyllon*, but whence he had that name, it is not knowne.

¶ The Temperature.

They are temperate in heat and drinesse.

¶ The Vertues.

A *Hippocrates* hath commended it in meats, for sallads and Pot-hearbs: but by the authoritie of *Glaucan* and *Nicander*, it is effectuell in medicine, hauing the taste and fauour of *Hypericon*, seruing in the place thereof for wounds, and is taken by *Tragus* for *Panax Chironium*, who doth reckon it inter *Herbas vulnerarias*.

The

The leaues stamped with salt and wine, and applied, doe consume and drue away the swelling B
of the neck, called the Kings euill, and are vsed against the stone and Grauell.

CHAP. 191. Of Gromell.

¶ The Description.

1 **T**He great Gromell hath long, slender and hairie stalkes, beset with long, browne & hoarie leaues; among which grow certaine bearded huskes, bearing at the first small blew floures, which being past, there succeedeth a gray stonie seed somewhat shining. The root is hard, and of a wooddie substance.

2 The second kinde of Gromell hath straight, round, wooddie stalks, full of branches: The leaues long, small, and sharpe, of a darke Greene colour, smaller than the leaues of great Gromell: among which come forth little white floures; which being past, there doth follow such seed as the former hath, but smaller.

† 3 There is another kinde of Gromell, which hath leaues and stalkes like the small kinde: the seed is not so white, neither so smooth and plaine, but somewhat shrieled or wrinckled. The leaues are somewhat rough like vnto the common Gromell, but the floures are of a purple colour, and in shape like those of that wilde kinde of Buglosse, called *Anchusa*, for which cause it carrieth that additament *Anchusæ facie*.

4 There is also a degenerate kinde hereof called *Anchusa degener*, being either a kinde of wilde Buglosse, or a kinde of wilde Gromell, or else a kinde of neither of both, but a plant participating of both kinds: it hath the seeds and stalkes of *Milium folis*, or Gromell: the leaues and rootes of *Anchusa*, which is Alkanet, and is altogether of a red colour like the same.

1 *Lithospermum maius*.
Great Gromell.

2 *Lithospermum minus*.
Small Gromell.

‡ 3 *Lithospermum Anchusa facie.*
Purple flowered Gromell.

‡ 4 *Anchusa degener facie Milij solis.*
Bastard Gromell.

¶ *The Place.*

The two first kindes do grow in vntoiled places, as by the high waies sides, and barren places, in the street at Southfleet in Kent, as you goe from the church vnto an house belonging to a gentleman of worship, called Mr. *William Swan*, and in sundry other places.

The two last kindes grow vpon the sands and Bach of the Sea, in the isle of Thanet neere Reculvers, among the kindes of wilde Buglosse there growing.

¶ *The Time.*

They floure from the Sommer Solstice, or from the twelfth day of Iune euen vnto Autumne, and in the meane season the seed is ripe.

¶ *The Names.*

Gromell is called in Greeke *Λιθόσπερμον*, of the hardnesse of the seed: of diuers, *Gorgonium*: of others, *Aegonychon*, *Leontion*, or *Diosporon*, or *Diospyron*, as *Plinie* readeth it, and also *Heracleos*: of the Arabians, *Milium soler*: in shops, and among the Italians, *Milium solis*: in Spanish, *Mijo del sol*: in French, *Gremill*, and *Herbe aux perles*: in English, Gromell: of some, Pearle plant; and of others, Lichwale.

¶ *The Temperature.*

The seed of Gromell is hot and drie in the second degree.

¶ *The Vertues.*

A The seed of Gromell pound, and drunke in White wine, breaketh, dissolueth, and driueth forth the stone, and prouoketh vrine, and especially breaketh the stone in the bladder.

CHAP. 192 Of Chickweed.

¶ *The Description.*

i The great Chickweede riseth vp with stalkes a cubit high, and sometime higher, a great many from one roote, long and round, slender, full of ioints, with a couple of leaues growing

growing out of euery knot or ioynt about an inch broad, and longer than the leaues of Pellitorie of the wall, whereunto they are very like in shape, but smooth without haire or downe, and of a light greene colour: the stalkes are something cleere, and as it were transparent or thorow-shining, and about the ioynts they be oftentimes of a very light red colour, as be those of Pellitorie of the wall: the floures be whitish on the top of the branches, like the floures of Stitchwort, but yet lesser: in whose places succeed long knops, but not great, wherein the seed is contained. The root consisteth of fine little strings like haire.

2 The second Chickweed for the most part lyeth vpon the ground: the stalkes are small, slender, long, and round, and also ioynted: from which slender branches do spring leaues resembling the precedent, but much lesser, as is likewise the whole herbe, which in no respect attaineth to the greatnes of the same: the floures are in like sort little and white: the knops or seed-heads are like the former: the root is also full of little strings.

1 *Alfne maior.*
Great Chickweed.

2 *Alfne minor, sive media.*
Middle or small Chickweed.

3 The third is like the second, but farre lesser: the stalkes be most tender and fine: the leaues are very small, the floures very little, the root maruellous slender.

4 Also there is a fourth kinde which groweth by the sea: this is like to the second, but the stemmes are thicker, shorter, and fuller of ioynts: the leaues in like sort be thicker: the knops or seed-heads be not long and round, but somewhat broad, in which are three or foure seeds contained.

5 The vpright Chickweed hath a very small single threddy root, from which riseth vp a slender stemme, diuiding it selfe into diuers branches euen from the bottome to the top; whereon do grow small leaues, thicke and fat in respect of the others, in shape like those of Rue or Herbe-Grace. The floures grow at the top of the branches, consisting of foure small leaues of a blew colour.

6 The stone Chickweed is one of the common Chickweeds, hauing very threddy branches couering the ground farre abroad where it groweth: the leaues be set together by couples: the floures be small and very white: the root is tough and very slender.

7 Speedwell

3 *Alsine minima.*
Fine Chickweed.

4 *Alsine marina.*
Sea Chickweed.

5 *Alsine recta.*
Right Chickweed.

6 *Alsine Petrea.*
Stone Chickweed.

7 *Alfne folijs Veronica.*
Speed-well Chickweed.

8 *Alfne fontana.*
Fountaine Chickweed.

9 *Alfne fluvialis.*
Riuer Chickweed.

10 *Alfne palustris.*
Marsh Chickweed.

7 Speedwel Chickweed hath a little tender stalk, from which come diuers small armes or branches as it were wings, set together by couples; whereon do grow leaues set likewise by couples, like those of *Veronica*, or herbe Fluellen, whereof it tooke his name. The floures grow along the branches of a blew colour; after which come little pouches wherein is the seed: the root is small, and likewise threddy. This in the *Hist. Lugd.* is called *Elatine polyschides*: and *Fabius Columna* iudgeth it to be the *Alysson* of *Dioscorides*. ‡

8 There is a kind of Chickweed growing in the brinks and borders of Wells, Fountains, & shallow Springs, hauing many threddy roots from which rise vp diuers tender stalks, whereupon doe grow long narrow leaues; from the bosomes of which come forth diuers smaller leaues of a bright Greene colour. The floures grow at the top of the stalkes, small, and white of colour.

9 There is likewise another water Chickweed smaller than the last described, hauing for his root a thicke hasslocke or tuft of threddy strings: from which rise vp very many tender stems, stretching or trailing along the streame; whereon do grow long leaues set vpon a middle rib, like those of Lentils or wilde Fetch: the floures and seeds are like the precedent, but much smaller.

‡ 11 *Alsine rotundifolia, sine Portulaca aquatica.*
Water Purslane.

‡ 12 *Alsine palustris serpillifolia.*
Creeping water Chickweed.

13 *Alsine baccifera.*
Berry-bearing Chickweed.

10 There growes in the marish or waterish grounds another sort of Chickweed, not much vnlike the rest of the stocke or kindred of Chickweeds. It hath a long root of the bignesse of a wheat straw, with diuers strings hanging thereat, very like the root of Couch-grasse: from the which riseth vp diuers vpright slender stalkes, set with pretty large sharpe pointed leaues standing by couples at certaine distances: on the top of the stalkes grow small white floures like those of Storchwort, but lesser, and of a white colour.

‡ 11 To these water Chickweeds may fitly be added those two which I mentioned and figured in my last iournall: the former of which, that I haue there called *Alsine aquatica folijs rotundioribus, sine Portulaca aquatica*, (that is) Round leaued Chickweed, or water Purslane, hath a small stringy root which sends forth diuers creeping square branches, which here and there at the ioynts put

put out small fibres, and take root againe: the leaues grow at the ioynts by couples, somewhat longish, and round at the points, resembling those of Purslane, but much smaller, and of a yellowish greene colour: at the bosomes of the leaues come forth little floures, which are succeeded by little round seed-vessels containing a small round seed. *Bauhine* hath set this forth by the name of *Alsine palustris minor folijs oblongis*.

12 The otherwater Chickweed, which *John Bauhine* hath mentioned by the name of *Serpillifolia*; and *Casper Bauhine* by the title of *Alsine palustris minor Serpillifolia*, hath also weake and tender creeping branches lying spred vpon the ground; set with two narrow sharp pointed leaues at each ioynt, greene aboue, and of a whitish colour below: at the setting on of these leaues grow small vessels parted as it were into two, with a little crest on each side, and in these is contained a verie small seed. Both these may be found in waterie places in Iuly and August, as betweene Clapham heath and Touting, and betweene Kentish towne and Hampstead.

13 This Plant that *Clusius* and others haue called *Alsine repens major*, and some haue thought the *Ciclamnus altera* of *Dioscorides*; and *Cucubalus* of *Pliny*, may fitly be put in this ranke; for it sendeth vp many long weake branches like the great Chickweed, set with two leaues at a ioynt, bigger than those of the greatest Chickweed, yet like them in shape and colour: at the tops of the branches, out of pretty large cups come whitish greene floures, which are succeeded by berries as big as those of Iuniper, at first greene, but afterwards blacke: the seed is small and smooth: the root white, very fibrous, long and woody, and it endures for many yeares. It floures most part of Sommer, and growes wilde in sundry places of Spaine and Germany, as also in Flanders and England, according to *Pena* and *Lobel*: yet I haue not seene it growing but in the garden of my friend Mr. *Pemble* at Marribone. The Authors last mentioned affirme the berries hereof to haue a poysonous facultie like as those of Dwalé or deadly Nightshade. ‡

¶ The Place.

Chickweeds, some grow among bushes and briers, old walls, gutters of houses, and shadowie places. The places where the rest grow are set forth in their seuerall descriptions.

¶ The Time.

The Chickweeds are greene in Winter, they floure and seed in the Spring.

¶ The Names.

Chickweed or Chickenweed is called in Greeke *Αλσίνη*: in Latine it retaineth the same name *Alsine*: of some of the Antients it is called *Hippia*. The rest of the plants are distinguished in their seuerall titles, with proper names which likewise setteth forth the place of their growings.

¶ The Temperature.

Chickweed is cold and moist, and of a waterish substance; and therefore it cooleth without astriction or binding, as *Galen* saith.

¶ The Vertues.

The leaues of Chickweed boyled in water very soft, adding thereto some hogs grease, the powder of Fenugreeke and Lineseed, and a few roots of marsh Mallowses, and stamped to the forme of cataplasme or pulstesse, taketh away the swellings of the legs or any other part; bringeth to suppuration or matter hot apostumes; dissolueth swellings that wil not willingly yeeld to suppuration; easeth members that are shrunk vp; comforteth wounds in sinewie parts; defendeth foule maligne and virulent vlcers from inflammation during the cure: in a word, it comforteth, digesteth, defendeth, and suppurateth very notably.

The leaues boyled in Vineger and salt are good against mangines of the hands and legs, if they be bathed therewith.

Little birds in cades (especially Linnets) are refreshed with the lesser Chickweed when they loath their meat; whereupon it was called of some *Passerina*.

CHAP. 193. Of the bastard Chickweeds.

¶ The Description.

1 **G**Ermander Chickweed hath small tender branches trailing vpon the ground, beset with leaues like vnto those of *Scordium*, or VVater Germander. Among which come forth little blew floures: which being faded, there appeare small flat husks or pouches, wherein lieth the seed. The root is small and threddy; which being once gotten into a garden ground is hard to be destroyed, but naturally commeth vp from yeare to yeare as a noisome weed.

2 *Clusius*.

1 *Alfine folijs trissaginis.*
Germander Chickweed.

2 *Alfine corniculata Clusij.*
Horned Chickweed.

3 *Alfine Hederacea.*
Ivy Chickweed.

4 *Alfine Hederula altera.*
Great Henne-bit.

2 *Clusus*, a man singular in the knowledge of plants, hath set downe this herbe for one of the Chickweeds, which doth very well resemble the Storks bill, and might haue been there inserted. But the matter being of small moment I let it passe; for doubtlesse it participateth of both, that is, the head or beake of Storkes bill, and the leaues of Chickweed, which are long and hairy, like those of Scorpion Mouse-eare. The floures are small, and of an herby colour; after which come long horned cods or seed-vessels, like vnto those of the Storks bill. The root is small and single, with strings fastened thereto.

3 Iuie Chickweed or small Henbit, hath thin hairy leaues somewhat broad, with two cuts or gashes in the sides, after the maner of those of ground Iuie, whereof it tooke his name, resembling the backe of a Bee when she flieth. The stalkes are small, tender, hairy, and lying flat vpon the ground. The floures are slender, and of a blew colour. The root is little and threddy.

4 The great Henbit hath feeble stalkes leaning toward the ground, whereupon doe grow at certaine distances leaues like those of the dead Nettell, from the bosome whereof come forth slender blew floures tending to purple; in shape like those of the small dead Nettle. The root is tough, single, and a few strings hanging thereat.

¶ The Place.

These Chickweeds are sowne in gardens among potherbes, in darke shadowie places, and in the fields after the corne is reaped.

¶ The Time.

They flourish and are greene when the other Chickweedes are.

¶ The Names.

The first and third is called *Morsus Gallinae*, Hens bit, *Alfine Hederula*, and *Hederacea*: Lobell also calls the fourth *Morsus Galinae folio Hederulae* alter: in high Dutch *Hunerbitz*: in French, *Morsgeline*, and *Morgeline*: in low Dutch, *Hoenderebeet*: in English, Henbit the greater and the lesser.

¶ The Temperature and Vertues.

These are thought also to be cold and moist, and like to the other Chickweeds in vertue and operation.

CHAP. 194. Of Pimpernell.

1 *Anagallis mas.*
Male Pimpernell.

2 *Anagallis femina.*
Female Pimpernell.

¶ The Description.

1 **P**impernell is like vnto Chickweed; the stalkes are foure square, trailing here and there vpon the ground, whereupon do grow broad leaues, and sharpe pointed, set together by couples: from the bosome whereof come forth slender tendrells, whereupon doe grow small purple floures tending to rednesse: which being past there succeed fine round bullets, like vnto the seed of Corianders, wherein is contained small dustie seed. The root consisteth of slender strings.

2 The female Pimpernell differeth not from the male in any one point, but in the colour of the floures; for like as the former hath reddish floures, this plant bringeth forth floures of a most perfect blew colour, wherein is the difference.

¶ 3 Of this there is another variety set forth by *Clusius* by the name of *Anagallis tenuifolia Monelli*, because he receiued the figure and History thereof from *Iohn Monell* of Tournay in France; it differs thus from the last mentioned, the leaues are longer and narrower, somewhat like those of *Gratiola*, and they now and then grow three at a joint, and out of the bosomes of the leaues come commonly as many little footstalkes as there are leaues, which carry floures of a blew colour with the middle purplish, and these are somewhat larger than them of the former, otherwise like. ¶

¶ 3 *Anagallis tenuifolia.*
Narrow leaued Pimpernell.

4 *Anagallis lutea.*
Yellow Pimpernell.

4 The yellow Pimpernell hath many weake and feeble branches trailing vpon the ground, beset with leaues one against another like the great Chickweed, not vnlike to *Nummularia*, or Money wort; betweene which and the stalkes, come forth two single and small tender footstalkes, each bearing at their top one yellow floure and no more. The root is small and threddy.

¶ The Place.

They grow in plowed fields neere path waies, in gardens and vineyardes, almost euery where. I found the female with blew floures in a chalkie corne field in the way from M^r. *William Swaines* house of Southfleet to Long field downs, but neuer any where else. ¶ I also being in Essex in the company of my kind friend M^r. *Nathaniel Wright* found this among the corne at Wrightsbridge, being the seate of M^r. *Iohn Wright* his brother. ¶ The yellow Pimpernell growes in the woods betweene High-gate and Hampstead, and in many other woods.

¶ The Time.

They floure in Summer, and especially in the moneth of August, at what time the husbandmen hauing occasion to go vnto their haruest worke, will first behold the floures of Pimpernell, whereby they know the weather that shall follow the next day after: as for example, if the floures be shut close vp, it betokeneth raine and foule weather; contrariwise, if they be spread abroad, faire weather.

¶ The

¶ The Names.

It is called in Greeke *Αναγallis*: in Latine also *Anagallis*: of diuers, (as *Pliny* reporteth) *Corchorus*, but vnruly: of *Marcellus* an old Writer, *Macia*; the word is extant in *Dioscorides* among the bastard names. That with the crimson floure, being the male, is named *Phenicion*, and *Corallion*: of this is made the composition or receipt called *Diacorallion*, that is vsed against the gout; which composition *Paulus Aegineta* setteth downe in his seuenth booke. Among the bastard names it hath bene called *Aëtitis*, *Agitis*, and *Sauritis*: in English, Red Pimpernell, and blew Pimpernell.

¶ The Temperature.

Both the sorts of Pimpernell are of a drying facultie without biting, and somewhat hot, with a certaine drawing quality, inso much that it doth draw forth splinters and things fixed in the flesh, as *Galen* writeth.

¶ The Vertues.

Dioscorides writes, That they are of power to mitigate paine, to cure inflammations or hot swellings, to draw out of the body and flesh thornes, splinters, or shiuers of wood, and to helpe the Kings Euill. A

The iuyce purgeth the head by gargarising or washing the throat therewith; it cures the toothache being snift vp into the nosethrills, especially into the contrary nosethrill. B

It helpeth those that be dim sighted: the iuyce mixed with honey cleanses the vlcers of the eye called in Latine *Argema*. C

Moreouer he affirmeth, That it is good against the stinging of Vipers, and other venomous beasts. D

It preuaileth against the infirmities of the liuer and kidneyes, if the iuyce be drunk with wine. E
He addeth further, how it is reported, That Pimpernell with the blew floure helpeth vp the fundament that is fallen downe; and that red Pimpernell applied, contrariwise bringeth it downe.

CHAP. 195. Of Brooke-lime, or water Pimpernell.

¶ The Description.

1 Brooke-lime or Brooklem hath fat thicke stalkes, round, and parted into diuers branches: the leaues be thicke, smooth, broad, and of a deepe Greene colour. The floures grow vpon small tender foot-stalkes, which thrust forth of the bosome of the leaues, of a perfect blew colour, not vnlike to the floures of land Pimpernell: the root is white, low creeping, with fine strings fastned thereto: out of the root spring many other stalkes, whereby it greatly encreaseth.

† There is a lesser varietie of this, which our Author set forth in the fourth place, differing not from this but onely in that it is lesse in all the parts thereof; wherefore I haue omitted the historie and figure, to make roome for more conspicuous differences. †

2 The great water Pimpernell is like vnto the precedent, sauing that this plant hath sharper pointed or larger leaues, and the floures are of a more whitish or a paler blew colour, wherein consisteth the difference.

† There is also a lesser varietie of this, whose figure and description our Authour gaue in the next place; but because the difference is in nothing but the magnitude I haue made bold to omit it also.

3 Now that I haue briefly giuen you the history of the foure formerly described by our Author, I will acquaint you with two or three more plants which may fitly be here inserted: The first of these *Lobel* calls *Anagallis aquatica tertia*; and therefore I haue thought fit to giue you it in the same place here. It hath a white and fibrous root; from which ariseth a round smooth stalke a foot and more high, (yet I haue sometimes found it not aboue three or foure inches high:) vpon the stalkes grow leaues round, Greene, and shining, standing not by couples, but one aboue another on all sides of the stalkes. The leaues that lie on the ground are longer than the rest, and are in shape somewhat like those of the common Daisie, but that they are not snipped about the edges: the floures are white, consisting of one leafe diuided into fise parts; and they grow at the first as it were in an vmbel, but afterwards more spike fashioned. It floures in Iune and Iuly, and groweth in many waterie places, as in the marishes of Dartford in Kent, also betweene Sandwich and Sandowne castle, and in the ditches on this side Sandwich. *Bauhine* saith, That *Guilandinus* called it sometimes *Alisma*, and otherwhiles *Cochlearia*: and others would haue it to be *Samolus* of *Pliny*, lib. 25. cap. 11. *Bauhine* himselfe fitly calls it *Anagallis aquatica folio rotundo non crenato*.

1 *Anagallis seu Becabunga.*
Brooke-lime.

2 *Anagallis aquatica maior.*
Great long leaved Brook-lime.

3 *Anagallis aquatica rotundifolia.*
Round leaved water Pimpernel.

4 I coniecture this figure which we here giue you with the Authors title to be onely the lesser variety of that which our Author describes in the second place; but because I haue no certaintie hereof (for that *Lobel* hath giuen vs no description thereof in any of his Latine Workes, and also *Bauhinus* hath distinguished them) I am forced to giue you onely the figure thereof; not intending to deceiue my reader by giuing descriptions from my fancie and the figure, as our Author somtimes made bold to do.

5 This which is set forth by most writers for *Cepaea*, and which some may obiekt to be more fit to be put next the Purslanes, I will here giue you, hauing forgot to doe it there; and I thinke this place not vnfit, because our Author in the Names in this Chapter takes occasion in *Dodonæus* his words to make mention thereof. It hath a small vnprofitable root, sending vp a stalke some foot high, diuided into many weake branches, which are here and there set with thicke leaues like those of Purslane, but much lesse, and narrower, and sharper pointed: the floures which grow in good plenty vpon the tops of the branches are composed of fise small white leaues; whereto succeeds small heads, wherein is contained a seed like that of Orpine. This by *Matthiolus* and others is called *Cepaea*: but *Clusius* doubts that it is not the true *Cepaea* of the Antients. ‡

¶ The

‡ 4 *Anagallis aquatica quarta*, Lob.
Lobels fourth water Pimpernel.

‡ 5 *Cepaea*.
Garden Brook-lime.

¶ The Place.

They grow by riuers sides, small running brookes, and waterie ditches. The yellow Pimpernel I found growing in Hampsted wood neere London, and in many other woods and copses.

¶ The Time.

They bring forth their floures and seed in Iune, Iuly, and August.

¶ The Names.

Water Pimpernel is called *Anagallis aquatica*: of most, *Becabunga*, which is borrowed of the Germane word *Bachpunghe*: in low-Dutch, *Beeckpunghe*: in French, *Berle*; whereupon some do call it *Berula*: notwithstanding *Marcellus* reporteth, That *Berula* is that which the Grecians call *κροταλιν*, or rather Cresses: it is thought to be *Cepaea*; that is to say, of the garden; which *Dioscorides* writeth to be like vnto Purslane, whereunto this Brook-lime doth very well agree. But if it be therefore said to be *κροταλιν*, because it groweth either onely or for the most part in gardens, Pimpernel or Brook-lime shall not be like vnto it, which groweth no where lesse than in gardens, being altogether of his owne nature wilde, desiring to grow in waterie places, and such as be continually ouerflowne: in English the first is called Brooklime, and the rest by no particular names; but we may call them water Pimpernels, or Brook-limes.

¶ The Temperature.

Brook-lime is of temperature hot and dry like water Cresses, yet not so much.

¶ The Vertues.

Brooke-lime is eaten in fallads as Water-Cresses are, and is good against that *kinge's euill* of such as dwell neere the Germane seas, which they call *Scurbupcke*: or as we terme it, the Scuruie, or Skirby, being vsed after the same manner that Water Cresses and Scuruy graspe is vsed, yet is it not of so great operation and vertue.

The herbe boyled maketh a good fomentation for swollen legs and the drop sic.
The leaues boyled, strained, and stamped in a stone mortar with the pouder of Fenugreek, Linseeds, the roots of marish Mallowes, and some hogs grease, vnto the forme of a cataplasme or pul-
tesse, taketh away any swelling in leg or arme; wounds also that are ready to fall into apostumati-
on it mightily defendeth, that no humor or accident shall happen thereunto.

- D The leaues of Brooke-lime stamped, strained, and giuen to drinke in wine, helpeth the strangurie, and griefes of the bladder.
- E The leaues of Brook-lime, and the tendrels of *Asparagus*, eaten with oyle, vineger, and Pepper, helpeth the strangurie and stone.

CHAP. 196. Of stinking Ground-Pine.

¶ The Kindes.

¶ *Dioscorides* hath antiently mentioned two sorts of *Anthyllis*: one with leaues like to the Lentill, & the other like to *Chamapitys*. To the first, some late writers haue referred diuers plants, as the two first described in this Chapter; The *Anthyllis Leguminosa Belgarum* hereafter to be described; the *Anthyllis Valentina Clusij* formerly set forth Chap. 171. To the second are referred the *Iua Moschata Monspeliaca*, described in the fourth place of the 150. Chap. of this booke; the *Linaria adulterina* described formerly chap. 165. in the 14. place, and that which is here described in the third place of this chapter, by the name of *Anthyllis altera Italarum*. ‡

¶ The Description.

1 **T** Here hath beene much adoe among Writers about the certaine knowledge of the true *Anthyllis* of *Dioscorides*: I will therefore set downe that plant which of all others is found most agreeable thereunto. It hath many small branches full ioynts, not aboue an handfull high, creeping sundry wayes, beset with small thicke leaues of a pale colour, resembling *Lenticula*, or rather *Alfne minor*, the lesser Chickweed. The floures grow at the top of the stalke, starre-fashion, of an herby colour like boxe, or *Sedum minus*: it fostereth his small seeds in a three cornered huske. The root is somewhat long, slender, ioynted, and deeply thrust into the ground like *Soldanella*: all the whole plant is saltish, bitter in taste, and somewhat heating.

‡ 1 *Anthyllis lentifolia, sine Alfne cruciata marina.*
Sea Pimpernell.

‡ 2 *Anthyllis Marina incana Alfne-folia.*
Many floured Ground-Pine.

‡ This description was taken out of the *Aduersaria*, pag. 195. where it is called *Anthyllis prior lentifolia Peplios effigie maritima*: also *Clusius* hath described it by the name of *Alfne genus pelagicum*: I haue called it in my last iournall by the name of *Alfne cruciata marina*, because the leaues which grow thicke together by couples crosse each other, as it happens in most plants which haue square stalkes with two leaues at each ioynt. I haue Englished it Sea Pimpernell, because the leaues in shape are as like those of Pimpernell as of any other Plant; and also for that our Author hath called another plant by the name of Sea Chickweed. The figure of the *Aduersaria* was not good, and *Clusius* hath none; which hath caused some to reckon this *Anthyllis* of *Lobel*, and *Alfne* of *Clusius* for two feuerall plants, which indeed are not so. I haue giuen you a figure hereof which I tooke from the growing plant, and which well expresth the growing thereof. ‡

3 *Anthyllis altera Italarum.*
Stinking ground Pine.

2 There is likewise another sort of *Anthyllis* or Sea Ground Pine, but in truth nothing els than a kinde of Sea Chickweed, hauing small branches trailing vpon the ground of two hands high; whereupon do grow little leaues like those of Chickweed, not vnlike those of *Lenticularia marina*, or Sea Lentils: on the top of the stalks stand many small mosse floures of a white colour. The whole plant is of a bitter and saltish taste. † This is the *Marina incana Anthyllis Alfine folia Narbonensium* of Lobel: it is the *Paronychia altera* of Matthiolum. ‡

‡ 3 To this figure (which formerly was giuen for the first of these by our Author) I will now giue you a brieue description. This in the branches, leaues, and whole face thereof is very like the French Herbe-Iuie, or Ground Pine, but that it is much lesse in all the parts thereof, but chiefly in the leaues which also are not snipt like those of the French Ground Pine, but sharp pointed: the tops of the branches are downie or woolly, and set with little pale yellow floures. †

¶ The Place.

These do grow in the South Isles belonging to England, especially in Portland in the grauelly and sandy foords, which lie low and against the sea; and likewise in the isle of Shepey neere the water side. † I haue onely found the first described, and that

both in Shepey, as also in West-gate bay by Margate in the Isle of Thanet. †

¶ The Time.

They floure and flourish in Iune and Iuly.

¶ The Names.

Their titles and descriptions sufficiently set forth their seuerall names.

¶ The Temperature.

These sea herbes are of a temperate facultie betweene hot and cold.

The Vertues.

Halfe an ounce of the dried leaues drunke, preuaileth greatly against the hot pisse, the stranguarie, or difficultie of making water, and purgeth the reines.

The same taken with Oxy mell or honied water is good for the falling sicknesse, giuen first at morning, and last at night.

† There was formerly three descriptions, yet but one figure in this chapter, and that was marked with the figure 1. and called *Anthyllis lentifolia*, but wrongly: wherefore I haue giuen you the title which Lobel the first Author thereof put vpon it, with a description thereto, that it might not stand as a cipher, as it formerly did. That description which formerly held the second place was of the *Anthyllis Valentina* of Clusius, described formerly chap. 17. and therefore I haue omitted it here.

CHAP. 197. Of Whiteblow, or Whitelaw Grasse.

¶ The Kindes.

1 The first is a very slender plant hauing a few small leaues like the least Chickweede, growing in little tufts, from the midst whereof riseth vp a small stalke, three or foure inches long; on whose top do grow very little white floures; which being past, there come in place small flat pouches composed of three filmes; which being ripe, the two outsides fall away, leauing the middle part standing long time after which is like white Sattin, as is that of *Bolbonac*, which our women call white Sattin, but much smaller: the taste is somewhat sharpe.

2 This kinde of *Paronychia*, hath small thicke and fat leaues, cut into three or more diuisions, much resembling the leaues of Rue, but a great deale smaller. The stalks are like the former, & the

leaues

leaves also, but the cases wherein the seede is contained, are like vnto the seed vessels of *Myositis Scopioides*, or Mouseare Scorpion grasse. The floures are small and white.

There is another sort of Whitlow grasse or Nailewoort, that is likewise a low or base herbe, hauing a small tough roote, with some threddie strings annexed thereto: from which rise vp diuers slender tough stalkes, set with little narrow leaves confusedly like those of the smallest Chickweed whereof doubtlesse these be kindes: alongst the stalks do grow very little white floures, after which come the seeds in small buttons, of the bignesse of a pins head. ‡ Our Author seemes here to describe the *Paronychia* 2. of *Tabern.* ‡

1 *Paronychia vulgaris.*

Common Whitlow grasse.

2 *Paronychia Rutaceo folio.*

Rew leaved or iagged Whitlow grasse.

¶ The Place.

These small, base and low herbs grow vpon bricke and stone wals, vpon old tiled houses, which are growne to haue much mosse vpon them, and vpon some shadowie, and dry muddy wals. It groweth plentifully vpon the bricke wall in Chancerie Lane, belonging to the Earle

of Southampton, in the Suburbs of London, and sundry other places.

¶ The Time.

These floure many times in Ianuary and February, and when hot weather approacheth, they are no more to be seen all the yeare after.

¶ The Names.

The Gracians haue called these plants *paronychia*: which *Cicero* calleth *Reduvia*: There be many kindes of plants, called by the said name of *Paronychia*, which hath caused many writers to doubt of the true kinde: but you may very boldly take these plants for the same, vntill time hath reuealed or raised vp some new plant, approachiing neerer vnto the truth: which I thinke will neuer be, so that we may call them in English, Naile-woort, and Whitlow grasse.

¶ The Temperatures and Vertues.

As touching the qualitie hereof, we haue nothing to set downe: onely it hath beene taken to heale the disease of the nailes called a Whitlow, whereof it took his name.

† Our Authour here gaue vs two figures, and as many descriptions of both these plants, wherefore I haue omitted 2. of the figures, and the more vnperfect Descriptions.

CHAP. 198. *Of the female Fluellen, or Speedwell.*

¶ The Description.

1 **T**He first kinde of *Elatine*, beeing of *Fuchsius* and *Matthiolus*, called *Veronica femina*, or the female Fluellen, shooteth from a small and fibrous root many flexible and tender branches, dispersed flat vpon the ground, ramping & creeping with leaues like *Nummularia*, but that the leaues of *Elatine* are of an hoarie, hairie, and ouerworne greene colour; among which come forth many small floures, of a yellow colour mixed with a little purple, like vnto the small Snapdragon, hauing a certaine taile or Spur fastened vnto euery such floure, like the herbe called Larkes spur. The lower iaw or chap of the floure is of a purple colour, and the vpper iawe of a faire yellowe; which beeing past, there succedes a small blacke seede contained in round husks.

2 The second kinde of *Elatine* hath stalkes, branches, floures, and roots, like the first: but the leaues are fashioned like the former, but that they haue two little ears at the lower end, somewhat resembling an arrow head, broad at the setting on: but the spur or taile of the floure is longer, and more purple mixed with the yellow in the floure.

1 *Veronica femina* *Fuchsj*, siue *Elatine*.
The Female Fluellen.

2 *Elatine altera*.
Sharpe pointed Fluellen.

¶ The Place.

Both these plants I haue found in sundry places where corne hath growne, especially barley, as in the fields about Southfleet in Kent, where within six miles compasse there is not a field wherein it doth not grow.

Also it groweth in a field next vnto the house sometime belonging to that honourable gentleman Sir *Frances Walsingham*, at Barn-elmes, and in sundry places of Essex, and in the next field vnto the Churchyard at Chiswicke neere London, towards the midst of the field.

¶ The Time.

They floure in August and September.

¶ The

¶ The Names.

Their severall titles set forth their names as well in Latine as English.

¶ The Nature and Vertues.

- A These plants are not onely of a singular astringent facultie, and thereby helpe them that bee griued with the Dy senterie and hot swelling, but of such singular efficacy to heale spreading and eating cankers, and corrosive vlcers, that their vertue in a manner passeth all credit in these fretting sores, vpon sure prooffe done vnto sundry persons, and especially vpon a man whom *Pena* reporteth to haue his nose eaten most grievously with a canker or eating sore, who sent for the Physitions & Chirurgions that were famously knowne to be the best, and they with one consent concluded to cut the said nose off, to preserve the rest of his face: among these Surgeons and Physitions came a poore sorie Barbar, who had no more skill than he had learned by tradition, and yet vndertooke to cure the patient. This foresaid Barbar standing in the companie and hearing their determination, desired that he might make triall of an herbe which he had seene his master vse for the same purpose, which herbe *Elatine*, though he were ignorant of the name whereby it was called, yet hee knew where to fetch it. To be short, this herbe he stamped, and gaue the iuice of it vnto the patient to drinke, and outwardly applied the same plaisterwise, and in very short space perfectly cured the man, and staied the rest of his body from further corruption, which was ready to fall into a leprosie, *Aduersar. pag. 197.*
- B *Elatine* helpeth the inflammation of the eies, and defendeth humours flowing vnto them, beeing boiled, and as a pultus applied thereto.
- C The leaues sodden in the broth of a hen, or Veale, staie the dysenterie.
- D The new writers affirme, that the female Fluellen openeth the obstructions or stoppings of the liuer and spleen, prouoketh vrine, driueth forth stones, and clenseth the kidneies and bladder, according to *Paulus*.
- E The weight of a dram or of a French crowne, of the powder of the herbe, with the like waight of treacle, is commended against pestilent Feuers.

CHAP. 192. Of Fluellen the male, or Paul's Betonie.

1 *Veronica vera & maior.*
Fluellen, or Speedwell.

† 2 *Veronica recta mas.*
The male Speedwell.

¶ The

¶ The Description.

1 **T**He first kinde of *Veronica* is a small herbe, and creepeth by the ground, with little reddish and hairy branches. The leafe is something round and hairy, indented or snipped round about the edges. The floures are of a light blew colour, declining to purple: the seed is contained in little flat pouches: the root is fibrous and hairy.

† 2 The second doth also creepe vpon the ground, hauing long slender stemmes, some foot high, and somewhat large leaues a little hairy, and pleasantly soft. The floures be blew like as those of the former, but somewhat bigger, and of a brighter colour, and they are also succeeded by round seed vessels.

3 The third kinde of *Veronica* creepeth with branches and leaues like vnto *Serpillum*, for which cause it hath beene called *Veronica Serpillifolia*. The floures grow along the small and tender branches, of a whitish colour declining to blewnesse. The root is small and threddie, taking hold vpon the vpper face of the earth, where it spreadeth. The seed is contained in small pouches like the former.

4 The fourth hath a root somewhat wooddie, from the which rise vp leaues like vnto the former. The small vpright stalke is beset with the like leaues, but lesser, at the top whereof commeth forth a slender spike closely thrust together, and full of blewish floures, which are succeeded by many horned seed vessels.

‡ 5 This hath many wooddie round smooth branches, some handfull and halfe high or better: the leaues are like those of wilde Tyme, but longer, and of a blacker colour, sometimes lightly snipt: at the tops of the branches grow floures of a whitish blew colour, consisting of foure, five, or else six little leaues a piece; which falling, there follow round seede vessels, containing a round small and blacke seed. It floures in August, and growes vpon cold and high mountaines, as the Alpes. Pona calls this *Veronica Alpina minima Serpillifolia*: and Clusius hath it by the name of *Veronica 3. fruticans*. ‡

3 *Veronica minor*.
Little Fluellen.

4 *Veronica recta minima*.
The smallest Fluellen.

‡ 5 *Veronica fruticans Serpillifolia.*
Shrubbie Fluellen.

6 *Veronica assurgens, sive Spicata.*
Tree Fluellen.

‡ 7 *Veronica spicata latifolia.*
Vpright Fluellen.

‡ 8 *Veronica supina.*
Leaning Fluellen.

6 The sixth kinde of *Veronica* hath many vpright branches a foote high and sometimes more, diuiding themselues into sundry other small twigs; at the top whereof do grow faire spikie tufts, bearing bright and shining blew floures. The leaues are somewhat long, indented about the edges like a saw: the root is compact of many threds, or strings.

7 This hath stalkes some cubit high and sometimes more, and these not very full of branches, yet hauing diuers joints, at each whereof do grow forth two leaues, two or three inches long, and one broad, and these leaues are also thicke, smooth, and shining, lightly snipt or cut about the edges, and of a very astringent and drying taste, and at last somewhat biting. At the top of the stalkes grow spikie tufts or blew floures like those of the last mentioned, but of somewhat a lighter colour, and they begin first to floure or shew themselues below, and so go vpwards; the seed, which is small and blacke, is conteyned in flat seed vessels: the roote is thicke with many fibres, euery yeere thrusting vp new shoots. There is a variety of this with the leaues not so blacke and shining, but hauing more branches; and another which hath a longer spike or tuft of floures.

Clusius calls this *Veronica erectior latifolia*. ‡

8 The eighth hauing his stalkes leaning vpon the ground looketh with his face vpright, hauing sundry flexible branches, set with leaues like vnto wilde Germander by couples, one right against another, deeply jagged about the edges, in respect of the other before mentioned. The floures are of a blew colour: the root is long, with some threds appendant thereto.

¶ The Place.

Veronica groweth vpon bankes, borders of fields, and grafsie mole-hils, in sandy grounds, and in woods, almost euery where.

The fourth kinde, my good friend Mr. *Stephen Bredwell*, practitioner in physicke found and shewed it me in the close next adjoining to the house of Mr. *Bele*, chiefe of the clerkes of her Maiesties Counsell, dwelling at Barnes neere London. The sixth is a stranger in England, but I haue it growing in my garden.

¶ The Time.

These floure from May to September.

¶ The Names.

† These plants are comprehended vnder this generall name *Veronica*; and *Dodonaeus* would haue the first of them to be the *Betonica* of *Paulus Aegineta*; and *Turner* and *Gesner* the third: we do call them in English, Pauls Betony, or Speedwell: in Welch it is called Fluellen, and the Welch people do attribute great vertues to the same: in high Dutch, *Gebondheill*: in low Dutch, *Geu prijs*, that is to say, Honor and praise.

¶ The Nature.

These are of a meane temperature, betweene heate and drinesse.

¶ The Vertues.

The decoction of *Veronica* drunke, sodereth and healeth all fresh and old wounds, clenseth the bloud from all corruption, and is good to be drunke for the kidnies, and against scruinesse and foule spreading tetters, and consuming and fretting sores, the small pox and measels. A

The water of *Veronica* distilled with wine, and re-distilled so often vntill the liquor wax of a reddish colour, preuaileth against the old cough, the drinesse of the lungs, and all vlcers and inflammation of the same. B

† The second and third were both figures of that described in the third place: and those that were formerly in the fifth and sixth places were also of the same plant, to wit that which is here described in the sixth place and which was formerly in the fifth.

CHAP. 198. Of herbe Two pence.

¶ The Description.

1 **H**Erbe Two pence hath a small and tender root, spreading and dispersing it selfe farre within the ground; from which rise vp many little, tender, flexible stalkes trailing vpon the ground, set by couples at certaine spaces, with smooth greene leaues somewhat round, whereof it tooke his name: from the bosome of which leaues shoote forth small tender foot-stalkes, whereon do grow little yellow floures, like those of Cinkefoile or Tormentill.

2 There is a kinde of Money woort or herbe Two pence, like the other of his kinde in each respect, sauing it is altogether lesser, wherein they differ.

3 There is another kinde of Money-woort which hath many very slender creeping branches which here and there put forth fibres, and take root againe: the leaues are small and round, standing by couples one against another; and out of the bosomes come slender foote-stalkes

G g g

bearing

bearing pretty little whitish purple floures consisting of five little leaues standing together in manner of a little bell-floure, and seldome otherwise: the seed is small, and contained in round heads. This growes in many wet rotten grounds and vpon bogges: I first found it Anno 1626, in the Bishopricke of Durham, and in two or three places of Yorkshyre, and not thinking any had taken notice thereof, I drew a figure of it & called it *Nummularia pusilla flore ex albo purpurascete*, but since I haue found that *Bauhine* had formerly set it forth in his *Prodromus* by the name of *Nummularia flore purpurascete*. It growes also on the bogges vpon the heath, neare Burnt wood in Essex: it floures in Iuly and August. ‡

1 *Nummularia.*

Herbe Two pence.

‡ 3 *Nummularia flore purpurascete.*

Purple floured Money-woort.

¶ The Place.

It groweth neere vnto ditches and streames, and other watery places, and is sometimes found in moist woods: I found it vpon the banke of the riuer of Thames, right against the Quenes palace of White hall; and almost in euery country where I haue trauelled.

¶ The Time.

It floureth from May till Summer be well spent.

¶ The Names.

Herbe Two pence is called in Latine *Nummularia*, and *Centummorbia*: and of diuers *Serpentaria*. It is reported that if serpents be hurt or wounded, they do heale themselves with this herbe, whereupon came the name *Serpentaria*: it is thought to be called *Centummorbia*, of the wonderfull effect which it hath in curing diseases; and it is called *Nummularia* of the forme of money, whereunto the leaues are like: in Dutch, *Penninckcruyt*: in English, Money woort, Herbe Two pence, and Two penny grasse.

¶ The Temperature.

That this herbe is dry, the binding taste thereof doth shew: it is also moderate colde.

¶ The Vertues.

A The floures and leaues stamped and laid vpon wounds and vlcers doth cure them: but it worketh most effectually being stamped and boiled in oile oliue, with some rosen, wax, and turpentine added thereto.

The

The iuice drunke in wine, is good for the bloudie flux, and all other issues in bloud of man or woman; the weakenesse and loosenesse of the belly and laske; it helpeth those that vomite bloud, and the Whites in such as haue them.

Boiled with wine and honie it cureth the wounds of the inward parts, and vlcers of the lungs, & in a word, there is not a better wound herbe, no not Tabaco it selfe, nor any other whatsoeuer.

The herbe boiled in wine with a little honie, or meade, preuaileth much against the cough in children, called the Chinne cough.

CHAP. 200. Of Bugle or Middle Comfrey.

The Description.

Bugula spreadeth and creepeth alongst the ground like Monie-woort; the leaues be long, fat, & oleous, and of a brown colour for the most part. The floures grow about the stalks in rundles, compassing the stalke, leauing betweene euery rundle bare or naked spaces; and are of a faire blew colour, and often white. I found many plants of it in a moist ground vpon Blacke Heath neere London, fast by a village called Charleton, but the leaues were green, and not browne at all like the other.

1 Bugula.

Middle Confound.

2 Bugula flore albo, sine carneo.

White or carnation floured Bugle.

2 Bugle with the white floure differeth not from the precedent, in roots, leaues, and stalks: the onely difference is, that this plant bringeth forth faire milk white floures, and the other those that are blew. ‡ It is also found with a flesh coloured floure, and the leaues are lesse snipt than those of the former. *Baubine* makes mention of one much lesse than those with round snipt leaues and a yellow floure, which he saith he had out of England, but I haue not as yet seene it, nor found any other mention thereof. ‡

The Place.

Bugula groweth almost in euery wood and copse, and such like shadowie and moist places, and is much planted in gardens: the other varieties are seldome to be met withall.

¶ The Time.

Bugula floureth in Aprill and May.

¶ The Names.

Bugle is reckoned among the Consonds or wound herbes: and it is called of some *Consolida media*, *Bugula*, and *Buglum*: in High Dutch, *Guntzel*: in Low Dutch *Senegroen*: of *Matthiolus*, *Herba Laurentina*: in English, Browne Bugle: of some, Sicklewoort, and herbe Carpenter, but not truly.

¶ The Nature.

Bugle is of a meane temperature, betweene heat and drinesse.

¶ The Vertues.

- A It is commended against inward burstings, and members torne, rent, and bruised: and therefore it is put into potions that serue for nodes, in which it is of such vertue, that it can dissolue & waste away congealed and elotted blood. *Ruellius* writeth that they commonly say in France, how he needeth neither Physition nor Surgeon that hath *Bugle* and Sanickle, for it doth not only cure rotten wounds being inwardly taken, but also applied to them outwardly; it is good for the infirmities of the Liuer, it taketh away the obstructions, and strengthneth it.
- B The decoction of *Bugle* drunken, dissolueth clotted or congealed blood within the bodie, healeth and maketh sound all wounds of the bodie, both inward and outward.
- C The same openeth the stoppings of the Liuer and gall, and is good against the iaundise and feuers of long continuance.
- D The same decoction cureth the rotten vlcers and sores of the mouth and gums.
- E *Bugula* is excellent in curing wounds and scratches, and the iuice cureth the wounds, vlcers and sores of the secret parts, or the herbe bruised and laid thereon.

CHAP. 201 Of Selfe-heale.

1 *Prunella*.
Selfe-heale.

2 *Prunella Lobelij*.
The second Selfe-heale.

¶ The

3 *Prunella flore albo.*

White floured Selfe-heale.

¶ The Description.

Prunell or Brunel hath square hairy stalks of a foot high, beset with long, hairy and sharpe pointed leaues, & at the top of the stalks grow floures thicke set together, like an eare or spiky knap, of a browne colour mixed with blew floures, and sometimes white, of which kinde I found some plants in Essex neere Henningham castle. The root is small and very threddie.

† 2 *Prunella altera*, or after *Lobel* and *Pena*, *Symphytum petraeum*, hath leaues like the last described, but somewhat narrower, and the leaues that grow commonly towards the tops of the stalks, are deeply diuided or cut in, after the manner of the leaues of the small *Valerian*, and sometimes the lower leaues are also diuided, but that is more seldom; the heads and floures are like those of the former, and the colour of the floures is commonly purple yet sometimes it is found with flesh coloured, and otherwhiles with white or ashe coloured floures.

3 The third sort of Selfe-heale is like vnto the last described in root, stalke, & leaues, & in euery other point, sauing that the floures hereof are of a perfect white colour, and the others not so, which maketh the difference.

† The figure which our Authour gaue in this third place, was of the *Prunella secunda* of

Tabern. which I iudge to be all one with the *Prunella* 1. *non vulgaris* of *Clusius*, and that because the floures in that of *Tabernamontanus* are expressed *Ventre laxiore*, which *Clusius* complains his drawer did not obserue; the other parts also agree: now this of *Clusius* hath much larger floures than the ordinary, and those commonly of a deeper purple colour, yet they are sometimes whitish, and otherwhiles of an ashe colour: the leaues also are somewhat more hairie, long and sharpe pointed, than the ordinary, and herein consists the greatest difference. †

¶ The Place.

The first kinde of Prunell or Brunel groweth verie commonly in all our fieldes throughout England.

The second Brunel or *Symphytum petraeum* groweth naturally vpon rocks, stonie mountaines, and grauelly grounds.

† The third for any thing that I know is a stranger with vs: but the first common kinde I haue found with white floures. †

¶ The Time.

These plants floure for the most part all Sommer long.

¶ The Names.

Brunel is called in English Prunell, Carpenters herbe, Selfe-heale, and Hooke-heale, and Sicklewoort. It is called of the later Herbarists *Brunella*, and *Prunella*, of *Matthiolus*, *Consolida minor*, and *Solidago minor*; but saith *Ruellius*, the Daisie is the right *Consolida minor*, and also the *Solidago minor*.

¶ The Nature.

These herbes are of the temperature of *Bugula*, that is to say, moderately hot and drie, and something binding.

¶ The Vertues.

The decoction of Prunell made with wine or water, doth ioine together and make whole and A found all wounds, both inward and outward, euen as Bugle doth.

Prunell bruised with oile of Roses and Vineger, and laied to the forepart of the head, swageth B and helpeth the paine and aking thereof.

To bee short, it serueth for the same that Bugle doth, and in the world there are not two better C wound herbes, as hath been often proued.

- D It is commended against the infirmities of the mouth, and especially the ruggednesse, blacknesse, and driness of the tongue, with a kinde of swelling in the same. It is an infirmity amongst souldiers that lie in campe. The Germans call it *de Braun*, which happeneth not without a continuall ague and frensie. The remedie hereof is the decoction of Selfe-heale, with common water, after blood letting out of the veins of the tongue: and the mouth and tongue must be often washed with the same decoction, and sometimes a little vinegar mixed therewith. This disease is thought to be unknowne to the old writers: but notwithstanding if it be conferred with that which *Paulus Aegineta* calleth *Erysipelas Cerebri*, an inflammation of the braine, then will it not be thought to be much differing, if it be not the very same.

CHAP. 202. Of the great Daisie, or Maudelen woort.

Bellis maior.
The great Daisie.

The Description.

The great Daisie hath very many broad leaues spred vpon the ground, somewhat indented about the edges, of the breadth of a finger, not vnlike those of ground swell: among which rise vp stalkes of the height of a cubit, set with the like leaues, but lesser, in the top whereof do grow large white floures with yellow thrums in the middle like those of the single field Daisie or Mayweed, without any smell at all. The root is full of strings.

The Place.

It groweth in Medowes and in the borders of fields almost euery where.

The Time.

It floureth and flourisheth in May and Iune.

The Names.

It is called (as we haue said) *Bellis maior*, and also *Consolida media vulnerariorum*, to make a difference betweene it and *Bugula*, which is the true *Consolida media*: notwithstanding this is holden of all to be *Consolida medij generis*, or a kinde of middle Consound: in High Dutch, as *Fuchsius* reporteth, *Gensblume*: in English, the Great Daisie and Maudelen woort.

The Temperature.

This great Daisie is moist in the end of the second degree, and cold in the beginning of the same.

The Vertues.

- A The leaues of the great Maudleine woort are good against all burning vlcers and apostemes, against the inflammation and running of the eies, being applied thereto.
- B The same made vp in an vnguent or salve with wax, oile, and turpentine, is most excellent for wounds, especially those wherein is any inflammation, and will not come to digestion or maturation, as are those weeping wounds made in the knees, elbowes, and other ioints.
- C The iuice, decoction, or distilled water, is drunk to very good purpose against the rupture or any inward burstings.
- D The herbe is good to be put into Vulnerarie drinks or potions, as one simple belonging thereto most necessarie, to the which effect, the best practised do vse it, as a simple in such cases of great effect.
- E It likewise affwageth the cruell torments of the gout, vsed with a few Mallows and butter boiled and made to the forme of a pultis.
- F The same receipt aforesaid vsed in Clysters, profiteth much against the vehement heat in agues, and ceaseth the torments or wringing of the guts or bowels.

CHAP. 203. Of little Daisies.

¶ The Description.

1 **T**He Daisie bringeth forth many leaues from a threddy root, smooth, fat, long, and somewhat round withall, very sleightly indented about the edges, for the most part lying vpon the ground: among which rise vp the floures, euery one with his owne slender stem, almost like those of Camomill, but lesser, of a perfect white colour, and very double.

2 The double red Daisie is like vnto the precedent in euery respect, sauing in the colour of the floures: for this plant bringeth forth floures of a red colour, and the other white as aforesaid.

† These double Daisies are of two sorts, that is either smaller or larger, and these againe either white or red, or of both mixed together: wherefore I haue giuen you in the first place the figure of the small, and in the second that of the larger.

3 Furthermore, there is another pretty double daisie which differs from the first described only in the floure, which at the sides thereof puts forth many foot-stalkes carrying also little double floures, being commonly of a red colour; so that each stalke carries as it were an old one and the brood thereof: whence they haue fitly termed it the childing Daisie. †

1 *Bellis minor multiplex flore albo vel rubro.*

The lesser double red or white Daisie.

2 *Bellis media multiplex flore albo vel rubro.*

The larger double white or red Daisie.

4 The wilde field Daisie hath many leaues spred vpon the ground like those of the garden Daisie: among which rise vp slender stems; on the top whereof do grow small single floures like those of Camomill, set about a bunch of yellow thrums, with a pale of white leaues, sometimes white, now and then red, and often of both mixed together. The root is threddy.

5 There doth likewise grow in the fields another sort of wilde Daisie, agreeing with the former in each respect, sauing that it is somewhat greater than the other, and the leaues are somewhat more cut in the edges, and larger.

6 The blew Italian Daisie hath many small threddy roots, from the which rise vp leaues like those

‡ 3 *Bellis minor prolifera.*
Childing Daisie.

4 *Bellis minor sylvestris.*
The small wilde Daisie.

5 *Bellis media sylvestris.*
The middle wilde Daisie.

those of the common Daisie, of a darke greene colour : among which commeth vp a fat stemme
set round about with the like leaues, but lesser. The floures grow at the top globe-fashion, that
is, round like a ball, of a perfect blew colour, verie like vnto the floures of Mountaine Scabious.
7 The French blew Daisie is like vnto the other blew Daisies in each respect, sauing it is alto-
gether lesser, wherein consisteth the difference.

‡ There were formerly three figures and descriptions of this blew Daisie, but one of them
might haue serued; for they differ but in the tallnesse of their growth, and in the bredth and nar-
rownesse of their leaues. ‡

¶ The Place.

The double Daisies are planted in gardens : the others grow wilde euery where.

The

The blew Daiesies are strangers in England ; their naturall place of abode is set forth in their severall titles.

6 *Bellis cœrulea sine Globularia Apula.*
The blew Italian Daiesie.

7 *Bellis cœrulea Monspeliana.*
Blew French Daiesies.

¶ The Time.

The Daiesies do floure most part of the Sommer.

¶ The Names.

The Daiesie is called in high-Dutch *Mazlieben* : in low Dutch, *Margrieten* : in Latine, *Bellis minor*, and *Consolida minor*, or the middle Confound : of *Tragus*, *Primula veris* ; but that name is more proper unto Primrose : of some, *Herba Margarita*, or *Margarites herbe* : in French, *Marguerites*, and *Cassandes* : in Italian, *Fiori di prima veri gentili*. In English, Daiesies, and Bruisewort.

The blew Daiesie is called *Bellis cœrulea* : of some, *Globularia*, of the round forme of the floure : it is also called *Aphyllanthes*, and *Frondiflora* : in Italian, *Botanaria* : in English, blew Daiesies, and Globe Daiesie.

¶ The Temperature.

The lesser Daiesies are cold and moist, being moist in the end of the second degree, and cold in the beginning of the same.

¶ The Vertues.

The Daiesies doe mitigate all kinde of paines, but especially of the ioynts, and gout proceeding from an hot and dry humor, if they be stamped with new butter vn salted, and applied vpon the pained place, but they worke more effectually if Mallowes be added thereto.

The leaues of Daiesies vsed amongst other Pot-herbes doe make the belly soluble, and they are also put into Clysters with good successe, in hot burning feuers, and against inflammations of the intestines.

The iuyce of the leaues and roots snift vp into the nostrils, purgeth the head mightily of foule and filthy slimie humors, and helpeth the megrim.

The same giuen to little dogs with milke keepeth them from growing great.

The leaues stamped taketh away bruises and swellings proceeding of some stroke, if they be stamped and laid thereon ; whereupon it was called in old time Bruisewort.

The iuyce put into the eyes cleareth them, and taketh away the watering.

The decoction of the field Daiesie (which is the best for physicks vse) made in water and drunke, is good against agues, inflammation of the liuer, and all other the inward parts.

CHAP. 204. Of Mouse-eare.

¶ The Description.

1 **T**He great Mouse-eare hath great and large leaues greater than our common *Pylosella*, or Mouse-eare, thicke, and full of substance: the stalkes and leaues be hoarie and white, with a silken mossinesse in handling like silke, pleasant and faire in view: it beareth three or foure quadrangled stalkes, somewhat knotty, a foot long: the roots are hard, wooddy, and full of strings: the floures come forth at the top of the stalke, like vnto the small Pisseabed, or Dandelion, of a bright yellow colour.

2 The second kinde of *Pylosella* is that which we call *Auricula muris*, or Mouse-eare, being a very common herb, but few more worthy of consideration because of his good effect, and yet clean vnremembred of the old Writers. It is called *Pylosella* of the rough hairy and whitish substance growing on the leaues, which are somewhat long like the little Daisie, but that they haue a small hollownesse in them resembling the eare of a Mouse: vpon the which consideration some haue called it *Myosotis*; wherein they were greatly deceiued, for it is nothing like vnto the *Myosotis* of *Dioscorides*: his small stalkes are likewise hairy, slender, and creeping vpon the ground; his floures are double, and of a pale yellow colour, much like vnto *Sonchus*, or *Hieracium*, or Hawke-weed.

1 *Pylosella major*.
Great Mouse-eare.

2 *Pylosella repens*.
Creeping Mouse-eare.

3 The small Mouse-eare with broad leaues hath a small tough root, from which rise vp many hairy and hoarie broad leaues spred vpon the ground; among which growes vp a slender stem, at the top whereof stand two or three small yellow floures, which being ripe turne vnto downe that is caried away with the winde.

¶ The Place.

These plants do grow vpon sandy bankes and vntoiled places that lie open to the aire.

¶ The Time.

They floure in May and Iune.

¶ The Names.

Great Mouse-eare is called of the later herbarists *Pylosella*: the smaller likewise *Pylosella*, and *Auricula muris*: in Dutch, *Agelcruist*, and *Duploot*: *Lacuna* thinkes it *Holostium*: in French, *Oreille de rat*, ou *souris*: in Italian, *Pelosella*: in English, Mouse-eare.

¶ The Temperature.

They are hot and dry of temperature, of an excellent astringent facultie, with a certaine hot renuitie admixed.

¶ The Vertues.

The decoction of *Pylosella* drunke doth cure and heale all wounds, both inward and outward: it A cureth hernies, ruptures, or burstings.

The leaues dried and made into pouder, do profit much in healing of wounds, being strewed B thereupon.

The decoction of the iuyce is of such excellencie, that if steele-edged tooles red hot be dren- C ched and cooled therein oftentimes, it maketh them so hard, that they will cut stone or iron, be they neuer so hard, without turning the edge or waxing dull.

This herbe being vsed in gargarismes cureth the loosenesse of the Vuula. D

Being taken in drinke it healeth the fluxes of the wombe, as also the diseases called *Dysenteria* E and *Enterocoele*: it glueth and confoundeth wounds, stayeth the swelling of the spleene, and the bloody excrements procured thereby.

The Apothecaries of the Low-countries make a syrump of the iuyce of this herb, which they vse F for the cough, consumption, and ptisicke.

† I haue in this chapter omitted two figures and one description: the first of the two omitted figures, which should haue bene the third, differs little from the first but in the smallnesse of the stalke, and fewnesse of the floures at the top thereof: the other, which was in the fourth place, was figured and described by me formerly in the fourth place of the 54 chapter of this booke.

CHAP. 205. Of Cotton-weed or Cud-weed.

1 *Gnaphalium Anglicum*.
English Cudweed.

2 *Gnaphalium vulgare*.
Common Cudweed.

¶ The Description.

1 **E**nglish Cudweed hath sundry slender and vpright stalkes diuided into many branches, and groweth as high as common Wormwood, whose colour and shape it doth much resemble. The leaues shoot from the bottome of the turfe full of haire, in shape somewhat like a Willow leafe below, but aboue they be narrower, and like the leaues of *Psyllium* or Flea-wort: among which do grow small pale coloured floures like those of the small *Comiza* or Flea-bane. The whole plant is of a bitter taste.

2 The second being our common *Gnaphalium* or Cudweed is a base or low herbe, nine or ten inches long, hauing many small stalks or tender branches, and little leaues, covered all ouer with a certain white cotton or fine wooll, and very thick: the floures be yellow, and grow like buttons at the top of the stalkes.

3 The third kinde of Cudweed or Cotton-weed, being of the sea, is like vnto the other Cudweed last described, but is altogether smaller and lower, seldome growing much aboue a handfull high: the leaues grow thicke vpon the stalkes, and are short, flat, and very white, soft and woolly. The floures grow at the top of the stalkes in small round buttons, of colour and fashion like the other Cudweed.

4 The fourth being the Cotton-weed of the hills and stony mountains, is so exceeding white and hoary, that one would thinke it to be a plant made of wooll, which may very easily be known by his picture, without other description.

3 *Gnaphalium marinum.*
Sea Cudweed.

4. 5. *Gnaphalium montanum purpureum & album.*
White and purple mountaine Cotton-weed.

5 The fifth kinde of Cotton-weed hath leaues and stalkes like the other of his kinde, and differeth in that, that this plant beareth a bush or tuft of purple floures, otherwise it is very like.

6 The sixth is like vnto the last recited, but greater: the floures are of an exceeding bright red colour, and of an aromaticall sweet smell.

7 The seventh kinde of *Gnaphalium* or Cotton-weed of *Clusius* his description, growes nine or ten inches high, hauing little long leaues like the small Mouf-eare, woolly within, and of a hoarie colour on the outside: the stalkes in like manner are very woolly, at the top whereof commeth forth a faire floure and a strange, hauing such woolly leaues bordering the floure about, that a man would thinke it to be nothing else but wooll it selfe: and in the midst of the floure come forth sundry

6 *Gnaphalium montanum suave rubens.*
Bright red mountaine Cotton-weed.

‡ 8 *Gnaphalium Americanum.*
Litte for euer.

† 7 *Gnaphalium Alpinum.*
Rocke Cotton-weed.

9 *Filago minor.*
Small Cud-weed.

fundry small heads of a pale yellow colour, like vnto the other of this kinde. The root is blacke and somewhat fibrous.

8 There is a kinde of Cotton-weed, being of greater beauty than the rest, that hath strait and vpright stalks 3 foot high or more, couered with a most soft and fine wooll, and in such plentiful manner, that a man may with his hands take it from the stalke in great quantitie: which stalke is beset with many small long and narrow leaues, greene vpon the inner side, and hoary on the other side, fashioned somewhat like the leaues of Rosemary, but greater. The floures do grow at the top of the stalkes in bundles or tufts, consisting of many small floures of a white colour, and very double, compact, or as it were consisting of little siluer scales thrust close together, which doe make the same very double. When the floure hath long flourished, and is waxen old, then comes there in the midst of the floure a certaine browne yellow thrumme, such as is in the midst of the Daisie: which floure being gathered when it is young, may be kept in such manner as it was gathered (I meane in such freshnesse and well liking) by the space of a whole yeare after, in your chest or elsewhere: wherefore our English women haue called it Liue-long, or Liue for euer, which name doth aptly answer his effects. † *Clusius* receiued this plant out of England, and first set it forth by the name of *Gnaphalium Americanum*, or *Argyroceme*. ‡

9 This plant hath three or foure small grayish cottony or woolly stalkes, growing strait from the root, and commonly diuided into many little branches: the leaues be long, narrow, whitish, soft, and woolly, like the other of his kinde: the floures be round like buttons, growing very many together at the top of the stalkes, but nothing so yellow as Moufe-eare, which turne into downe, and are caried away with the winde.

10 *Fikago, sine Herba impia.*
Herbe impious, or wicked Cudweed.

11 *Leontopodium, sine Pes Leoninus.*
Lions Cudweed.

10 The tenth is like vnto the last before mentioned, in stalkes, leaues, and floures, but much larger, and for the most part those floures which appeare first are the lowest and basest, and they are ouertopt by other floures which come on younger branches, and grow higher, as children seeking to ouergrow or ouertop their parents, (as many wicked children do) for which cause it hath beene called *Herba impia*, that is, the wicked Herbe, or Herbe Impious.

11 The eleuenth plant comprehended vnder the title of *Gnaphalium*, (being without doubt a kinde thereof, as may appeare by the shape of his floures and stalks, couered ouer with a soft wool like vnto the other kindes of Cotton-weed) is an handfull high or thereabouts, beset with leaues like

† 12 *Leontopodium parvum*.
Small Lyons Cudweed.

† 13 *Gnaphalium oblongo folio*.
Long leaved Cudweed.

† 14 *Gnaphalium minus latiore folio*.
Small broad leaved Cudweed.

like *Gnaphalium Anglicum*, but somewhat broader. At the top of the stalke groweth a floure of a blackish brown violet colour, beset about with rough and woolly hairie leaues, which make the whole floure to resemble the rough haired foot of a Lyon, of a Hare, or a Beate, or rather in mine opinion of a rough footed Doue. The heads of these floures when they are spred abroad carry a greater circumference than is required in so small a plant; and when the floure is faded, the seed is wrapped in such a deale of wooll that it is scarcely to be found out.

12 This small kinde of *Leontopodium* being likewise a kind of Corton-weed, neither by *Dioscorides* or any other antient writer once remembred, hath one single stalke nine inches in height, and the leaues of *Gnaphalium montanum*; which leaues and stalkes are white, with a thicke hoary woolliness, bearing at the top pale yellow floures like *Gnaphalium montanum*: the root is slender and woody.

† 13 This, which *Clusius* calls *Gnaphalium Plateau* 2. hath small stalkes some handfull high or somewhat more, of which

some stand vpright, others lie along vpon the ground, being round, hairy, and vnorderly set with soft hoary leaues ingirting their stalkes at their setting on, and sharpe pointed at their vpper ends. The tops of the stalkes carry many whitish heads full of a yellowish downe: the root is thicke and blackish, with some fibres.

14 This sends vp one stalke parted into feuerall branches set here and there with broad soft and hoarie leaues, and at the diuision of the branches and amongst the leaues grow seuen or eight little heads thicke thrust together, being of a grayish yellow colour, and full of much downe: the root is vnprofitable, and perishes as soone as it hath perfected his seed. *Clusius* calls this *Gnaphalium Plateau* 3. he hauing as it seemes receiued them both from his friend *Iaques Plateau*. ‡

¶ The Place.

The first groweth in the darke woods of Hampsted, and in the woods neere vnto Deptford by London. The second groweth vpon dry sandy bankes. The third groweth at a place called Merezey, six miles from Colchester, neere vnto the sea side. ‡ I also had it sent me from my worshipfull friend Mr. *Thomas Glynn*, who gathered it vpon the sea coast of Wales. ‡

The rest grow vpon mountaines, hilly grounds, and barren pastures.

The kinde of *Gnaphalium* newly set forth (to wit *Americanum*) groweth naturally neere vnto the Mediterranean sea, from whence it hath bene brought and planted in our English gardens. ‡ If this be true which our Author here affirms, it might haue had a fitter (at least a neerer) denomination than from America: yet *Bauhine* affirms that it growes frequently in Brasill, and it is not improbable that both their assertions be true. ‡

¶ The Time.

They floure for the most part from Iune to the end of August.

¶ The Names.

Cotton-weed is called in Greeke *Gnaphalion*; and it is called *Gnaphalion*, because men vse the tender leaues of it in stead of bombaste or Cotton, as *Paulus Aegineta* writeth. *Pliny* saith it is called *Chamaexylon*, as though he should say Dwarfed Cotton; for it hath a soft and white cotton like vnto bombaste: whereupon also it was called of diuers *Tomentitia*, and *Coronaria*: of others, *Centunculus*, *Centuncularis*, and *Albinum*; which word is found among the bastard names: but the later word, by reason of the white colour, doth reasonably well agree with it. It is also called *Bombax*, *Humilis filago*, and *Herba Impia*, because the yonger, or those floures that spring vp later, are higher, and ouertop those that come first, as many wicked children do vnto their parents, as before touched in the description: in English, Cotton-weed, Cud-weed, Chaffe-weed, and petty Cotton.

¶ The Nature.

These herbes be of an astringent or binding and drying qualitie.

¶ The Vertues.

- A *Gnaphalium* boyled in strong lee cleanseth the haire from nits and lice: also the herbe being laid in ward-robes and presses keepeth apparell from moths.
- B The same boyled in wine and drunken, killeth wormes and bringeth them forth, and preuaileth against the bitings and stingings of venomous beasts.
- C The fume or smoke of the herbe dried, and taken with a funnell, being burned therein, and receiued in such manner as we vse to take the fume of Tabaco, that is, with a crooked pipe made for the same purpose by the Potter, preuaileth against the cough of the lungs, the great ache or paine of the head, and clenseth the brest and inward parts.

† The figure that was formerly in the seuenth place should haue bene in the eleuenth; and that in the eleuenth in the seuenth.

CHAP. 206.

Of Golden Moth-wort, or Cudweed.

¶ The Description.

1 Golden Moth-wort bringeth forth slender stalkes somewhat hard and woody, diuided into diuers small branches, whereupon do grow leaues somewhat rough, and of a white colour, very much iagged like Southernwood. The floures stand on the tops of the stalkes, ioyned together in tufts, of a yellow colour glittering like gold, in forme resembling the scaly floures of Tanse, or the middle button of the floures of Camomil; which being gathred before they be ripe or withered, remaine beautifull long time after, as my selfe did see in the hands of Mr. *Wade*, one of the Clerks of her Maiesties Counsell, which were sent him among other things from

from Padua in Italy. For which cause of long lasting, the images and carued gods were wont to weare garlands thereof: whereupon some haue called it Gods floure. For which purpose *Ptolomy* King of Egypt did most diligently obserue them; as *Pliny* writeth.

1 *Elychryson, sine Coma aurea.*
Golden Moth-wort.

¶ The Place.

It growes in most vntilled places of Italy and Spaine, in meadowes where the soile is barren, and about the banks of riuers; it is a stranger in England.

¶ The Time.

It floures in August and September: notwithstanding *Theophrastus* and *Pliny* reckon it among the floures of the Spring.

¶ The Names.

Golden Moth-wort is called of *Dioscorides* *Elichryson*: *Pliny* and *Theophrastus* call it *Heli-chryson*: *Gaza* translates it *Aurelia*: in English, Gold-floure, Golden Moth-wort.

¶ The Temperature.

It is (saith *Galen*) of power to cut and make thinne.

¶ The Vertues.

Dioscorides teacheth, that the tops thereof A drunke in wine are good for them that can hardly make water; against stings of Serpents, paines of the huckle bones: and taken in sweet wine it dissolueth congealed blood.

The branches and leaues laid amongst B cloathes keepeth them from moths, whereupon it hath bene called of some Moth-weed, or Mothwort.

† Here formerly were two figures and descriptions of the same Plants.

CHAP. 207. Of Golden Floure-Gentle.

¶ The Description.

1 **T**His yellow Euerlasting or Floure-Gentle, called of the later Herbarists Yellow *Stœcas*, is a plant that hath stalkes of a span long, and slender, whereupon do grow narrow leaues white and downie, as are also the stalks. The floures stand on the tops of the stalks, consisting of a scattered or disordered scaly tuft, of a reasonable good smell, of a bright yellow colour; which being gathered before they be ripe, do keep their colour and beauty a long time without withering, as do most of the Cottonweeds or Cudweeds, whereof this is a kinde. The root is blacke and slender. † There is some varietie in the heads of this plant, for they are sometimes very large and longish, as *Camerarius* notes in his Epitome of *Matthiolum*; otherwhiles they are very compact and round, and of the bignesse of the ordinarie.

2 This growes to some foot or more high, and hath rough downie leaues like the former, but broader: the floures are longer, but of the same yellow colour and long continuance as those of the last described. This varies something in the bredth and length of the leaues, whence *Tabernamontanus* gaue three figures thereof, and therein was followed by our Author, as you shall finde more particularly specified at the end of the chapter. †

3 About Nemausium and Montpelier there growes another kinde of *Chrysocome*, or as *Lobel* termes it, *Stachas Citrina altera*, but that as this plant is in all points like, so in all points it is lesser and slenderer, blacker, and not of such beauty as the former, growing more neere vnto an ash colour, consisting of many small twigs a foot long. The root is lesser, and hath fewer strings annexed thereto; and it is seldome found but in the cliffes and crags, among rubbish, and on walls of cities. This plant is browne, without sent or sauor like the other: euery branch hath his own bunch of floures comming forth of a scaly or round head, but not a number heaped together, as in the first kinde. It prospereth well in our London Gardens.

Hhh 3

4 There

† 1 *Stæchas Citrina, siue Amaranthus luteus.*
Golden Stæchas, or Goldilockes.

† 2 *Amaranthus luteus latifolius.*
Broad leaved Goldilockes.

† 3 *Chrysocome capitulis conglobatis.*
Round headed Goldilockes.

† 4 *Amaranthus luteus flore oblongo.*
Golden Cudweed.

4 There is a kinde hereof beeing a very rare plant, and as rare to be found where it naturally groweth, which is in the woods among the Scarlet-Okes betweene Sommieres and Mountpellier. It is a fine and beautifull plant, in shew passing the last described *Stæchas Citrina altera*: but the leaues of this kinde are broad, and somewhat hoarie, as is all the rest of the whole plant; the stalke a foot long, and beareth the very floures of *Stæchas Citrina altera*, but bigger and longer, and somewhat like the floures of *Lactuca agrestis*: the root is like the former, without any manifest smel, little knowne, hard to finde, whose faculties be yet vnknowne.

† 5 This

† 5 *Heliochrysos sylvestris*.
Wilde Goldylockes.

† 5 This is a wilde kinde (which Lobel setteth forth) that here may be inserted, called *Heliochrysos sylvestris*. The woolly or flockey leafe of this plant resembleth *Gnaphalium vulgare*, but that it is somewhat broader in the middle: the floures grow clustering together vpon the tops of the branches, of a yellow colour, and almost like those of Maudline: the roots are blacke and wooddie.

¶ The Place.

The first mentioned growes in Italy, and other hot countries: and the second growes in rough and granelly places almost euery where neere vnto the Rhene, especially between Spires and Wormes.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

Golden floure is called in Latine *Coma aurea*, of his golden locks or beautifull bush, and also *Tineraria*: in shops, *Stachas citrina*, *Amaranthus luteus*, Fuchsj, & Tragi: of some, *Linaria aurea*, but not truely: in Greeke, *Chrysocome*: in Dutch, *Reynbloemen*, and *Dorten cruyt*: in Italian, *Amarantho Giallo*: in English, Gold-floure, Gods floure, Goldilockes, and Golden *Stachas*.

¶ The Temperature and Vertues.

The floures of Golden *Stoechados* A boiled in wine and drunke, expell worms out of the bellie, and being boiled in Lee made of strong ashes doth kill lice and nits, if they bee bathed therewith. The other faculties are refered to the former plants mentioned in the last chapter.

† There were formerly the same number of figures as are now in this Chapter, but no way agreeing with the descriptions: the first was of *Millefolium Luteum*, being the *Heliochrysum italicum* of *Matthiolas*: The second was of the *Amaranthus primus* of *Tragus*, which still keeps the 2 place: and the 4. & 5. were onely varieties of this, according to *Gaubme*: but if they be not varieties, but made to expresse the 2. figures of the *Aduersar*, which we here giue, as I coniecture they were, then should the fourth haue bene put in the third place, and the fifth in the fourth, & the third should haue been put in the fifth, as you may see now it is.

CHAP. 208. Of Costmarie and Maudeleim.

¶ The Description.

1 **C**ostmary groweth vp with round hard stalkes two foot high, bearing long broad leaues finely nicked in the edges, of an ouerworn whitish green colour. The tuft or bundle is of a golden colour, consisting of many little floures like clusters, ioyned together in a rundle after the manner of golden *Stoechados*. The root is of a wooddy substance, by nature verie durable, not without a multitude of little strings hanging thereat. The whole plant is of a pleasant smell, sauour, or taste.

2 Maudeleine is somewhat like to Costmary (whereof it is a kinde) in colour, smell, taste, and in the golden floures, set vpon the tops of the stalks in round clusters. It bringeth forth a number of stalkes, slender, and round. The leaues are narrow, long, indented, and deeply cut about the edges. The cluster of floures is lesser than that of Costmarie, but of a better smell, and yellower colour. The roots are long lasting and many.

† 3 There is another kinde of *Balsamita minor*, or *Ageratum*, which hath leaues lesser and narrower than the former, and those not snipt about the edges: the ymbel or tuft of floures is yellow

1 *Balsamita mas.*
Costmarie.

2 *Balsamita femina, sive Ageratum.*
Maudelein.

3 *Ageratum folijs non serratis.* Maudelein with vncut leaues.
4 *Ageratum floribus albis.* White floured Maudelein.

yellow like as the former, and you may call each of these last described at your pleasure, either *Ageratum*, or *Balsamita*: the Gracians call it *Αιζον*, which is in Latine *Ageratum*, vel non senescens, called in shops (though vntuly) *Eupatorium Mesue*. The floures are of a beautifull and seemely shew, which will not lose their excellencie of grace in growing, vntill they be very old, and therefore called *Ageratum*, or *Non senescens*, as before, and are like in tuft to *Eliochryson*, but of a white colour; and this is thought to be the true and right *Ageratum* of *Dioscorides*, although there hath been great, controuersie which should be the true plant.

¶ 4 This differeth not from the common Maudelein, but in the colour of the floures, which are white, when as those of the ordinarie sort are yellow. ¶

¶ The Place.

They grow euery where in gardens, and are cherished for their sweet floures and leaues.

¶ The Time.

They bring forth their tufts of yellow floures in the Sommer moneths.

¶ The

¶ The Names.

Costmarie is called in Latine *Balsamita maior* or *mas* : of some, *Costus hortorum* : it is also called *Mentha Græca* : and *Saracenicæ Officinæ* : of *Tragus*, *Alisma* : of *Mathiolus*, *Herba Græca* : of others, *Salvia Romana*, and *Herba lassulata* : of some, *Herba D. Mariæ* in English, Costmarie, and Ale-coast : in High Dutch, *Frauwenkraut* : in low Dutch, *Heydnisch windkraut* : in French, *Coq*.

Maudlein is without doubt a kinde of Costmarie, called of the Italians *Herba Giulia* : of *Valerius Cordus*, *Mentha Corymbifera minor* : and *Eupatorium Mesue* : It is iudged to be *Dioscorides* his *Ageratum*, and it is the *Costus minor hortensis* of *Gesner* : we call it in English Maudlein.

¶ The Nature.

They are hot and drie in the second degree.

¶ The Vertues.

These plants are very effectuell, especially Maudlein, taken either inwardly or else outwardly to prouoke vrine, and the fume thereof doth the same, and mollifieth the hardnesse of the Matrix.

Costmarie is put into Ale to steepe, as also into the barrells and Stands amongst those herbes wherewith they doe make Sage Ale ; which drinke is very profitable for the diseases before spoken of.

The leaues of Maudleine and Adders tongue stamped and boiled in Oile Oliue, adding thereto a little wax, rosin, and a little turpentine, maketh an excellent healing vnguent, or incarnatiue salve to raise or bring vp flesh from a deepe and hollow wound or vicer, whereof I haue had long experience.

The Conserue made with the leaues of Costmarie and Sugar, doth warme and drie the braine, and openeth the stoppings of the same : stoppeth all Catarrhes, rheumes and distillations, taken in the quantitie of a beane.

The leaues of Costmarie boiled in wine and drunken, cureth the griping paine of the bellie, the guts and bowels, and cureth the bloudie flix.

It is good for them that haue the greene sicknesse, or the drop sicke, especially in the beginning, and it helpeth all that haue a weake and cold liuer.

The seed expelleth all manner of wormes out of the belly, as wormseed doth.

CHAP. 209. Of Tanisie.

¶ The Description.

1 Tanisie groweth vp with many stalkes, bearing on the tops of them certaine clustered tufts, with floures like the round buttons of yellow Romane Cammomill, or Feuerfew (without any leaues paled about them) as yellow as gold. The leaues be long, made as it were of a great many set together vpon one stalke, like those of Agrimony, or rather wild Tanisie, very like to the female Ferne, but softer and lesser, and euery one of them slashed in the edges as are the leaues of Ferne. The root is tough and of a wooddie substance. The whole plant is bitter in taste, and of a strong smell, but yet pleasant.

2 The double English Tanisie hath leaues infinitely iagged and nicked, and curled withall, like vnto a plume of feathers : it is altogether like vnto the other, both in smell and taste, as also in floures, but more pleasantly smelling by many degrees, wherein especially consisteth the difference.

3 The third kinde of Tanisie hath leaues, roots, stalkes, and branches like the other, and differeth from them, in that this hath no smell or sauour at all, and the floures are like the common single Featherfew.

4 *Clusius* hath described another bigger kind of vnsauorie Tanisie, whose figure here we giue you, it grows some cubit and halfe high, with crested stalks, hauing leaues set vpon somewhat longer stalks than those of the last described, otherwise much like them : the floures are much larger, being of the bignesse of the great Daisie, and of the same colour : the seede is long and blacke : The root is of the thicknes of ones finger, running vpon the surface of the ground, & putting forth some fibres, and it lasts diuers yeares, so that the plant may be encreased thereby. This floures in May and Iune, and grows wilde vpon diuers hills in Hungary and Austria.

5 The

1 *Tanacetum.*
Tanfie.

2 *Tanacetum crispum Anglicum.*
Double English Tanfie.

3 *Tanacetum non odorum.*
Vnsauorie Tanfie.

4 *Tanacetum in odorum maius.*
Great vnsauorie Tanfie.

† 4 *Tanacetum minus album.*
Small white Tansie.

5 The fifth kinde of Tansie hath broad leaues, much iagged and wel cut, like the leaues of Fetherfew, but smaller, and more deeply cut. The stalke is small, a foot long, whereupon doe grow little tufts of little white floures, like the tuft of Milfoile or Yarrow. The herbe is in smell and saour like the common Tansie, but not altogether so strong.

¶ The Place.

The first groweth wilde in fields as well as in gardens: the others grow in my garden.

¶ The Time.

They floure in Iuly and August.

¶ The Names.

The first is called Tansie; the second double Tansie, the third vsauory Tansie, the last white Tansie: in Latine, *Tanacetum*, and *Athanasia*, as though it were immortall: because the floures do not speedily wither: of some, *Artemisia*, but vntruly.

¶ The Nature.

The Tansies which smel sweet are hot in the second degree, and dry in the third. That without smell is hot and drie, and of a meane temperature.

¶ The Vertues.

In the Spring time are made with the leaues A hereof newly sprung vp, and with eggs, cakes or tansies, which be pleasant in taste, and good for the stomacke. For if any bad humours cleaue thereunto, it doth perfectly concoct them, and scowre them downwards. The root preferred with hony or sugar, is an especial thing against the gout, if euery day for a certaine space, a rea-

sonable quantitie thereof be eaten fasting.

The seed of Tansie is a singular and approoued medicine against Wormes, for in what sort so- B euer it be taken, it killeth and driueth them forth.

The same pound, and mixed with oile Oliue, is very good against the paine and shrinking of the C finewes.

Also being drunke with wine, it is good against the paine of the bladder, and when a man can- D not pisse but by drops.

† The figure that was formerly in the fourth place was onely the varietie of the ordinary Tansie, hauing a white floure, but that which agreed with the description was pag 915. vnder the title of *Achillea*, sive *Millefolium nobile*.

CHAP. 210. Of Fetherfew.

¶ The Description.

1 Fetherfew bringeth forth many little round stalkes, diuided into certaine branches. The leaues are tender, diuersly torne and iagged, and nickt on the edges like the first and ne- thermost leaues of Coriander, but greater. The floures stand on the tops of the branches, with a small pale of white leaues, set round about a yellow ball or button, like the wilde field Daisie. The root is hard and rough: the whole plant is of a light whitish greene colour, of a strong smell and bitter taste.

2 The second kinde of Feuerfew, *Matricaria*, or *Parthenium*, differeth from the former, in that it hath double floures; otherwise in smell, leaues, and branches, it is all one with the common Feuerfew.

3 There is a third sort called Mountaine Feuerfew, of *Carolus Clusius* his description, that hath small

1 *Matricaria*.
Feuerfew.2 *Matricaria duplici flore*.
Double Feuerfew.3 *Matricaria Alpina Clusij*.
Mountaine Feuerfew.

small and fibrous roots; from which proceed slender wooddie stalks, a foot high and somewhat more, beset or garnished about with leaues like Camomill, deeply iagged or cut, of the saour or smell of Feuerfew, but not so strong; in taste hot, but not vnpleasant. At the top of the stalks there come forth smal white floures not like vnto the first, but rather like vnto *Absynthium album*, or White Wormewood.

4 I haue growing in my Garden another sort, like vnto the first kinde, but of a most pleasant sweet saour, in respect of any of the rest. † This seemes to be the *Matricaria altera ex Ilua*, mentioned by *Camerarius* in his *Hortus medicus*. †

¶ The Place.

The common single Feuerfew groweth in hedges, gardens, and about old wals, it ioieth to grow among rubbish. There is oftentimes found when it is digged vp a little cole vnder the strings of the root, and neuer without it, whereof *Cardane* in his booke of Subtilties setteth down diuers vaine and trifling things.

¶ The Time.

They floure for the most part all the Sommer long.

¶ The Names.

Feuerfew is called in Greeke of *Dioscorides* *μαρδανις*; of *Galen*, and *Paulus* one of his sect, *Αρσινου*; in Latine, *Parthenium*, *Matricaria*, and *Febrifus*.

Febrifuga, of *Fuchsius*, *Artemisia Tenuifolia*: in Italian, *Amarella*: in Dutch, *Hoeder cruyt*: in French, *Essargoute*: in English, *Fedderfew* and *Feuerfew*, taken from his force of driving away Agues.

¶ *The Temperature.*

Feuerfew doth manifestly heat, it is hot in the third degree, and drie in the second; it clenseth, purgeth, or scoureth, openeth and fully performeth all that bitter things can do,

¶ *The Vertues.*

It is a great remedie against the diseases of the matrix; it procureth womens sicknes with speed; A it bringeth forth the after birth and the dead childe, whether it bee drunke in a decoction, or boiled in a bath and the woman sit ouer it, or the herbes sodden and applied to the priue part, in manner of a cataplasme or pultis.

Dioscorides also teacheth, that it is profitably applied to Saint Anthonies fire, to all hot inflammations, and hot swellings, if it be laid vnto, both leaues and floures.

The same Author affirmeth, that the pouder of *Feuerfew* drunke with *Oxymell*, or syrup of *Vineger*, or wine for want of the others, draweth away flegme and melancholy, and is good for them that are purtie, and haue their lungs stuffed with flegme; and is profitable likewise to be drunke against the stone, as the same Author saith.

Feuerfew dried and made into pouder, and two drams of it taken with honie or sweet wine, purgeth by siege melancholy and flegme; wherefore it is very good for them that are giddie in the head, or which haue the turning called *Vertigo*, that is a swimming and turning in the head. Also it is good for such as be melancholike, sad, pensieue, and without speech.

The herbe is good against the suffocation of the mother, that is, the hardnesse and stopping of the same, being boiled in wine, and applied to the place.

The decoction of the same is good for women to sit ouer, for the purposes aforesaid.

It is vsed both in drinks, and bound to the wrists with bay salt, and the pouder of glasse stamped together, as a most singular experiment against the ague.

CHAP. 211. Of *Poley*, or *Pellamontaine*.

1 *Polium montanum album*.

White *Poley* mountaine.

2 *Polium montanum luteum*.

Yellow *Poley* mountaine.

¶ The Description.

1 The first kinde of *Polium*, or in English Poley of the mountain, is a little tender and sweet smelling herbe, verie hoarie, whereupon it tooke his name: for it is not onely hoary in part, but his hoarie flockinesse possesseth the whole plant, tufts and all, being no lesse hoarie than *Gnaphalium*, especially where it groweth neere the Sea at the bending of the hils, or neere the sandie shores of the Mediterranean Sea: from his wooddie and somewhat threddie root shooteth forth straight from the earth a number of small round stalkes nine inches long, and by certaine distances from the stalke proceed somewhat long leaues like *Gnaphalium*, which haue light nicks about the edges, that stand one against another, inclosing the stalke: in the toppe of the stalkes stand spokie tufts of floures, white of colour like *Serpillum*. This plant is stronger of sent or sauour than any of the rest following, which sent is somewhat sharp, and affecting the nose with his sweetness.

2 The tufts of the second kinde of *Polium* are longer than the tufts or floures of the last before mentioned, and they are of a yellow colour; the leaues also are broader, otherwise they are very like.

3 From the wooddie rootes of this third kinde of *Polium* proceed a great number of shootes like vnto the last rehearsed, lying flat vpright vpon the ground, whose slender branches take hold vpon the vpper part of the earth where they creepe. The floures are like the other, but of a purple colour.

4 The last kinde of *Polium*, and of all the rest the smallest, is of an indifferent good smell, in all points like vnto the common *Polium*, but that it is foure times lesser, hauing the leaues not snipt, & the floures white.

¶ 5 This sends vp many branches from one root like to those of the first described, but shorter and more shrubbie, lying partly vpon the ground; the leaues grow by couples at certain spaces, somewhat like, but lesser than those of Rosemarie or Lauander, Greene aboue, and whitish beneath, not snipt about their edges; their taste is bitter, and smell somewhat pleasant: the floures grow plentifully vpon the tops of the branches, white of colour, and in shape not vnlike those of the other Poley: they grow on a bunch together, and not Spike fashion: the seed is blackish and contained in small vessels: the root is hard and wooddie, with many fibres. *Clusius* calls this *Polium 7. albo flore*. It is the *Polium alterum* of *Matthiolus*, and *Polium recentiorum famina Lavandula folio* of *Lobel*. I here giue you (as *Clusius* also hath done) two figures to make one good one: the former shews the floures and their manner of growing; the other, the seede vessels, and the leaues growing by couples, together with a little better expression of the root. ¶

3 *Polium montanum purpureum*. Purple Poley.

¶ The Place.

These plants do grow naturally vpon the mountaines of France, Italie, Spaine, and other hot regions. They are strangers in England, notwithstanding I haue plants of that Poley with yellow floures by the gift of *Lobel*.

¶ The Time.

They floure from the end of May, to the beginning of August.

¶ The

4 *Polium montanum minimum.*
Creeping Poley.

5 *Polium Lavandulaefolio, flore albo.*
Lavander leaved Poley.

Another figure of the Lavander leaved Poley.

¶ The Names.

Poley mountaine is called in Greeke *ῥοῖον*, of his hoarinesse, and in Latine also *Polium*. Divers suspect that *Polium* is *Leucas*, and that *Dioscorides* hath twice intreated of that herbe, ynder diuers names; the kindes, the occasion of the name, and likewise the faculties do agree. There bee two of the *Leucades*, one *ῥοῖον*: that is of the mountaine: the other, *ῥευρος*, which is that with the broader leafe: it is called *Leucas* of the whitish colour, and *Polium* of the hoarinesse, because it seemeth like to a mans hoarie head; for whatsoever waxeth hoarie, is said to be white.

¶ The Temperature.

Poley is of temperature drie in the third degree, and hot in the end of the second.

¶ The Vertues.

Dioscorides saith, it is a remedie for them that haue the dropie, the yellow iaudice, and that are troubled with the spleene.

It prouoketh vrine, & is put into Mithridate, Breacle, and counterpoisons.

It profiteth much against the bitings of venomous beasts, and driueth away all venomous beasts from the place where it is strewed or burnt.

The same drunke with vineger, is good for the

the diseases of the milt and spleene; it troubleth the stomacke, and afflicteth the head, and prouoketh the looseneffe of the bellie.

CHAP. 212. Of Germander.

¶ The Kindes.

THe old writers haue set downe no certaine kinds of Germander, yet we haue thought it good, and not without cause, to intreat of mo sorts than haue been obserued of all, diuiding those vnder the title of *Tencrium* from *Chamadryes*: although they are both of one kind, but yet differing very notably.

¶ The Description.

1 **T**He first Germander groweth lowe, with very many branches lying vpon the ground, rough, hard, and wooddie, spreading it selfe here and there: whereupon are placed small leaues snipt about the edges like the teeth of a saw, resembling the shape of an oken leafe. The floures are of a purple colour, very small, standing close to the leaues toward the top of the branches. The seed is little and blacke. The root slender and full of strings, creeping, and alwaies spreading within the ground, whereby it greatly increaseth. ‡ This is sometimes found with bigger leaues, otherwhiles with lesse; also the floure is sometimes white, and otherwhiles red in the same plant, whence *Tabernam.* gaue two figures, and our Authour two figures and descriptions, whereof I haue omitted the later, and put the two titles into one. ‡

2 The second Germander riseth with a little straight stalk a span long, and sometimes longer, wooddie and hard like vnto a littel shrub: it is afterwards diuided into very many little small branches. The leaues are indented and nicked about the edges, lesser than the leaues of the former, great creeping Germander: the floures likewise stand neere to the leaues, and on the vpper parts of the sprigs, of colour sometimes purple, and oftentimes tending to blewnesse: the roote is diuersly disperfed with many strings.

1 *Chamadrys maior latifolia.*

Great broad leaued Germander.

2 *Chamadrys minor.*

Small Germander.

3 *Chamadrys sylvestris.*
Wilde Germander.

3 Wilde Germander hath little stalkes, weake and feeble, edged or cornered, somewhat hairie, and set as it were with ioints; about the which by certaine distances there come forth at each ioint two leaues something broad, nicked in the edges, and something greater than the leaues of creeping Germander, and softer. The floures be of a gallant blew colour, made of foure small leaues a peece, standing orderly on the tops of the tender spriggie spraiies; after which come in place little huskes or seede vessels. The root is small and threddie.

¶ The Place.

These plants do grow in rocky and rough grounds, and in gardens they do easily prosper.

The wilde Germander groweth in manie places about London in Medowes and fertil fields, and in euery place wheresoeuer I haue trauelled in England.

¶ The Time.

They floure and flourish from the end of May, to the later end of August.

¶ The Names.

Garden Germander is called in Greeke, *Chamadrys*: of some, *Trissago*, & *Trixago*, and likewise *Quercula minor*; notwithstanding most of these names do more properly belong to *Scordium*, or water Germander: in Italian, *Querciuola*: in English, Germander, or English Treacle: in French, *Germandre*.

Before creeping Germander was knowne, this wilde kinde bare the name of Germander amongst the Apothecaries, and was vsed for the right Germander in the compositions of Medicines: but after the former were brought to light, this began to be named *Sylvestris*, and *Spuria Chamadrys*: that is wilde and bastard Germander: of some, *Teucrium pratense*, and without error; because all the sorts of plants comprehended vnder the title of *Teucrium*, are doubtlesse kinds of Germander. Of some it hath been thought to be the plant that *Dioscorides* called *ἱερὰ βοτάνη*, *Hierobotane*; that is to say, the Holie herbe, if so bee that the Holie herbe, and *Verbenaca*, or Veruaine, which is called in Greeke *ἱερὰ βοτάνη*, be sundrie herbes. *Dioscorides* maketh them sundrie herbes, describing them apart, the one after the other: but other Authors, as *Paulus*, *Aetius*, and *Oribasius*, make no mention of *Herba Sacra*, the Holie herbe, but onely of *Peristereon*: and this same is found to be likewise called *Hierobotane*, or the Holie Herb, and therefore it is euident that it is one and the selfe same plant, called by diuers names: the which things considered, if they say so, and say truely, this wilde Germander cannot be *Hierobotane* at all, as diuers haue written and said it to be.

¶ The Temperature.

Garden Germander is of thin parts, and hath a cutting facultie, it is hot and drie almost in the third degree, euen as *Galen* doth write of *Teucrium*, or wilde Germander.

The wilde Germander is likewise hot and drie, and is not altogether without force or power to open and cleanse: it may be counted among the number of them that do open the liuer and spleen.

¶ The Vertues.

Germander boiled in water and drunk, deliuereth the bodie from all obstructions or stoppings, A diuideth and cutteth tough and clammie humors: being receiued as aforesaid, it is good for them that haue the cough, and shortnesse of breath, the strangurie or stopping of vrine, and helpeth those which are entring into a dropsie.

The leaues stamped with honie and strained, and a drop at sundrie times put into the eies, takes B away the web and haue in the same, or any dimnesse of sight.

It prouoketh mightily the termes, being boiled in wine, and the decoction drunk, with a fomen- C tation or bath made also thereof, and the secret parts bathed therewith.

CHAP. 213: Of Tree Germander.

¶ The Description.

1 The first kinde of Tree Germander riseth vp with a little straight stalke a cubite high, wooddie and hard like vnto a small wooddie shrubbe. The stalke diuideth it selfe from the bottome vnto the toppe into diuers branches, whereon are set indented leaues nicked about the edges, in shape not much vnlike the leafe of the common Germander. The floures grow among the leaues of a purple colour. The root is wooddie, as is all the rest of the plant.

1 *Teucrium latifolium.*
Tree Germander with broad leaues.

2 *Teucrium Pannonicum.*
Hungarie Germander.

2 The Tree Germander of Hungarie hath many tough threddie roots, from which rise vp diuers weake and feeble stalks, reeling this way and that way; whereupon are set together by couples, long leaues iagged in the edges, not vnlike those of the vpright Fluellen: on the tops of the stalks stand the floures Spike fashion, thicke thrust together, of a purple colour tending towards blewnesse.

¶ **3** This (which is the fourth of *Clusius* description) hath diuers stalkes some cubite high, foure square, rough, and set at certaine spaces with leaues growing by couples like those of the wilde Germander: the tops of the stalkes are diuided into fundry branches, carrying long spokes of blew floures, consisting of foure leaues, whereof the vppermost leafe is the largest, and distinguished with veines: after the floures are past follow such flat seed vessels as in Fluellen: the root is fibrous and liues long, sending forth euery yeare new branches. ¶

4 This

‡ 3 *Teucrium mains Pannonicum.*
Great Austrian Germander.

‡ 4 *Teucrium petraum pumilum.*
Dwarfe Rocke Germander.

5 *Teucrium Baticum.*
Spanish Tree Germander.

6 *Teucrium Alpinum Cisti flore.*
Rough headed Tree Germander.

4 This Dwarf Germander sends vp stalkes some handfull high, round, not branched : the leaues grow vpon these stalkes by couples, thicke, shining, a little hairy and greene on their vpper sides, and whitish below : the tops of the stalkes carry spoky tufts of floures, consisting of foure or fiue blewish leaues ; which falling, there followes a seed-vessell, as in the *Veronica's*. The root is knotty and fibrous, and growes so fast amongst the rockes that it cannot easily be got out. It floureteth in Iuly. *Cistus* describes this by the name of *Teucrium 6. Pumilum* : and *Pona* sets it forth by the name of *Veronica petrea semper viuens*. ‡

5 This Spanish Germander riseth vp oft times to the height of a man, in manner of a hedge bush, with one stiffe stalke of the bignesse of a mans little finger, couered ouer with a whitish bark, diuided sometimes into other branches, which are alwayes placed by couples one right against another, of an ouerworne hoarie colour ; and vpon them are placed leaues not much vnlike the common Germander ; the vpper parts whereof are of a grayish hoarie colour, and the lower of a deepe greene ; of a bitter taste, and somewhat crooked, turning and winding themselues after the manner of a welt. The floures come forth from the bosome of the leaues, standing vpon small tender foot-stalkes of a white colour, without any helmet or hood on their tops, hauing in the middle many threddy strings. The whole plant keepeth greene all the Winter long.

6 Among the rest of the Tree Germanders this is not of least beauty and account, hauing many weake and feeble branches trailing vpon the ground, of a darke reddish colour, hard and wooddie ; at the bottome of which stalks come forth many long broad iagged leaues not vnlike the precedent, hoary vnderneath, and greene aboue, of a binding and drying taste. The floures grow at the top of the stalkes, not vnlike to those of *Cistus famina*, or Sage-rose, and are white of colour, consisting of eight or nine leaues, in the middle whereof do grow many threddy chiues without smell or sauour : which being past, there succeedeth a tuft of rough threddy or flocky matter, not vnlike to those of the great Auens or *Pulsatilla* : the root is woody, and set with some few hairie strings fastned to the same.

¶ The Place.

These plants do ioy in stony and rough mountaines and dry places, and such as lie open to the Sunne and aire, and prosper well in gardens : and of the second sort I haue receiued one plant for my garden of M^r. Garret Apothecarie.

¶ The Time.

They floure, flourish, and seed when the other Germanders do.

¶ The Names.

Tree Germander is called in Greeke *χάμαδρυς*, retaining the name of the former *Chamedrys*, and *χάμαδρυς*, according to the authoritie of *Dioscorides* and *Pliny* : in Latine *Teucrium* : in English, Great Germander, vpriht Germander, and Tree Germander.

¶ The Temperature and Vertues.

Their temperature and faculties are referred vnto the garden Germander, but they are not of such force and working, wherefore they be not much vsed in physicke.

CHAP. 214.

Of Water Germander, or Garlicke Germander.

¶ The Description.

S*cordium* or water Germander hath square hairie stalkes creeping by the ground, beset with soft whitish crumpled leaues, nickt and snipt round about the edges like a Saw : among which grow small purple floures like the floures of dead Nettle. The root is small and threddy, creeping in the ground very deepely. The whole plant being bruised smelleth like Garlicke, whereof it tooke that name *Scordium*. ‡ This by reason of goodnesse of soile varieth in the largenesse thereof, whence *Tabernamontanus* and our Author made a bigger and a lesser thereof, but I haue omitted the later as superfluous. ‡

¶ The Place.

Water Germander groweth neere to Oxenford, by Ruley, on both sides of the water, and in a meadow

medow by Abington called Nietford, by the relation of a learned Gentleman of S. Johns in the said towne of Oxenford, a diligent *φίλος βοτάνης*, my very good friend, called M^r. Richard Slater. Also it groweth in great plenty in the Isle of Elie, and in a medow by Harwood in Lancashire, and diuers other places.

Scordium.
Water Germander.

¶ The Time.

The floures appeare in Iune and Iuly: it is best to gather the herbe in August: it perisheth not in Winter, but onely loseth the stalkes, which come vp againe in Sommer: the root remaineth fresh all the yeare.

¶ The Names.

The Grecians call it *Σκώδιον*: the Latines do keepe that name *Scordium*: the Apothecaries haue no other name: It is called of some *Trixago Palustris*, *Quercula*, and also *Mithridatium*, of *Mithridates* the finder of it out. It tooke the name *Scordium* from the smell of Garlicke, which the Grecians call *σκόρδα*, and *σκόρδα*, of the rancknesse of the smell: in high-Dutch, *ma-sker battenig*: in French, *Scordion*: in Italian, *Chalamandrina palustre*: in English, *Scordium*, *Water Germander*, and *Garlicke Germander*.

¶ The Temperature.

Water Germander is hot and dry: it hath a certaine bitter taste, harsh and sharpe, as *Galen* witnesseth.

¶ The Vertues.

Water Germander cleanseth the intrals, and likewise old vlcers, being mixed with honey according to art: it prouoketh vrine, and bringeth downe the monethly sicknesse: it draweth out of the chest thicke flegme and rotten matter: it is good for an old cough, paine in the sides which commeth of stopping and cold, and for burstings and inward ruptures. A

The decoction made in wine and drunke, is good against the bitings of Serpents, and deadly poysons; and is vsed in antidotes or counterpoysons with good successe. B

It is reported to mitigate the paine of the gout, being stamped and applied with a little vineger and water. C

Some affirme, that raw flesh being laid among the leaues of *Scordium*, may be preferued a long time from corruption. D

Being drunke with wine it openeth the stoppings of the liuer, the milt, kidnies, bladder, and matrix, prouoketh vrine, helpeth the strangurie, that is, when a man cannot pisse but by drops, and is a most singular cordiall to comfort and make merry the heart. E

The pouder of *Scordium* taken in the quantitie of two drams in meade or honied water, cureth and stoppeth the bloody flix, and comforteth the stomacke. Of this *Scordium* is made a most singular medicine called *Diascordium*, which serueth very notably for all the purposes aforesaid. F

The same medicine made with *Scordium* is giuen with very good successe vnto children and aged people, that haue the small pockes, measles, or the Purples, or any other pestilent sicknesse whatsoeuer, euen the plague it selfe, giuen before the sicknes haue vniuersally possessed the whole body. G

CHAP. 215. Of Wood Sage, or Garlicke Sage.

¶ The Description.

That which is called Wilde Sage hath stalkes foure square, somewhat hairie, about which are leaues like those of Sage, but shorter, broader, and softer: the floures grow vp all vpon one side of the stalke, open and forked as those of dead Nettle, but lesser, of a pale white colour: then grow the feeds foure together in one huske: the root is full of strings. It is a plant that liueth but a yeare: it smelleth of garlicke when it is bruised, being a kinde of Garlicke Germander, as appeareth by the smell of garlicke wherewith it is possessed.

† *Scorodonia, siue Salvia agrestis.*
Wood Sage, or Garlicke Sage.

¶ The Place.

It groweth vpon heaths and barren places: it is also found in Woods, and neere vnto hedgerowes, and about the borders of fields: it somewhat delighteth in a leane soile, and yet not altogether barren and dry.

¶ The Time.

It floureth and seedeth in Iune, Iuly, and August, and it is then to be gathered and laid vp.

¶ The Names.

It is called of the later Herbarists *Salvia agrestis*: of diuers also *Ambrosia*; but true *Ambrosia*, which is Oke of Cappadocia, differs from this. *Valerius Cordus* names it *Scorodonia*, or *Scorodonia*, and *Scordium alterum*. *Ruellius* saith it is called *Boscifalvia*, or *Salvia Bosci*: in high Dutch, **waldt salbey**: in English, wilde Sage, wood Sage, and Garlicke Sage.

It seemeth to be *Theophrastus* his *sphaecelus*, which is also taken for the small Sage, but not rightly.

¶ The Temperature.

Wilde Sage is of temperature hot and drie, yet lesse than common Sage; therefore it is hot and dry in the second degree.

¶ The Vertues.

A It is commended against burstings, dry beatings, and against wounds: the decoction thereof is giuen to them that fall, and are inwardly bruised: it also prouoketh vrine.

B Some likewise giue the decoction hereof to drinke, with good successe, to them that are infected with the French Pox; for it causeth sweat, drieth vp vlcers, digesteth humors, wasteth away and consumeth swellings, if it be taken thirtie or forty dayes together, or put into the decoction of *Guaiacum*, in stead of *Epithymum* and other adiutories belonging to the said decoction.

† The figure which was formerly here was of *Calamintha montana* præstantior of *Lobel.*

CHAP. 216. Of Eye-bright.

¶ The Description.

E*uphrasia* or Eye-bright is a small low herbe not aboue two handfuls high, full of branches, couered with little blackish leaues dented or snipt about the edges like a saw: the floures are small

small and white, sprinkled and poudered on the inner side, with yellow and purple specks mixed therewith. The root is small and hairie.

Euphrasia.
Eye-bright.

¶ *The Place.*

This plant growes in dry medows, in green and grassie wayes and pastures standing against the Sunne.

¶ *The Time.*

Eye-bright beginneth to floure in August and continueth vnto September, and must be gathered while it floureth for physicks vse.

¶ *The Names.*

It is commonly called *Euphrasia*, as also *Euphrosyne*; notwithstanding there is another *Euphrosyne*, viz. Buglosse: it is called of some *Ocularis*, & *Ophthalmica* of the effect: in high-Dutch, *Augen trost*; in low-Dutch, *Ooghen troost*; in Italian, Spanish, and French, *Eufra-sia*, after the Latine name: in English, Eye-bright.

¶ *The Nature.*

This herbe is hot and dry, but yet more hot than dry.

¶ *The Vertues.*

It is very much commended for the eyes. **A** Being taken it selfe alone, or any way else, it preserves the sight, and being feeble and lost it restores the same: it is giuen most fitly being beaten into pouder; oftentimes a like quantitie of Fennel seed is added thereto, and a little mace, to the which is put so much sugar as the weight of them all cometh to.

Eye-bright stamped and layd vpon the eyes, or the iuyce thereof mixed with white Wine, and **B** dropped into the eyes, or the distilled water, taketh away the darknesse and dimnesse of the eyes, and cleareth the sight.

Three parts of the pouder of Eye-bright, and one part of maces mixed therewith, taketh away **C** all hurts from the eyes, comforteth the memorie, and cleareth the sight, if halfe a spoonfull be taken euery morning fasting with a cup of white wine.

† That which was formerly here set forth in the second place vnder the title of *Euphrasia carulea Tabern.* was described by our Authour amongst the Scorpion grasses, in the third place, Chap. 54. and the figure is pag. 338. vnder the title of *Myosotis Scorpioides palustris*.

CHAP. 217. Of Marierome.

¶ *The Description.*

I Sweet Marjerome is a low and shrubby plant, of a whitish colour and marvellous sweet smell, a foot or somewhat more high. The stalkes are slender, and parted into diuers branches, about which grow forth little leaues soft and hoarie: the floures grow at the top in scaly or chaffie spiked eares, of a white colour like vnto those of Candy Organy. The root is compact of many small threds. The whole plant and euerie part thereof is of a most pleasant taste, and aromaticall smell, and perisheth at the first approach of Winter.

2 Pot Marierome or Winter Maierome hath many threddy tough roots, from which rise immediately diuers small branches, whereon are placed such leaues as the precedent, but not so hoarie, nor yet so sweet of smell, bearing at the top of the branches tufts of white floures tending to purple. The whole plant is of long continuance, and keepeth greene all the Winter; whereupon our English women haue called it, and that very properly, Winter Mariérome.

3 Marierome Gentle hath many branches rising from a threddy root, whereupon do grow soft and sweet smelling leaues of an outworne russet colour. The floures stand at the top of the stalks, compact

1 *Mariorana maior.*
Great sweet Marierome.

2 *Mariorana maior Anglica.*
Pot Marierome.

3 *Mariorana tenuifolia.*
Marierome gentle.

compact of diuers small chaffie scales, of a white colour tending to a blush. The whole plant is altogether like the great sweet Marierome, sauing that it is altogether lesser, and far sweeter, wherein especially consisteth the difference.

4 *Epimariorana* is likewise a kind of Marierome, differing not from the last described, sauing in that, that this plant hath in his naturall country of Candy, and not elswhere, some laces or threds fastned vnto his branches, such, and after the same manner as those are that doe grow vpon Sauorie, wherein is the difference.

¶ The Place.

These plants do grow in Spaine, Italy, Candy, and other Islands thereabout, wilde, and in the fields; from whence wee haue the seeds for the gardens of our cold countries.

¶ The Time.

They are sowne in May, and bring forth their scaly or chaffie huskes or eares in August. They are to be watered in the middle of the day, when the Sunne shineth hottest, euen as Basill should be, and not in the euening nor morning, as most Plants are.

¶ The Names.

Marierome is called *Mariorana*, and *Amaracus*, and also *Marum* and *Sampsychum* of others: in high-Dutch, *Mayoran*: in Spanish, *Mayorana*, *Moradux*, and *Almoradux*: in French, *Mariolaine*: in English, Sweet Marierome, Fine Marierome, and Marierome

some gentle; of the best sort Marjerane. The pot Marjerome is also called Winter Marjerome. Some haue made a doubt whether *Maiorana* and *Sampsychum* be all one; which doubt, as I take it, is because that *Galen* maketh a difference betweene them, intreating of them apart, and attributeth to either of them their operations. But *Amaracus Galeni* is *Parthenium*, or Feuerfew. *Dioscorides* likewise witnesseth, that some do call *Amaracus*, *Parthenium*; and *Galen* in his booke of the faculties of simple medicines, doth in no place make mention of *Parthenium*, but by the name of *Amaracus*. *Pliny* in his 21 booke, chap. 2. witnesseth, that *Diocles* the phyfition, and they of Sicily did call that *Amaracus*, which the Egyptians and the Syrians did call *Sampsychum*.

Virgill in the first booke of his *Aeneidos* sheweth, that *Amaracus* is a shrub bearing floures, writing thus:

*Vbi mollis Amaracus illum
Floribus, & dulci aspirans complectitur umbra.*

Likewise *Catullus* in his *Epithalamium*, or mariage song of *Iulia* and *Mallius* saith,

*Cinge tempora floribus
Suave olentis Amaraci.*

Compasse the temples of the head with floures.
Of Amarac affording sweete fauours.

Notwithstanding it may not seeme strange, that Majorane is vsed in stead of *Sampsychum*, seeing that in *Galen*s time also *Marum* was in the mixture of the ointment called *Amaracinum unguentum*, in the place of *Sampsychum*, as he himselfe witnesseth in his first booke of counterpoisons.

¶ The Temperature.

They are hot and dry in the second degree; after some copies, hot and dry in the third.

¶ The Virtues.

Sweete Marjerome is a remedy against cold diseases of the braine and head, being taken any way to your best liking; put vp into the nostrils it prouoketh sneezing, and draweth forth much baggage flegme: it easeth the tooth-ache being chewed in the mouth; being drunke it prouoketh vrine, and draweth away waterish humors, and is vsed in medicines against poison.

The leaues boiled in water, and the decoction drunke, helpeth them that are entering into the dropfie: it easeth them that are troubled with difficultie of making water, and such as are giuen to ouermuch sighing, and easeth the paines of the belly.

The leaues dried and mingled with hony, and giuen, dissolueth congealed or clotted blood, and putteth away blacke and blew markes after stripes and bruses, being applied thereto.

The leaues are excellent good to be put into all odoriferous ointments, waters, pouders, broths, and meates.

The dried leaues poudered, and finely searched, are good to be put into Cerotes, or Cere-cloths and ointments, profitable against colde swellings, and members out of joint.

There is an excellent oile to be drawne forth of these herbes, good against the shrinking of sinewes, crampes, convulsions, and all aches proceeding of a colde cause.

CHAP. 218. Of wilde Marjerome.

¶ The Description.

1 **B**astard Marjerome groweth straight vp with little round stalkes of a reddish colour, full of branches, a foot high and sometimes higher. The leaues be broad, more long than round, of a whitish Greene colour: on the top of the branches stand long spikie scaled eares, out of which shoor forth little white floures like the flouring of wheate. The whole plant is of a sweete smell, and sharpe biting taste.

2 The white Organy, or bastard Marjerome with white floures, differing little from the precedent, but in colour and stature. This plant hath whiter and broader leaues, and also much higher, wherein consisteth the difference.

3 Bastard Marjerome of Candy hath many threddy roots; from which rise vp diuers weake and feeble branches trailing vpon the ground, set with faire Greene leaues, not vnlike those of Penny Royall, but broader and shorter: at the top of those branches stand scalie or chaffie eares of a purple colour. The whole plant is of a most pleasant sweet smell. The root endured in my garden

1 *Origanum Heracleoticum*.
Bastard Marjerome.

† 2 *Origanum album*, Tabern.
White bastard Marjerome.

† 3 *Origanum Creticum*.
Wilde Marjerome of Candy.

4 *Origanum Anglicum*.
English wilde Marjerome.

and the leaues also greene all this winter long, 1597. although it hath been said that it doth perish at the first frost, as sweete Marjerome doth.

4 English wilde Marjerome is exceedingly well knowne to all, to haue long, stiffe, and hard stalkes of two cubits high, set with leaues like those of sweet Marjerome, but broader and greater, of a russet greene colour, on the top of the branches stand tufts of purple floures, composed of many small ones set together very closely vmbell fashion. The root creepeth in the ground, and is long lasting.

¶ The Place.

These plants do grow wilde in the kingdome of Spaine, Italy, and other of those hot regions. The last of the foure doth grow wilde in the borders of fields, and low copses, in most places of England.

¶ The Time.

They floure and flourish in the Sommer moneths, afterward the seed is perfected.

¶ The Names.

Bastard Marjerome is called in Greeke, *ῥιγανή*; and that which is surnamed *Heracleoticum*, *ῥιγανή* of diuers it is called *Cunila*: in shops, *Origanum Hispanicum*, Spanish Organy: our English wilde Marjerome is called in Greeke of *Dioscorides*, *Galen*, and *Pliny*, *Onitis*, of some, *Agrioriganum*, or *Sylvestre Origanum*: in Italian, *Origano*: in Spanish *Oregano*: in French, *Mariolaine bastarde*: in English, Organe, bastard Marjerome: and that of ours, wilde Marjerome, and groue Marjerome.

¶ The Temperature.

All the Organies do cut, attenuate, or make thin, dry, and heate, and that in the third degree; and *Galen* teacheth that wilde Marjerome is more forceable and of greater strength; notwithstanding Organy of Candy which is brought dry out of Spaine (whereof I haue a plant in my garden) is more biting than any of the rest, and of greatest heate.

¶ The Vertues.

Organy giuen in wine is a remedy against the bitings, and stingings of venomous beasts, and cureth them that haue drunke *Opium*, or the juice of blacke poppy, or hemlockes, especially if it be giuen with wine and raisons of the sunne. A

The decoction of Organy prouoketh vrine, bringeth downe the monethly course, and is giuen with good successe to those that haue the drop sic. B

It is profitably vsed in a looch, or a medicine to be licked, against an old cough and the stuffing of the lungs. C

It healeth scabs, itches, and scuruiuesse, being vsed in bathes, and it taketh away the bad colour which commeth of the yellow jaundice. D

The weight of a dram taken with meade or honied water, draweth forth by stoole blacke and filthy humors, as *Dioscorides* and *Pliny* write. E

The juice mixed with a little milke, being poured into the eares, mitigateth the paines thereof. F

The same mixed with the oile of *Ireos*, or the rootes of the white Florentine floure de luce, and drawne vp into the nostrils, draweth downe water and flegme: the herbe strowed vpon the ground driueth away serpents. G

The decoction looseth the belly, and voideth choler; and drunke with vineger helpeth the infirmities of the spleene, and drunke in wine helpeth against all mortall poisons, and for that cause it is put into mithridate and treacles prepared for that purpose. H

These plants are easie to be taken in potions, and therefore to good purpose they may be vsed and ministred vnto such as cannot brooke their meate, and to such as haue a sowre and sqamish and watery stomacke, as also against the swooning of the heart. I

† The second and third figures were formerly transposed.

CHAP. 219.

Of Goates Marjerome, or Organy.

¶ The Description.

1 THE stalkes of Goates Organy are slender, hard and wooddy, of a blackish colour; whereon are set long leaues, greater than those of the wilde Time, sweete of smell, rough, and somewhat hairy. The floures be small, and grow out of little crownes or wharles round about the top of the stalkes, tending to a purple colour. The root is small and threddy.

† 1 *Tragoriganum* Dod.

Goats Mariherome.

† *Tragoriganum* Lob.† 2 *Tragoriganum* Clusij.

Clusius his Goats Mariherome.

† 3 *Tragoriganum* Cretense.

Candy Goats Mariherome.

2 *Carolus Clusius* hath set forth in his Spanish Obseruations another sort of Goats Marierome growing vp like a small shrub: the leaues are longer and more hoarie than wilde Marierome, and also narrower, of a hot biting taste, but of a sweet smell, though not very pleasant. The floures do stand at the top of the stalkes in spokie rundles, of a white colour. The root is thicke and woody.

† 3 This differs little in forme and magnitude from the last described, but the branches are of a blacker colour, with rougher and darker coloured leaues: the floures also are lesser, and of a purple colour. Both this and the last described continue alwaies greene, but this last is of a much more fragrant smell. This floures in March, and was found growing wilde by *Clusius* in the fields of Valentia: he calls it *Tragoriganum Hispanicum tertium*. *Pena* and *Lobel* call it *Tragoriganum Cretense apud Venetas*; that is, the Candy Goats Marierome of the Venetians. †

¶ The Place.

These plants grow wilde in Spaine, Italy, and other hot countries. The first of these I found growing in diuers barren and chalky fields and high-ways neere vnto Sittingburne and Rochester in Kent, and also neere vnto Cobham house and Southfleet in the same county.

† I doubt our Author was mistaken, for I haue not heard of this growing wilde with vs. †

¶ The Time.

They floure in the moneth of August. I remember (saith *Dodonaeus*) that I haue seene *Tragoriganum* in the Low-countries, in the gardens of those that apply their whole study to the knowledge of plants; or as we may say, in the gardens of cunning Herbarists.

¶ The Names.

Goats Organie is called in Greeke *γαιοργάνιον*: in Latine likewise *Tragoriganum*: in English, goats Organie, and Goats Marierome.

¶ The Temperature.

Goats Organies are hot and dry in the third degree: They are (saith *Galen*) of a binding qualitie.

¶ The Vertues.

Tragoriganum or Goats Marierome is very good against the wamblings of the stomacke, and the A soure belchings of the same, and stayeth the desire to vomit, especially at sea.

These bastard kindes of Organie or wilde Marieromes haue the same force and faculties that B the other Organies haue for the diseases mentioned in the same chapter.

† There were formerly two figures in this chapter; the first whereof was of that which is described in the second place: the second was of *Tragoriganum* of *Matthioli*, whereof there is no mention made. The figure of the *Tragoriganum alterum* of *Lobel* (which as I haue formerly said, *Baudouin* would haue all one with that of *Dodonaeus*) was formerly vnder the name of *Thymum Creticum*, pag. 459. of the former edition.

CHAP. 220. Of Herbe Masticke.

¶ The Description.

1 THE English and French herbarists at this day do in their vulgar tongues call this herb Masticke or Mastich, taking this name *Marum* of *Maro* King of Thrace; though some rather suppose the name corruptly to be deriued from this word *Amaracus*, the one plant being so like the other, that many learned haue taken them to be one and the selfe same plant: others haue taken *Marum* for *Sampsuchus*; which doubtlesse is a kinde of Marierome. Some (as *Dodonaeus*) haue called this our *Marum* by the name of *Clinopodium*; which name rather belongs to another plant than to Masticke. † This growes some foot high, with little longish leaues set by couples: at the tops of the stalkes amongst white downie heads come little white floures: the whole plant is of a very sweet and pleasing smell. †

2 If any be desirous to search for the true *Marum*, let them be assured that the plant last mentioned is the same: but if any do doubt thereof, for nouelties sake here is presented vnto your view a plant of the same kinde (which cannot be reiected) for a speciall kind thereof, which hath a most pleasant sent or smell, and in shew resembleth Marierome and *Origanum*, consisting of smal twigs a foot and more long; the heads tufted like the common Marierome; but the leaues are lesse, and like *Myrtus*: the root is of a woody substance, with many strings hanging thereat.

3 There is another kinde hereof set forth by *Lobel*, which I haue not as yet seen, nor himselfe hath well described, which I leaue to a better consideration. † Though our Authour knew not how to describe this creeping *Marum* of *Lobel*, yet no question, if he had knowne so much, he would haue giuen vs the figure thereof as wel in this place, as in the third place of the next chapter for

1 *Marum.*
Herbe Masticke.

2 *Marum Syriacum.*
Assyrian Masticke.

3 *Marum supinum Lobelij.*
Creeping Masticke.

for a Penny-Royall; and might as well here as there, and much more fitly have ventured at a description. But that which is defective in him and *Lobel*, I will endeavour to supply out of *Casalpini*. This plant hath many creeping branches like to those of wilde Time, but set with whiter and shorter leaues like to those of the smaller Marjerome, but somewhat narrower: the floures grow in rundles amongst the leaues, as in Calamint, and are of a purple colour: the whole plant is of a strong and sweet smell, and of an hot and bitter taste. *Casalpini* thinks this to be the *Sampsuchum* of *Dioscorides*: and so also do the Authors of the *Aduersaria*. *Tabernamontanus* calls it *Marum repens*. †

¶ The Place.

These plants are set and sowne in the gardens of England, and there maintained with great care and diligence from the iniurie of our cold clymate.

¶ The Time.

They floure about August, and somewhat later in cold Sommers.

¶ The Names.

† Masticke is called of the new writers *Marum*: and some, as *Lobel* and *Anguillara* thinke it the *Helenium odorum* of *Theophrastus*. *Dodonæus* iudges it to be the *Clinopodium* of *Dioscorides*. *Clusius* makes it his *Trageriganum* 1. and saith he receiued the seeds thereof by the name of *Ambra dulcis*. ‡

¶ The Nature.

These plants are hot and drie in the third degree.

¶ The Vertues.

Dioscorides writeth, that the herbe is drunke, and likewise the decoction thereof, against the bitings of venomous beasts, crampes and convulsions, burstings and the strangurie. A

The decoction boiled in wine till the third part be consumed, and drunke, stoppeth the laske in B them that haue an ague, and vnto others in water.

† That we here giue you in the third place was formerly vastly figured in the third place of the ensuing Chapter by the name of *Pulegium Angustifolium*.

CHAP. 221. Of Pennie Royall, or pudding grasse.

† 1 *Pulegium regium*.
Pennie Royall.

† 2 *Pulegium mas*.
Vpright Pennie Royall.

¶ The Description.

1 *Pulegium regium vulgatum* is so exceedingly well knowne to all our English Nation, that it needeth no description, being our common Pennie Royall.

2 The second being the male Pennie Royall is like vnto the former, in leaues, floures and smell, and differeth in that this male kinde groweth vpright of himselfe without creeping, much like in shew vnto wilde Marierome.

† 3 *Pulegium angustifolium*.
Narrow leaved Pennie Royall.

3 The third kinde of Pennie Royall growes like vnto Tyme, and is of a wooddie substance, somewhat like vnto the thinne leaved Hyssope, of the sauour of common Pennie Royall, † but much stronger and more pleasant: the longish narrow leaues stand vpon the stalkes by couples, with little leaues comming forth of their bosomes: and towards the tops of the branches grow rundles of small purple floures. This grows plentifully about Montpellier, and by the Authors of the *Aduersaria*, who first set it forth, it is stiled *Pulegium, angustifol. sive ceruinum Montspeliensium*. †

¶ The Place.

The first and common Pennie Royall groweth naturally wilde in moist and ouerflown places, as in the Common neere London called Miles end, about the holes & ponds thereof in sundry places, from whence poore women bring plentie to sell in London markets, and it groweth in sundrie other Commons neere London likewise.

The second groweth in my garden: the third I haue not as yet seene.

¶ The Time.

They floure from the beginning of Iune to the end of August.

¶ The Names.

Pennie Royall is called in Greeke *πυλέγιον*, and oftentimes *βληχον*: in Latine, *Pulegium*, and *Pulegium regale*, for difference sake betweene it and wilde Tyme, which of some is called *Pulegium montanum*: in Italian, *Pulegio*: in Spanish, *Poleo*: in Dutch, *Poley*: in French, *Pouliot*: in English, Pennie Royall, Pudding grasse, Puliall Royall, and of some Organie.

¶ The Nature.

Pennie Royall is hot and drie in the third degree, and of subtile parts, as *Galen* saith.

¶ The Vertues.

- A Pennie Royall boiled in wine and drunken, prouoketh the monthly termes, bringeth forth the secondine, the dead childe and vnnaturall birth: it prouoketh vrine, and breaketh the stone, especially of the kidneies.
- B Pennie Royall taken with honie clenseth the lungs, and cleereth the breast from all grosse and thicke humours.
- C The same taken with honie and Aloes, purgeth by stoole melancholie humours; helpeth the crampe and drawing together of sinewes.
- D The same taken with water and Vineger asswageth the inordinate desire to vomite, & the pains of the stomacke.
- E If you haue when you are at the sea Pennie Royal in great quantitie drie, and cast it into corrupt water, it helpeth it much, neither will it hurt them that drinke thereof.
- F A Garland of Pennie royall made and worne about the head is of great force against the swimming in the head, the paines and giddinesse thereof.
- G The decoction of Pennie Royall is very good against ventositie, windinesse, or such like, and against the hardnes & stopping of the mother being vsed in a bath or stew for the woman to sit ouer.

† It is apparant by the titles and descriptions that our Authour in this chapter followed *Lobel* but the figures were not agreeable to the historie, for the two first figures were of the *Pulegium Angustifolium* described in the third place; and the third figure was of the *Marum supinum* described in the last place of the foregoing Chapter.

CHAP. 222. Of Basill.

¶ The Description.

1 **G**arden Basill is of two sorts, differing one from another in bignesse. The first hath broad, thicke, and fat leaues, of a pleasant sweet smell, and of which some one here and there are of a black reddish colour, somewhat snipped about the edges, not vnlike the leaues of French Mercurie. The stalke groweth to the height of halfe a cubite, diuiding it self into diuers branches, whereupon doe stand small and base floures sometimes whitish, and often tending to a darke purple. The root is threddie, and dieth at the approach of Winter.

1 *Ocimum magnum.*
Great Basill.

2 *Ocimum medium citratum.*
Citron Basill.

3 *Ocimum minus Gariophyllatum.*
Bush Basill.

4 *Ocimum Indicum.*
Indian Basill.

2 The middle Basill is very like vnto the former, but it is altogether lesser. The whole plant is of a most odoriferous smell, not vnlike the smell of a Limon, or Citron, whereof it tooke his surname.

3 Bush Basill, or fine Basill, is a low and base plant, hauing a threddie root, from which rise vp many small and tender stalks, branched into diuers armes or boughes, whereupon are placed many little leaues, lesser than those of Pennie Royall. The whole plant is of a most pleasing sweete smell.

† 4 This which some call *Ocimum Indicum*, or rather (as *Camerarius* saith) *Hispanicum*, sends vp a stalk a foot or more high, foure square, and of a purple colour, set at each ioint with two leaues, and out of their bosomes come little branches: the largest leaues are some two inches broad, and some three long, growing vpon long stalks, and deeply cut in about their edges, being also thicke, fat and iuicie, and either of a darke purple colour, or else spotted with more or lesse such coloured spots. The tops of the branches end in spokie tufts of white floures with purple veines running alongst them. The feede is contained in such seed vessels as that of the other Basils, and is round, blacke and large. The plant perishes euery yeare as soone as it hath perfected the seed. *Clusius* calls this *Ocimum Indicum*. †

¶ The Place.

Basill is sowne in gardens, and in earthen pots. It commeth vp quickly, and loueth little moisture except in the middle of the day; otherwise if it be sowne in rainie weather, the seed will putrifie, and grow into a iellie or slime, and come to nothing.

¶ The Time.

Basill floureth in Iune and Iuly, and that by little and little, whereby it is long a flourishing, beginning first at the top.

¶ The Names.

Basill is called in Greeke *ὄκυμα*, and more commonly with * in the first syllable *ὄκυμα*: in Latine, *Ocimum*. It differeth from *Ōcymum* which some haue called *Cereale* as we (saith *Dodonaeus*) haue shewed in the Historie of Graine. The later Græcians haue called it *βασιλικόν*: in shops likewise *Basilicum*, and *Regium*: in Spanish, *Albahaca*: in French, *Basilic*: in English, Basill, garden Basill, the greater Basill Royall, the lesser Basill gentle, and bush Basill: of some, *Basilicum Gariophyllatum*, or Cloue Basill.

¶ The Temperature.

Basill, as *Galen* teacheth, is hot in the second degree, but it hath adioined with it a superfluous moisture, by reason whereof he doth not like that it should be taken inwardly, but being applied outwardly, it is good to digest or distribute, and to concoct.

¶ The Vertues.

- A *Dioscorides* saith that if Basill be much eaten, it dulleth the sight, it mollifieth the belly, breedeth winde, prouoketh vrine, drieth vp milke, and is of a hard digestion.
- B The iuice mixed with fine meale of parched Barly, oile of roses and Vineger, is good against inflammations, and the stinging of venomous beasts.
- C The iuice drunke in wine of *Chios* or strong Sacke, is good against head ache.
- D The iuice clenseth away the dimmenesse of the eyes, and drieth vp the humour that falleth into them.
- E The feede drunke is a remedie for melancholicke people, for those that are short winded, and them that can hardly make water.
- F If the same be snift vp in the nose, it causeth often neesing: also the herbe it selfe doth the same.
- G There be that shunne Basill and will not eat thereof, because that if it be chewed and laid in the Sun, it ingendreth wormes.
- H They of Africke do also affirme, that they who are stung of the Scorpion and haue eaten of it, shall feele no paine at all.
- I The Later writers, among whom *Simeon Zethy* is one, doe teach, that the smell of Basill is good for the heart and for the head. That the feede cureth the infirmities of the heart, taketh away sorrowfulnesse which commeth of melancholy, and maketh a man merry and glad.

CHAP. 223. Of wilde Basill.

¶ The Description.

1 **T**He wilde Basil or *Acynos*, called of *Pena*, *Clinopodium vulgare*, hath square hairie stems, beset with little leaues like vnto the small Basil, but much smaller, and more hairie, sharp pointed, and a little snipt towards the end of the leafe, with small floures of a purple colour, fashioned like vnto the garden Basill. The root is full of hairie threds, and creepeth along the ground, and springeth vp yearely anew of it selfe without sowing. † This is the *Clinopodium alterum* of *Matthiolus*. †

2 This kinde of wilde Basill called amongst the Græcians *ακνός*, which by interpretation is *Sine semine*, or *Sterilis*, hath caused sundry opinions and great doubts concerning the words of *Plinie* and *Theophrastus*, affirming that this herbe hath no floures nor seeds; which opinions I am sure of mine owne knowledge to be without reason: but to omit controuersies, this plant beareth purple floures, wharled about square stalkes, rough leaues and hairie, verie like in shape vnto Basil: † The stalkes are some cubite and more high, parted into few branches, and set at certaine spaces with leaues growing by couples. This is the *Clinopodium vulgare* of *Matthiolus*, and that of *Cordus*, *Gesner*, and others; it is the *Acinos* of *Lobel*. †

3 *Serapio* and others haue set forth another wilde Basill vnder the title of *Molochia*; and *Lobel* after the minde of *Iohn Brancion*, calleth it *Corcoros*, which we haue Englished, Fish Basill, the seeds whereof the said *Brancion* receiued from Spaine, saying that *Corcoros Plinij* hath the leaues of Basil: the stalkes are two handfuls high, the floures yellow, growing close to the stalkes, bearing his seed in smal long cods. The root is compact and made of an innumerable companie of strings, creeping far abroad like running Time. † This figure of *Lobels* which here we giue you is (as *Camerarius* hath obserued) vnperfect, for it expressees not the long cods wherein the seed is contained, neither the two little strings or beards that come forth at the setting on of each leafe to the stalke. †

1 *Ocimum sylvestre*.
Wilde Basill.2 *Acynos*.
Stone Basill.

‡ 3 *Corchoros.*
Fish Basill.

‡ 5 *Clinopodium Austriacum.*
Austrian field Basill.

‡ 6 *Clinopodium Alpinum.*
Wilde Basill of the Alpes.

‡ 4 It may be our Authour would have described this in the first place, as I coniecture by those words which he vsed in mentioning the place of their growing; and [*Clinopodium vulgare* groweth in great plentie vpon Longfield downs in Kent;] but to this neither figure nor description did agree, wherefore I will giue you the Historie therof. It sends vp many little square stalks some handfull and an halfe high, seldome diuided into branches: at each ioint stand two smal greenish leaues, little hairy, and not diuided or snipt about the edges, and much like those of the next described, as you see them exprest in the figure: the little hollow and somewhat hooded floures grow in roundles towards the tops of the stalkes, as in the first described, and they are of a blewish violet colour. The seeds I haue not yet obserued: the root is fibrous and wooddie, and lasts for many years. The whole plant hath a pretty pleasing but weake smell. It floures in Iuly and August. I first obserued it Anno 1626, a little on this side Pomfret in Yorkshire, and since by Datford in Kent, and in the Ile of Tenet. I haue sometimes seene it brought to Cheapside market, where the herbe women called it Poley mountaine, some it may bee that haue taken it for *Polium montanum* misinforming them; *Clusius* first tooke notice of this plant, and called it *Acinos Anglicum*, finding it growing in Kent, Anno, 1581. and he thinks it to be

be the *Acinos* of *Dioscorides*: now the vertues attributed by *Dioscorides* to his *Acinos* are set downe at the end of the chapter vnder the letter B.

5 This which *Clusius* hath also set forth by the name of *Clinopodium*, or *Acinos Austriacum*, doth not much differ from the last described, for it hath tender square hard stalkes like those of the last described, set also with two leaues at each joint, heere and there a little snipt (which is omitted in the figure) the floures grow onely at the tops of the stalkes, and these pretty large, and of a violet colour (yet they are sometimes found white:) they hang commonly forward, and at is were with there vpper parts turned downe. The seed vessels are like those of the first described, and containe each of them foure little blacke seeds: This floures in May, and the seed is ripe in Iune: It growes about the bathes of Badon and in diuers places of Austria.

6 *Pena* also hath giuen vs knowledge of another, that from a fibrous root sends vp many quadrangular rough branches, of the height of the two former, set also with two leaues at each joint, and these rough and lightly snipt about the edges; the floures grow thicke together at the tops of the stalkes of a darke red colour, and in shape like those of the mountaine Calaminte. It floures in the beginning of Iuly, and growes vpon mount Baldus in Italy; *Pena* sets it forth by the name of *Clinopodium Alpinum*.

7 To these I thinke fit to adde another, whose description was sent me by Mr. *Goodyer*, and I question whether it may not be the plant which *Fabius Columna Phytobasani*, pag. 23. sets forth by the name of *Acinos Dioscoridis*; for he makes his to be endued *odore fragrantissimo*: but to the purpose.

Acinos odoratissimum.

This herbe hath foure, fise, or more, foure square hard wooddy stalkes growing from one root, diuided into many branches, couered with a soft white hairinesse, two or three foot long or longer, not growing vpright, but trailing vpon the ground; the leaues grow on little short footstalkes by couples of a light Greene colour, somewhat like the leaues of Basill, very like the leaues of *Acinos Lobelij*, but smaller, about three quarters of an inch broad, and not fully an inch long, somewhat sharpe pointed, lightly notched about the edges, also couered with a light soft hoary hairinesse, of a very sweete smell, little inferiour to Garden Marjerome, of a hot biting taste: out of their bosomes grow other smaller leaues, or else branches; the floures also grow forth of the bosomes of the leaues toward the tops of the stalkes and branches, not in whorles like the said *Acinos*, but hauing one little short footstake growing forth of the bosome of each leafe, on which is placed three, foure, or more small floures, gaping open, and diuided into foure vnequall parts at the top, like the floures of Basill, and very neare of the likenesse and bignesse of the floures of Garden Marjerome, but of a pale blewish colour tending towards a purple. The seed I neuer obserued by reason it floured late. This plant I first found growing in the Garden of Mr. *William Talden* in Sheete neere Petersfield in Hampshire, Anno 1620. amongst sweete Marjerome, and which by chance they bought with the seedes thereof. It is to be considered whether the seedes of sweete Marjerome degenerate and send forth this herbe or not. 11. October, 1621. *John Goodyer*. ‡

¶ The Place.

The wilde kindes doe grow vpon grauelly grounds by water sides, and especially I found the three last in the barren plaine by an house in Kent two miles from Dartford, called Saint Iones, in a village called Sutton; and *Clinopodium vulgare* groweth in great plentie vpon Long field downes in Kent. ‡ One of the three last of our Authors description is omitted, as you may finde noted at the end of the chapter: yet I cannot be perswaded that euer he found any of the foure he described euer wilde in this kingdome, vnlesse the second, which growes plentifully in Autumne almost by euery hedge: also the fourth being of my description growes neere Dartford and in many such dry barren places in sundry parts of the kingdome. ‡

¶ The Time.

These herbes floure in Iune and Iuly.

¶ The Names.

Vnprofitable Basil, or wilde Basill is called by some *Clinopodium*.

¶ The Nature.

The seed of these herbes are of complexion hot and dry.

¶ The Vertues.

Wilde Basill pound with wine appeaseth the paine of the eyes, and the iuice doth mundifie the same, and putteth away all obscurity and dimnesse, all catarrhes and flowing humors that fall into the eies, being often dropped into the same.

B † The stone Basill howsoever it be taken stoppeth the laske, and courses; and outwardly applied it helps hot Tumors and inflammations.

‡ These plants are good for all such effects as require moderate heate and astringion. ‡

† The figure that was formerly in the third place of this chapter was of the *Calamagrostis Ocymoides* of *Tabernaemontanus*, and it was described by our Author in the fourth place of the next chapter save one, and there you shall finde it: the description seemes to be of the *Ocymoides repens* *Polygenis* of the *Adversaria*, formerly described by me in the fifth place of the 128. chapter of this booke; if that the place and floures in the omitted description of our Author did not seeme to vary: howeuer I iudge it the same and therefore haue heere excluded it.

CHAP. 224. Of Basill Valerian.

¶ The Description.

1 **T**He first kinde of *Ocymastrum*, called of *Dodonaus*, *Valeriana rubra*, bringeth forth long and brittle stalkes two cubits high, full of knots or joints, in which place is joined long leaues much like vnto great Basill, but greater, broader, and larger, or rather like the leaues of Woade. At the top of the stalkes do grow very pleasant and long red floures, of the fashion of the floures of Valerian, which hath caused *Dodonaus* to call this plant red Valerian; which being past, the feedes are caried away with the winde being, few in number, and little in quantity, so that without great diligence the seed is not to be gathered or preserued: for my selfe haue often indeuoured to see it, and yet haue lost my labour. The roote is very thicke, and of an excellent sweete sauour.

1 *Valeriana rubra Dodonai.*
Red Valerian.

2 *Behen album.*
Spatling poppy.

2 The second is taken for *Spumeum papauer*, in respect of that kinde of frothy spattle, or spume, which we call Cuckow spittle, that more aboundeth in the bosomes of the leaues of these plants, than in any other plant that is knowne: for which cause *Pena* calleth it *Papaver spumeum*, that is, frothy, or spatling Poppy: his floure doth very little resemble any kinde of Poppy, but onely the feede and cod, or bowle wherein the feede is contained, otherwise it is like the other *Ocymastrum*;

strum: the floures grow at the top of the stalkes hanging downewards, of a white colour, and it is taken generally for *Behen album*: the roote is white, plaine, and long, and very tough and hard to breake.

¶ *The Place.*

The first groweth plentifully in my garden, being a great ornament to the same, and not common in England.

The second groweth almost in euery pasture.

¶ *The Time.*

These plants do floure from May to the end of August.

¶ *The Names.*

Red Valerian hath beene so called of the likenesse of the floures and spoked rundles with Valerian, by which name we had rather haue it called, than rashly to lay vpon it an vnproper name. There are some also who would haue it to be a kinde of *Behen* of the later Herbarists, naming the same *Behen rubrum*, for difference between it and the other *Behen album*, that of some is called *Ocymastrum*, and *Papauer spumeum*: which I haue Englished, Spatling Poppie, and is in truth another plant, much differing from *Behen* of the Arabians: it is also called *Valerianthon*, *Saponaria altera*, *Struthium Aldroandi*, and *Condur'dum*: in English, red Valerian, and red Cow Basill.

Spatling Poppie is called *Behen album*, *Ocymastrum alterum*; of some, *Polemonium*, and *Papauer spumeum*: in English, Spatling Poppie, frothie Poppie, and white Ben.

¶ *The Nature.*

These plants are drie in the second degree.

¶ *The Vertues.*

The root of *Behen Album* drunke in wine, is good against the bloudie fluxe: and beeing pound A
leaves and floures, and laid to, cureth the stingings of Scorpions and such like venomous beasts; insomuch that who so doth hold the same in his hand, can receiue no damage or hurt by any venomous beast.

The decoction of the root made in water and drunke, prouoketh vrine, it helpeth the strangurie, B
and paines about the backe and Huckle bone.

† That which was formerly here set forth in the third place by the name of *Ocymastrum multiflorum*, is nothing else but the *Lycnis fluestris alba multiplex*, which I haue described amongst the rest of the same kinde in the 128. Chapter of this booke.

CHAP. 225. Of Mints.

¶ *The Kindes.*

There be diuers sorts of Mints; some of the garden; other wilde, or of the field; and also some of the water.

¶ *The Description.*

1 The first tame or garden Mint commeth vp with stalkes foure square, of an obscure red colour somewhat hairie, which are couered with round leaues nicked in the edges like a saw, of a deepe Greene colour: the floures are little and red, and grow about the stalkes circle-wise, as those of Pennie Royall: the roote creepeth aslope in the ground, hauing some strings on it, and now and then in sundry places it buddeth out afresh: the whole herbe is of a pleasant smell, and it rather lieth downe than standeth vp.

2 The second is like to the first in hairie stalkes something round, in blackish leaues, in creeping roots, and also in smell, but the floures do not at all compasse the stalke about, but stand vp in the tops of the branches being orderly placed in little eares, or rather catkines or aglets.

3 The leaues of Speare-Mint are long like those of the Willow tree, but whiter, softer, and more bairie: the floures are orderly placed in the tops of the stalks, and in ears like those of the second. The root hereof doth also creepe no otherwise than doth that of the first, vnto which it is like.

4 There is another sort of Mint which hath long leaues like to the third in stalks, yet in leaues and in roots lesser; but the floures hereof stand not in the tops of the branches, but compasse the stalks about circle-wise as do those of the first, which be of a light purple colour.

5 This hath round leaues broader than the common Mint, rounder also, and as crisp or curled as those described in the second place (of which it seemes but a larger varietie:) the stalkes are

† 1 *Mentha sativavirubra.*
Red Garden Mints.

† 2 *Mentha cruciata, sive crispata.*
Crosse Mint, or curled Mint.

† 3 *Mentha Romana.*
Speare Mint.

† 4 *Mentha Cardiaca.*
Heart Mint.

‡ 5 *Mentha spicata altera*.
Balsam Mint.

four square, and the flowers grow in eares or spokie tufts, like those of the second. ‡

¶ The Place.

Most vse to set Mints in Gardens almost e- uery where.

¶ The Time.

Mints do floure and flourish in Sommer, in Winter the roots onely remaine : being once set they continue long, and remaine sure and fast in the ground.

¶ The Names.

Mint is called in Greeke *ῥόσμος* and *μινθῆ*: the sweet smell saith *Pliny* in his 19. booke cap. 8. hath changed the name among the Græcians when as otherwise it should be called *Mintha*, from whence our old writers haue deriued the name : for *ῥος* signifieth sweet, and *σμος* smel: The Apothecaries, Italians, and French men, do keepe the Latine name *Mentha*: the Spaniards do call it *Yerua buena*, and *Ortelana*: in High Dutch, *Muntz*: in Low Dutch, *Munte*: in English, Mint.

The first Mint is called in High Dutch, *Diement*: in Low Dutch, *Bruyn heyliche*: he that would translate it into Latin, must call it *Sacra nigricans*, or the holy blackish mint: in English, browne Mint, or red Mint.

The second is also called in High Dutch *Krausz diement*, *Krausz muntz*, and *Krausz balsam*: that is to say, *Mentha cruciata*: in French, *Beaume cressu*: in English, Crosse-Mint, or curled Mint.

The third is called of diuers *Mentha Sarracenica*, *Mentha Romana*: it is called in High Dutch *Balsam muntz*, *Onser frawen muntz*, *Spitzer muntz*, *Spitzer balsam*: it may be called *Mentha angustifolia*: that is to say, Mint with the narrow leafe: and in English, Speare Mint, common garden Mint, our Ladies Mint, browne Mint, and Macrell Mint.

The fourth is called in High Dutch *Hertz kraut*, as though it were to bee named *Cardiaca*, or *Cardiaca Mentha*: in English, Hart-woort, or Heart-mint ‡ This is the *Sisymbrium sativum* of *Matthiolus*, and *Mentha horten sis altera* of *Gesner*: the Italians call it *Sisembrio domestico*, and *Balsamita*; the Germanes, *Bakenbalsam*. ‡

¶ The Temperature.

Mint is hot and drie in the third degree. It is saith *Galen*, somewhat bitter and harsh, and it is inferiour to Calamint. The smell of Mint, saith *Pliny* doth stir vp the minde, and the taste to a greedy desire to meat.

¶ The Vertues.

Mint is maruellous wholesome for the stomacke, it staieth the Hicket, parbraking, vomiting & A scouring in the Cholerike passion, if it be taken with the iuice of a foure pomegranate.

It stoppeth the casting vp of bloud, being giuen with water and vineger, as *Galen* teacheth. B

And in broth saith *Pliny*, it staieth the floures, and is singular good against the whites, that is to C say, that Mint which is described in the first place. For it is found by experience, that many haue had this kinde of flux staied by the continuall vse of this onely Mint: the same being applied to the forehead, or to the temples, as *Pliny* teacheth, doth take away the headache.

It is good against watering eies, and all manner of breakings out in the head, and against the in- D firmities of the fundament, it is a sure remedie for childrens sore heads.

It is poured into the eares with honie water. It is taken inwardly against Scolopenders, Beare- E wormes, Sea-scorpions and serpents.

It is applied with salt to the bitings of mad dogs. It will not suffer milke to cruddle in the sto- F macke (*Pliny* addeth to wax soure.) therefore it is put in Milke that is drunke for feare that those who haue drunke thereof should be strangled.

It is thought, that by the same vertue it is an enemy to generation, by ouerthickning the seed. G

- H *Dioscorides* teacheth, that being applied to the secret part of a woman before the act, it hindreth conception.
- I Garden Mint taken in meat or drinke warmeth and strengtheneth the stomacke, and drieth vp all superfluous humours gathered in the same, and causeth good digestion.
- K Mints mingled with the leaues of parched Barly, consumeth tumors and hard swellings.
- L The water of Mints is of like operation in diuers medicines, it cureth the trenching and griping paines of the belly and bowels, it appeaseth headach, staieth yexing and vomiting.
- M It is singular against the grauell and stone in the kidneies, and against the strangurie, being boyled in wine and drunke.
- N They lay it to the stinging of waspes and bees with good successe.

† The figures which were formerly in this Chapter were no way agreeable to the descriptions and names taken forth of *Dodonæus*. The first was of the *Calamintha montana* a vulgaris of *Lobel* & *Tab.* The 2. was of that which is described in the third place, the third was of the *Mentha Cattaria angustifolia* described in the third place of the next Chapter. The figure agreeing to the 4. description was in the chapter next saue one afore by the title of *Ocymoides repens*.

CHAP. 226. Of Nep, or Cat Mint.

¶ The Description.

1 **C**At Mint or Nep groweth high; it bringeth forth stalks about a cubit long, cornered, chamfered, and full of branches: the leaues are broad, nicked in the edges like those of Bawme, or of Horehound, but longer. The floures are of a whitish colour, they partly compasse about the vppermost sprigs, and partly grow on the very top, they are set in a manner like an eare or catkin: the root is diuersly parted, and ful of strings, and endureth a long time. The whole herbe together with the leaues and stalks is soft, and couered with a white downe, but lesser than Horse-mint; it is of a sharpe smel, and pearceth into the head: it hath a hot taste with a certaine bitterness.

‡ 2 Our Authour figured this and described the next in the second place of this Chapter. This hath pretty large square stalks, set at each ioint with two leaues like those of Costmary, but of a gray or ouerworn colour: the floures grow at the tops of the stalks in long spokie tufts like those of the last described, and of a whitish colour, the smel is pleasanter than that of the last described. ‡

1 *Mentha Felina, seu Cattaria.*
Nep, or Cat-mint.

2 *Mentha Cattaria altera.*
Great Cat-mint.

3 There is also another kind hereof that hath a longer and narrower leafe, and not of so white a colour: the stalkes hereof are foure square: the floures be more plentifull, of a red light purple colour inclining to blew, sprinkled with little fine purple specks: the smell hereof is stronger, but the taste is more biting. ‡ The figure of this was formerly in the third place of the last chapter. ‡

† 3 *Mentha Cattaria angustifolia.*
Small Cat-Mint.

¶ The Place.

The first growes about the borders of gardens and fields, neere to rough bankes, ditches, and common wayes: it is delighted with moist and waterie places: it is brought into gardens.

‡ The other two commonly grow in gardens with vs. ‡

¶ The Time.

The Cat-Mints flourish by and by after the Spring: they floure in Iuly and August.

¶ The Names.

The later Herbarists do cal it *Herba Cattaria*, and *Herba Catti*, because the Cats are very much delighted herewith, for the smell of it is so pleasant to them, that they rub themselues vpon it, and wallow or tumble in it, and also feed on the branches and leaues very greedily. It is named of the Apothecaries *Nepeta*: but *Nepeta* is properly called (as we haue said) wilde Penny-royall: in high-Dutch, *Katzen Muntz*: in Low-Dutch, *Catte cruijt*: in Italian, *Gattaria*, or *herba Gatta*: in Spanish, *Terna Gatera*: in English, Cat Mint and Nep. ‡ The true *Nepeta* is *Calamintha Pulegijs* odore. ‡

¶ The Temperature.

Nep is of temperature hot and dry, and hath the faculties of the Calamints.

¶ The Vertues.

It is commended against cold paines of the head, stomacke, and matrix, and those diseases inwardly by meanes of some fall receiued from an high place, and that are very much bruised, if the iuyce be giuen with wine or mede. A

It is vsed in baths and decoctions for women to sit ouer, to bring downe their sicknesse, and to make them fruitfull. B

‡ It is also good against those diseases for which the ordinarie Mints do serue and are vsed. ‡ C

CHAP. 227. Of Horse-Mint or Water-Mint.

¶ The Description.

1 **W**ater Mint is a kinde of wilde Mint, it is like to the first Garden Mint, the leaues thereof are round, the stalkes cornered, both the leaues and stalkes are of a darke red colour: the roots creepe far abroad, but euery part is greater, and the herbe it selfe is of a stronger smell: the floures in the tops of the branches are gathered together into a round eare, of a purple colour.

† 2 The second kinde of water Mint in each respect is like the others, sauing that the same hath a more odoriferous sauer being lightly touched with the hand: otherwise being hardly touched, the sauer is ouer hot to smell vnto: it beareth his floures in sundry tufts or roundles ingirting the stalkes in many places; and they are of a light purple colour: the leaues are also lesse than those of the former, and of an hoary gray colour.

‡ 3 This common Horse-Mint hath creeping roots like as the other Mints, from which proceed stalkes partly leaning, and partly growing vpriht: the leaues are pretty large, thicke, wrinkled,

† 1 *Mentha aquatica, sine Sisymbrium.*
Water Mint.

† 2 *Calamintha aquatica.*
Water Calamint.

‡ 3 *Mentastrum.*
Horfe-Mint.

‡ 4 *Mentastrum niveum Anglicum.*
Party coloured Horfe-Mint.

‡ 5 *Mentastrium minus*.
Small Horfe-Mint.

‡ 6 *Mentastrium montanum* 1. *Clusij*.
Mountaine Horfe-Mint.

‡ 7 *Mentastrium tuberosa radice* *Clusij*.
Turnep-rooted Horfe-Mint.

wrinkled, hoary and rough both above and below, and lightly snapped about the edges; the floures grow in thicke compact eares at the tops of the stalks, and are like those of common Mint. The whole plant is of a more vnpleasant sent than any of the other Mints. It growes in diuers wet and moist grounds, and floures in Iune and Iuly. This by most writers is called only *Mentastrium*, without any other attribute.

4 In some of our English gardens (as *Pena* and *Lobel* obserued) growes another Horfe-mint, much lesse, and better smelling than the last mentioned, hauing the leaues partly greene, and partly milke white; yet sometimes the leaues are some of them wholly white, but more, and more commonly all greene: the stalkes, floures, and other parts are like those of the former, but lesse. This is the *Mentastrium niueum Anglicum*, of *Lobel*; and *Mentastrium alterum* of *Dodonæus*.

5 This growes in waterie places, hauing a stalke of a cubit or cubit and halfe high, set with longish hoary leaues like those of Horfe-mint: the floures grow in spokie tufts at the tops of the stalkes, of a duskie purple colour, and in shape like those of the common Mint: the smell of this comes neere to that of the water Mint. This is the *Mentastri folia aquatica hirsuta*, sine *Calamintha* 3. *Dioscoridis*, of *Lobel*: in the *hist. Lugd.* it is called *Mentastrium minus spicatum*.

6 The stalke of this is some cubit and halfe high, square, and full of pith: the leaues are like in shape to those of Cat-Mint, but not hoarie, but rather Greene: the tops of the branches are set with roundles of such white floures as those of the Cats-mint: the smell of this plant is like to that of the Horfe-Mint; whence *Clusius* calls it *Mentastrium montanum primum*. It floures in August, and growes in the mountainous places of Austria.

7 The same Author hath also set forth another by the name of *Mentastrium tuberosa radice*. It hath roughish stalkes like the former, and longish crumpled leaues somewhat snipt about the edges like those of the last described: the floures grow in roundles alongst the tops of the branches, and are white of colour, and like those of Cat-Mint. The root of this (which, as also the leaues, is not well exprest in the figure) is like a Radish, and blackish on the out side, sending forth many succours like to little Turneps, and also diuers fibres: these succours taken from the maine root will also take root and grow. It floures in Iune. *Clusius* receiued the seed of it from Spaine. ‡

¶ The Place.

They grow in moist and waterie places, as in meadowes neere vnto ditches that haue water in them, and by riuers.

¶ The Time.

They floure when the other Mints do, and reuiue in the Spring.

¶ The Names.

It is called in Greeke *Σισυμβριον*: in Latine, *Sisymbrium*: in high-Dutch, *Roszmuntz*, *Wasser-muntz*: in French, *Menthe sauuage*: in English, Water Mint, Fish-Mint, Brooke-Mint, and Horse-mint.

¶ The Temperature.

Water Mint is hot and dry as is the Garden Mint, and is of a stronger smell and operation.

¶ The Vertues.

- A It is commended to haue the like vertues that the garden Mint hath; and also to be good against the stinging of Bees and Wasps, if the place be rubbed therewith.
- B The fauour or smell of the Water-Mint reioyceth the heart of man; for which cause they vse to strew it in chambers and places of recreation, pleasure, and repose, and where feasts and banquets are made.
- C There is no vse hereof in physicke whilest we haue the garden Mint, which is sweeter, and more agreeing to the nature of man.

† The figure that was in the first place was of the Horfe-Mint, and that in the second place should haue bene in the first, as now it is.

CHAP. 228. Of Mountaine Mint or Calamint.

¶ The Description.

1 **M**ountaine Calamint is a low herbe, seldome about a foot high, parted into many branches: the stalkes are foure square, and haue ioyns as it were, out of euery one whereof grow forth leaues something round, lesser than those of Basill, couered with a very thinne hairy downe, as are also the stalkes, somewhat whitish, and of a sweet smell: the tops of the branches are gallantly deckt with floures, somewhat of a purple colour; then groweth the seed which is blacke: the roots are full of strings, and continue.

2 This most excellent kinde of Calamint hath vpright stalkes a cubit high, couered ouer with a woolly mossiness, beset with rough leaues like a Nettle, somewhat notched about the edges; among the leaues come forth blewish or sky-coloured floures: the root is woody, and the whole plant is of a very good smell.

3 There is another kinde of Calamint which hath hard square stalks, couered in like manner as the other with a certaine hoary or fine cotton. The leaues be in shape like Basill, but that they are rough; and the floures grow in roundles toward the tops of the branches, sometimes three or foure vpon a stemme, of a purplish colour. The root is threddy, and long lasting.

† 4 There is a kinde of strong smelling Calamint that hath also square stalks couered with soft cotton, and almost creeping by the ground, hauing euermore two leaues standing one against another, small and soft, not much vnlike the leaues of Penny-Royall, sauing that they are larger and whiter: the floures grow about the stalks like wharles or garlands, of a blewish purple colour; the root is small and threddy: the whole plant hath the smell of Penny-Royal; whence it hath the addition of *Pulegij odore*.

† 1 *Calamintha montana vulgaris.*
Calamint, or Mountaine Mint.

† 2 *Calamintha montana praestantior.*
The more excellent Calamint.

† 3 *Calamintha vulgaris Officinarum.*
Common Calamint.

† 3 *Calamintha odore Pulegij.*
Field Calamint.

¶ The Place.

It delighteth to grow in mountaines, and in the shadowy and grauelly sides thereof: it is found in many places of Italy and France, and in other countries: it is brought into gardens, where it prospereth marvellous well, and very easily soweth it selfe. I haue found these plants growing vpon the chalkie grounds and highwayes leading from Grauesend vnto Canturbury, in most places, or almost euery where. † I haue onely obserued the third and fourth to grow wilde with vs in England. †

¶ The Time.

It flourisheth in Sommer, and almost all the yeare thorow: it bringeth forth floures and seed from Iune to Autumne.

¶ The Names.

It is called in Greeke *Καλαμίνθη*, as though you should say, *Elegans aut utilis Mentha*, a gallant or profitable Mint: the Latines keepe the name *Calamintha*: *Apuleius* also nameth it amisse, *Mentastrum*, and confoundeth the names one with another: the Apothecaries call it *Montana Calamintha*, *Calamentum*, and sometime *Calamentum montanum*: in French, *Calament*: in English, Mountain Calamint. † The fourth is certainly the second Calamint of *Dioscorides*, and the true *Nepeta* of the Antients. †

¶ The Temperature.

This Calamint which groweth in mountaines is of a feruent taste, and biting, hot, and of a thin substance, and dry after a sort in the third degree, as *Galen* saith: it digesteth or wasteth away thin humors, it cutteth, and maketh thicke humors thin.

¶ The Vertues.

- A Therefore being inwardly taken by it selfe, and also with meade, or honied water, it doth manifestly heate, prouoketh sweat, and consumeth superfluous humors of the body; it taketh away the shiuering of Agues that come by fits.
- B The same also is performed by the sallet oyle in which it is boyled, if the body be anointed and well rubbed and chafed therewith.
- C The decoction thereof drunke prouoketh vrine, bringeth downe the monethly sicknesse, and expelleth the childe, which also it doth being but onely applied.
- D It helpeth those that are bruised, such as are troubled with crampes and convulsions, and that cannot breathe vnlesse they hold their necks vpriight (that haue the wheefing of the lungs, saith *Galen*) and it is a remedie saith *Dioscorides* for a cholericke passion, otherwise called the Felony.
- E It is good for them that haue the yellow jaundice, for that it remoueth the stoppings of the liuer and gall, and withall clenfeth: being taken afore-hand in Wine, it keepeth a man from being poysoned: being inwardly taken, or outwardly applied it cureth them that are bitten of Serpents: being burned or strewed it driues serpents away: it takes away black and blew spots that come by blowes or dry beatings, making the skin faire and white; but for such things (saith *Galen*) it is better to be laid to greene than dry.
- F It killeth all manner of wormes of the belly, if it be drunk with salt and honey: the iuyce dropped into the eares doth in like manner kill the wormes thereof.
- G *Pliny* saith, that if the iuyce be conueyed vp into the nostrils it stancheth the bleeding at the nose; and the root (which *Dioscorides* writeth to be good for nothing) helpeth the Squincie, if it be gargarised, or the throat washed therewith, being vsed in Cute, and Myrtle seed withall.
- H It is applied to those that haue the Sciatica or ache in the huckle bone, for it drawes the humor from the very bottome, and bringeth a comfortable heat to the whole ioynt: *Paulus Aegineta* saith, that for the paine of the haunches or huckle bones it is to be vsed in Clysters.
- I Being much eaten it is good for them that haue the leprosie, so that the patient drinke whay after it, as *Dioscorides* witnesseth.
- K *Apuleius* affirmeth, that if the leaues be often eaten, they are a sure and certaine remedy against the leprosie.
- L There is made of this an Antidote or composition, which *Galen* in his fourth booke of the Government of health describes by the name of *Diacalaminthos*, that doth not onely notably digest or waste away crudities, but also is marvellous good for young maidens that want their courses, if their bodies be first well purged; for in continuance of time it bringeth them downe very gently without force.

† The figure which formerly was in the second place belonged to the fourth description; and the figure that belonged thereto was before falsly put for the *Scorodonia* or Wood-Sage. As also that which should haue beene put in the fourth place was put in the first place of the last chapter saue two, for the Red Garden Mint.

CHAP. 229. Of Bawme.

¶ The Description.

1 **A** *Piastrum*, or *Melissa*, is our common best knowne Balme or Bawme, hauing many square stalkes and blackish leaues like to *Ballore*, or blacke Hore-hound, but larger, of a pleasant smell, drawing neere in smell and saour vnto a Citron: the floures are of a Carnation colour; the root of a woody substance.

2 The second kinde of Bawme was brought into my garden and others, by his seed from the parts of Turkey, wherefore we haue called it Turkey Balme: it excelleth the rest of the kinds, if you respect the sweet saour and goodly beauty thereof, and deserueth a more liuely description than my rude pen can deliuer. This rare plant hath sundry small weake and brittle square stalkes and branches, mounting to the height of a cubit and somewhat more, beset with leaues like to *Germander* or *Scordium*, indented or toothed very bluntly about the edges, but somewhat sharpe pointed at the top. The floures grow in small coronets, of a purplish blew colour: the root is small and threddy, and dieth at the first approach of Winter, and must be sowne anew in the beginning of May, in good and fertill ground.

1 *Melissa*.
Bawme.

2 *Melissa Turcica*.
Turkey Bawme.

3 *Fuchsius* setteth forth a kinde of Bawme hauing a square stalke, with leaues like vnto common Bawme, but larger and blacker, and of an euill saour; the floures white, and much greater than those of the common Bawme; the root hard, and of a woody substance. † This varies with the leaues sometimes broader and otherwhiles narrower: also the floures are commonly purple, yet sometimes white, and otherwhiles of diuers colours: the leaues are also sometimes broader, otherwhiles narrower: wherefore I haue giuen you one of the figures of *Clusius*, and that of *Lobel*, that you may see the seuerall expressions of this plant. *Clusius*, and after him *Bauhine*, referre it to the *Lanium*, or Arch-angell: and the former calls it *Lanium Pannonicum*: and the later, *Lanium montanum Melissæ folio*. †

4 There is a kinde of Bawme called *Herba Iudaica*, which *Lobel* calles *Tetrabit*, that hath many
M m m weake

‡ 3 *Melissa Fuchsj flore albo.*
Bastard Bawme with white floures.

‡ 3 *Melissa Fuchsj flore purpureo.*
Bastard Bawme with purple floures.

‡ 4 *Herba Indaica Lobelij.*
Smiths Bawme, or Iewes All-heale.

weake and tender square hairie branches; some leaning backward, and others turning inward, diuiding themselues into sundry other small armes or twigs, which are beset with long rough leaues dented about, and smaller than the leaues of Sage. And growing in another soile or clymat, you shal see the leaues like the oken leaf; in other places like *Marrubium Creticum*, very hoary, which caused *Dioscorides* to describe it with so many shapes, and also the floures, which are sometimes blew and purple, and oftentimes white: the root is small and crooked, with some hairie strings fastned thereto. All the whole plant draweth to the sauour of Balme, called *Melissa*. ‡ This might much more fitly haue beene put to the rest of the *Siderites*, but that our Authour had thrust it as by force into this Chapter. ‡

§ There be also two other plants comprehended vnder the kindes of Balme, the one very like vnto the other, although not knowne to many Herbarists, and haue been of some called by the title of *Cardiaca*: the first kinde *Pena* calleth *Cardiaca Melica*, or *Molucca Syriaca*, so called for that it was first brought out of Syria: it groweth three cubits

cubits high, and yeeldeth many shoots from a woody root, full of many whitish strings; the stalkes be round, somewhat thicke, and of a reddish colour, which are hollow within, with certain obscure prints or small furrowes along the stalkes; with equall spaces halfe kneed or knotted, and at euery such knee or ioynt stand two leaues one against another, tufted like *Melissa*, but more rough and deeply indented, yet not so deeply as our common *Cardiaca*, called Mother-wort; nor so sharpe pointed: about the knees there come forth small little prickles, with six or eight small open wide bells, hauing many corners thinne like parchment, and of the same colour, somewhat stiffe and long; and at the top of the edge of the bell it is cornered and pointed with sharpe prickles; and out of the middle of this prickly bell riseth a floure somewhat purple tending to whitenesse, not vnlike our *Lamium* or *Cardiaca*, which bringeth forth a cornered seed, the bottome flat, and smaller toward the top like a steeple: the fauour of the plant draweth toward the sent of *Lamium*.

6 The other kinde of *Melica*, otherwise called *Molucca asperior* (whereof *Penawriteth*) differeth from the last before mentioned, in that the cups or bells wherein the floures grow are more prickly than the first, and much sharper, longer, and more in number: the stalke of this is foure square, lightly hollowed or furrowed; the seed three cornered, sharpe vpward like a wedge; the tunnels of the floures brownish, and not so white as the first.

5 *Melissamolucca laevis*.

Smooth Molucca Bawme.

6 *Molucca spinosa*.

Thorny Molucca Bawme.

The Place.

Bawme is much sown and set in gardens, and oftentimes it groweth of it selfe in Woods and mountaines, and other wilde places: it is profitably planted in gardens, as *Pliny* writeth, lib. 21. cap. 12. about places where Bees are kept, because they are delighted with this herbe aboue others, whereupon it hath bene called *Apiastrum*: for, saith he, when they are strayed away, they do finde their way home againe by it, as *Virgil* writeth in his *Georgicks*:

Huctu inssos asperge liquores,

Trita Meliphylla, & Cerinthi nobile gramen.

Vse here such helpe as husbandry doth vsually prescribe,

Bawme bruised in a mortar, and base Hony-wort beside.

All these I haue in my garden from yeare to yeare.

M m m 2

The

¶ The Time.

Bawme floureth in Iune, Iuly, and August: it withereth in the Winter; but the root remaineth, which in the beginning of the Spring bringeth forth fresh leaues and stalkes.

The other sorts do likewise flourish in Iune, Iuly, and August; but they doe perish when they haue perfected their seed.

¶ The Names.

Bawme is called in Greeke *μαλισσιν*: by *Pliny*, *Melitis*: in Latine, *Melissa*, *Apiastrum*, and *Citrage*: of some, *Melissophyllon*, and *Meliphyllon*: in Dutch, *Confilie de greyn*: in French, *Poucyrade*, or *Melisse*: in Italian, *Cedronella*, and *Arantiata*: in Spanish, *Torongil*: in English, Balme, or Bawme.

¶ The Temperature.

Bawme is of temperature hot and dry in the second degree, as *Auicenn* saith: *Galen* saith it is like Horehound in facultie.

¶ The Vertues.

- A Bawme drunke in wine is good against the bitings of venomous beasts, comforts the heart, and driueth away all melancholy and sadnesse.
- B Common Bawme is good for women which haue the strangling of the mother, either being eaten or smelled vnto.
- C The iuyce thereof glueth together greene wounds, being put into oyle, vnguent, or Balme, for that purpose, and maketh it of greater efficacie.
- D The herbe stamped, and infused in *Aqua vita*, may be vsed vnto the purposes aforesaid (I meane the liquour and not the herbe) and is a most cordiall liquour against all the diseases before spoken of.
- E The hiues of Bees being rubbed with the leaues of Bawme, causeth the Bees to keep together, and causeth others to come vnto them.
- F The later age, together with the Arabians and Mauritanians, affirme Balme to be singular good for the heart, and to be a remedie against the infirmitie thereof; for *Auicenn* in his booke written of the infirmitie of the heart, teacheth that Bawme makes the heart merry and ioyfull, and strengtheneth the vitall spirits.
- G *Serapio* affirmeth it to be comfortable for a moist and cold stomacke, to stir vp concoction, to open the stopping of the braine, and to driue away sorrow and care of the minde.
- H *Dioscorides* writeth, That the leaues drunke with wine, or applied outwardly, are good against the stingings of venomous beasts, and the bitings of mad dogs: also it helpeth the tooth-ache, the mouth being washed with the decoction, and is likewise good for those that cannot take breath vnlesse they hold their necks vpright.
- I The leaues being mixed with salt (saith the same Author) helpeth the Kings Euil, or any other hard swellings and kernels, and mitigateth the paine of the Gout.
- K Smiths Bawme or Carpenters Bawme is most singular to heale vp greene wounds that are cut with iron; it cureth the rupture in short time; it stayeth the whites. *Dioscorides* and *Pliny* haue attributed like vertues vnto this kinde of Bawme, which they call Iron-wort. The leaues (say they) being applied, close vp wounds without any perill of inflammation. *Pliny* saith that it is of so great vertue, that though it be but tied to his sword that hath giuen the wound, it stancheth the bloud.

CHAP. 230. Of Horehound.

¶ The Description.

1 **W**Hite Horehound bringeth forth very many stalkes foure square, a cubit high, couered ouer with a thin whitish downinesse: whereupon are placed by couples at certaine distances, thicke whitish leaues somewhat round, wrinkled and nicked on the edges, and couered ouer with the like downinesse; from the bosomes of which leaues come forth small floures of a feint purplish colour, set round about the stalke in round wharles, which turne into sharpe prickly husks after the floures be past. The whole plant is of a strong sauer, but not vnpleasant: the root is threddy.

2 The second kinde of Horehound hath sundry crooked slender stalkes, diuided into many small branches couered ouer with a white hoarinesse or cottony downe. The leaues are likewise hoarie and cottony, longer and narrower than the precedent, lightly indented about the edges, and sharply pointed like the Turkey Bawme, and of the same bignesse, hauing small wharles of white floures,

1 *Marrubium album.*
White Horehound.

2 *Marrubium candidum.*
Snow white Horehound.

3 *Marrubium Hispanicum.*
Spanish Horehound.

4 *Marrubium Creticum.*
Candy Horehound.

floures, and prickly rundles or seed-veffels set about the stalks by certaine distances. The root is likewise threddy.

3 Spanish Horehound hath a stiffe hoarie and hairy stalke, diuiding it selfe at the bottome into two wings or more armes, and likewise toward the top into two others; whereupon are placed by couples at certaine spaces faire broad leaues, more round than any of the rest, and likewise more woolly and hairy. The floures grow at the top of the stalkes, spike fashion, composed of small gaping floures of a purple colour. The whole plant hath the fauor of *Stœchados*.

4 Candy Horehound hath a thicke and hard root, with many hairy threds fastned thereunto; from which rise vp immediately rough square stalkes, set confusedly with long leaues of a hoarie colour, of a most pleasant strong smell. The floures grow toward the top of the stalkes in chaffie rundles, of a whitish colour.

¶ *The Place.*

The first of these Horehounds, being the common kinde, groweth plentifully in all places of England, neere vnto old walls, highwayes, and beaten paths, in vntilled places. It groweth in all other countries likewise, where it altereth according to the scituation and nature of the countries; for commonly that which growes in Candy and in Hungary is much whiter, and of a sweeter smell, and the leaues oftentimes narrower and lesser than that which groweth in England and these Northerne Regions.

¶ *The Time.*

They floure in Iuly and August, and that in the second yeare after the sowing of them.

¶ *The Names.*

Horehound is called in Greeke *ωσάνη*: in Latine, *Marrubium*: in shops, *Prasium*, and also *Marrubium*. There be certaine bastard names found in *Apuleius*, as *Melittena*, *Labeonia*, and *Vlceraria*: in Italian, *Marrubio*: in Spanish, *Marruio*: in Dutch, *Malroue*: in French, *Marubin*: in English, Horehound. ‡ *Clusius* calls the third *Ocimastrum Valentinum*. ‡

¶ *The Temperature.*

Horehound (as *Galen* teacheth) is hot in the second degree, and dry in the third, and of a bitter taste.

¶ *The Vertues.*

A Common Horehound boyled in water and drunke, openeth the liuer and spleene, cleanseth the brest and lungs, and preuailes greatly against an old cough, the paine of the side, spitting of blood, the pty sicke, and vlcérations of the lungs.

B The same boyled in wine and drunke, bringeth downe the termes, expelleth the secondine, after birth, or dead childe, and also easeth those that haue fore and hard labour in childe-bearing.

C Syrrup made of the greene fresh leaues and sugar, is a most singular remedie against the cough and wheefing of the lungs.

D The same fyrrup doth wonderfully and aboue credit ease such as haue lien long sicke of any consumption of the lungs, as hath bene often proued by the learned Physitions of our London Colledge.

E It is likewise good for them that haue drunke poyson, or that haue bene bitten of Serpents. The leaues are applied with honey to cleanse foule and filthy vlcers. It stayeth and keepeth back the pearle or web in the eyes.

F The iuyce pressed forth of the leaues, and hardned in the Sun, is very good for the same things, especially if it be mixed with a little wine and honey; and dropped into the eyes, it helps them, and cleereth the sight.

G Being drawne vp into the nostrils it cleanseth the yellownesse of the eyes, and stayeth the running and watering of them.

CHAP. 231. Of wilde Horehound.

¶ *The Description.*

1 **W**ild Horehound is also like to common Horehound: there riseth from the root hereof a great number of stalkes high and ioynted, and out of euery ioynt a couple of leaues opposite, or set one against another, somewhat hard, a little longer than those of common Horehound, and whiter, as also the stalkes are set with soft haire, and of a sweet smell: the floures do compasse the stalke about as those doe of common Horehound, but they are yellow, and the wharles be narrower: the root is woody and durable.

2 Besides

1 *Stachys*.
Wilde Horehound.

2 *Stachys Fuchsij*.
Wilde stinking Horehound.

3 *Stachys spinosa Cretica*.
Thorny Horehound.

4 *Stachys Lusitanica*.
Portugall Wilde Horehound.

‡ 5 *Sideritis Scordioides*.
Germander Ironwoort.

‡ 6 *Sideritis Alpina Hyssopifolia*.
Hyssop-leaved Iron-wort.

6 Mountaine *Sideritis* beeing also of the kindes of Horehound, was first found by *Valerandus Donraz*, in the mountains of Sauoy, resembling very wel the last described, but the leaues are much narrower, and like those of Hyssope: the floures grow in small rough rundlets or tufts, pale of colour like *Marrubium* or *Tetrabit*; the root long and bending, of a wooddie substance, and purple colour, bitter in taste, but not vnpleasant, whose vertue is yet vnknowne.

¶ The Place.

These herbes are forreiners, they grow in rough and barren places, notwithstanding I haue them growing in my garden. ‡ My kinde friend M^r. *Buckner* an Apothecary of London the last yeare, beeing

2 Besides this there is also another described by *Fuchsius*: the stalkes hereof are thicke, foure square, now and then two or three foot long: the leaues be broad, long, hoarie, nicked in the edges, hairie as are also the stalks, and much broader than those of the common Horehound: the floures in the whorles which compasse the stalke about, are of a purple colour; the seede is round and blackish: the root hard & something yellow.

‡ 3 This thorny *Stachys* hath leaues before it comes to send forth the stalk, like those of the lesser Sage, but more white & hairie, those that grow vpon the stalkes are much narrower: the stalks are square some foot high: and at the parting of them into branches grow alwaies two leaues one opposit against another: the tops of the branches end in long sharpe thornie prickles: the floures grow about the toppes of the branches like those of Sage, but of somewhat a lighter colour. This grows naturally in Candy, about a Towne called Larda, where *Honorius Bellus* first obserued it, there it is called *Guidarothymo*, or Asses Tyme, though it agree with Tyme in nothing but the place of growth. *Clusius* sets it forth by the name of *Stachys spinosa*.

4 *Lobel* hath giuen vs the figure and first description of this by the name of *Stachys Lusitanica*. It hath creeping and downie stalkes some handfull and halfe high, set with little leaues: amongst which in rundles grow smal floures like those of the other wilde Horehounds; the whole plant is of somewhat a gratefull smell. ‡

5 There is another wilde Horehound of Mountpelier, called *Sideritis MonsPELLIACA Scordioides*, sine *Scordij folio*: being that kind of *Sideritis* or wilde Horehound which is like vnto *Scordium*, or water Germander, which groweth to the height of a handfull and a halfe, with many small branches rising vpright, of a wooddie substance, hauing the tops and spokie coronets of Hyssop, but the leaues do resemble *Dioscorides* his *Scordium*, saue that they be somewhat lesser, stiffer, more wrinkled or curled and hairie, than *Tetrabit*, or the Iudaicall herb: the floures do resemble those of the common Sauorie, in taste bitter, and of an aromaticall smell.

being 1632, found the second of these growing wilde in Oxfordshire in the field ioyning to Witney Parke a mile from the Towne. ‡

¶ The Time.

They floure in the Sommer moneths, and wither towards winter: the root remaineth aliue a certaine time.

¶ The Names.

The former is taken for the right *Stachys*, which is called in Greeke *σταχύς*: it is knowne in shoppes and euery where: we name it in English yellow Horehound, and wilde Horehoond. ‡ *Lobel* calls it *Stachys Lychnites spuria Flandrorum*. ‡

The other wilde Horehound, seeing it hath no name, is to be called *Stachys spuria*: for it is not the right, neither is it *Sphacelus* (as most haue suspected) of which *Theophrastus* hath made mention: it is called in English purple Horehound, bastard wild Horehound, & *Fuchsius* his wild Horehound. ‡ *Fabius Columna* proues the second to be the *Sideritis Heraclia* of *Dioscorides* and the Antients. ‡

¶ The Temperature.

These herbes are of a biting and bitter taste, and are hot in the third degree according to *Galen*.

‡ The *Stachys Fuchsi* and *Sideritides* seem to be hot and drie in the first degree. ‡

¶ The Vertues.

The decoction of the leaues drunk doth draw downe the menses and the secondine, as *Dioscorides* teacheth. A

‡ 2 This is of singular vse (as most of the herbes of this kinde are) to keep wounds from inflammation, and speedily to heale them vp, as also to stay all fluxes and defluations, hauing a drying and moderate astringent facultie. B

Aetius and *Agineta* commend the vse of it in medicines vsed in the cure of the biting of a mad Dog. ‡ C

‡ CHAP. 232. Of the Ironwoorts or Alheales.

‡ 1 *Sideritis vulgaris*.
Ironwoort, or Alheale.

‡ 2 *Sideritis Angustifolia*.
Narrow leaved Alheale.

¶ The

¶ The Kindes.

‡ **T**Here are many plants that belong to this kindred of the *Sideritides*, or Ironwoorts, and some of them are already treated of, though in severall places, & that not verie fitly by our Authour; and one of them is also set forth hereafter by the name of Clownes Alheale: these that are formerly handled, and properly belong to this Chapter, are first the *Herba Iudaica Lobelij*, being in the fourth place of the 229. Chapter. Secondly, the *Stachys Fuchsy* (being the first *Sideritis* of *Dioscorides*) described in the second place of the last chapter. Thirdly, the *Sideritis Scordoides* set forth in the fift place, and fourthly the *Sideritis Alpina Hyssopifolia* set forth in the sixt place of the last chapter. Now besides all these, I will in this Chapter give you the Descriptions of some others like to them in face and Vertues, and all of them may be referred to the first *Sideritis* of *Dioscorides* his description.

¶ The Description.

1 **T**His hath square stalkes some cubite high, rough, and iointed with two leaues at each ioint which are wrinkled and hairie, of an indifferent bignesse, snipt about the edges, of a strong smell, and of a bitterish and somewhat hottish taste: almost forth of euery ioint grow branches, set with lesser leaues: the floures which in roundles incompasse the tops of the stalks end in a spike, being somewhat hooded, whitish, well smelling, and marked on the inside with sanguine spots. The seed is rough and blacke, being contained in five cornered seed vessels. The root is hard and wooddie, sending forth many stalkes. This is the *Sideritis prima* of *Fuchsius*, *Cordus*, *Clusius*, and others; it hath a very great affinitie with the *Panax Coloni*, or Clownes Alheale of our Authour, and the difference betweene them certainly is very small.

‡ 3 *Sideritis procumbens ramosa*.
Creeping branched Ironwoort.

‡ 3 *Sideritis procumbens non ramosa*.
Not branched Creeping Ironwoort.

2 The foure square stalke of this plant is not aboue a foot high, and it is presently from the root diuided into diuers branches; the leaues are long and narrow with some nerues or veines running

‡ 6 *Sideritis latifolia glabra.*
Smooth broad leaved Allieale.

ning amongst them, being also very hairie, but not snipt about the edges: the floures grow amongst the branches, and vpon the main stalk in roundles like those of the first mentioned, but lesser, and of a darke colour, with a yellowish spot on their insides: the seed is also contained in five cornered vessels like as the former. It floures in Iune and Iuly, and growes amongst the corne in Hungarie and Austria. This is onely set forth by *Clusius*, and that vnder the name of *Sideritis 6. Pannonica*.

3 This hath some branches lying along vpon the ground, slender, quadrangular & hairie, which at certain spaces are set with leaues growing by couples, almost like those of the first, but much lesse, and snipt onely from the middle to the end: the floures grow after the manner of the former, and (as *Clusius* thinkes) are like them, as is also the seed. *Clusius* hath this by the name of *Sideritis 4*.

4 The same Authour hath also giuen vs another, which from the top of the root sends forth many branches, partly lying spred on the ground, and partly standing vpright, being hairy, iointed, and square like those of the former, and such also are the leaues, but that they are lesse snipt about the edges: and in their bosomes from the bottome of the stalkes to the top grow roundles of whitish floures shaped like others of this kinde. *Clusius* calls this *Sideritis 5*. He had onely the figures of these, elegantly drawne by the hand of *Iaques Plateau*, and so sent him.

5 This from a small wooddie root sends forth a square hairie stalke some halfe foot high, and sometimes higher, and this stalke most commonly sends forth some foure branches, which subdiuide themselves into smaller ones, all of them sometimes lying vpon the ground, and the stalke standing vpright; the leaues grow by couples at each ioint, from a broader bottome, ending in an obtuse point, the lower leaues being some inch long, and not much lesse in breadth: the floures are whitish, or light purple, small and hooded, engirting the stalkes in roundles, which falling, foure longish blacke seeds are contained in five cornered vessels. I first found it August 1626 in floure and leed amongst the corne in a field ioining to a wood side not far from Greene-hue in Kent, and I at that time, not finding it to be written of by any, called it *Sideritis humilis lato obtuso folio*, but since I finde that *Bauhine* hath set it forth in his *Prodromus* by the name of *Sideritis Alfine Trissaginis folio*.

6 This (which *Tabernamontanus* calls *Alyssum Germanicum*, and whose figure was formerly giuen with the same title by our Authour in the 118 Chapter of the former Edition, with a Description no waies agreeing therewith) grows vp with square stalkes some cubite high, set with pretty large and greene smooth leaues snipt about the edges: the floures grow in roundles at the tops of the branches, being hooded, and of a pale yellow colour. This grows in the Corne fields in some places of Germany and Italy: and it is the *Sideritis 2*. of *Matthiolus* in *Bauhines* opinion, who calls it *Sideritis arvensis latifolia glabra*.

7 There is another plant that growes frequently in the Corne fields of Kent, and by Purfleet in Essex which may fitly be iointed to these, for *Camerarius* calls it *Sideritis arvensis flore rubro*, and in the *Historia Lugd.* it is named *Tetradit angustifolium*, and thought to be *Ladanum segetum* of *Pliny*, mentioned *lib. 29. cap. 8.* and *lib. 26. cap. 11*. It hath a stalke some foot or better high, set with sharp pointed longish leaues, hauing two or three nickes on their sides, and growing by couples; at the top of the branches, and also the maine stalke it selfe, stand in one or two roundles faire red hooded floures: the root is small and fibrous, dying euery yeare when it hath perfected the seed. It floures in Iuly and August. This is also sometimes found with a white floure.

¶ The Time, Place, &c.

All these are sufficiently deliuered in the descriptions.

¶ The

¶ The Temperatures and Vertues.

- A These plants are drier with little or no heat, and are endued with an astringent faculty. They conduce much to the healing of greene wounds being beaten and applied, or put in vnguent or plaisters made for that purpose.
- B They are also good for those things that are mentioned in the last chapter, in B, and C.
- C *Clusius* saith, the first and second are vsed in Stiria in fomentations, to bathe the head against the paines or aches thereof, as also against the stiffenesse and wearinesse of the limbs or ioints.
- D And the same Author affirms that he hath knowne the decoction vsed with very good successe in curing the inflammations and vlcérations of the legs. ‡

CHAP. 233. Of Water Horehound.

‡ 1 *Marrubium aquaticum.*
Water Horehound.

¶ The Description.

1 **W**ater Horehound is very like to blacke and stinking Horehound in stalke and floured cups, which are rough, pricking, & compassing the stalks round about like garlands: the leaues thereof be also blacke, but longer, harder, more deeply gashed in the edges than those of stinking Horehound, yet not hairie at all, but wrinkled: the floures be small and whitish: the root is fastened with many blacke strings.

¶ The Place.

It growes in Brooks on the brinks of water ditches and neere vnto mores, for it requireth store of water, and groweth not in drie places.

¶ The Time.

It flourishes and floures in the Sommer moneths, in Iuly and August.

¶ The Names.

It is called *Aquatile*, and *Palustre Marrubium*: In English, water Horehound. *Matthiolus* taketh it to be *Species prima Sideritidis*; or a kind of Ironwoort, which *Dioscorides* hath described in the first place; but with this doth better agree that which is called *Herba Iudaica*, or Glidwoort; it much lesse agreeth with *Sideritis secunda*, or the second Ironwoort, which opinion also hath his fauourers, for it is like in leafe to none of the Fernes. Some also thinke good to

call it *Herba Egyptia*, because they that feine themselves Egyptians (such as many times wander like vagabonds from citie to citie in Germanie and other places) do vse with this herbe to giue themselves a swart colour, such as the Egyptians and the people of Africke are of; for the iuice of this herbe doth die euery thing with this kinde of colour, which also holdeth so fast, as that it cannot be wiped or washed away: insomuch as linnen cloth being died herewith, doth alwaies keepe that colour.

¶ The Temperature.

It seemeth to be cold, and withall very astringent or binding.

¶ The Vertues.

There is little vse of the water Horehound in Physicke.

† The figure that heretofore was in the first place was of the *Marrubium nigrum* described in the next chapter; and the figure and description that were in the second place by the name of *Marrubium aquaticum acutum*, were of the so much magnified *Panax* *Coloni* or *Clewns* *Al-heale* of our Author, and therefore here omitted to auoid Tautologie.

CHAP. 234. Of blacke or stinking Horehound.

¶ The Description.

1 **B**lacke Horehound is somewhat like vnto the white kinde. The stalkes be also square and hairie. The leaues somewhat larger, of a darke swart or blackish colour, somewhat like the leaues of Nettles, snipt about the edges, of an vnpleasant and stinking sauour. The floures grow about the stalks in certain spaces, of a purple colour, in shape like those of Archangell or dead Nettle. The roote is small and threddie. † I haue found this also with white floures.

† 2 To this may fitly be referred that plant which some haue called *Parietaria*, *Sideritis*, and *Herba venti*, with the additament of *Monspeliensium* to each of these denominations: but *Bauhine*, who therein follow, calls it *Marrubium nigrum longifolium*. It is thus described: the root is thicke and very fibrous, sending vp many square rough stalkes some cubite high; set at certaine spaces with leaues longer and broader than Sage, rough also and snipt about the edges: and out of their bowes come floures, hooded, and purple of colour, engirting the stalkes as in other plants of this kinde. Some haue thought this to be *Othonna* of the Antients, because the leaues not falling off in Winter, are either eaten by the Wormes, or wasted by the iniurie of the weather to the very nerues or veines that runne over them, so that by this meanes they are all perforated, and easily blowne thorow by each blast of winde: which caused some to giue it also the name of *Herba venti*. It grows in the corne fields about Montpelier. †

† 1 *Marrubium nigrum*.
Stinking Horehound.

† 2 *Marrubium nigrum Longifolium*.
Long leaued Horehound.

¶ The Place.

It is found in gardens amongst pot herbes, and oftentimes amongst stones and rubbish in drie soiles.

¶ The Time.

It floureth and flourisheth when the others do.

¶ The Names.

It is called in Greeke *βαλαν*, and *μύλας πικρίας*, as *Pliny* testifieth in his 27. booke, 8. chapter: of some, *Marrubiastrum*, or *Marrubium spurium*, or bastard Horehound: in shops, *Prasium fetidum*, and *Ballore*: in Italian, *Marrubiastro*: in Spanish, *Marraño negro*: in French, *Marubin noir & putant*: in English stinking Horehound.

¶ The Temperature.

Stinking Horehound is hot and dry, and as *Paulus Aegineta* teacheth, of a sharpe and clenfing faculty.

¶ The Vertues.

A Being stamped with salt and applied, it cureth the biting of a mad dogge, against which it is of great efficacy, as *Dioscorides* writeth.

B The leaues rosted in hot embers do waste and consume away hard lumps or knots in or about the fundament. It also clenfeth foule and filthy vlcers, as the same Author teacheth.

† The figure was of *Lamium album*, or Archangell with the white floure; and the figure that should have beene here was in the former Chapter.

CHAP. 235. Of Archangell, or dead Nettle.

† 1 *Lamium album*.
White Archangell.

2 *Lamium luteum*.
Yellow Archangell.

¶ The Description.

1 **W**hite Archangell hath foure square stalkes, a cubit high, leaning this way and that way, by reason of the great weight of his ponderous leaues, which are in shape like those of Nettles, nicked round about the edges, yet not stinging at all, but

but soft, and as it were downy. The floures compasse the stalkes round about at certaine distances, euen as those of Horehound doe, whereof doubtlesse this is a kinde, and not of Nettles, as hath been generally holden: which floures are white of colour, fashioned like to little gaping hoods or helmets. The root is very threddy. † There is also a variety of this hauing red or purple floures. †

2 Yellow Archangell hath square stalkes rising from a threddy root, set with leaues by couples, very much cut or hackt about the edges, and sharpe pointed. The vppermost whereof are oftentimes of a faire purple colour. The floures grow among the same leaues, of a gold yellow colour, fashioned like those of the white Archangell, but greater, and more wider gaping open.

3 Red Archangell being called *Vrtica non mordax*, or dead Nettle, hath many leaues spred vpon the ground, among which rise vp stalkes hollow, and square, whereupon do grow rough leaues of an ouer worn colour, among which come forth purple floures, set about in round wharles, or rundles. The root is small, and perisheth at the first approach of winter.

† 3 *Lamium rubrum*.
Red Archangell.

† 4 *Lamium Pannonicum*, siue *Galeopsis*.
Hungary dead Nettle.

4 Dead Nettle of Hungary hath many large rough leaues very much curled or crumpled like those of the stinging nettle, of a darke Greene colour, shipt about the edges like the teeth of a sawe, set vpon a foure square stalke by couples, from the bosome of which leaues come forth the floures close to the stalkes, of a perfect purple colour, in shape like those of the white Archangell, gaping like a dragons mouth, the lower chap whereof is of a bright purple spotted with white, which being past, there doth follow seed inclosed in rough huskes, with fine sharpe points sticking out. The root is thicke, tough, consisting of many threds and long strings.

† 5 To this of *Clusius*, we may fitly refer 2. other plants; the first of which *Tragus* and others call *Vrtica Heraclea*, or *Herculea*, and *Clusius* iudges it to be the true *Galeopsis* of *Dioscorides*, as *Tragus* also thought before him. The root hereof is fibrous and creeping, sending forth many foure square stalkes, vpon which at each joint grow two leaues vpon long stalkes very like those of Nettles, but more soft and hairy, not stinging: the tops of the branches end as it were in a spike made of seuerall roundles of floures like those of Archangell but lesse, and of a purple colour spotted with white on their insides; the seedes are contained foure in a vessell, and are blacke when they come to be ripe; It growes about hedges in very many places, and floures in Iune and Iuly.

‡ 6 This hath roots like those of the last described, sending vp also square stalkes a foot high, set at each ioint with leaues growing vpon long stalkes like those of the small dead Nettle, or rather like those of Alehoofe: out of the bosoms of those come three or foure stalks carrying floures like those of Alehoof, gaping, but without a hood, but with a lip turned vp, which is variegated with blew, white, and purple. This historie *Clusius* (who did not see the plant, but an exact figure thereof in colours) giues vs, and he names it as you finde exprest in the title. ‡

‡ 5 *Galeopsis vera.*
Hedge Nettle.

‡ 6 *Lamium Pannonicum* 3. *Clusij.*
Hungary Nettle with the variegated floure.

¶ The Place.

These plants are found vnder hedges, old wals, common waies, among rubbish, in the borders of fieldes, and in earable grounds, oftentimes in gardens ill husbanded.

That with the yellow floure groweth not so common as the others. I haue found it vnder the hedge on the left hand as you go from the village of Hampsted neere London to the Church, and in the wood thereby, as also in many other copes about Lee in Essex, neere Watford and Bushie in Middlesex, and in the woods belonging to the Lord Cobham in Kent.

¶ The Time.

They floure for the most part all Sommer long, but chiefly in the beginning of May.

¶ The Names.

Archangel is called of some *Vrticainers*, and *Mortua*: of some, *Lamium*: in English, Archangel, blinde Nettle, and dead Nettle.

¶ The Temperature.

They are hotter and drier than Nettle, approaching to the temperature of Horehound.

¶ The Vertues.

A Archangel [or rather the hedge Nettle] stamped with vineger, and applied in manner of a pultis taketh away Wens and hard swellings, the Kings euill, inflammation of the kernels vnder the eares and iawes, and also hot fierie inflammations of the kernels of the necke, arme-holes and flanks.

B It is good to bathe those parts with the decoction of it, as *Dioscorides* and *Pliny* say.

C The later Physitions thinke that the white floures of Archangel doe staie the whites, and for the same purpose diuers do make of them a Conserue, as they call it of the floures and sugar, which they appoint to be taken for certaine daies together.

The floures are baked with sugar as roses are, which is called sugar Roset: as also the distilled water of them, which is vsed to make the heart merry; to make a good colour in the face, and to make the vitall spirits more fresh and liuely.

† The first figure that was formerly in this Chapter, was of the *Galioffia* of *Tabern* being a kinde of dead Nettle that hath the leaues spotted with white, & somewhat smaller than the ordinary one: the figure that should haue been here was in the last Chapter; the third was the same with the first (that should haue bin differing only in colour of floures, and that which should haue beene in the third place was in the fourth,

CHAP. 236. Of Motherwoort.

Cardiaca.

Mother-woort.

¶ The Description.

Motherwoort bringeth forth stalks foure square, thick, hard, two cubites high, of an obscure or ouerworn red colour: the leaues are somewhat black, like those of Nettles, but greater and broader than the leaues of Horehound, deeply indented or cut on the edges. The husks are hard & pricking, which do compasse the stalks about like wharles, or little crownets, out of which do grow purplish floures, not vnlike to those of dead Nettle, but lesser: The roote is compact of many small strings, the whole plant is of a very ranke smell and bitter taste.

¶ The Place.

It ioieth among rubbish, in stony and other barren and rough places, especially about Oxford; it profiteth well in gardens.

¶ The Time.

It flourisheth, floureth, and seedeth from Iune to September: the leaues and stalks perish in winter, but the root endureth.

¶ The Names.

It is called in our age *Cardiaca*: in High Dutch, *Hertzgesport*: in Low Dutch, *Hertegspan*: in French, *Agripauline*: in English, Motherwoort. Somethere be that make it a kinde of Bawme, it seemes that it may be also referred to *Sideritis Herculana*, or Hercules Ironwoort.

¶ The Temperature.

Motherwoort is hot and dry in the second degree, by reason of the clenring and binding quality that it hath.

¶ The Vertues.

Diuers commend it against the infirmities of the heart: it is iudged to be so forceable, that it is thought it tooke his name *Cardiaca* of the effect.

It is also reported to cure convulsions and cramps, and likewise the palsie: to open the obstructions or stoppings of the intrails: to kill all kindes of Wormes of the bellie.

The pouder of the herbe giuen in wine, prouoketh not onely vrine, or the monthly course, but also is good for them that are in hard trauell with childe.

Moreouer, the same is commended for greene wounds: it is also a remedie against certain diseases in cattell, as the cough and murreine, and for that cause diuers husbandmen oftentimes much desire it.

CHAP. 237. *Of stinging Nettle.*¶ *The Description.*

1 **T**He stalkes of the first be now and then halfe a yard high, round, and hollow within: the leaues are broad, sharp pointed, cut round about like a saw, they be rough on both sides, and couered with a stinging downe, which with a light touch onely causeth a great burning, and raiseth hard knots in the skin like blisters, and sometimes maketh it red. The seed commeth from the roots of the leaues in round pellets bigger than Pease; it is slippery, glittering like Line-seed, but yet lesser and rounder. The roote is set with strings.

1 *Vrtica Romana.*
Romane Nettle.

2 *Vrtica vrens.*
Common stinging Nettle.

2 The second Nettle beeing our common Nettle is like to the former in leaues and stalkes, but yet now and then higher and more full of branches: it is also couered with a downe that stin- geth and burneth as well as the other: the seed hereof is small, and groweth not in round bullets, but on long slender strings, as it were in clusters, as those of the female Mercury, which grow along the stalkes and branches aboue the leaues, very many. The root is full of strings; of colour some- thing yellow, and creepeth all about. † This hath the stalkes and rootes sometimes a little red- dish, whence *Tabernamontanus* and our Authour gaue another figure thereof by the name of *Vrtica rubra*, Red Nettle. †

3 The third is like to the second in stalkes, leaues and seed, that groweth by clusters, but les- ser, and commonly more full of branches, of a light greene, more burning and stinging; the root is small and not without strings.

¶ *The*

3 *Vrtica minor*.
Small Nettle.¶ *The Place.*

Nettles grow in vntilled places, and the first in thicke woods, and is a stranger in England, notwithstanding it groweth in my garden.

The second is more common, and groweth of it selfe neere vnto hedges, bushes, brambles, and old walls, almost euery where.

The third also commeth vp in the same places, which notwithstanding groweth in gardens and moist earable grounds.

¶ *The Time.*

They all flourish in Sommer: the second suffereth the winters cold: the seed is ripe, and may be gathered in Iuly and August.

¶ *The Names.*

It is called in Greeke *Αχλαύνη*: in Latine, *Vrtica*, *ab vrendo*, of his burning and stinging qualitie: whereupon *Macer* saith,

— *nec immerito nomen sumpsisse videtur,
Tacta quod exurat digitos vrtica tenentis.*

Neither without desert his name hee seemes to git,

As that which quickly burnes the fingers touching it.

And of diuers also *vrtica*, because it stingeth with hurtfull downe: in high-Dutch, *Pessel*: in Italian, *Ortica*: in Spanish, *Hortiga*: in French, *Ortie*: in English, Nettle. The first is called in low Dutch *Roomsche Petelen*, that is, *Romana*

vrtica, or Roman Nettle: and likewise in high-Dutch *Walsche Pesselen*, that is, *Italica vrtica*, Italian Nettle, because it is rare, and groweth but in few places, and the seed is sent from other countries, and sowne in gardens for his vertues: it is also called of diuers *Vrtica mas*: and of *Dioscorides*, *Vrtica sylvestris*, or wilde Nettle, which he saith is more rough, with broader and longer leaues, and with the seed of Flax, but lesser. *Pliny* maketh the wilde Nettle the male, and in his 21 booke, chap. 15. saith that it is milder and gentler: it is called in English *Romane Nettle*, *Greeke Nettle*, *Male Nettle*. The second is called *Vrtica femina*, and oftentimes *Vrtica maior*, that it may differ from the third Nettle: in English, *Female Nettle*, *Great Nettle*, or *common Nettle*. The third is named in high-Dutch *Hepter Pessel*: in the Brabanders speech, *Heite Petelen*, so called of the stinging qualitie: in English, *Small Nettle*, *Small burning Nettle*: but whether this be that or no which *Pliny* calleth *Cania*, or rather the first, let the Students consider. There is in the wilde Nettle a more stinging qualitie, which, saith he, is called *Cania*, with a stalke more stinging, hauing nicked leaues.

¶ *The Temperature.*

Nettle is of temperature dry, a little hot, scarce in the first degree: it is of thin and subtil parts; for it doth not therefore burne and sting by reason it is extreme hot, but because the downe of it is stiffe and hard, piercing like fine little prickles or stings, and entring into the skin: for if it be withered or boyled it stingeth not at all, by reason that the stiffenesse of the downe is fallen away.

¶ *The Vertues.*

Being eaten, as *Dioscorides* saith, boyled with Perywinkles, it maketh the body soluble, doing it by a kinde of cleansing qualitie: it also prouoketh vrine, and expelleth stones out of the kidneyes: being boyled with barley creame it bringeth vp tough humours that sticke in the chest, as it is thought.

Being stamped, and the iuyce put vp into the nostrills, it stoppeth the bleeding of the nose: the iuyce is good against the inflammation of the Vuula.

The seed of Nettle stirreth vp lust, especially drunke with Cute: for (as *Galen* saith) it hath in it a certaine windinesse.

- D It concocteth and draweth out of the cheft raw humors.
- E It is good for them that cannot breathe vnlesse they hold their necks vpright, and for those that haue the pleurisie, and for such as be sick of the inflammation of the lungs, if it be taken in a looch or licking medicine, and also against the troublesome cough that children haue, called the Chin-cough.
- F *Nicander* affirmeth that it is a remedie against the venomous qualitie of Hemlocke, Mushrooms, and Quick-siluer.
- G And *Apollodorus* saith that it is a counterpoyson for Henbane, Serpents, and Scorpions.
- H As *Pliny* witnesseth, the same Author writeth, that the oyle of it takes away the sting which the Nettle it selfe maketh.
- I The same grossely powned, and drunke in white wine, is a most singular medicine against the stone either in the bladder or in the reines, as hath beene often proued, to the great ease and comfort of those that haue been grievously tormented with that maladie.
- K It expelleth grauell, and causeth to make water.
- L The leaues of any kinde of Nettle, or the seeds, do worke the like effect, but not with that good speed and so assuredly as the Romane Nettle.

CHAP. 238. Of Hempe.

1 *Cannabis mas.*
Male or Steele Hempe.

2 *Cannabis femina.*
Femeline, or Female Hempe.

¶ The Description.

1 **H**empe bringeth forth round stalkes, straight, hollow, fise or six foot high, full of branches when it groweth wilde of it selfe; but when it is sowne in fields it hath very few or no branches at all. The leaues thereof be hard, tough, somewhat blacke, and if they be bruised they be of a ranke smell, made vp of diuers little leaues ioyned together, every particular leafe whereof is narrow, long, sharpe pointed, and nicked in the edges: the seeds come forth from the bottomes of the wings and leaues, being round, somewhat hard, full of white substance. The roots haue many strings.

2 There is another, being the female Hempe, yet barren and without seed, contrarie vnto the nature

nature of that sex; which is very like to the other being the male, and one must be gathered before the other be ripe, else it will wither away, and come to no good purpose.

¶ The Place.

Hempe, as *Columella* writeth, delighteth to grow in a fat dugged and waterie soile, or plaine and moist, and deeply digged.

¶ The Time.

Hempe is sowne in March and Aprill; the first is ripe in the end of August, the other in July.

¶ The Names.

This is named of the Grecians *cannabis*; also of the Latines *Cannabis*: the Apothecaries keep that name: in high-Dutch, *Zamerhanff*: of the Italians *Canape*: of the Spaniards, *Canamo*: in French, *Chanure*: of the Brabanders, *kemp*: in English, Hempe. The male is called Charle Hempe, and Winter Hempe: the female, Barren Hempe, and Sommer Hempe.

¶ The Temperature and Vertues.

The seed of Hempe, as *Galen* writeth in his bookes of the faculties of simple medicines, is hard of digestion, hurtfull to the stomacke and head, and containeth in it an ill iuyce: notwithstanding some do vse to eate the same parched, *cum alijs tragematis*, with other junkets.

It consumeth winde, as the said Author saith in his booke of the faculties of medicines, and is so great a drier, as that it drieth vp the seed if too much be eaten of it.

Dioscorides saith, That the iuyce of the herbe dropped into the eares asswageth the paine thereof proceeding (as I take it) of obstruction or stopping, as *Galen* addeth.

The inner substance or pulpe of the seed pressed out in some kinde of liquor, is given to those that haue the yellow jaundice, when the disease first appeares, and oftentimes with good successe, if the disease come of obstruction without an ague, for it openeth the passage of the gall, and disperseth and concocteth the choler through the whole body.

Matthiolus saith, that the seed given to hens causeth them to lay egges more plentifully.

CHAP. 239. Of wilde Hempe.

1 *Cannabis Spuria.*

Wilde Hempe.

2 *Cannabis Spuria altera.*

Bastard Hempe.

¶ 3 *Cannabis Spuria tertia.*
Small Bastard Hempe.

¶ The Description.

This wilde Hempe, called *Cannabis Spuria*, or Bastard Hempe, hath smal slender hoary and hairie stalkes a foot high, beset at euery ioynt with two leaues, smally indented about the edges somewhat like a Nettle. The floures grow in rundles about the stalkes, of a purple colour, and sometimes also white: the root is little and threddy.

2 There is likewise another kind of wild Hempe which hath hairie stalkes and leaues like the former, but the floures are greater, gaping wide open like the floures of *Lamium*, or dead Nettle, whereof this hath been taken for a kinde: but hee that knoweth any thing may easily discern the sauer of hempe from the smell of dead Nettle. The floures are of a cleare and light carnation colour, declining to purple.

3 There is also another kinde of wilde Hempe like vnto the last before mentioned, sauing that it is smaller in each respect, and not so hairy. The leafe is somewhat rounder: the root small and threddy: the floure is larger, being purple or white, with a yellow spot in the inside.

¶ The Place.

These kinds of wild or bastard Hempe do grow vpon hills and mountaines, and barren hilly grounds, especially in earable land, as I haue often seene in the corne fields of Kent, as about Grauesend, Southfleet, and in all the tract from thence to Canturbury, and in many places about London.

¶ The Time.

These herbes do floure from Iuly to the end of August.

¶ The Names.

It shall suffice what hath been set downe in the titles for the Latine names: in English, Wilde Hempe, Nettle Hempe, and Bastard Hempe.

¶ The Temperature and Vertues.

The temperature and faculties are referred to the manured Hempe, notwithstanding they are not vsed in phyicke where the other may be had.

CHAP. 240. Of Water-Hempe.

¶ The Description.

Water-Hempe or Water-Agrimony is seldome found in hot regions, for which cause it is called *Eupatorium Cannabinum faemina Septentrionalium*, and groweth in the cold Northerne countries in moist places, and in the midst of ponds, slow running riuers, and ditches. The root continueth long, hauing many long and slender strings, after the nature of water herbes: the stalkes grow a cubit and a halfe high, of a darke purple colour, with many branches standing by distances one from another. The leaues are more indented and lesse hairy than the male kind: the floures grow at the top, of a browne yellow colour, spotted with blacke spots like *Aster atticus*; which consisteth of such a substance as is in the midst of the Daisie, or the Tansie floure, and is set about with small and sharpe leaues, such as are about the Rose, which causeth the whole floure to resemble a star, and it saureth like gum *Elemni*, *Rosine*, or Cedar wood when it is burned. The seed is long like *Pyrethrum*, closely thrust together, and lightly cleaueth to any woollen garment, that it toucheth

toucheth by reason of his roughnesse. ‡ This is found with the leaues whole, and also with them parted into three parts: the first varietie was exprest by our Authors figure; and the second is exprest by this we giue you in the place thereof. ‡

2 There is another wilde Hempe growing in the water, whereof there be two sorts more, delighting to grow in the like ground, in shew differing very little. This springs vp with long round stalkes, and somewhat reddish, about two cubits high, or something higher: they are beset with long Greene leaues indented about the edges, whereof you shal see commonly five or seuen of those leaues hanging vpon one stem like the leaues of Hempe, but yet softer. The floures are little, of a pale reddish colour, consisting of soft round tufts, and stand perting vpon the top of the sprigges, which at length vanish away into downe: the root vnderneath is full of threddy strings of a mean bignesse.

1 *Eupatorium Cannabinum semina.*

Water Hempe, or Water Agrimony.

‡ 2 *Eupatorium Cannabinum mas.*

Common Dutch Agrimonie.

¶ The Place.

They grow about the brinks of ditches, running waters, and standing pooles, and in watery places almost euery where.

¶ The Time.

They floure and flourish in Iuly and August: the root continues, but the stalkes and leaues wither away in Winter.

¶ The Names.

The bastard or wilde Hemptes, especially those of the water, are commonly called *Hepatorium Cannabinum*: of diuers also *Eupatorium*, *Leonhar*. *Fuchsius* nameth it *Eupatorium Adulterinum*: of most, *Cannabina*, of the likenesse it hath with the leaues of *Cannabis*, Hempe, and *Eupatorium Anicenna*. It is thought also to be that which *Baptista Sardus* doth terme *Terzola*: in high-Dutch, *S. Kunigund kraut*; that is to say in Latine, *Sancta Cunigunda herba*, *S. Cunigunds herbe*: in Low-Dutch, *Boelkens kruit*: in English, Water Hempe, Bastard and water Agrimonie. It is called *Hepatorium*, of the facultie, being good for *Hepar*, the liuer. ‡ I haue named the second Common Dutch Agrimonie, because it is commonly vsed for Agrimonie in the shops of that countrey. ‡

¶ The Temperature.

The leaues and roots of these herbes are bitter, also hot and dry in the second degree: they haue vertue to scoure and open, to attenuate or make thinne thicke and grosse humours, and to expell or driue them forth by vrine: they cleanse and purifie the blood.

¶ The

¶ The Vertues, which chiefly belong to the last described.

- A The decoction hereof is profitably giuen to those that be scabbed and haue filthy skinned; and likewise to such as haue their spleen and liuer stopped or swolne: for it taketh away the stoppings of both those intrals, and also of the gall: wherefore it is good for them that haue the jaundice, especially somewhat after the beginning.
- B The herbe boyled in wine or water is singular good against tertian Feuers.
- C The decoction drunke, and the leaues outwardly applied, do heale all wounds both inward and outward.
- D ¶ *Fuchsius* saith that the second is very effectually against poyson. And *Gesner* in his Epistles affirmeth, that he boyled about a pugil of the fibres of the root of this plant in wine, and drunke it, which an houre after gaue him one stoole, and afterwards twelue vomits, whereby he cast vp much flegme: so that it workes (saith he) like white Hellebor, but much more easily and safely, and it did me very much good. ‡

CHAP. 241. Of Egrimonie.

Agrimonia.
Agrimonie.

¶ The Description.

The leaues of Agrimonie are long & hairie, Greene above, and somewhat grayish vnderneath, parted into diuers other small leaues snipt round about the edges, almost like the leaues of hempe: the stalke is two foot and a halfe long, rough & hairy, whereupon grow many small yellow floures one aboue another vpwards toward the top: after the floures come the seeds somewhat long and rough, like to small burs hanging downwards; which when they be ripe doe catch hold vpon peoples garments that passe by it. The root is great, long, and blacke.

¶ The Place.

It growes in barren places by highwayes, inclosures of medowes, and of corne fields, and oftentimes in woods and copses, and almost euery where.

¶ The Time.

It floureth in Iune and somewhat later, and seedeth after that a great part of Sommer.

¶ The Names.

The Grecians call it *ἰσμενίον*: and the Latines also *Eupatorium*: *Pliny*, *Eupatoria*: yet there is another *Eupatorium* in *Apuleius*, and that is *Marrubium*, Horehound. In like maner the Apothecaries of Germany haue another *Hepatorium* that is there commonly vsed, being described in the last chapter, and may be named *Hepatorium adulterinum*. Agrimonie is named *Lappa inuersa*: and it is so called, because the seeds which are rough like burres do hang downwards: of some, *Philanthropos*, of the cleauing qualitie of the seeds hanging to mens garments: the Italians and Spaniards call it *Agramonia*: in high Dutch, *Odermeng*, *Bzuckwurtz*: in low-Dutch, in French, and in English, *Agrimonie*, and *Egrimonie*: *Eupatorium* taketh the name of *Eupator*, the finder of it out: and (saith *Pliny*) it hath a royall and princely authoritie.

¶ The Temperature.

It is hot, and doth moderately binde, and is of a temperate drinesse. *Galen* saith that Agrimonie is of fine and subtile parts, that it cutteth and scoureth, therefore, saith he, it remoues obstructions or stoppings out of the liuer, and doth likewise strengthen it by reason of the binding quality that is in it.

¶ The

¶ The Vertues.

The decoction of the leaues of Egrimony is good for them that haue naughty liuers, and for such as pisse bloud vpon the diseases of the kidnies. A

The seed being drunke in wine (as *Pliny* affirmeth) doth helpe the bloody fluxe. B

Dioscorides addeth, that it is a remedy for them that haue bad liuers, and for such as are bitten with serpents. C

The leaues being stamped with old swines grease, and applied, closeth vp vlcers that be hardly healed, as *Dioscorides* saith. D

‡ Agrimony boiled in wine and drunke, helps inueterate hepaticke fluxes in old people. ‡ E

CHAP. 242. Of Sawewoort.

1. 2. *Serratula purpurea, sine alba.*

Saw-woort with purple, or white floures.

¶ The Description.

THE plant which the new writers haue called *Serratula* differeth from *Betonica*, although the Antients haue so called *Betony*; It hath large leaues somewhat snipt about the edges like a saw (whereof it tooke his name) rising immediately from the root: among which come vp stalkes of a cubite high, beset with leaues very deeply cut or jagged euen to the middle of the rib, not much vnlike the male *Scabious*. The stalkes towards the top diuide themselues into other small branches, at the top whereof they beare floures somewhat scaly, like the *Knapweed*, but not so great nor hard: at the top of the knap commeth forth a bushie or thrummy floure, of a purple colour. The root is threddy, and thereby increaseth and becommeth of a great quantity.

2 Sawewoort with white floures differeth not from the precedent, but in the colour of the floures: for as the other bringeth forth a bush of purple floures; in a manner this plant bringeth forth floures of the same fashion, but of a snow white colour, wherein consisteth the difference.

‡ Our Authour out of *Tabernamontanus* gaue three figures, with as many descriptions of this plant, yet made it onely to vary in the colour of the floures, being either purple, white,

or red; but he did not touch the difference which *Tabernamontanus* by his figures exprest, which was, the first had all the leaues whole, being only snipt about the edges; the lower leaues of the second were most of them whole, and those vpon the stalkes deeply cut in, or diuided, and the third had the leaues both below and aboue all cut in or deeply diuided. The figure which we here giue you exprests the first and third varieties, and if you please, the one may be with white, and the other with red or purple floures. ‡

¶ The Place.

Sawe-woort groweth in woods and shadowie places, and sometimes in meadowes. They grow in Hampsted wood: likewise I haue seene it growing in great abundance in the wood adjoining to Islington, within halfe a mile from the further end of the towne, and in sundry places of Essex and Suffolke.

¶ The Time.

They floure in Iuly and August.

000

¶ The

¶ The Names.

The later age doe call them *Serratula*, and *Serratula tinctoria*, it differeth as we have said from Betony, which is also called *Serratula*: other names if it haue any we know not: it is called in English Sawewoort. ‡ *Casalpinus* calls it *Cerretta* and *Serretta*, and *Thalius*, *Centauroides*, or *Centaureum minus sylvestre Germanicum*. ‡

¶ The Temperature and Vertues.

A *Serratula* is wonderfully commended to be most singular for wounds, ruptures, burstings, and such like: and is referred vnto the temperature of Sanicle.

CHAP. 243. Of Betony.

¶ The Description.

1 **B**etony groweth vp with long leaues and broad, of a darke greene colour, slightly indented about the edges like a saw. The stalke is slender, foure square, somewhat rough, a foote high more or lesse. It beareth eared floures, of a purplish colour, and sometimes reddish; after the floures, commeth in place long cornered seed. The root consisteth of many strings.

1 *Betonica.*
Betony.

2 Betony with white floures is like the precedent in each respect, sauing that the flours of this plant are white, and of greater beautie, and the others purple or red, as aforesaid.

¶ The Place.

Betony loues shadowie woods, hedge-rows, and copses, the borders of pastures, and such like places.

Betony with white floures is seldome seene. I found it in a wood by a village called Hampstead, neere vnto a worshipfull Gentlemans house, one of the Clerkes of the Queenes counsell called Mr. Wade, from whence I brought plants for my garden, where they flourish as in their naturall place of growing.

¶ The Time.

They floure and flourish for the most part in Iune and Iuly.

¶ The Names.

Betony is called in Greeke *νίτρον*: in Latine, *Betonica*: of diuers *Vetonica*: but vnproperly. There is likewise another *Betonica*, which *Paulus Aegineta* described; and *Galen* in his first booke of the gouernment of health sheweth that it is called *νίτρον*, that is to say, *Betonica*, *Betonie*, and also *Sarxiphagon*: *Dioscorides* notwithstanding doth describe another *Sarxiphagon*.

¶ The Temperature.

Betony is hot and dry in the second degree: it hath force to cut, as *Galen* saith.

¶ The Vertues.

A Betony is good for them that be subject to the falling sicknesse, and for those also that haue ill heads vpon a cold cause.

B It clenseth the lungs and cheft, it taketh away obstructions or stoppings of the liuer, milt, and gall: it is good against the yellow jaundise.

It maketh a man to haue a good stomack and appetite to his meate: it preuaileth against sower belchings:

belchings : it maketh a man to pisse well : it mitigateth paine in the kidnies and bladder : it breaketh stones in the kidnies, and driueth them forth.

It is also good for ruptures, cramps, and convulsions : it is a remedie against the bitings of mad dogs and venomous serpents, being drunke, and also applied to the hurts, and is most singular against poyson.

It is commended against the paine of the Sciatica, or ache of the huckle bone.

There is a Conserue made of the floures and sugar good for many things, and especially for the head-ache. A dram weight of the root of Betonie dried, and taken with meade or honied water, procureth vomit, and bringeth forth grosse and rough humors, as diuers of our age do report.

The pouder of the dried leaues drunke in wine is good for them that spit or pisse bloud, and cureth all inward wounds, especially the greene leaues boyled in wine and giuen.

The pouder taken with meate looseth the belly very gently, and helpeth them that haue the falling sicknesse with madnesse and head-ache.

It is singular against all paines of the head : it killeth wormes in the belly ; helpeth the Ague : it cleanseth the mother, and hath great vertue to heale the body, being hurt within by bruising or such like.

CHAP. 244. Of Water-Betony.

The Description.

Water Betony hath great square hollow and brown stalks, whereon are set very broad leaues notched about the edges like vnto those of Nettles, of a swart Greene colour, growing for the most part by two and two as it were from one ioynt, opposite, or standing one right against another. The floures grow at the top of the branches, of a darke purple colour, in shape like to little helmets. The seed is small, contained in round bullets or buttons. The root is compact of many and infinite strings.

Betonica aquatica.
Water Betony.

The Place.

It groweth by brookes and running waters, by ditch sides, and by the brinks of riuers, and is seldome found in dry places.

The Time.

It floureth in Iuly and August, and from that time the seed waxeth ripe.

The Names.

Water Betonie is called in Latine *Betonica aquatica* : some haue thought it *Dioscorides* his *Clymenum* : others, his *Galeopsis* : it is *Scrophularia altera* of *Dodonaus* : of *Turner*, *Clymenon* : of some, *Sesamoides minus*, but not properly : of others, *Serpentaria* : in Dutch, *S. Antonies cryd* : in English, Water Betonie : and by some, Browne-wort : in Yorke-shire, Bishops leaues.

The Temperature.

Water Betony is hot and dry.

The Vertues.

The leaues of Water Betony are of a scouring or cleansing qualitie, and is very good to mundifie foule and stinking vlcers, especially the iuyce boyled with honey.

It is reported, if the face be washed with the iuyce thereof, it taketh away the rednesse and deformitie of it.

CHAP. 245.

Of Great Figge-wort, or Brownwort.

¶ The Description.

1 **T**He great Fig-wort springeth vp with stalkes foure square, two cubits high, of a darke purple colour, and hollow within: the leaues grow alwayes by couples, as it were from one ioynt, opposite, or standing one right against another, broad, sharpe pointed, snipped round about the edges like the leaues of the greater Nettle, but bigger, blacker, and nothing at all stinging when they be touched: the floures in the tops of the branches are of a darke purple colour, very like in forme to little helmets: then commeth vp little smal seed in pretty round buttons, but sharpe at the end: the root is whitish, beset with little knobs and bunches as it were knots and kernels.

2 There is another Figge-wort called *Scrophularia Indica*, that hath many and great branches trailing here and there vpon the ground, full of leaues, in fashion like the wilde or common Thistle, but altogether without prickles: among the leaues appeare the floures in fashion like a hood, on the out side of a feint colour, and within intermixt with purple, which being fallen and withered, there come in place small knops very hard to breake, and sharpe at the point as a bodkin: which containeth a small seed like vnto Time. The whole plant perisheth at the first approach of Winter, and must be sown againe in Aprill, in good and fertile ground. ‡ This is the *Scrophularia Cretica* 1. of *Clusius*. ‡

1 *Scrophularia maior.*
Great Fig-wort.

‡ 2 *Scrophularia Indica.*
Indian Fig-wort.

‡ 3 The stalke of this is also square, and some yard high, set with leaues like those of the hedge Nettle, but somewhat larger and thicker, and a little deeper cut in: out of the bosomes of these leaues come little rough foot-stalkes some inch or two long, carrying some foure or five hollow round floures of a greenish yellow colour, with some threds in them, being open at the top, and cut in with five little gashes: the seeds are blacke, and contained in vessels like those of the first

first described : the root is like that of the Nettle, and liues many yeares : it floures in May, and the seeds are ripe in Iune. I haue not found nor heard of this wilde with vs, but seen it flourishing in the garden of my kinde friend Mr. *John Parkinson*. *Clusius* calls it *Lamium 2. Pannonicum exoticum* : and *Bauhine* hath set it forth by the name of *Scrophularia flore luteo* : whom in this I follow. ‡

‡ 3 *Scrophularia flore luteo*.
Yellow floured Fig-wort.

¶ The Place.

The great *Scrophularia* groweth plentifully in shadowie Woods, and sometimes in moist medowes, especially in greatest abundance in a wood as you go from London to Harnesey, and also in Stow wood and Shotouer neere Oxford.

The strange Indian figure was sent me from Paris by *John Robin* the Kings Herbarist, and it now groweth in my garden.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

Fig-wort or Kernel-wort is called in Latine *Scrophularia maior*, that it might differ from the lesser Celandine, which is likewise called *Scrophularia*, with this addition *minor*, the lesser : it is called of some *Millemorbia*, and *Castrangula* : in English, great Fig-wort, or Kernel-wort, but most vsually Brown-wort.

¶ The Vertues.

Fig-wort is good against the hard kernells A which the Grecians call *σπίρη* : the Latines, *Strumas*, and commonly *Scrophulas*, that is, the Kings Euill : and it is reported to be a remedy against those diseases whereof it tooke his name, as also the painefull piles and swelling of the hæmorrhoides.

Diuers do rashly teach, that if it be hanged B about the necke, or else carried about one, it keepeth a man in health.

Some do stampe the root with butter, and set it in a moist shadowie place fifteene dayes together : then they do boyle it, straine it, and keepe it, wherewith they anoint the hard kernells, and the hæmorrhoides veines, or the piles which are in the fundament, and that with good successe. C

CHAP. 246. Of Veruaine.

¶ The Description.

1 THE stalke of vpright Veruaine riseth from the root single, cornered, a foot high, seldome aboue a cubite, and afterwards diuided into many branches. The leaues are long, greater than those of the Oke, but with bigger cuts and deeper : the floures along the sprigs are little, blew, or white, orderly placed : the root is long, with strings growing on it.

2 Creeping Veruaine sendeth forth stalkes like vnto the former, now and then a cubit long, cornered, more slender, for the most part lying vpon the ground. The leaues are like the former, but with deeper cuts, and more in number. The floures at the tops of the sprigs are blew, and purple withall, very small as those of the last described, and placed after the same manner and order. The root groweth straight downe, being slender and long, as is also the root of the former.

1. *Verbena communis.*
Common Veruaine.

2. *Verbena sacra.*
Common Veruaine.

¶ The Place.

Both of them grow in vntilled places neere vnto hedges, high-ways, and commonly by ditches almost euery where. ‡ I haue not seene the second, and doubt it is not to be found wilde in England. ‡

¶ The Time.

The Veruaines floure in Iuly and August.

¶ The Names.

Veruaine is called in Greeke *νεύροειδής*: in Latine, *Verbena*, and *Verbenaca*, *Herculania*, *Ferraria*, and *Exupera*: of some, *Matricalis*, and *Hiera botane*: of others, *Veruena*, and *Sacra herba*: *Verbena* are herbes that were taken from the Altar, or from some holy place, which because the Consull or Pretor did cut vp, they were likewise called *Sagmina*, which oftentimes are mentioned in *Linny* to be grassie herbes cut vp in the Capitoll. *Pliny* also in his two and twentieth booke, and eleuenth Chapter witnesseth, That *Verbena* and *Sagmina* be all one: and this is manifest by that which wee reade in *Andrea* in *Terence*: *Ex ara verbenas hinc sume*; Take herbes here from the Altar: in which place *Terence* did not meane Veruaine to be taken from the Altar, but some certaine herbes: for in *Menander*, out of whom this Comedie was translated, is read *μυρτίν*, or Myrtle, as *Donatus* saith. In Spanish it is called *Vrgebaom*: in Italian, *Verminacula*: in Dutch, *Iser cruist*: in French, *Veruaine*: in English, Iuno's reares, Mercuries moist blood, Holy-herbe; and of some, Pigeons grasse, or Columbine, because Pigeons are delighted to be amongst it, as also to eat thereof, as *Apuleius* writeth.

¶ The Temperature.

Both the Veruaines are of temperature very dry, and do meanly binde and coole.

¶ The Vertues.

- A The leaues of Veruaine pownd with oile of Roses or hogs greafe, doth mitigate and appease the paines of the mother, being applied thereto.
- B The leaues of Veruaine and Roses stamped with a little new hogs greafe, and emplaistered after the manner of a pultesse, doth cease the inflammation and grievous paines of wounds, and suffereth them not to come to corruption: and the greene leaues stamped with hogs greafe takes away the swelling and paine of hot impostumes and tumors, and cleanseth corrupt and rotten vlcers.
- C It is reported to be of singular force against the Tertian and Quartane Feuers: but you must obserue

obserue mother *Bombies* rules, to take iust so many knots or sprigs, and no more, lest it fall out so that it do you no good, if you catch no harm by it. Many odde old wiuies fables are written of Veruaine tending to witchcraft and forcerie, which you may read elswhere, for I am not willing to trouble your eares with reporting such trifles, as honest eares abhorre to heare.

Archigenes maketh a garland of Veruaine for the head-ache, when the cause of the infirmitie D proceedeth of heat.

The herbe stamped with oile of roses and Vineger, or the decoction of it made in oile of roses, E keepeth the haire from falling, being bathed or annointed therewith.

It is a remedie against putrified vlcers, it healeth vp wounds, and perfectly cureth Fistulaes, it F wasteth away old swellings, and taketh away the heat of inflammations.

The decoction of the roots and leaues swageth the tooth-ache, and fasteneth them, and healeth G the vlcers of the mouth.

They report saith *Pliny*, that if the dining roome be sprinkled with water in which the herbe H hath beene steeped, the guests will be the merrier, which also *Dioscorides* mentioneth.

Most of the latter Physitions do giue the iuice or decoction hereof to them that hath the plague I but these men are deceiued, not only in that they looke for some truth from the father of falshood and leasings, but also because in stead of a good and sure remedie they minister no remedy at all for it is reported, that the Diuell did reueale it as a secret and diuine medicine.

CHAP. 247. Of Scabious.

† 1 *Scabiosa maior vulgaris.*
Common Scabious.

† 2 *Scabiosa minor, sive Columbaria.*
The small common Scabious.

¶ The Description.

† The first kinde of Scabious being the most common and best known, hath leaues long and broad, of a grayish, hoary, and hairy colour, spred abroad vpon the ground, among which rise vp round and rough stems, beset with hairy iagged leaues, in fashion like great

great Valerian, which we call Setwall. At the top of the stalks grow blew floures in thicke tufts or buttons. The root is white and single.

2 The second is like vnto the former, sauing that his leaues are much cut or iagged, and the whole plant is altogether lesser, scarcely growing to the height of a foot.

3 The third kinde of Scabious is in all things like vnto the second, sauing that the knap or head doth not dilate it selfe so abroad, and is not so thicke or closely thrust together, and the lowest leaues are not so deeply cut or iagged, but the vpper are much smaller, and also the more diuided.

4 The fourth groweth with large stalkes, hauing two leaues one set right against another, very much iagged, almost like vnto common Ferne, or rather Ash: and at the top of the stalks there grow larger floures, like vnto the first, but greater, and the roote is also like it, and it differs nowaie from the first described, but onely by reason of the soile.

5 Purple floured Scabious hath a rough hairie stalk, whereon doe grow broad leaues deepe-ly cut in the edges, in forme like those of Sowthistle, rough likewise and hairie; the floures grow at the top of the stalks, composed of an innumerable sort of purple thrums: after which come scaly knaps like thole of *Iacea*, or Knapweed, wherein is the seed. The root is small and threddie.

6 The sixth sort of Scabious hath stalks some cubite high, round, and set with leaues not cut and iagged almost to the middle rib, as in the former, yet somewhat rough and hairie, snipt about the edges, and of a light greene colour, amongst which rise vp rough stalkes, on the top whereof do grow faire red floures consisting of a bundle of thrummes. The root is long, tough, and fibrous.

7 The seuenth kinde of Scabious hath sundrie great, rough and round stemmes, as high as a tall man, beset with leaues like the first Scabious, but far greater. The floures grow at the top of the stalkes like vnto the others, but of a faint yellow colour, which fall as soone as it is touched with the hand, whereby it mightily increaseth, notwithstanding the roote endureth for many yeares, and groweth to be wonderfull great: and in my garden it did grow to the bignesse of a mans body.

† 3 *Scabiosa media.*
Middle Scabious.

4 *Scabiosa campestris, sive segetum.*
Corne Scabious.

5 *Scabiosa flore purpureo.*
Purple flowered Scabious.

† 6 *Scabiosa rubra Austriaca.*
Red Scabious of Austrich.

† 7 *Scabiosa montana maxima.*
Mountaine Scabious.

‡ 8 *Scabiosa montana alba.*
White mountaine Scabious.

6 *Scabiosa maior Hispanica.*
Spanish Scabious.

10 *Scabiosa peregrina.*
Strange Scabious.

† 11 *Scabiosa omnium minima.*
Sheepes Scabious.

‡ 8 The white mountaine Scabious hath broad leaues spred vpon the ground, like those of the field Primrose, but greater. Amongst which riseth vp a great stiffe stalke smooth and plain, garnished with leaues not like those next the ground, but lesser, much more diuided, and of a greener colour & harder. The floures are like those of the common Scabious, but white of colour: the root of this perishes euery yeare after the perfecting of the seed. ‡

9 The ninth kinde of Scabious is like vnto the mountaine Scabious, but lower and smaller, hauing sundry large and broad leaues next the ground, snipt confusedly and out of order at the edges like the Oken leafe, among which riseth vp a stem two cubites high, diuiding it selfe into sundry other branches. The floures are set at the top of the na-

ked stalkes, of a whitish colour; which being past, the seed appeareth like a tuft of small bucklers, round, and somewhat hollow within, and made as it were of parchment, very strange to behold: and within the bucklers there are sundry small crosses of blacke fastened to the bottome, as it were the needle in a diall, running vpon the point of a needle. The plant dieth at the beginning of winter, and must be sowne in Aprill in good and fertile ground.

10 The tenth is like vnto the last before mentioned, in stalkes, root, and floures, and differeth that this plant hath leaues altogether without any cuts or iaggies about the edges, but is smooth and plaine like the leaues of Marigolds, or Diuels bit, and the floures are like vnto those of the last described.

11 Sheepes Scabious hath small and tender branches trailing vpon the ground, whereupon do grow small leaues very finely iaggd or minced euen almost to the middle ribbe, of an ouerworne colour. The floures grow at the top of a blewish colour, consisting of much thrummie matter, hard thrust together like a button: the root is small, and creepeth in the ground.

12 *Scabiosa minima hirsuta.*
Hairie Sheepes Scabious

13 *Scabiosa minima Bellidis folio.*
Daisie leaved Scabious.

14 *Scabiosa flore pallido.*
Yellow Scabious.

15 *Scabiosa prolifera.*
Childing Scabious.

‡ 12 The other Sheeps Scabious of our Author (according to the figure) is greater than the last described, growing some foot or better high, with slender rough branches set with leaues not so much diuided, but onely nicked about the edges: the floures are in colour and shape like those of the last described, or of the blew daisie; the root is single, and like that of a Rampion, whence *Fabius Columna* (the seed and milkie juice inducing him) hath refer'd this to the Rampions, calling it *Rapuntium montanum capitatum leptophyllum*. *Lobell* calls it *Scabiosa media*: and *Dodonæus*, *Scabiosa minor*.

13 To these little plants we may fitly adde another small one refer'd by *Clusius* to this Classis, and called *Scabiosa*. 10. *sive repens*: yet *Bauhine* refers it to the Daisies, and termes it *Bellis carulea montana frutescens*; but it matters not to which we referre it: the description is thus; The root is hard, blacke, and creeping, so that it spreads much vpon the surface of the ground, sending forth many thicke, smooth, greene leaues, like those of the blew Daisie, not sharpe pointed, but ending as we vulgarly figure an heart, hauing a certaine grassie but not vnpleasant smell, and somewhat a bitter and hot taste: out of the middest of these leaues grow slender naked stalks some hand high, hauing round floures on their tops, like those of Diuells bit, and of the same colour, yet sometimes of a lighter blew. It growes in the mountaines of Hungary and Austria. It floures in Aprill and May, and ripens the seed in Iuly and August.

‡ 16 *Scabiosa rubra Indica*.
Red Indian Scabious.

‡ 17 *Scabiosa æstivalis Clusij*.
Sommer Scabious.

14 This (which is the seuenth Scabious of *Clusius*, and which he termes *αχελαιός*, of the whitish yellow colour of the floure) hath round, slender, stiffe, and greene stalkes set at each joint with two large and much diuided leaues of a whitish greene colour: those leaues that come from the root before the stalke grow vp are broader, and lesse diuided; vpon the tops of the branches and stalkes grow floures like those of the common Scabious, being white or rather (before they be thoroughly open) of a whitish yellow colour; which fading, there follow seedes like as in the ordinary kinde. This floures in Iune and Iuly, and growes very plentifully in all the hilly grounds and dry Meades of Austria and Morauia.

15 There is also a kinde of Scabious hauing the leaues much cut and diuided, and the stalkes and floures like to the common sort, of a blewish purple colour, but differing in this, that at the

the sides of the floure it puts forth little stalkes, bearing smaller floures, as is seene in some other plants, as in Daiesies and Marigolds, which therefore are fitly termed in Latine *Prolifera* or *Childing*. This growes onely in Gardens, and floures at the same time with the former.

16 The stalkes of the red Scabious grow some cubit or more in height, and are diuided into many very slender branches, which at the tops carry floures composed after the manner of the other sorts of Scabious, that is, of many little floures diuided into fve parts at the top, and these are of a perfect red colour, and haue small threds with pendants at them comming forth of the middle of each of these little floures, which are of a whitish colour, and make a pretty show. The leaues are greene, and very much diuided or cut in. The starry seeds grow in long round hairy heads handsomely set together. This is an annuall, and perishes as soone as it hath perfected the seed. *Clusius* makes it his sixt Scabious, and calls it *Scabiosa Indica*. It floures in Iuly, and growes in the Gardens of our prime Herbarists.

17 The same Authour hath also giuen vs the figure and description of another Scabious, which sends vpa stalke some three cubits or more high, set at certaine spaces with leaues large, and snipt about their edges, and a little cut in neere their stalkes. The stalkes are diuided into others, which at there tops carry blewish floures in long scaly heads, which are succeeded by long whitish seed. The roote is whitish and fibrous, and dyes euery yeare. This is the *Scabiosa 9, sine aestivalis* of *Clusius*. †

¶ The Place.

These kindes of Scabious do grow in pastures, medowes, corne fields, and barren sandy grounds almost euery where.

The strange sorts do grow in my garden, yet are they strangers in England.

¶ The Time.

They floure and flourish in the Sommer moneths.

¶ The Names.

Scabious is commonly called *Scabiosa*, diuers thinke it is named *scæbe*, which signifieth a scabbe, and a certaine herbe so called by *Aëtius*: I do not know, saith *Hermolaus Barbarus*, whether it be Scabious which *Aëtius* doth call *Psora*, the smoake of which being burnt doth kill cankers or little wormes. The Author of the *Pandeëts* doth interpret *Scabiosa* to be *Dioscorides* his *stæbe*: *Dioscorides* describeth *stæbe* by no marks at all, being commonly knowne in his time; and *Galen* in his first booke of *Antidotes* saith thus: There is found amongst vs a certaine shrubby herbe, hot, very sharpe and biting, hauing a little kind of aromaticall or spicy smell, which the inhabitants do call *Colymbade*, and *stæbe* singular good to keepe and preserue wine: but it seemeth that this *stæbe* doth differ from that of which he hath made mention in his booke of the faculties of medicines, which agreeth with that of *Dioscorides*: for he writeth that this is of a binding quality without biting, so that it cannot be very sharpe.

¶ The Temperature.

Scabious is hot and dry in the later end of the second degree, or neere hand in the third, and of thin and subtile parts: it cutteth, attenuateth, or maketh thin, and thoroughly concocteth tough and grosse humours.

¶ The Vertues.

Scabious scoureth the chest and lungs; it is good against an old cough, shortnesse of breath, A paine in the sides, and such like infirmities of the chest.

The same prouoketh vrine, and purgeth now and then rotten matter by the bladder, which hap- B peneth when an impostume hath somewhere lien within the body.

It is reported that it cureth scabs, if the decoction thereof be drunke certain daies, and the juice C vsed in ointments.

The later Herbarists doe also affirme that it is a remedy against the bitings of Serpents and D stingings of venomous beasts, being outwardly applied or inwardly taken.

The juice being drunke procureth sweat, especially with Treacle; and it speedily consumeth E plague sores, if it be giuen in time, and forthwith at the beginning: but it must be vsed often. F

It is thought to be forceable, and that against all pestilent feuers.

† Formerly the 1. 2. 3. 11. figures were all nothing else than the varieties of one Plant, being of the 1. 2. 3. 4. *Scabiosa minor* of *Tabern.* they differ onely in the more or lesse cutting or diuiding of the leaues: I haue of these onely referred the third, and in other places put such figures as are agreeable to the titles. The figure that was in the sixt place was of the ordinary first described Scabious; and the figure that should haue beene there was in the eighth place; and that which was in the seventh place belongs to the plant described by me in the fourteenth place.

CHAP. 248. Of Diuels bit.

Morsus Diaboli.
Diuels bit.

¶ The Description.

Diuels bit hath small vpright round stalks of a cubite high, beset with long leaues somewhat broad, very little or nothing snipt about the edges, somewhat hairie and euen. The floures also are of a darke purple colour, fashioned like the floures of Scabious, which being ripe are carried away with the winde. The root is blacke, thicke, hard and short, with many threddie strings fastened thereto. The great part of the root seemeth to be bitten away: old fantasticke charmers report, that the diuell did bite it for enuie, because it is an herbe that hath so many good vertues, and is so beneficiall to mankinde.

¶ The Place.

Diuels bit groweth in drie medows and woods, and about waies sides. I haue found great store of it growing in Hampstead wood neere London, at Lee in Essex, and at Raleigh in Essex, in a wood called Hammerell, and sundrie other places.

¶ The Time.

It floureth in August, and is hard to be knowne from Scabious, sauing when it floureth.

¶ The Names.

It is commonly called *Morsus Diaboli*, or Diuels bit, of the root (as it seemeth) that is bitten off: for the superstitious people hold opinion, that the diuell for enuie that he beareth to mankinde bit it off, because it would be otherwise good for many vses: it is called of *Fuchsius*, *Succisa*: in High Dutch *Teuffels abbitz*: in Low Dutch, *Dupuelles beet* in French *Mors du Diable*: in English, Diuels bit, and Forebit. ‡ *Fabius Columna* iudgeth it to bee

the *Pycnocomon* of *Dioscorides*, described by him *lib. 4. cap. 176. ‡*

¶ The Temperature.

Diuels bit is something bitter, and of a hot and drie temperature, and that in the later end of the second degree.

¶ The Vertues.

- A There is no better thing against old swellings of the Almonds, and vpper parts of the throat that be hardly ripened.
- B It clenfeth away slimie flegme that sticketh in the iawes, it digesteth and consumeth it: and it quickly taketh away the swellings in those parts, if the decoction thereof be often held in the mouth and gargarized, especially if a little quantitie of *Mel Rosarum*, or honie of Roses be put in to it.
- C It is reported to be good for the infirmities that Scabious serueth for, and to be of no lesse force against the stingings of venomous beasts, poisons, and pestilent diseases, and to consume and waste away plague sores, being stamped and laid vpon them.
- D And also to mitigate the paines of the matrix or mother, and to driue forth winde, if the decoction thereof be drunke.

CHAP. 249. Of Matfellow or Knapweed.

¶ The Description.

1 **M**atfellow or blacke Knapweed is doubtlesse a kinde of Scabious, as all the others are, intituled with the name of *Iacea*; yet for distinction I haue thought good to set them downe in a severall Chapter, beginning with that kinde which is called in English Knapweed and Matfellow, or *Materfilon*. It hath long and narrow leaues, of a blackish green colour, in shape like Diuels bit, but longer, set vpon stalks two cubits high, somewhat bluntly cut or snipt about the edges: the floures do grow at the top of the stalks, being first small scaly knops, like to the knops of Corne floure, or blew bottles, but greater; out of the midst thereof groweth a purple thrummie or threddie floure. The root is thicke and short.

2 The great Knapweed is very like vnto the former, but that the whole plant is much greater, the leaues bigger, and more deeply cut, euen to the middle rib: the floures come forth of such like scaly heads, of an excellent faire purple colour, and much greater.

3 The third kinde of Matfellow, or Knapweed is very like vnto the former great Knapweed last before mentioned, sauing that the floures of this plant are of an excellent faire yellow colour, proceeding forth of a scaly head or knop, beset with most sharppricks, not to be touched without hurt: the floure is of a pleasing smel, and very sweet; the root is long and lasting, and creepeth far abroad, by means whereof it greatly increaseth.

1 *Iacea nigra.*

Blacke Matfellow.

† 2 *Iacea maior.*

Great Matfellow.

4 The mountaine Knapweede of Narbone in France, hath a strong stem of two cubits high, and is very plentifull about Couentrie among the hedges and bushes: the leaues are very much jagged, in forme of *Lonchitis*, or Spleenewort; the floures are like the rest of the Knapweeds, of a purple colour.

3 *Iacea maior lutea.*
Yellow Knapweed.

4 *Iacea montana.*
Mountaine Knapweed.

5 *Iacea flore albo.*
White flowered Knapweed.

6 *Iacea tuberosa.*
Knobbed Knapweed.

‡ 7. *Iacea Austriaca villosa*.
Rough headed Knapweed.

ends are hairy, and they are set so orderly, that by this meanes the heads seeme as they were inclosed in little nets: the floures are purple, and like those of the first described; the seede is small and long, and of an ash colour. This *Clusius* calls *Iacea* 4. *Austriaca villosa capite*.

Iacea capitulis hirsutis Boelij.

8 This hath many small cornered straked hairie trailing branches growing from the root, and those again diuided into many other branches, trailing or spreading vpon the ground three or foure foot long, imploying or couering a good plot of ground, whereon grow hairy leaues diuided or iagged into many parts, like the leaues of *Iacea maior*, or Rocket, of a very bitter taste: at the top of each branch groweth one scaly head, each scale ending with foue, six, or seuen little weake prickles growing orderly like halfe the rowell of a spur, but farre lesser: the floures grow forth of the heads of a light purple colour, consisting of many smal floures, like those of the common *Iacea*, the bordering floures, being bigger and larger than those of the middle of the floure, each small floure being diuided into foue small parts or leaues, not much vnlike those of *Cyanus*: the seed is small, and inclosed in downe. The root perisheth when the seed is ripe.

This plant hath not been hitherto written of that I can find. Seeds of it I receiued from Mr. *William Coys*, with whom also I obserued the plant, October 10. 1621. he receiued it from *Boelius* a Low countrey man. *Iohn Goodyer*. ‡

¶ The Place.

The two first grow commonly in euery fertile pasture: the rest grow in my garden.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

The later age doth call it *Iacea nigra*, putting *nigra* for a difference betweene it and the Hearts-ease or Pancie, which is likewise called *Iacea*: it is called also *Matersillon*, and *Matrefillen*: in English, Matfellow, Bulweed, and Knapweed.

¶ The Temperature and Vertues.

A These plants are of the nature of Scabious, whereof they be kindes, therefore their faculties are like, although not so proper to Physickes vse.

B They be commended against the swellings of the Vvula, as is Diuels bit, but of lesse force and vertue.

† The figure that was formerly in the second place was of the *Yacea tertia* of Tabern. which differs from that our Author meant and described, whose figure we haue giuen you in the place thereof.

CHAP. 250.

Of Siluer Knapweed.

¶ The Description.

THe great Siluer Knapweed hath at his first comming vp diuers leaues spred vpon the ground, of a deepe Greene colour, cut and iagged as are the other Knapweeds, straked here and there with some siluer lines downe the same, whereof it tooke his surname, *Argentea*: among which leaues riseth vp a straight stalke, of the height of two or three cubits, somewhat rough and brittle, diuiding it selfe toward the top into other twiggie branches: on the tops whereof do grow floures set in scaly heads, or knaps like the other Matfellons, of a gallant purple colour, consisting of a number of threds or thrums thicke thrust together: after which the seedes appeare, slipperie, smooth at one end, and bearded with blacke haire at the other end, which maketh it to leap and skip away when a man doth but lightly touch it. The root is small, single, and perisheth when the seed is ripe. † This is not streaked with any lines, as our Author imagined, nor called *Argentea* by any but himselfe, and that very vnfitly. †

† 1 *Stabe argentea maior.*

Great Siluer Knapweed.

† 2 *Stabe argentea minor.*

Little siluer Knapweed.

2 The second agreeth with the first in each respect, saying that the leaues hereof are more iagged, and the siluer lines or strakes are greater, and more in number, wherein consisteth the difference.

‡ 4 *Stæbe Rosmarini folio.*
Narrow leaved Knapweed.

‡ 5 *Stæbe ex Codice Casareo.*
Thornie Knapweed.

rence. ‡ The leaues of this are very much diuided and hoarie, the stalkes some two cubites high, set also with much diuided leaues, that end in soft harmlesse prickles: at the tops of the branches stand the heads composed as it were of siluer scales (whence *Label* and others haue called this plant *Stæbe argentea*) and out of these siluer heads come floures like those of the blew bottles, but of a light purple colour, the seed is small, blackish, and hairy at the tops. ‡

‡ 3 There is another like this in each respect, but that the heads haue not so white a shining siluer colour: and this I haue also seene growing with Master *Iohn Tradescant* at South Lambeth. ‡

‡ 4 To these may be added that plant which *Pona* hath set forth by the name of *Stæbe capitata Rosmarini folio*. It hath a whitish woody root, from whence arise diuers branches set with long narrow leaues somewhat like those of Rosemary, but liker those of the Pine, of a greenish colour above, and whitish below: at the tops of the branches grow such heads as in the first described *Stæbe*, with floures of somewhat a deeper purple colour: the seed is like that of *Carthamus*, but blackish. The root is not annuall, but lasts many yeares. ‡

‡ 5 Though these plants haue of late been vulgarly set forth by the name of *Stæbe's*, yet are they not iudged to bee the true *Stæbe* of *Dioscorides* and the Antients, but rather another, whose figure which we here giue was by *Dodonæus* taken forth of a manuscript in the Emperours Library, and he saith, *Paludanus* brought home some of the same out of Cyprus and Morea, as he returned from his journey out of Syria: the bottome leaues are said to be much diuided, those on the stalkes long, and onely snipt about the edges, and white: the floures white, and contained in scaly heads like the Blew-bottles, and the tops of the branches end in sharpe prickles. ‡

The Place.

These doe grow of themselves in fields neere common high waies, and in vntilled places, but they are strangers in England, neuerthelesse I haue them in my garden.

¶ The

¶ *The Time.*

They spring vp in April, they floure in August, and the seed is ripe in September.

¶ *The Names.*

Siluer Knapweed is called of *Lobel*, *Stabe Salamantica*: of *Dodonaus*, *Aphyllanthes*, that is, without leaues, for the floures consist onely of a number of threds without any leaues at all: in English, Siluer Knapweed, or Siluer Scabious, whereof doubtlesse they be kindes.

¶ *The Temperature and Vertues.*

The faculties of these Matfellons are not as yet found out, neither are they vsed for meat or medicine.

‡ *The faculties of Stabe out of Dioscorides.*

A The seed and leaues are astringent, wherefore the decoction of them is cast vp in Dysenteries, and into purulent eares, and the leaues applied in manner of a pultis are good to hinder the blacknesse of the eies occasioned by a blow, and stop the flowing of blood. ‡

† The figures were formerly transposed.

CHAP. 251. Of Blew Bottle, or Corne Floure.

1 *Cyanus maior.*

Great blew Bottle.

2 *Cyanus vulgaris.*

Common blew Bottle.

¶ *The Description.*

1 **T**He great blew Bottle hath long leaues, smooth, soft, downie, and sharpe pointed: among the leaues rise vp crooked, and prettie thicke branches, chamfered, furrowed, and garnished with such leaues as are next the ground: on the toppes whereof stand faire blew floures tending to purple, consisting of diuers little floures, set in a scaly huske or knap like those of the Knapweeds: the seed is rough or bearded at one end, smooth at the other, and shining. The root is rough, and long lasting (contrary to the rest of the Corne floures) and groweth yearely into new shoots and springs, whereby it greatly increaseth.

2 The

7 *Cyanus cœruleus multiflorus*.
Double Blew-Bottles.

8 *Cyanus purpureus multiflorus*.
Double Purple-Bottles.

9 *Cyanus repens latifolius*.
Broad leaved creeping Blew-Bottle.

10 *Cyanus repens angustifolius*.
Small creeping Blew-Bottle.

2 The common Corne-floure hath leaues spred vpon the ground, of a whitish Greene colour, somewhat hackt or cut in the edges like those of Corne Scabious: among which riseth vp a stalke diuided into diuers small branches, whereon do grow long leaues of an ouerworne Greene colour, with few cuts or none at all. The floures grow at the top of the stalkes, of a blew colour, consisting of many small floures set in a scaly or chaffie head like those of the Knapweeds: the seed is smooth, bright shining, and wrapped in a woolly or flocky matter. The root is small and single, and perisheth when it hath perfected his seed.

3 This Bottle is like the last described in each respect, sauing in the colour of the floures, which are purple, wherein consisteth the difference.

4 The fourth Bottle is also like the precedent, not differing in any point but in the floures; for as the last before mentioned are of a purple colour, contrariwise these are of a milke white colour, which setteth forth the difference.

5 The Violet-coloured Bottle or Corne-floure is like the precedent, in stalkes, leaues, seeds, and roots: the onely difference is, that this bringeth floures of a violet colour, and the others not so.

6 Variable Corne-floure is so like the others in stalks, leaues, and proportion, that it cannot be distinguished with words; onely the floures hereof are of two colours mixed together, that is, purple and white, wherein it differeth from the rest.

7 There is no difference to be found in the leaues, stalkes, seed, or rootes of this Corne-floure from the other, but onely that the floures hereof are of a faire blew colour, and very double.

8 The eighth Corne-floure is like vnto the precedent, without any difference at all, sauing in the colour of the floures, the which are of a bright purple colour, that setteth forth the difference.

9 This from a small root sends vp diuers creeping branches some foot long, set with long hoary narrow leaues: at the tops of the stalkes stand the floures in scaly heads, like as the other Blew-Bottles, but of a darke purple colour. The whole plant is very bitter and vngratefull to the taste. *Lobel* calls this *Cyanus repens*.

10 This is like the last described, but that the leaues are much smaller or narrower, also the scaly heads of this are of a finer white siluer colour: and this plant is not possessed with such bitterness as the former. *Lobel* calls this *Cyanus minimus repens*. ‡

¶ The Place.

The first groweth in my garden, and in the gardens of Herbarists, but not wilde that I know of. The others grow in corne fields among wheat, Rie, Barley, and other graine: it is sowne in gardens, which by cunning to looking doth oft times become of other colours, and some also double, which hath bene touched in their seuerall descriptions. ‡ The two last grow wilde about Montpellier in France. ‡

¶ The Time.

They bring forth their floures from the beginning of May vnto the end of harvest.

¶ The Names.

The old Herbarists called it *Cyanus flos*, of the blew colour which it naturally hath: most of the later sort following the common Germane name, call it *Flos frumentorum*; for the Germans name it **Corn blumen**: in low-Dutch, **Cozn bloemen**: in French, *Blaucole*, and *Bluet*: in Italian, *Fior cam-pese*, and *Bladisferis*, i. *Seris bladi*, and *Battisecula*, or *Baptisecula*, as though it should be called *Blaptisecula*, because it hindereth and annoyeth the Reapers, by dulling and turning the edges of their sickles in reaping of corne: in English it is called Blew-Bottle, Blew-Blow, Corne-floure, & hurt-Sickle. ‡ *Fabius Columna* would haue it to be the *Papauer spumeum*, or *Heracleum* of the Antients. ‡

¶ The Temperature and Vertues.

A The faculties of these floures are not yet sufficiently knowne. Sith there is no vse of them in physicke, we will leaue the rest that might be said to a further consideration: notwithstanding some haue thought the common Blew-Bottle to be of temperature something cold, and therefore good against the inflammation of the eyes, as some thinke.

CHAP. 252. Of Goats Beard, or Go to bed at noone.

¶ The Description.

1 **G**oats-beard, or Go to bed at noone hath hollow stalks, smooth, and of a whitish green colour, whereupon do grow long leaues crested downe the middle with a swelling rib, sharpe pointed, yeelding a milky iuyce when it is broken, in shape like those of Garlick; from the bosome of which leaues thrust forth small tender stalks set with the like leaues but lesser: the floures grow at the top of the stalkes, consisting of a number of purple leaues, dashed ouer as it were with a little yellow dust, set about with nine or ten sharpe pointed Greene leaues: the whole floure resembles a starre when it is spread abroad; for it shutteth it selfe at twelue of the clocke, and sheweth not his face open vntill the next dayes Sun doth make it floure anew, whereupon it was called Go to bed at noon: when these floures be come to their full maturitie and ripenesse, they grow into a downy Blow-ball like those of Dandelion, which is carried away with the winde. The seed is long, hauing at the end one piece of that downie matter hanging at it. The root is long and single, with some few threds thereto annexed, which perisheth when it hath perfected his seed, yeelding much quantitie of a milky iuyce when it is cut or broken, as doth all the rest of the plant.

2 The yellow Goats beard hath the like leaues, stalkes, root, seed, and downie blow-balls that the other hath, and also yeeldeth the like quantitie of milke, insomuch that if the pilling while it is Greene be pulled from the stalkes, the milky iuyce followeth: but when it hath there remained a little while it waxeth yellow. The floures hereof are of a gold yellow colour, and haue not such long Greene leaues to garnish it withall, wherein consisteth the difference.

1 *Tragopogon purpureum.*
Purple Goats-beard.

2 *Tragopogon luteum.*
Yellow Goats-beard.

3 There is another small sort of Goats-beard or Go to bed at noone, which hath a thicke root full of a milky sap, from which rise vp many leaues spread vpon the ground, very long, narrow, thin, and like vnto those of grasse, but thicker and grosser: among which rise vp tender stalkes, on the tops whereof do stand faire double yellow floures like the precedent, but lesser. The whole plant yeeldeth

yeeldeth a milkie sap or iuyce as the others do : it perisheth like as the other when it hath perfected his seed. This may be called *Tragopogon minus angustifolium*, Little narrow leaved Goats-beard.

¶ *The Place.*

The first growes not wild in England that I could euer see or heare of, except in Lancashire vpon the banks of the riuer Chalder, neere to my Lady *Heskiths* house, two miles from Whawley : it is sown in gardens for the beauty of the floures almost euery where. The others grow in meadows and fertil pastures in most places of England. It growes plentifully in most of the fields about London, as at Islington, in the meadows by Redriffe, Detford, and Putney, and in diuers other places.

¶ *The Time.*

They floure and flourish from the beginning of Iune to the end of August.

¶ *The Names.*

Goats-beard is called in Greeke *Tragopogon* : in Latine, *Barba hirci*, and also *Coma* : in high-Dutch, *Bockbaert* : in low-Dutch, *Iosephes bloemen* : in French, *Barbe de bouc*, and *Sassify* : in Italian, *Sassifraga* : in Spanish, *Barba Cabrana* : in English, Goats-beard, Iosephs floure, Star of Ierusalem, Noone-tide, and Go to bed at noone.

¶ *The Temperature.*

These herbes are temperate betweene heate and moisture.

¶ *The Vertues.*

A The roots of Goats-beard boyled in wine and drunke, asswageth the paine and pricking stiches of the sides.

B The same boyled in water vntill they be tender, and buttered as parseneps and carrots, are a most pleasant and wholsome meate, in delicate taste farre surpassing either Parsenep or Carrot : which meate procures appetite, warmeth the stomacke, preuaileth greatly in consumptions, and strengthneth those that haue been sicke of a long lingring disease.

CHAP. 253. Of Vipers-Grasse.

1 *Viperaria, siue Scorzonera Hispanica.*
Common Vipers Grasse.

2 *Viperaria humilis.*
Dwarfe Vipers Grasse.

† 3 *Viperaria Pannonica.*
Austrian Vipers grasse.

‡ 4 *Viperaria angustifolia elatior.*
Hungary Vipers grasse.

5 *Viperaria Pannonica angustifolia.*
Narrow leaved Vipers grasse.

¶ The Description.

THe first of the Viper grasses hath long broad leaues, fat, or ful bodied, vneuen about the edges, sharpe pointed, with a high swolne ribbe downe the middle, and of an ouerworne colour, tending to the colour of Woade: among which riseth vp a stiffe stalke, smooth and plaine, of two cubits high, whereon do grow such leaues as those next the ground. The flours stand on the top of the stalkes, consisting of many small yellow leaues thicke thrust together, very double, as are those of Goates beard, whereof it is a kinde, as are all the rest that doe follow in this present chapter: the root is long, thicke, very brittle, continuing many yeeres, yeelding great increase of roots, blacke without, white within, and yeelding a milkie juice, as doe the leaues also, like vnto the Goates beard.

2 The dwarfe Vipers grasse differeth not from the precedent, sauing that it is altogether lesser, wherein especially consisteth the difference.

† 3 The broad leaved Austrian Vipers-grasse hath broad leaues sharpe pointed, vneuen about the edges, of a blewish Greene colour: the stalke riseth vp to the height of a foot or better, on the top whereof do stand faire yellow flours, very double, greater and broader than any of the rest

of a resonable good smell. The seed followeth, long and sharpe, like vnto those of Goates-beard. The root is thicke, long, and full of a milkie juice, as are the leaues also.

4 The narrow leaved Hungary Vipers-grasse hath long leaues like to those of Goates-beard, but longer and narrower, among which riseth vp a slender hollow stalke, stiffe and smooth, on the top whereof do stand faire double floures of a faire blew colour tending to purple, in shape like the other of his kinde, of a pleasant sweet smell, like the smell of sweet balls made of *Benzoin*. The seed is contained in small cups like those of Goates beard, wrapped in a downie matter, that is caried away with the winde. The root is not so thicke nor long as the others, very single, bearded at the top, with certain hairy thrums yeelding a milkie juice of a refinous taste, and somewhat sharpe withall. It endureth the winter euen as the others do.

‡ 5 This (whose figure was by our Authour put to the last description) hath leaues like those of Goates-beard, but stiffer and shorter, amongst which there growes vp a short hollow stalke some handfull high, set with a few short leaues, bearing a yellow floure at the top, almost like that of the last saue one, but lesse, the seed is contained in such cups as the common Vipers-grasse, and being ripe is caried away with the least winde. The root is blacke, with a wrinkled barke, and full of milke, hauing the head hairy, as also the last described hath. This by *Clusius* is called *Scorsonera humilis angustifolia Pannonica*. ‡

¶ The Place and Time.

Most of these are strangers in England. The two first described do grow in my garden. The rest are touched in their seuerall titles.

They floure and flourish from May to the end of Iuly.

¶ The Names.

Vipers-grasse is called of the Spaniards *Scorzonera*, which soundeth in Latine *Viperaria*, or *Viperina*, or *Serpentaria*, so called because it is accounted to be of force and efficacy against the poisons of Vipers and serpents, for *Vipera* or a viper is called in Spanish *Scurzo*: it hath no name either in the high or low Dutch, nor in any other, more than hath been said, that I can reade: in English we may call it *Scorzoner*, after the Spanish name, or Vipers-grasse.

¶ The Temperature.

They are hot and moist as are the Goates-beards.

¶ The Vertues.

- A It is reported by those of great iudgement, that Vipers-grasse is most excellent against the infections of the plague, and all poisons of venomous beasts, and especially to cure the bitings of vipers, (of which there be very many in Spaine and other hot countries, yet haue I heard that they haue been seen in England) if the juice or herbe be drunke.
- B It helpeth the infirmities of the heart, and such as vse to swoone much: it cureth also them that haue the falling sicknesse, and such as are troubled with giddinesse in the head.
- C The root being eaten, either roasted in embers, sodden, or raw, doth make a man merry, and remoueth all sorrow.
- D The root condited with sugar, as are the roots of *Eringos* and such like, worke the like effects: but more familiarly, being thus dressed.

† Formerly there were six figures in this chapter, whereof the first and fourth were both of one plant, and the fifth which was of the *Scorsonera Boemica* of *Martius* did not much differ from them; if it differ at all. In the title and history of the third there should haue been put *Pannonica* in stead of *Hispanica*; as now it is.

CHAP. 254. Of Marigolds.

¶ The Description.

1 The greatest double Marigold hath many large, fat, broad leaues, springing immediately from a fibrous or threddy root; the vpper sides of the leaues are of a deepe greene, and the lower side of a more light and shining greene: among which rise vp stalkes somewhat hairie, and also somewhat jointed, and full of a spungious pith. The floures in the top are beautifull, round, very large and double, something sweet, with a certaine strong smell, of a light saffron colour, or like pure gold: from the which follow a number of long crooked seeds, especially the outmost, or those that stand about the edges of the floure, which being sowne commonly bring forth single floures, whereas contrariwise those seeds in the middle are lesse, and for the most part bring forth such floures as that was from whence it was taken.

2 The common double Marigold hath many fat, thicke, crumpled leaues set vpon a grosse and spungious stalke: whereupon do grow faire double yellow floures, hauing for the most part in the middle a bunch of threddes thicke thrust together: which being past there succeed such crooked seeds as the first described. The root is thicke and hard, with some threds annexed thereto.

3 The

1. 2. *Calendula maior polyanthos.*
The greater double Marigold.

4 *Calendula multiflora orbiculata.*
Double globe Marigold.

6 *Calendula simplici flore.*
Single Marigold.

7 *Calendula prolifera.*
Fruitfull Marigold.

3 The smaller or finer leaved double Marigold groweth vpright, hauing for the most part one stem or fat spongeous stalke, garnished with smooth and fat leaues confusedly. The floures grow at the top of the small branches, very double, but lesser than the other, consisting of more fine iaggednesse, and of a faire yellow gold colour. The root is like the precedent.

4 The Globe-flouring Marigold hath many large broad leaues rising immediately forth of the ground, among which riseth vp a stalke of the height of a cubit, diuiding it selfe toward the top into other smaller branches, set or garnished with the like leaues, but confusedly, or without order. The floures grow at the top of the stalkes, very double; the small leaues whereof are set in comely order by certaine rankes or rowes, as sundry lines are in a Globe, trauerfing the whole compasse of the same; whereupon it tooke the name *Orbiculata*.

5 The fifth sort of double Marigold differeth not from the last described, sauing in the colour of the floures; for this plant bringeth forth floures of a straw or light yellow colour, and the others not so, wherein consisteth the difference.

† All these five here described, and which formerly had so many figures, differ nothing but in the bignesse and littlenesse of the plants and floures, and in the intensenesse and remisnesse of their colour, which is either orange, yellow, or of a straw colour. †

6 The Marigold with single floures differeth not from those with double floures, but in that it consisteth of fewer leaues, which we therefore terme Single, in comparison of the rest, and that maketh the difference.

7 This fruitfull or much bearing Marigold is likewise called of the vulgar sort of women, Iacke-an-apes on horsebacke: it hath leaues, stalkes, and roots like the common sort of Marigold, differing in the shape of his floures, for this plant doth bring forth at the top of the stalke one floure like the other Marigolds; from the which start forth sundry other smal floures, yellow likewise, and of the same fashion as the first, which if I be not deceiued commeth to passe *per accidens*, or by chance, as Nature oftentimes liketh to play with other floures, or as children are borne with two thumbes on one hand, and such like, which liuing to be men, do get children like vnto others; euen so is the seed of this Marigold, which if it be sowed, it brings forth not one floure in a thousand like the plant from whence it was taken.

8 The other fruitfull Marigold is doubtlesse a degenerate kind, comming by chance from the seed of the double Marigold, whereas for the most part the other commeth of the seed of the single floures, wherein consisteth the difference. † The floure of this (wherein the onely difference consists) you shall finde exprest at the bottome of the fourth figure. †

9 *Calendula Alpina*.
Mountaine Marigold.

9 The Alpish or mountaine Marigold, which *Lobelius* setteth downe for *Nardus Celtica*, or *Plantago Alpina*, is called by *Taberna-montanus*, *Caltha*, or *Calendula Alpina*: and because I see it rather resembles a Marigold, than any other plant, I haue not thought it amisse to insert it in this place, leauing the consideration thereof vnto the friendly Reader, or to a further consideration, because it is a plant that I am not well acquainted withall; yet I doe reade that it hath a thicke root, growing aslope vnder the vpper crust of the earth, of an aromaticall or spicie taste, and somewhat biting, with many threddy strings annexed thereto: from which rise vp broad thicke and rough leaues of an ouerworn green colour, not vnlike to those of Plantaine: among which there riseth vp a rough and tender stalke set with the like leaues; on the top wherof commeth forth a single yellow floure, paled about the edges with small leaues of a light yellow, tending to a straw colour; the middle of the floure is composed of a bundle of threds, thicke thrust together, such as is in the middle of the field Daisie, of a deepe yellow colour.

† This Plant is all one with the two described in the next Chapter: they vary onely thus;

thus; the stalkes and leaues are sometimes hairy, otherwhiles smooth, the floure is yellow, or else blew. I hauing three figures ready cut, thinke it not amisse to giue you one to expresse each variety. †

10 The wilde Marigold is like vnto the single garden Marigold, but altogether lesser, and the whole plant perissheth at the first approach of Winter, and recouereth it selfe againe by falling of the seed.

¶ The Place.

These Marigolds, with double floures especially, are set and sown in gardens: the rest, their titles do set forth their naturall being.

¶ The Time.

The Marigold floureth from Aprill or May euenvntill Winter, and in Winter also, if it be warme.

¶ The Names.

The Marigold is called *Calendula*: it is to be seene in floure in the Calends almost of euerie moneth: it is also called *Chrysanthemum*, of his golden colour: of some, *Caltha*, and *Caltha Poetarum*: whereof *Columella* and *Virgil* doe write, saying, That *Caltha* is a floure of a yellow colour: whereof *Virgil* in his *Bucolickes*, the second *Eclog*e, writeth thus;

*Tum Casia atque alijs intexens suduibus herbis
Mollia Luteola pingit vaccinia Caltha.*

And then shee'l Spike and such sweet herbes infold,
And paint the Iacynth with the Marigold.

Columella also in his tenth booke of Gardens hath these words;

Candida Leucoia & flauentia Lumina Caltha.

Stock-Gillofloures exceeding white,
And Marigolds most yellow bright.

It is thought to be *Gromphena Plinij*: in low-Dutch it is called *Goudt bloemen*: in high-Dutch, *Kingleblumen*: in French, *Sousij & Gonde*: in Italian, *Fior d'ogni mese*: in English, Marigolds, and Ruddes.

¶ The Temperature and Vertues.

The floure of the Marigold is of temperature hot, almost in the second degree, especially when it is dry: it is thought to strengthen and comfort the heart very much, and also to withstand poyson, as also to be good against pestilent Agues, being taken any way. *Fuchsius* hath written, That being drunke with wine it bringeth downe the termes, and that the fume thereof expelleth the secondine or after-birth.

But the leaues of the herbe are hotter; for there is in them a certain biting, but by reason of the moisture ioyned with it, it doth not by and by shew it selfe; by meanes of which moisture they mollifie the belly, and procure solublenesse if it be vsed as a pot-herbe.

Fuchsius writeth, That if the mouth be washed with the iuyce it helpeth the tooth-ache.

The floures and leaues of Marigolds being distilled, and the water dropped into red and watery eyes, ceaseth the inflammation, and taketh away the paine.

Conserue made of the floures and sugar taken in the morning fasting, cureth the trembling of the heart, and is also given in time of plague or pestilence, or corruption of the aire.

The yellow leaues of the floures are dried and kept throughout Dutchland against Winter, to put into broths, in physicall potions, and for diuers other purposes, in such quantity, that in some Grocers or Spice-sellers houses are to be found barrels filled with them, and retailed by the penny more or lesse, insomuch that no broths are well made without dried Marigolds.

CHAP. 255. Of Germane Marigolds.

¶ The Description.

1 Golden Marigold with the broad leafe doth forthwith bring from the root long leaues spread vpon the ground, broad, greene, something rough in the vpper part, vnderneath smooth, and of a light greene colour: among which spring vp slender stalks a cubit high;

high, something hoarie, hauing three or foure ioynts, out of euery one whereof grow two leaues, set one right against another, and oftentimes little slender stems; on the tops whereof stand broad round floures like those of Ox-eye, or the corne Marigold, hauing a round ball in the middle (such as is in the middle of those of Camomil) bordered about with a pale of bright yellow leaues. The whole floure turneth into downe that is carried away with the winde; among which down is found long blackish seed. The root consisteth of threddy strings.

† 2 The lesser sort hath foure or fve leaues spred vpon the ground like vnto those of the last described, but altogether lesser and shorter: among which riseth vp a slender stalke two hands high; on the top whereof stand such floures as the precedent, but not so large, and of a blew colour.

‡ These two here described, and that described in the ninth place of the foregoing Chapter, are all but the varieties of one and the same plant, differing as I haue shewed in the foregoing Chapter. ‡

1 *Chrysanthemum latifolium*.
Golden Marigold with the broad leafe.

2 *Chrysanthemum latifolium minus*.
The lesser Dutch Marigold.

¶ The Place.

They be found euery where in vntilled places of Germanie, and in woods, but are strangers in England.

¶ The Time.

They are to be seene with their floures in Iune, in the gardens of the Low-countries.

¶ The Names.

Golden Marigold is called in high-Dutch *Waldstrome*. There are that would haue it to be *Alisma Dioscoridis*; which is also called *Damaconium*, but vnproperly; therefore we must rather call it *Chrysanthemum latifolium*, than rashly attribute vnto it the name of *Alisma*. ‡ This plant indeed is a *Doronicum*; and the figure in the precedent chapter by *Glusius* is set forth by the name of *Doronicum 6. Pannonicum*: *Matthiolus* calls this plant *Alisma*: *Gesner*, *Caltha Alpina*: *Dodonaeus*, *Chrysanthemum latifolium*: *Pena* and *Lobel*, *Nardus Celtica altera*. Now in the *Historia Lugd.* it is set forth in foure seuerall places by three of the former names; and pag. 1169. by the name of *Parmica montana Dalechampij*.

¶ The Temperature.

It is hot and dry in the second degree being greene, but in the third being dry.

¶ The

¶ The Vertues.

The women that liue about the Alps wonderfully commend the root of this plant against the suffocation of the mother, the stoppings of the courses, and the green sicknesse and such like affects in maids. *Histor. Lugd.* †

CHAP. 256. Of Corne-Marigold.

¶ The Description.

1 **C**orne Marigold or golden Corne floure hath a soft stalke, hollow, and of a greene colour, wherupon do grow great leaues, much hackt and cut into diuers sections, and placed confusedly or out of order: vpon the top of the branches stand faire starlike floures, yellow in the middle, and such likewise is the pale or border of leaues that compasseth the soft ball in the middle, like that in the middle of Camomill floures, of a reasonable pleasant smel. The roots are full of strings.

† 1 *Chrysanthemum segetum.*
Corne Marigold.

2 *Chrysanthemum Valentinum.*
Corne Marigold of Valentia.

2 The golden floure of Valentia hath a thicke fat stalk, rough, yneuen, and somewhat crooked, wherupon do grow long leaues, consisting of a long middle rib, with diuers little fetherlike leaues set thereon without order. The floures grow at the top of the stalks, composed of a yellow thrummie matter, such as in the middle of the Camomill floures, and is altogether like the Corne Marigold last described, sauing it doth want that border or pale of little leaues that do compasse the ball or head: the root is thicke, rough, and dispereth it selfe far abroad.

† 3 To these may be added diuers other, as the *Chrysanthema Alpina*, of *Clusius*, & his *Chrysanthemum Creticum*, & others. The first of these smal mountain Marigolds of *Clusius* his description hath leaues like those of white Wormewood, but greener and thicker: the stalks grow some handfull high, set with few and much diuided leaues; and at the tops, as in an ymbell, they carry some dozen

zen floures more or lesse, not much vnlike in shape, colour, and smell, to those of the common *Iacobaea*, or Ragwort. The root is somewhat thicke, and puts forth many long white fibres. It floures in Iuly and August, and growes vpon the Alpes of Stiria. *Clusius* calls it *Chrysanthemum Alpinum*. 1.

4 The second of his description hath many leaues at the root, like to the leaues of the male Sothernwood, but of a lighter and brighter Greene, and of no vnpleasant smell, though the taste be bitterish and vngratefull: in the middest of the leaues grow vp stalkes some foot high, diuided at their tops into sundry branches, which carry each of them two or three floures bigger than, yet like those of the common Cammōmill, but without smel, and wholly yellow: the root is fibrous, blackish, and much spreading. It floures in August, and growes in the like places as the former. *Bauhine* iudges this to be the *Achillea montana* *Artemisia tenuifolia* facie of the *Aduers*, and the *Ageratum ferulaceum* in the *Hist. Lugd.* But I cannot be of that opinion, yet I iudge the *Achillea montana*, and *Ageratum ferulaceum* to be but of the same plant. But different from this, & that chiefly in that it hath many more, and those much lesse floures than those of the plant here figured and described.

5 Now should I haue giuen you the historie of the *Chrysanthemum Creticum* of the same Authour, but that my friend Mr. *Goodyer* hath saued me the labour, by sending an exact description thereof, together with one or two others of this kinde, which I thinke fit here to giue you.

‡ 3 *Chrysanthemum Alpinum* 1. *Clus.*
Small mountaine Marigold.

‡ 4 *Chrysanthemum Alpinum* 2. *Clus.*
The other Alpine Marigold.

Chrysanthemum Creticum primum Clusij, pag. 334.

The stalkes are round, straked, branched, hard, of a whitish Greene, with a very little pith within; neere three foot high: the leaues grow out of order, diuided into many parts, and those again snipt or diuided, of the colour of the stalkes: at the tops of the stalkes and branches grow great floures, bigger than any of the rest of the Corne-floures, forth of scaly heads, consisting of twelue or more broad leaues apeece, notched at the top, of a shining golden colour at the first, which after turne to a pale, whitish, or very light yellow, and grow round about a large yellow ball, of smell somewhat sweet. The floures past, there commeth abundance of seed closely compact or thrust together, and it is short, blunt at both ends, straked, of a saue colour, somewhat flat, & of a reasonable bignes. The

root

‡ 5 *Chrysanthemum Creticum*.
Candy Corne Marigold.

root is whitish, neere a fingers bignesse, short, with many threds hanging thereat, and perisheth when the seede is ripe; and at the Spring groweth vp againe by the falling of the seed.

Chrysanthemum Batium Boelij, inscriptum.

The stalks are round, straked, reddish brown, diuided into branches, containing a spongius white pith within, a cubite high: the leaues grow out of order, without footstalkes, about three inches long, and an inch broad, notched about the edges, not at all diuided, of a darke greene colour: the floures grow at the tops of the stalkes and branches, forth of great scaly heads, containing twentie leaues a piece or more, notched at the top, of a shining yellow colour, growing about a round yellow ball, of a reasonable good smell, very like those of the common *Chrysanthemum segetum*: the seede groweth like the other, and is very small, long, round, crooked and whitish: the root is small, whitish, threddie, and perisheth also when the seed is ripe.

Chrysanthemum tenuifolium Batium Boelij.

The stalks are round, small, straked, reddish, somewhat hairie, branched, a cubit high, or higher: the leaues are small, much diuided, jagged, and very like the leaues of *Cotula fetida*: the floures are yellow, shining like gold, composed of thirteene or fourteene leaues a piece,

notched at the top, set about a yellow ball, also like the common *Chrysanthemum segetum*: the seed groweth amongst white flattish scales, which are closely compacted in a round head together, and are small, flat, grayish, and broad at the top: the root is small, whitish, with a few threds, and dyeth when the seed is ripe. Iuly 28. 1621. *John Goodyer*. ‡

¶ The Place.

The first groweth among corne, and where corne hath been growing: it is found in some places with leaues more iagged, and in others lesse.

The second is a stranger in England.

¶ The Time.

They floure in Iuly and August.

¶ The Names.

These plants are called by one name in Greeke, of the golden glittering colour, *χρυσάνθεμον*: in High Dutch, **Sant Johans blum**: in Low Dutch, **Uokelaer**: in English, **Corne Marigold**, **yellow Corne floure**, and **golden Corne floure**.

There be diuers other floures called *Chrysanthemum* also, as *Batrachion*, a kinde of yellow Crow-foot, *Heliophryson*, but these golden floures differ from them.

¶ The Temperature.

They are thought to be of a meane temperature betweene heat and moisture.

¶ The Vertues.

The stalks and leaues of Corne Marigold, as *Dioscorides* saith, are eaten as other pot-herbes are. **A**

The floures mixed with wax, oile, rosine, and frankinsence, and made vp into a seare-cloth, wa- **B**
steth away cold and hard swellings.

The herbe it selfe drunke, after the comming forth of the bath, of them that haue the yellow **C**
iaundise, doth in short time make them well coloured.

† The figure that was in the first place was of the *Chrysanthemum* of *Matthiolus*, which is a stranger with vs, and the leaues of it are much like those of *Feuerfew*, or *Mugwort*, the floure is somewhat like, but larger than that of *Feuerfew*, and wholly yellow.

CHAP. 257. Of Oxe-Eie.

¶ The Description.

1 The plant which wee haue called *Bupthalmum*, or Oxe-eie, hath slender stalks growing from the roots, three, foure, or more, a foot high, or higher, about which be green leaues finely iagged like to the leaues of Fenell, but much lesser: the floures in the tops of the stalks are great, much like to Marigolds, of a light yellow colour, with yellow threds in the middle, after which commeth vp a little head or knap like to that of red Mathes before described, called *Adonis*, consisting of many seeds set together. The roots are slender, and nothing but strings, like to the roots of blacke Ellebor, whereof it hath beene taken to be a kinde.

2 The Oxe-eie which is generally holden to be the true *Bupthalmum* hath many leaues spread vpon the ground, of a light Greene colour, laied far abroad like wings, consisting of very many fine iags, set vpon a tender middle rib: among which spring vp diuers stalks, stiffe and brittle, vpon the top whereof do grow faire yellow leaues, set about a head or ball of thrummie matter, such as in the middle of Cammomill, like a border or pale. The root is tough and thicke, with certaine strings fastned thereto.

3 The white Oxe-eie hath small vpright stalks of a foot high, whereon do grow long leaues, composed of diuers smal leaues, and those snipt about the edges like the teeth of a saw. The floures grow on the tops of the stalks, in shape like those of the other Oxe-eie; the middle part whereof is likewise made of a yellow substance, but the pale or border of little leaues, are exceeding white, like those of great Daisie, called *Consolidamedia vulnerariorum*. The root is long, creeping alongst vnder the vpper crust of the earth, whereby it greatly increaseth. ‡ This by the common consent of all writers that haue deliuered the historie thereof, hath not the pale or out leaues of the floure white, as our Author affirms, but of a bright and perfect yellow colour. And this is the *Bupthalmum*, of *Tragus*, *Matthiolus*, *Lobel*, *Clusius* and others. ‡

1 *Bupthalmum sive Helleborus niger ferulaceus.*
Oxe-eie.

2 *Bupthalmum verum.*
The right Oxe-eie.

3 *Bupthalmum vulgare.*

White Oxe-eie.

¶ The Place.

The two first growe of themselves in Germany, Bohemia, and in the Gardens of the Low-countries; of the first I have a plant in my garden. The last groweth in barren pastures and fields almost euery where.

‡ The last is also a stranger with vs, for any thing that I know or can learne; neither can I coniecture what our Authour meant here: first in that he said the floures of this were white, and secondly in that it grew in barren pastures and fields almost euery where. ‡

¶ The Time.

They floure in May and Iune. The last in August.

¶ The Names.

Touching the naming of the first of those plants the late writers are of diuers opinions: some would haue it to be a kind of *Veratrum nigrum*, blacke Hellebor: other some *Consiligo*, or Bearefoot; and againe, others, *Sesamoides*; and some, *Elleborastrum*: But there be found two kindes of blacke Ellebor among the old writers, one with a leafe like vnto Laurel, with the fruit of *Sesamum*: the other with a leafe like that of the Plane tree, with the seed of *Carthamus* or Bastard Saffron. But it is most eident, that this *Bupthalmum*, in English, Oxe-eie,

which in this Chapter we in the first place haue described, doth agree with neither of these: what form *Consiligo* is of, we finde not among the old writers. *Pliny* 26. cap. 7. saith, That in his time it was found amongst the *Marfi*, and was a present remedy for the infirmitie of the lungs of swine, and of all kinde of cattel, though it were but drawne thorow the eare. *Columella* in his 6. booke, Chap. 5. doth also say, that in the mountaines called *Marfi* there is very great store thereof, and that it is very helpfull to all kind of cattel, and he telleth how and in what manner it must be put into the eare; the roots also of our Oxe-eie are said to cure certain infirmities of cattel, if they be put into the slit or bored eare: but it followeth not that for the same reason it should be *Consiligo*; and it is an ordinary thing to find out plants that are of a like force and qualitie: for *Pliny* doth testifie in his 25 booke, 5 chapter, That the roots also of blacke Ellebor can do the same: it cureth (saith he) the cough in cattel, if it be drawn thorow the eare, and taken out againe the next day at the same houre: which is likewise most certaine by experiments of the countrey men of our age; who do cure the diseases of their cattel with the roots of common black Ellebor. The roots of white Ellebor also do the like, as *Absyrtus*, and after him *Hierocles* doth write: who notwithstanding do not thrust the roots of white Ellebor into the eare, but vnder the skin of the brest called the dewlap: after which manner also *Vegetius Renatus* doth vse *Consiligo*, in his first booke of the curing of cattel, chapter 12. intituled, Of the cure of the infirmities vnder the skin: although in his 3. booke, 2. Chapter, *de Mal- leo*, he writeth, that they also must be fastned thorow the eare: which things do sufficiently declare, that sundry plants haue oftentimes like faculties: and that it doth not at all follow by the same reason, that our Oxe-eie is *Consiligo*, because it doth cure diseases in Cattel as well as *Consiligo* doth. But if we must coniecture by the faculties, *Consiligo* then should bee White Ellebor: for *Vegetius* useth *Consiligo* in the very same maner that *Absyrtus* and *Hierocles* do vse white Ellebor. This suspicion is made the greater, because it is thought that *Vegetius* hath taken this manner of curing from the Grecians; for which cause also most doe take *Consiligo* to be nothing else but white Ellebor: the which if it be so, then shall this present Oxe-eie much differ from *Consiligo*; for it is nothing at all like to white Ellebor.

And that the same is not *Sesamoides*, either the first or the second, it is better knowne, than needfull to be confuted.

This

This same also is vnproperly called *Helleborastrum*; for that may aptly bee called *Helleborastrum* which hath the forme and likenesse of Hellebor: and this Oxe eie is nothing at all like to Ellebore. For all which causes it seemeth that none of these names agree with this plant, but only the name *Bupthalmum*; with whose description which is extant in *Dioscorides* this plant doth most aptly agree. We take it to be the right Oxe eie; for Oxe eie bringeth forth slender soft stalks, and hath leaues of the likenesse or similitude of Fennell leaues: the floure is yellow, bigger than that of Cammomill, even such an one is this present plant, which doth so exquisitely expresse that form or likenesse of Fennell leaues, both in slenderesse and manifold iaggednesse of the leaues, as no other little leaved herb can do better; so that without all doubt this plant seemeth to be the true and right Oxe eie. Oxe eie is called *Cachla*, or rather *Caltha*; but *Caltha* is *Calendula*, or Marigold, which we said that our Oxe eie in floure did neereft represent. There are some that would haue *Bupthalmum* or Oxe eie to be *Chrysanthemum*, yellow Cammomil, & say that *Dioscorides* hath in sundry places, and by diuers names intreated of this herbe; but if those men had somewhat more diligently weighed *Dioscorides* his words, they would haue bin of another minde: for although descriptions of either of them do in many things agree, yet there is no property wanting that may shew the plants to differ. The leaues of *Chrysanthemum* are said to be diuided and cut into many fine iags: and the leaues of *Bupthalmum* to be like the leaues of Fennell: for all things that be finely iagged and cut into many parts haue not the likenesse of the leaues of Fennell. Moreover, *Dioscorides* saith, that *Chrysanthemum* doth bring forth a floure much glittering, but he telleth not that the floure of *Bupthalmum*, or Oxe eie is much glittering, neither doth the floure of that which we haue set downe glitter, so that it can or ought not to be said to glitter much. Do not these things declare a manifest difference betwene *Bupthalmum* and *Chrysanthemum*, and confirme that which we haue set down to be the true and right Oxe eie? We are of that minde, let others thinke as they will: and they that would haue *Chrysanthemum* to be *Bupthalmum*, let them seeke out another, if they denie this to bee Oxe eie: for that which we and others haue described for *Chrysanthemum* cannot be the true *Bupthalmum* or Oxe eie; for the leaues of it are not like Fennell, such as those of the true *Bupthalmum* ought to be.

The Temperature.

But concerning the faculties *Matthiolus* saith, that all the Physitions and Apothecaries in Bohemia, vse the roots of this Oxe eie in stead of those of blacke Ellebor, namely for diseases in cattel: but he doth not affirme that the roots hereof in medicines are substitutes, or *quid pro quo*; for, saith he, I do remember that I once saw the roots hereof in a sufficient big quantitie put by certain Physitions into decoctions which were made to purge by siege, but they purged no more than if they had not been put in at all: which thing maketh it most plaine, that it cannot be any of the Ellebors, although it hath been vsed to be fastned through the eares of cattell for certaine diseases, and doth cure them as Ellebor doth. The roots of *Gentian* do mightily open the orifices of Fistulaes, which be too narrow, so do the roots of *Aristolochia*, or Birthwoort, or Brionie, or pieces of sponges, which notwithstanding do much differ one from another in other operations: wherefore though the roots of Oxe eie can do something like vnto blacke Ellebor, yet for al that they cannot perform all those things that the same can. We know that thornes, stings, splinters of wood, and such like, bring pain, cause inflammations, draw vnto them humors from the parts neere adioining, if they be fastned in any part of the bodie; no part of the bodie is hurt without pain, the which is increased if any thing be thrust through, or put into the wound: peraduenture also if any other thing beside be put into the slit or bored eare, the same effect would follow which hapned by the root of this plant thrust in; notwithstanding we here affirme nothing, we onely make way for curious men to make more diligent search touching the operations hereof. † *Clusius* affirms that when hee came to Vienna in Austria, this was vulgarly bought, sold, and vsed for the true blacke Ellebor, the ignorance of the Physitions and Apothecaries in the knowledge of simples was such to make vse of this so far different plant, when as they had the true blacke Hellebor growing plentifully wilde within seuen miles of the citie, the which afterward vpon his admonition, they made vse of. †

The Vertues.

A *Dioscorides* saith, that the floures of Oxe eie made vp in a seare-cloth doe assuage and waste away cold hard swellings; and it is reported that if they be drunk by and by after bathing, they make them in short time well coloured that haue been troubled with the yellow iauindice.

CHAP.

CHAP. 258. Of French Marigold, or African Marigold.

¶ The Description.

1 The great double African Marigold hath a great long browne reddish stalke, crested, furrowed and somewhat knobby, diuiding it selfe toward the top into other branches; whereupon do grow leaues composed of many small leaues set vpon a middle rib by couples, much like vnto the leaues of wilde Valerian, bearing at the top very faire and beautifull double yellow floures, greater and more double than the greatest Damaske Rose, of a strong smell, but not vnpleasant. The floures being past, there succeedeth long blacke flat seed: the whole plant perisheth at the first approach of winter.

2 There is little difference betweene this and the precedent, or last described, sauing that this plant is much lesser, and bringeth forth more store of floures, which maketh the difference. † And we may therefore call it *Flos Aphricanus minor multiflorus*, The small double Africane Marigold. †

1 *Flos Aphricanus maior Polyanthos.*

The great African double Marigold.

3 *Flos Aphricanus maior simplici flore.*

The great single French Marigold.

3 The single great Africane Marigold hath a thicke root, with some fibres annexed thereto; from which riseth vp a thicke stalke chamfered and furrowed, of the height of two cubits, diuided into other small branches; whereupon are set long leaues, compact or composed of many little leaues like those of the Ash tree, of a strong smell, yet not very vnpleasant: on the top of the branches do grow yellow single floures, composed in the middle of a bundle of yellow thrummes hard thrust together, paled about the edges with a border of yellow leaues; after which commeth long blacke seed. The whole plant perisheth with the first frost, and must be sowne yeerely as the other sorts must be.

4 The common Africane or as they vulgarly terme it French Marigold hath small weake and tender branches trailing vpon the ground, reeling and leaning this way and that way, beset with leaues consisting of many particular leaues, indented about the edges, which being held vp against the sunne, or to the light, are seene to be full of holes like a sieue, euen as those of Saint Johns wort:

woort: The floures stand at the top of the springie branches forth of long cups or huskes, consisting of eight or ten small leaues, yellow vnderneath, on the vpper side of a deeper yellow tending to the colour of a darke crimson veluet, as also soft in handling: but to describe the colour in words, it is not possible, but this way; lay vpon paper with a pensill a yellow colour called Masticot, which being dry, lay the same ouer with a little saffron steeped in water or wine, which setteth forth most liuely the colour. The whole plant is of a most ranke and vnwholesome smell, and perissheth at the first frost.

¶ The Place.

4 *Flos Aphricanus minor simplici flore.*
The small French Marigold.

They are cherished and sowne in gardens euery yeere: they grow euery where almost in Africke of themselves, from whence we first had them, and that was when *Charles* the fifth Emperour of Rome made a famous conquest of Tunis; whereupon it was called *Flos Aphricanus*, or *Flos Tunetanus*.

¶ The Time.

They are to be sowne in the beginning of Aprill, if the season fall out to be warme, otherwise they must be sowne in a bed of dung, as shall be shewed in the chapter of Cucumbers. They bring forth their pleasant floures very late, and therefore there is the more diligence to be vsed to sow them very earely, because they shall not be ouertaken with the frost before their seed be ripe.

¶ The Names.

The Africane or French Marigold is called in Dutch, *Thunis bloemen*; in high Dutch, *Indianisch negelin*, that is, the floure or Gillofloure of India: in Latine, *Cariophyllus Indicus*; whereupon the French men call it *Oeillets d'Inde*. *Cordus* calleth it *Tanacetum Peruvianum*, of the likenesse the leaues haue with Tanisie, and of Peru a Prouince of America, from whence hee thought, it may be, it was first brought into Europe. *Gesner* calleth it *Caltha*

Aphricana, and saith that it is called in the Carthaginian tongue, *Pedua*: some would haue it to be *Petilius flos Plinij*, but not properly: for *Petilius flos* is an Autumne floure growing among briars and brambles. *Andreas Lacuna* calleth it *Othonna*, which is a certaine herbe of the Troglodytes, growing in that part of Arabia which lieth toward Ægypt, hauing leaues full of holes as though they were eaten with mothes. *Galen* in his first booke of the faculties of Simple medicines, maketh mention of an herbe called *Lycopersicum*, the juice whereof a certain Centurion did cary out of Barbarie all Ægypt ouer with so ranke a smell, and so lothsome, as *Galen* himselfe durst not so much as taste of it, but conjectured it to be deadly; yet that Centurion did vse it against the extreme paines of the joints, and it seemeth to the patients themselves, to be of a very cold temperature; but doubtlesse of a poisonfome quality, very neere to that of hemlockes.

¶ The Temperature and Vertues.

A The vnpleasant smell, especiall that common sort with single floures (that stuffeth the head like to that of Hemlocke, such as the juice of *Lycopersum* had) doth shew that is of a poisonfome and cooling qualitie; and also the same is manifested by diuers experiments: for I remember, saith *Dodonæus*, that I did see a boy whose lippes and mouth when he began to chew the floures did swell extremely; as it hath often happened vnto them, that playing or piping with quils or kexes of Hemlockes, do hold them a while between their lippes: likewise he saith, we gaue to a cat the floures with their cups, tempered with fresh cheese, she forthwith mightely swelled, and a little while after died: also mice that haue eaten of the seed thereof haue been found dead. All which things do declare that this herbe is of a venomous and poisonfome facultie; and that they are

not

not to be hearkned vnto, that suppose this herbe to be an harmles plant: so to conclude, these plants are most venomous and full of poison, and therefore not to be touched or smelled vnto, much lesse vsed in meat or medicine.

CHAP. 259. *Of the floure of the Sun, or the Marigold of Peru.*

¶ The Description.

THe Indian Sun or the golden floure of Peru is a plant of such stature and talnesse that in one Sommer being sowne of a seede in Aprill, it hath risen vp to the height of foureteene foot in my garden, where one floure was in weight three pound and two ounces, and crosse ouerthwart the floure by measure sixteene inches broad. The stalkes are vpright and straight, of the bignesse of a strong mans arme, beset with large leaues euen to the top, like vnto the great Clot Bur: at the top of the stalke commeth forth for the most part one floure, yet many times there spring out sucking buds, which come to no perfection: this great floure is in shape like to the Cammomil floure, beset round about with a pale or border of goodly yellow leaues, in shape like the leaues of the floures of white Lillies: the middle part whereof is made as it were of vnshorn veluet, or some curious cloth wrought with the needle, which braue worke; if you do thorowly view and marke well, it seemeth to be an innumerable sort of small floures, resembling the nose or nozell of a candlestick, broken from the foot thereof: from which small nozell sweateth forth excellent fine and cleere Turpentine, in sight, substance, sauour and taste. The whole plant in like manner being broken, smelleth of Turpentine: when the plant groweth to maturitie, the floures fall away, in place whereof appeareth the seed, blacke, and large, much like the seed of Gourds, set as though a cunning workeman had of purpose placed them in very good order, much like the honiecombes of Bees: the root is white, compact of many strings, which perish at the first approch of winter, and must be set in most perfect duned ground: the manner how, shall be shewed when vpon the like occasion I shall speake of Cucumbers and Melons.

1 *Flos Solis maior.*

The greater Sun floure.

2 *Flos Solis minor.*

The lesser Sunne floure.

2 The other golden floure of Peru is like the former, sauing that it is altogether lower, and the leaues more iagged, and very few in number.

3 The male floure of the Sun of the smaller sort hath a thicke root, hard, and of a wooddy substance, with many threddie strings annexed thereto, from which riseth vp a gray or russet st alke, to the height of fise or six cubits, of the bignesse of ones arme, whereupon are set great broad leaues with long foot-stalkes, very fragill or easie to breake, of an ouerworne greene colour, sharp pointed, and somewhat cut or hackt about the edges like a saw: the floure groweth at the top of the stalks, bordered about with a pale of yellow leaues: the thrummed middle part is blacker than that of the last described. The whole floure is compassed about likewise with diuers such russet leaues as those are that do grow lower vpon the stalks, but lesser and narrower. The plant and euery part thereof doth smell of Turpentine, and the floure yeeldeth forth most cleere Turpentine, as my selfe haue noted diuers yeares. The seed is also long and blacke, with certaine lines or strakes of white running alongst the same. The roote and euery part thereof perisheth when it hath perfected his seed.

4 The female or Marigold Sun floure hath a thicke and wooddie root, from which riseth vp a straight stem, diuiding it selfe into one or more branches, set with smooth leaues sharpe pointed, sleightly indented about the edges. The floures grow at the top of the branches, of a faint yellow colour, the middle part is of a deeper yellow tending to blacknesse, of the forme and shape of a single Marigold, whereupon I haue named it the Sunne Marigold. The seed as yet I haue not obserued.

¶ The Place.

These plants do grow of themselves without setting or sowing, in Peru, and in diuers other prouinces of America, from whence the seeds haue beene brought into these parts of Europe. There hath been seen in Spaine and other hot regions a plant sowne and nourished vp from seed, to attain to the height of 24. foot in one yeare.

¶ The Time.

The seed must be set or sowne in the beginning of Aprill if the weather be temperate, in the most fertile ground that may be, and where the Sun hath most power the whole day.

¶ The Names.

The floure of the Sun is called in Latine *Flos Solis*, taking that name from those that haue reported it to turne with the Sun, the which I could neuer obserue, although I haue endeouored to finde out the truth of it; but I rather thinke it was so called because it doth resemble the radiant beames of the Sun, whereupon some haue called it *Corona Solis*, and *Sol Indianus*, the Indian Sunne floure: others haue called it *Chrysanthemum Peruuianum*, or the golden floure of Peru: in English, the floure of the Sun, or the Sun floure.

¶ The Temperature.

They are thought to be hot and dry of complexion.

¶ The Vertues.

- A There hath not any thing been set downe either of the antient or later writers concerning the vertues of these plants, notwithstanding we haue found by triall, that the buds before they be floured, boiled and eaten with butter, vineger, and pepper, after the manner of Artichokes, are exceeding pleasant meat, surpassing the Artichoke far in procuring bodily lust.
- B The same buds with the stalks neere vnto the top (the hairinesse being taken away) broiled vpon a gridiron, and afterward eaten with oile, vineger, and pepper, haue the like property.

CHAP. 260. Of Ierusalem Artichoke.

ONE may wel by the English name of this plant perceiue that those that vulgarly impose names vpon plants haue little either iudgement or knowledge of them. For this plant hath no similitude in leafe, stalke, root or manner of growing with an Artichoke, but onely a little similitude of taste in the dressed root; neither came it from Ierusalem or out of Asia, but out of America, whence *Fabius Columna* one of the first settlers of it forth fitly uames it *Aster Peruuianus tuberosus*, and *Flos solis Farnesianus*, because it so much resembles the *Flos solis*, and for that he first obserued it growing in the garden of Cardinall *Farnesius*, who had procured roots thereof from the West Indies. *Pelliterius* calls this *Heliotropium Indicum tuberosum*; and *Bauhinus* in his *Prodromus* sets this forth by the name of *Chrysanthemum latifolium Brasiliannum*; but in his *Pinax* he hath it by the name of

of *Helianthemum Indicum tuberosum*. Also our Countreyman M^r. Parkinson hath exactly deliuered the history of this by the name of *Battatas de Canada*, Englishing it Potatoes of Canada: now all these that haue written and mentioned it, bring it from America, but from far different places, as from Peru, Brasil, and Canada: but this is not much material, seeing it now grows so wel & plentifully in so many places of England. I will now deliuer you the Historie, as I haue receiued it from my oft mentioned friend M^r. Goodyer, who, as you may see by the date, took it presently vpon the first arriual into England.

¶ The Description.

‡ *Flos Solis Pyramidalis*.
Ierusalem Artichoke.

Flos solis Pyramidalis, paruo flore, tuberosa radice.
Heliotropium Indicum quorundam.

THIS wonderfull increasing plant hath growing vp from one root, one, sometimes two, three or more round green rough hairy straked stalks, commonly about twelue foot high, sometimes sixteene foot high or higher, as big as a childs arme, full of white spungious pith within. The leaues grow all alongst the stalkes out of order, of a light green color, rough, sharp pointed, about eight inches broad, and ten oreleuen inches long, deeply notched or indented about the edges, very like the leaues of the common *flos solis Peruanus*, but nothing crumpled, and not so broad. The stalkes diuide themselues into many long branches euen from the roots to their very tops, bearing leaues smaller and smaller toward the tops, making the herbe appeare like a little tree, narrower and slenderer toward the top, in fashion of a steeple or Pyramide. The floures with vs grow onely at the toppes of the stalkes and branches, like those of the said *flos solis*, but no bigger than our common single Marigold, consisting of twelue or thirteene straked sharpe pointed bright yellow bordering leaues, growing forth of a scaly small hairie head, with a small yellow thrummie matter within. These floures by reason of their late flourishing, which is commonly two or three weeks after Michaelmas, neuer bring their seed to perfection, & it maketh shew of abundance of small heads neere the tops of the stalkes and branches forth of the bosomes of the

leaues, which neuer open and floure with vs, by reason they are destroyed with the frosts, which otherwise it seemes would be a goodly spectacle. The stalke sendes forth many small creeping roots, whereby it is fed or nourished, full of hairie threddes euen from the vpper part of the earth, spreading farre abroad: amongst which from the maine root grow forth many tuberous roots, clustering together, sometimes fastened to the great root it selfe, sometimes growing on long strings a foot or more from the root, raising or heauing vp the earth aboue them, and sometimes appearing aboue the earth, producing from the increase of one root, thirty, forty, or fifty in number, or more, making in all vsually aboue a pecke, many times neere halfe a bushell, if the soile be good. These tuberous roots are of a reddish colour without, of a soft white substance within, bunched or bumped out many waies, sometimes as big as a mans fist, or not so big, with white noses or peaks where they will sprout or grow the next year. The stalkes bowed downe, and some part of them covered ouer with earth, send forth smal creeping threddie roots, and also tuberous roots like the former, which I haue found by experience. These tuberous roots will abide alieue in the earth all winter,

though the stalkes and rootes by the which they were nourished vtterly rot and perish away, and will beginne to spring vp againe at the beginning of May, seldome sooner.

¶ *The Place.*

Where this plant groweth naturally I know not, in Anno 1617 I receiued two small roots thereof from Master *Franqueuill* of London, no bigger than hens egges: the one I planted, and the other I gaue to a friend, mine brought mee a pecke of roots, wherewith I stored Hampshire.

¶ *The Vertues.*

A These rootes are dressed diuers waies; some boile them in water, and after stew them with sacke and butter, adding a little Ginger: others bake them in pies, putting Marrow, Dates, Ginger, Raisons of the Sun, Sacke, &c. Others some other way, as they are led by their skill in Cookerie. But in my iudgement, which way soeuer they be drest and eaten they stirre and cause a filthie loathsome stinking wind within the bodie, thereby causing the belly to bee pained and tormented, and are a meat more fit for swine, than men: yet some say they haue vsually eaten them, and haue found no such windie qualitie in them. 17. Octob. 1621. *John Goodyer.* ‡

CHAP. 261. Of Cammomill.

1 *Chamamelum.*
Cammomill.

2 *Chamamelum nudum odoratum.*
Sweet naked Cammomill.

¶ *The*

¶ The Description.

1 TO distinguish the kinds of Cammomils with sundry descriptions would be but to enlarge the volume, and small profit would thereby redound to the Reader, considering they are so well knowne to all: notwithstanding it shall not be amisse to say something of them, to keepe the order and method of the booke, hitherto obserued. The common Cammomill hath many weake and feeble branches trailing vpon the ground, taking hold vpon the top of the earth, as it runneth, whereby it greatly encrease. The leaues are very fine, and much iagged or deeply cut, of a strong sweet smell: among which come forth the floures like vnto the field Daisie, bordered about the edge with a pale of white leaues: the middle part is yellow, composed of such thrums close thrust together, as is that of the Daisie. The root is very small and threddy.

2 The second kinde of Cammomill hath leaues, roots, stalks, and creeping branches like the precedent: the floures grow at the tops of small tender stems, which are nothing else but such yellow thrummie matter as is in the midst of the rest of the Cammomils, without any pale or border of white floures, as the others haue: the whole plant is of a pleasing sweet smell; whereupon some haue giuen it this addition, *O odoratum*.

3 This third Cammomil differeth not from the former, sauing that the leaues hereof are very much doubled with white leaues, insomuch that the yellow thrum in the middle is but little seen, and the other very single, wherein consisteth the difference.

3 *Chamamelum Anglicum flore multiplici.*
Double floured Cammomill.

4 *Chamamelum Romanum.*
Romane Cammomil.

4 Romane Cammomill hath many slender stalkes, yet stiffer and stronger than any of the others, by reason whereof it standeth more vpright, and doth not creepe vpon the earth as the others doe. The leaues are of a more whitish colour, tending to the colour of the leaues of Woad. The floures be likewise yellow in the middle, and paled about with a border of small white floures.

¶ The Place.

These plants are set in gardens both for pleasure and also profit.

¶ The Time.

They floure most part of all the Sommer.

¶ The

¶ The Names.

Cammomill is called *Chamamelum* : of some, *Anthemis*, and *Leucanthemis*, and also *Leucanthemon*, especially that double floured Cammomill : which Greeke name is taken from the whitenesse of his floure : in English, Cammomill : it is called Cammomil, because the floures haue the smell of *malus*, an apple, which is plainly perceiued in common Cammomill.

¶ The Temperature.

Cammomill, saith *Galen*, is hot and dry in the first degree, and is of thinn parts : it is of force to digest, slacken, and rarifie ; also it is thought to be like the Rose in thinnesse of parts, coming to the operation of oyle in heate, which are to man familiar and temperate : wherefore it is a speciall helpe against wearisomenesse ; it easeth and mitigateth paine, it mollifieth and suppleth, and all these operations are in our vulgar Cammomill, as common experience teacheth, for it heateth moderately, and drieth little.

¶ The Vertues.

- A Cammomill is good against the collicke and stone ; it prouoketh vrine, and is most singular in Clysters which are made against the foresaid diseases.
- B Oyle of Cammomill is exceeding good against all manner of ache and paine, bruifings, shrinking of sinewes, hardnesse, and cold swellings.
- C The decoction of Cammomill made in wine and drunke, is good against coldnesse in the stomacke, soure belchings, voideth winde, and mightily bringeth downe the monethly courses.
- D The Egyptians haue vsed it for a remedie against all cold agues ; and they did therefore consecrate it (as *Galen* saith) to their Deities.
- E The decoction made in white wine and drunk, expelleth the dead child, and secondine or after-birth, speedily, and clenseth those parts.
- F The herbe boyled in posset Ale, and giuen to drinke, easeth the paine of the chest coming of winde, and expelleth tough and clammy flegme, and helpeth children of the Ague.
- G The herbe vsed in baths prouoketh sweat, rarifieth the skinne, and openeth the pores : briefly, it mitigateth gripings and gnawings of the belly ; it alayeth the paines of the sides, mollifies hard swellings, and wasteth away raw and vndigested humors.
- H The oyle compounded of the floures performeth the same, and is a remedie against all wearisomenesse, and is with good successe mixed with all those things that are applied to mitigate paine.

CHAP. 262.

Of May-weed, or wilde Cammomill.

¶ The Kindes.

There be three kinds of wilde Cammomill, which are generally called in Latine *Cotula* ; one stinking, and two other not stinking : the one hath his floure all white throughout the compass, and also in the middle ; and the other yellow. Besides these there is another with verie faire double floures voyd of smell, which a Kentish Gentleman called Mr. *Bartholmew Lane* found growing wilde in a field in the Isle of Thanet, neere vnto a house called Queakes, sometime the house of Sir *Henry Crispe*. Likewise Mr. *Hesketh*, before remembred, found it in the garden of his Inne at Barnet, if my memorie faile me not, at the signe of the red Lyon, or neere vnto it, and in a poore womans garden as he was riding into Lancashire.

‡ The double floured May-weed, the last yeare, being 1632. I (being in company with Mr. *William Broad*, Mr. *James Clarke*, and some other London Apothecaries in the Isle of Thanet) found it growing wild vpon the cliffe side, close by the towne of Margate, and in some other places of the Island. ‡

¶ The Description.

1 May-weed bringeth forth round stalkes, greene, brittle, and full of iuyce, parted into many branches thicker and higher than those of Cammomil ; the leaues in like manner are broader, and of a blackish greene colour. The floures are like in forme and colour, yet commonly larger, and of a ranke and naughty smell : the root is woody, and perisheth when the seed is ripe. The whole plant stinketh, and giueth a ranke smell.

‡ This

‡ This herbe varies, in that it is found sometimes with narrower, and otherwhiles with broader leaues; as also with a strong vnpleasant smell, or without any smell at all: the floures also are single, or else (which is seldome found) very double. ‡

2 The yellow May-weed hath a small and tender root, from which riseth vp a feeble stalke diuiding it selfe into many other branches, whereupon do grow leaues not vnlike to Cammomill, but thinner, and fewer in number. The floures grow at the top of the stalkes, of a gold yellow colour, ‡ This I take to be no other than the *Buphthalmum verum* of our Author, formerly described in the second place of the 257. chapter.

3 This mountaine Cammomill hath leaues somewhat deeply cut in almost to the middle rib, thicke also and iuycie, of a bitterish taste, and of no pleasant smell: the stalkes are weake, and some foot high, carrying at their tops single floures, bigger, yet like those of Cammomill, yellow in the middle, with a border of twenty or more long white leaues, encompassing it. It increaseth much, as Cammomill doth, and hath creeping roots. It is found vpon the Stirian Alpes, and flourisheth in Iuly and August. *Clusius* hath set this forth by the name of *Leucanthemum Alpinum*. ‡

1 *Cotula fetida*.

May-weed.

‡ 3 *Leucanthemum Alpinum* *Clusij*.

Wilde Mountaine Cammomill.

¶ The Place.

They grow in Corne fields neere vnto path wayes, and in the borders of fields.

¶ The Time.

Thee floure in Iuly and August.

¶ The Names.

May-weed is called in shops *Cotula fetida*: of *Leonhartus Fuchsius*, *Parthenium*, and *Virginea*, but not truly: of others, *Kortendill*: in high-Dutch, *Krotendill*: in low-Dutch, *Paddebloemen*: in French, *Espargoutte*: in English, May-weed, wilde Cammomill, and stinking Mathes.

¶ The Temperature and Vertues.

May-weed is not vsed for meate nor medicine, and therefore the faculties are vnknowne; yet all of them are thought to be hot and dry, and like after a sort in operation to Cammomill, but nothing at all agreeing with mans nature; notwithstanding it is commended against the infirmities of the mother, seeing all stinking things are good against those diseases.

It is

It is an vnprofitable weed among corne, and raiseth blisters vpon the hands of the weeders and reapers.

CHAP. 263. Of Pellitorie of Spaine.

¶ The Description.

Pythreum, in English, Pellitorie of Spaine (by the name whereof some doe vnproperly call another plant, which is indeed the true *Imperatoria*, or Master-wort, and not Pellitorie) hath great and fat leaues like vnto Fennell, trailing vpon the ground : amongst which, immediately from the root riseth vp a fat great stem, bearing at the top a goodly floure, fashioned like the great single white Daisie, whose bunch or knob in the midst is yellow like that of the Daisie, and bordered about with a pale of small leaues, exceeding white on the vpper side, and vnder of a faire purple colour : the root is long, of the bignesse of a finger, very hot, and of a burning taste.

2 The wilde Pellitorie groweth vp like vnto wilde Cheruile, resembling the leaues of *Caucalis*, of a quicke and nipping taste, like the leaues of Dittander, or Pepper-wort : the floures grow at the top of slender stalkes, in small tufts or spoky umbels, of a white colour : the root is tough, and of the bignesse of a little finger, with some threds thereto belonging, and of a quicke biting taste.

1 *Pyrethrum officinarum*.
Pellitorie of Spaine.

2 *Pyrethrum sylvestre*.
Wilde Pellitorie.

¶ The Place.

It groweth in my garden very plentifully.

¶ The Time.

It floureth and seedeth in Iuly and August.

¶ The Names.

Pellitorie of Spaine is called in Greeke *μίστρον*, by reason of his hot and fierie taste : in shops also *Pyrethrum* : in Latine, *Salinaris* : in Italian, *Pyrethro* : in Spanish, *Pelitre* : in French, *Pied d'Alexandre*,

Alexandre, that is to say, *Pes Alexandrinus*, or Alexanders foot: in high and low Dutch, *Bertram*: in English, Pellitorie of Spaine; and of some, Bertram, after the Dutch name: and this is the right *Pyrethrum*, or Pellitorie of Spaine; for that which diuers here in England take to be the right, is not so, as I haue before noted.

¶ *The Temperature and Vertues.*

The root of Pellitorie of Spaine is very hot and burning, by reason whereof it taketh away the cold shiuering of Agues, that haue been of long continuance, and is good for those that are taken with a dead palsie, as *Dioscorides* writeth. A

The same is with good successe mixed with Antidotes or counterpoysons which serue against the megrim or continuall paine of the head, the dizziness called *Vertigo*, the apoplexie, the falling sicknesse, the trembling of the sinewes, and palsies, for it is a singular good and effectuell remedy for all cold and continuall infirmities of the head and sinewes. B

Pyrethrum taken with honey is good against all cold diseases of the braine. C

The root chewed in the mouth draweth forth great store of rheume, slime, and filthy waterish humors, and easeth the paine of the teeth, especially if it be stamped with a little Staues-aere, and tied in a small bag, and put into the mouth, and there suffered to remaine a certaine space. D

If it be boyled in Vineger, and kept warme in the mouth it hath the same effect. E

The oyle wherein Pellitorie hath been boyled is good to anoint the body to procure sweating, and is excellent good to anoint any part that is bruised and blacke, although the member be declining to mortification: it is good also for such as are stricken with the palse. F

It is most singular for the Surgeons of the Hospitals to put into their vnctions *contra Neapolitanum morbum*, and such other diseases that be cousin germanes thereunto. G

CHAP. 264. Of Leopards bane.

† 1 *Doronicum minus officinarum.*
Small Leopards bane.

† 2 *Doronicum maius Officinarum.*
Great Leopards bane.

¶ *The Description.*

OF this Plant *Doronicum* there be sundry kindes, whereof I will onely touch foure: *Dodonæus* vnproperly calleth it *Aconitum pardalianches*, which hath hapned through the negligence

negligence of *Dioscorides* and *Theophrastus*, who in describing *Doronicum*, haue not onely omitted the floures thereof, but haue committed that negligence in many and diuers other plants, leauing out in many plants which they haue described, the special accidents; which hath not a little troubled the study and determination of the best herbarists of late yeares, not knowing certainly what to determine and set downe in so ambiguous a matter, some taking it one way, and some another, and some esteeming it to be *Aconitum*. But for the better vnderstanding hereof, know that this word *Aconitum*, as it is a name attributed to diuers plants, so it is to be considered, that all plants called by this name are malignant and venomous, as with the iuyce and root whereof such as hunted after wilde and noysome beasts were wont to embrue and dip their arrowes, the sooner and more surely to dispatch and slay the beast in chase. But for the prooue of the goodnesse of this *Doronicum* and the rest of his kind, know also, That *Lobel* writeth of one called *John de Vroede*, who ate very many of the roots at sundry times, and found them very pleasant in tast, and very comfortable. But to leaue controuersies, circumstances, and obiections which here might be brought in and alledged, assure your selues that this plant *Doronicum minus Officinatum* (whose roots *Pena* reporteth to haue found plentifully growing vpon the Pede-mountaine hills and certaine high places in France) hath many leaues spred vpon the ground, somewhat like Plantaine: among which rise vp many tender hairy stalks some handfull and an halfe high, bearing at the top certain single yellow floures, which when they fade change into downe, and are caried away with the winde. The roots are thicke and many, very crookedly crossing and tangling one within another, resembling a Scorpion, and in some yeares do grow in our English gardens into infinite numbers.

3 *Doronicum radice repente.*
Cray-fish Wolfes bane.

4 *Doronicum brachiata radice.*
Winged Wolfes bane.

2 The second kinde of *Doronicum* hath larger leaues than the former, but round, and broader, almost like the small leaues of the Clot or Burre; among which riseth vp a stalke scarce a cubit high: the floures are like the former: the root is longer and bigger than the former, barred ouer with many scaly barks, in colour white, and shining like white marble, hauing on each side one arme or finne, not vnlike to the sea Shrimpe called *Squilla marina*, or rather like the ribbes or scales of a Scorpions body, and is sweet in taste.

3 The third kinde of *Doronicum*, growing naturally in great abundance in the mountaines of

of France, is also brought into and acquainted with our English grounds, bearing very large leaues of a light yellowish Greene, and hairy like *Pilosella*, or *Cucumis agrestis*. The stalkes are a cubit high, hauing at the top yellow floures like *Bupthalmum*, or *Consolida media vulnerariorum*: all the root is barred and welted ouer with scales like the taile of a Scorpion, white of colour, and in taste sweet, with some bitternesse, yeelding forth much clamminesse, which is very astringent.

4 The fourth kinde hereof is found in the woody mountaines about Turin and Sauoy, very like vnto the former, sauing that the leaues are somewhat rougher, the floures greater, and the stalks higher. But to be short, each of these kinds are so like one another, that in shew, taste, smell, and manner of growing they seeme to be as it were all one: therefore it were superfluous to stand vpon their varietie of names, *Pardalianches*, *Myoetonum*, *Thelyphonum*, *Camorum*, and such like, of *Theophrastus*, *Dioscorides*, *Pliny*, or any of the new Writers, which names they haue giuen vnto *Doronicum*; for by the opinion of the most skilfull in plants, they are but Synonimies of one kinde of plant. And though these old writers speake of the hurtfull qualities of these plants; yet experience teacheth vs that they haue written what they haue heard and read, and not what they haue knowne and proued; for it is apparant, that *Doronicum* (by the consent of the old and new writers) is vsed as an antidote or certaine treacle, as well in the confections *de Gemmis Mesue*, as in *Electuario Aromaticum*. And though *Matthiolus* disclaimeth against the vse thereof, and calleth it *Pardalianches*, that is, Wolfes bane; yet let the Learned know, that *quantitas, non qualitas, nocet*: for though Saffron be comfortable to the heart, yet if you giue thereof, or of muske, or any such cordial thing, too great a quantitie, it killeth the party which receiueth it.

‡ 5 *Doronicum angustifolium Austriacum*.
Narrow leaued Wolfes bane.

‡ 6 *Doronicum Stiriacum flore amplo*.
Large floured Wolfes bane.

‡ 5 To these foure formerly intended by our Author, may we fitly adde some others out of *Clusius*. The first of these hath a stalke some foot high, soft, rough, and crested: the leaues are few, thicke, narrow, long, very Greene and shining, yet hairy on their vpper sides, but smooth on the lower sides, and of a lighter Greene; yet those that adorne the stalke are narrower: there groweth commonly at the top of the stalke one single floure of the shape and bignesse of the common *Doronicum* described in the second place, but of a brighter yellow: the seed is little and blackish, and is carried away with the winde: the root is small, blackish, and ioyned, hauing somewhat thicke

Sff

white

white fibres, and an aromaticke taste. This floures in Iuly and August, and growes in rockie places vpon the highest Alpes. *Clusius* (the first and onely describer thereof) calls it *Doronicum 2. sine Austriacum 1.*

6 This growes somewhat higher than the last described, and hath much broader and rounder leaues, and those full of veines, and snipt about the edges. The knots and off-sets of the roots descend not down, but run on the surface of the ground, and so send forth fibres on each side, to fasten them and attract nourishment. The floure is like that of the former, but much larger. This groweth in the high mountainous places of Stiria, and floures at the same time as the former. *Clusius* calls this *Doronicum 4. Stiriacum.*

7 This is the largest of all the rest, and hath a stalke two cubits or more high, of the thicknesse of ones little finger, crested, rough, and towards the top diuided into sundry branches. The leaues next to the root are round, wrinkled, hairy, and fastned to a long stalke: those towards the top of the stalke are longer and narrower, and ingirt the stalke at their setting on. The floures are large and yellow, like to the other plants of this kinde: the seed also is carried away with the winde, and is longish, and of a greenish colour: the root is knotty or ioyned like to a little Shrimpe, and of a whitish Greene colour. This floures in Iune or Iuly, and growes vpon the like places as the former. *Clusius* calls this *Doronicum 7. Austriacum 3.* ‡

‡ 7 *Doronicum maximum.*
The greatest Wolfe-bane.

The place is sufficiently set forth in the description; yet you shall vnderstand, that I haue the two first in my garden; the second hath beene found and gathered in the cold mountaines of Northumberland, by Dr. Penny lately of London deceased, a man of much experience and knowledge in Simples; whose death my selfe and many others do greatly bewaile.

¶ The Time.

They floure in the months of Iune and Iuly.

¶ The Names.

Concerning their names I haue already spoken; yet sith I would be glad that our English women may know how to call it, they may terme *Doronicum* by this name, Cray-fish Pisse-a-bed, because the floure is like Dandelion, which is called Pisse-a-bed.

‡ Our Author certainly at the beginning of this chapter did not well vnderstand what he said, when he affirms, That the reason of the not well knowing the *Doronicum* of the Antients was, [through the negligence of *Dioscorides* and *Theophrastus*, who in describing *Doronicum*, &c.] Now it is manifest, that neither of these Authors, nor any of the antient Greekes euer so much as named *Doronicum*: but that which he should haue said, was, That the want of exact describing the *Aconitum thelyphonon* in *Theophrastus*, and *Aconitum Pardalianches* in *Dioscorides*,

(which are iudged to be the same plant and all one with our *Doronicum*) hath beene the cause, that the controuersie which *Matthiolus* and others haue of late raised cannot be fully determined; which is, Whether that the vulgar *Doronicum*, vsed in shops, and described in this chapter, be the *Aconitum Pardalianches*? *Matthiolus* affirms it is, and much and vehemently exclaims against the vse thereof in cordiall Eleatuaries, as that which is of a most pernicious and deadly qualitie, because that (as he affirms) it will kill dogs: now *Dodonaeus* also seems to incline to his opinion: but others (and not without good reason) deny it; as *Gesner* in his Epistles, who made often triall of it vpon himselfe: part of his words are set downe hereafter by our Author (being translated out of *Dodonaeus*) and some part also you shall finde added in the end of the vertues: and these are other some; *Plura alia nunc omitto, quibus ostendere liquido possem, nec Doronicum nostrum, nec*

Aconitum

Aconitum villo modo esse venenatum homini. Canibus autem letiferum esse scio, non solum si drachmarum 4. sed etiam si unus pondere sumant. And before he said, quasi non alia multa canibus sint venena, quæ homini salubria sunt; ut de asparago fertur. Of the same opinion with Gesner is Pena and Lobel, who; *Aduers.* p. 290, & 291. do largely handle this matter, & exceedingly deride and scoffe at *Matthiolus*, for his vehement declaiming against the vse thereof. Now briefly my opinion is this, That the *Doronicum* here mentioned is not that mentioned and written of by *Serapio* and the Arabians; neither is it the *Aconitum Pardalianches* of *Dioscorides*, nor of so malignant a qualitie as *Matthiolus* would haue it; for I my selfe also haue often eaten of it, and that in a pretty quantitie, without the least offence. ‡

¶ The Nature and Vertues.

I haue sufficiently spoken of that for which I haue warrant to write, both touching their natures **A** and vertues; for the matter hath continued so ambiguous and so doubtful; yea, and so full of controuersies, that I dare not commit that to the world which I haue read: these few lines therefore shall suffice for this present; the rest which might be said I referre to the great and learned Doctors, and to your owne consideration.

These herbes are mixed with compound medicines that mitigate the paine of the eyes, and by **B** reason of his cold qualitie, being fresh and Greene, it helpeth the inflammation or fierie heate of the eyes.

It is reported and affirmed, that it killeth Panthers, Swine, Wolues, and all kindes of wilde **C** beasts, being giuen them with flesh. *Theophrastus* saith, That it killeth Cattell, Sheepe, Oxen, and all foure-footed beasts, within the compasse of one day, not by taking it inwardly onely, but if the herbe or root be tied vnto their priuy parts. Yet he writeth further, That the root being drunke is a remedie against the stinging of Scorpions; which sheweth, that this herbe or the root thereof is not deadly to man, but to diuers beasts onely: which thing also is found out by trial and manifest experience; for *Conrade Gesner* (a man in our time singularly learned, and a most diligent searcher of many things) in a certaine Epistle written to *Adolphus Occo*, sheweth, That he himselfe hath oftentimes inwardly taken the root hereof Greene, dry, whole, preserued with honey, and also beaten to powder; and that euen the very same day in which hee wrote these things, hee had drunke with warme water two drams of the roots made into fine powder, neither felt he any hurt thereby: and that he oftentimes also had giuen the same to his sicke Patients, both by it selfe, and also mixed with other things, and that very luckily. Moreouer, the Apothecaries in stead of *Doronicum* doe vse (though amisse) the roots thereof without any manifest danger.

That this *Aconite* killeth dogs, it is very certaine, and found out by triall: which thing *Matthio-* **D** *lus* could hardly beleue, but that at length he found it out to be true by a manifest example, as he confesseth in his Commentaries.

‡ I haue (saith *Gesner*) oft with very good successe prescribed it to my Patients, both alone, as **E** also mixed with other medicines, especially in the *Vertigo* and falling sicknesse: somtimes also I mix therewith *Gentian*, the powder of *Mistle-toe*, and *Astrantia*: thus it workes admirable effects in the Epilepsie, if the vse thereof be continued for some time. ‡

† Formerly the figure that was in the first place should haue beene in the second, and the first and second were confounded in the description.

CHAP. 265. Of Sage.

¶ The Description.

THe great Sage is very full of stalkes, foure square, of a woody substance, parted into branches, about the which grow broad leaues, long, wrinckled, rough, whitish, verie like to the leaues of wilde Mullein, but rougher, and not so white, like in roughnesse to woollen cloath thread-bare: the floures stand forked in the tops of the branches like those of dead Nettle, or of Clarie, of a purple blew colour; in the place of which doth grow little blackish seeds, in small huskes. The root is hard and woody, sending forth a number of little strings.

2 The lesser Sage is also a shrubby plant, spred into branches like to the former, but lesser: the stalkes hereof are tenderer: the leaues be long, lesser, narrower, but not lesse rough; to which there do grow in the place wherein they are fixed to the stalke, two little leaues standing on either side one right against another, somewhat after the manner of finnes or little eares: the floures are

careed blew like those of the former : the root also is woody : both of them are of a certaine strong smell, but nothing at all offensive ; and that which is the lesser is the better.

3 This Indian Sage hath diuers branches of a woody substance, whereon doe grow small leaues, long, rough, and narrow, of an ouerworne colour, and of a most sweet and fragrant smell. The floures grow alongst the top of the branches, of a white colour, in forme like the precedent. The root is rough and woody.

1 *Salvia maior.*
Great Sage.

2 *Salvia minor.*
Small Sage.

4 The Mountaine Sage hath an vpright stalke smooth and plaine, whereupon do grow broad rough and rugged leaues, sleightly nicked, and vneuenly indented about the edges, of an hoarie colour, sharpe pointed, and of a ranke smell : the floures grow alongst the top of the stalke, in shape like those of Rosemarie, of a whitish red colour. The root is likewise woody.

5 We haue in our gardens a kinde of Sage, the leaues whereof are reddish, part of those red leaues are striped with white, others mixed with white, Greene, and red, euen as Nature list to play with such plants. This is an elegant varietie, and is called *Salvia variegata elegans*, Variegated or painted Sage.

6 We haue also another, the leaues whereof are for the most part white, somewhat mixed with Greene, often one leafe white, and another Greene, euen as Nature list, as we haue said. This is not so rare as the former, nor neere so beautifull, wherefore it may be termed *Salvia variegata vulgaris*, Common painted Sage.

7 There is kept in some of our chiefe gardens a fine Sage, which in shape and manner of growing resembles the smaller Sage, but in smell and taste hath some affinity with Wormwood, whence it may be termed *Salvia Absinthites*, or Wormewood Sage. *Bauhine* onely hath mentioned this, and that in the fourth place in his *Pinax*, pag. 237. by the name of *Salvia minor altera* : and hee addes, *Hæc odore & sapore est Absinthij, floreque rubente* : That is, This hath the smell and taste of Wormewood, and a red floure : but ours (if my memorie faile me not) hath a whitish floure : it is a tender plant, and must be carefully preserued from the extremitie of Winter. I first saw this Sage with M^r. *Canon*, and by him it was communicated to some others.

3 *Salvia Indica.*
Indian Sage.

4 *Salvia Alpina.*
Mountain Sage.

± 8 *Salvia Cretica pomifera.*
Apple-bearing Sage of Candy.

± 8 *Salvia Cretica non pomifera.*
Candy Sage without Apples.

8 This which we here giue you hath pretty large leaues, and those also very hairy on the vnder side, but rough on the vpper side like as the ordinarie Sage. The stalkes are rough and hairie, foure square below, and round at their tops. The floures in their growing and shape are like those of the ordinarie, but of a whitish purple colour; and fading, they are each of them succeeded by three or foure seeds, which are larger than in other Sages, and so fill their seed-vessels, that they shew like berries. The smell of the whole plant is somewhat more vehement than that of the ordinarie: the leaues also haue sometimes little eares or appendices, as in the smaller or Pig-Sage: and in Candy (the naturall place of the growth) it beares excrescences, or Apples (if we may so terme them) of the bignesse of large Galls, or Oke-Apples: whence *Clusius* hath giuen you two figures by the same titles as I here present the same to your view. *Matthiolus*, *Dodonæus*, and others also haue made mention hereof. ‡

¶ The Place.

These kindes of Sage grow not wilde in England: I haue them all in my garden: most of them are very common.

‡ The fine or elegant painted Sage was first found in a countrey garden, by Mr. *Iohn Tradescant*, and by him imparted to other louers of plants. ‡

¶ The Time.

These Sages floure in Iune and Iuly, or later: they are fitly remoued and planted in March.

¶ The Names.

Sage is called in Greeke *ιαριον*: the Apothecaries, the Italians, and the Spaniards keepe the Latine name *Salvia*: in high-Dutch, **Salben**: in French, *Sauge*: in low-Dutch, **Saue**: in English, Sage.

¶ The Temperature.

Sage is manifestly hot and dry in the beginning of the third degree, or in the later end of the second; it hath adioyned no little astringion or binding.

¶ The Vertues.

- A *Agrippa* and likewise *Actius* haue called it the Holy-herbe, because women with childe if they be like to come before their time, and are troubled with abortments, do eate thereof to their great good; for it closeth the matrix, and maketh them fruitfull, it retaineth the birth, and giuerh it life, and if the woman about the fourth day of her going abroad after her childing, shal drink nine ounces of the iuyce of Sage with a little salt, and then vse the companie of her husband, she shall without doubt conceiue and bring forth store of children, which are the blessing of God. Thus far *Agrippa*.
- B Sage is singular good for the head and braine; it quickneth the senses and memory, strengthneth the sinewes, restoreth health to those that haue the palsie vpon a moist cause, takes away shaking or trembling of the members; and being put vp into the nostrils, it draweth thin flegme out of the head.
- C It is likewise commended against the spitting of bloud, the cough, and paines of the sides, and bitings of Serpents.
- D The iuyce of Sage drunke with honey is good for those that spit and vomit bloud, and stoppeth the flux thereof incontinently, expelleth winde, drieth the dropisie, helpeth the palsie, strengthneth the sinewes, and cleanseth the bloud.
- E The leaues sodden in water, with Wood-binde leaues, Plantaine, Rosemary, Honey, Allome, and some white wine, make an excellent water to wash the secret parts of man or woman, and for cankers or other soreness in the mouth, especially if you boyle in the same a faire bright shining Sea-cole, which maketh it of greater efficacie.
- F No man needs to doubt of the wholesomnesse of Sage Ale, being brewed as it should be, with Sage, Scabious, Betony, Spikenard, Squinanth, and Fennell seeds.
- G The leaues of red Sage put into a wooden dish, wherein is put very quicke coles, with some ashes in the bottome of the dish to keepe the same from burning, and a little vineger sprinkled vpon the leaues lying vpon the coles, and so wrapped in a linnen cloath, and holden very hot vnto the side of those that are troubled with a grievous stich, taketh away the paine presently: The same helpeth greatly the extremitie of the pleurisie.

CHAP. 266. Of French Sage or wooddie Mullein.

1 *Verbascum Matthioli.*
French Sage.

‡ 2 *Verbascum angustis Salvia folijs.*
The lesser French Sage.

‡ 3 *Phlomis Lychnites Syriaca.*
Syrian Sage-leaved Mullein.

¶ The Description.

1 **W**ild Mullein, wooddie Mullein, *Mattholus* his Mullein, or French Sage groweth vp like a small wooddie shrub, hauing many wooddie branches of a woollie and hoarie colour, soft and downie: whereupon are placed thicke hoarie leaues, of a strong ponticke sauiour, in shape like the leaues of Sage, whereupon the vulgar people call it French Sage: toward the top of the branches are placed roundles or crownetts of yellow gaping floures like those of dead Nettle; but much greater. The root is thicke, tough, and of a wooddie substance, as is all the rest of the plant.

† 2 There is another sort hereof that is very like the other, sauing that the leaues & euery other part of this plant, hath a most sweet and pleasant smell, and the other more strong and offensive: the leaues also are much lesser and narrower, somewhat resembling those of the lesser Sage.

‡ 3 I thinke it not amisse here to insert this no lesse rare than beautifull plant, which differs from the last described in the manner of growing & shape of the floures, which resemble those of the *Lychnis Chalcedonica*, or None-such, but are of a yellow colour. The leaues are hairy, narrow, and sharp pointed; the stalkes square, and root wooddie. *Lobel*

(to

(to whom we are beholden for this figure and description) calls this, *Phlomos Lychnitis altera Syriaca*. ‡

¶ The Place.

Thesewilde Mulleins do grow wilde in diuers Prouinces of Spaine, and also in Languedoc, vpon drie bankes, and stony places: I haue them both in my garden, and many others likewise.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

They are called of the learned men of our time, *Verbascum Sylvestria*: the first is called of the Grecians *φλυμος*, Or *φλυμνος*: in Latine, *Elychnium*, or after others, *Elychinium*, because of the Cottonie substance thereof, matches, or weeks were made to keep light in lamps: *Verbascum Lychnitis*, as *Dioscorides* himselfe testifieth, is named also *Thryallis* or Rose Campion; but the floure of *Thryallis* is red of colour, as *Nicander* in his Counterpoisons doth shew, but the floures of these are yellow: therefore they are neither *Thryallis* nor *Lychnitis*, but *Sylvestre Verbascum*, or wilde Mullein, as we haue already taught in the Chapter of Rose Campion, that *Thryallis* is *Lychnitis satina*, or Rose Campion. There is nothing to the contrary, but that there may be many plants with soft downie leaues fit to make Candle weeke of: in English it is generally called French Sage: wee may call it Sage Mullaine.

¶ The Temperature.

As these be like in vertues to the others going before, so they be likewise drie in temperature.

¶ The Vertues.

A *Dioscorides* faith, that the leaues are stamped and laied in manner of a pultis vpon burnings and scaldings.

CHAP. 267. Of Clarie.

1 *Gallitricum, sive Horminum.*
Common Clarie.

2 *Gallitricum alterum.*
Small Clarie.

¶ The

‡ 3 *Horminum sylvestre*, Fuchsj.
Fuchsius his wilde Clarie.

¶ The Description.

THe first kinde of Clarie which is the right, bringeth forth thick stalks foure square, two foot long, diuided into branches: it hath many leaues growing both from the rootes, and along the stalkes and branches by distances, one against another by two and two, great, a handfull broad or broader, somewhat rough, vnequall, whitish and hairie, as be also the stalkes. The floures are like those of Sage, or of dead Nettle, of colour white, out of a light blew: after which grow vp long toothed huskes in stead of cods, in which is blacke seed. The root is full of strings: the whole herbe yeeldeth forth a rank and strong smell that stuffeth the head: it perisheth after the seed is ripe, which is in the second yeare after it is sowne.

2 The second kinde of Clarie hath likewise stalkes foure square, a foot and a halfe high: the leaues also be rough and rugged, lesser, and not so white. The floures be alike, of colour purple or blew: the rootes bee as those of the former are. This hath not so strong a sent by a great deale.

3 There is a kinde of Clarie which Fuchsius pictureth for wilde Clarie, that hath shorter stalkes, hairie, and also foure square: the leaues lesser, long, deeper indented: the floures blew of colour, sweet of smell, but not so sweet as those of

† 4 *Colus Iouis*. Iupiters distaffe.

the right Clarie: the husks or cods when they are ripe bend downwards: the seed is blackish; the roots in like manner are blacke and full of strings.

4 The fourth kind of *Horminum*, called *Iovis Colus*, representeth in the highest top of the stalke a distaffe, wrapped about with yellow flax, whereof it tooke his name, hauing knobbie roots, with certaine strings annexed thereto like *Galeopsis*, or like vnto the roots of Clarie, which doe yeeld forth sundry foure square rough stalks, two cubits high; whereon do grow leaues like those of the Nettle, rough, sharpe pointed, and of an ouerworne greene colour: the floures do grow alongst the top of the stalks, by certaine spaces, set round about in smal coronets, or wharles, like those of Sage in forme, but of a yellow colour.

¶ The Place.

These doe grow wilde in some places, notwithstanding they are manured and planted in Gardens, almost euery where, except Iupiters distaffe, beeing a kinde thereof, which I haue in my Garden.

¶ The Time.

They floure in Iune, Iuly, and August.

¶ The Names.

Clarie is called of the Apothecaries *Gallitricum*; it is likewise named *Oruala*: of some, *Tota bona*, but not properly: of others, *Scarlea*, *Sclarea*, *Centrum Galli*, and *Matrisaluia*: in Italian, *Sciaria*: in French, *Oruale*: in High Dutch, *Scharlach*: in Low Dutch, *Scharlepe*: in English, Clarie, or Cleere eie.

Iupiters distaffe is called *Colus Iovis*: of some, *Galeopsis lutea*, but not properly: of diuers, *Horminum luteum*, or yellow Clarie, and *Horminum Tridentinum*, or Clarie of Trent.

¶ The Temperature.

Clarie is hot and drie in the third degree.

¶ The Vertues.

- A The seed of Clarie poudered, finely searced and mixed with hony, taketh away the dimnesse of the eies, and cleereth the sight.
- B The same stamped, infused, or laied to steepe in warme water, the mussilag or slimie substance taken and applied plaisterwise, draweth forth splinters of wood, thornes, or any other thing fixed in the bodie: it also scattereth and dissolueth all kindes of swellings, especially in the ioints.
- C The seed poudered and drunke with wine, stirreth vp bodily lust.
- D The leaues of Clarie taken any manner of way, helpeth the weaknesse of the backe proceeding of the ouermuch flowing of the whites, but most effectually if they be fried with egges in manner of a Tansie, either the leaues whole or stamped.

† The figure which formerly was vnder the title of *Colus Iouis*, was of the *Horminum syluestris* of *Euchsius*, which is described immediately before it.

CHAP. 268: Of wilde Clarie, or Oculus Christi.

¶ The Description.

1 **O**culus Christi is also a kinde of Clarie, but lesser: the stalkes are many, a cubite high, squared, and somewhat hairie: the leaues be broad, rough, and of a blackish green colour. The floures grow alongst the stalkes, of a blewish colour. The seed is round and blackish, the root is thicke and tough, with some threds annexed thereto. † This is *Hormini syluestris* 4. quinta species of *Clusius*. †

2 The purple Clarie hath leaues somewhat round, layd ouer with a hoarie cottony substance, not much vnlike Horehound: among which rise vp small hairie square stalks, set toward the top with little leaues of a purple colour, which appeare at the first view to be floures, and yet are nothing else but leaues, turned into an excellent purple colour: and among these beautifull leaues come forth small floures of a blewish or watchet colour, in fashion like vnto the floures of Rose-marie, which being withered, the husks wherein they did grow containe certaine blacke seed, that falleth forth vpon the ground very quickly, because that euery such huske doth turne and hang downe his head toward the ground. The root dieth at the first approach of Winter.

† 3 Broad leaued Clarie hath a square stalke some cubite high, hairy, firme, and iointed: the leaues are large, rough, and sharpe pointed, snipt about the edges, wrinckled, and standing by couples at each ioint: vpon the branches in roundles grow purple floures, lesse than those of Clarie, and scarce any bigger than those of Lauander: the seed is smal and blacke: the root is large, hard, black,

† 1 *Horminum sylvestre*.
Wilde Clarie, or *Oculus Christi*.

2 *Horminum sylvestre folijs purpureis*.
Clarie with purple leaues.

† 3 *Horminum sylvestre latifolium*.
Broad leaved wilde Clarie.

† 4 *Horminum sylvestre flore albo*.
White floured wilde Clarie.

‡ 5th *Horminum sylvestre flore rub ro.*
Red floured wilde Clarie.

blacke, and liues many yeares. It floures in Iune and Iuly, and growes wilde in many mountainous places of Germany. *Clusius* calls it *Horminum sylvestre tertium*.

4 This hath long leaues next vnto the ground, growing vpon prettie long stalkes, broad at their setting on, and so ending by little and little in sharpe points, they are not deeply cut in, but onely lightly snipt about the edges: they are also wrinkled on the vpper side, and whitish, but hairie on the vnder side. The square stalkes are some cubite high, iointed, and set with two leaues at each ioint. The floures grow alongst the tops of the branches, and are of a snow white colour. There is a varietie of this with the leaues greener, and the floures of an elegant deepe purple colour. This is the *Horminum sylvestris quarti species prima* of *Clusius*, and the varietie with the white floures is his *Hormini sylvestris quarti species prima*; and the figure that our Authour gaue in the first place was of these.

5 There is another variety of the last described, which also hath square stalkes set with rough snipt leaues, which end in sharp points, but are narrower at the lower end than the former, and they are greene of colour: vpon the tops of the stalkes grow red hooded floures, and those not very large: the seed is small and blacke, and the root liues many yeares. This floures in Iuly. *Clusius* makes this his *Hormini sylvestris quarti species quarta*. ‡

¶ The Place.

The first groweth wilde in diuers barren places, almost in euery Country, especially in the fields of Holborne neere vnto Grayes Inne, in the high way by the end of a bricke wall: at the end of Chelsey next to London, in the high way as you go from the Queenes pallace of Richmond to the waters side, and in diuers other places.

The other is a stranger in England: it groweth in my garden.

¶ The Time.

They floure and flourish from Iune to the end of August.

¶ The Names.

Wilde Clarie is called after the Latine name *Oculus Christi*, of his effect in helping the diseases of the eies: in Greeke *οφθαλμος*: and likewise in Latine, *Horminum*: of some, *Geminalis*: in English, wild Clarie, and *Oculus Christi*.

The second is thought of some to be the right Clarie, and they haue called it *Horminum verum*, but with greater error: it may be called in Latine *Horminum sylvestre folijs & floribus purpureis*, Clarie with leaues and floures of a purple colour.

‡ Our Authour should haue shewn his reasons why this is not the *Horminum verum*, to haue conuicted the error of *Anguillara*, *Matthiolus*, *Gesner*, *Dodonæus*, *Lobel* and others, who haue accounted it so, as I my selfe must needs do, vntill some reason be shewne to the contrarie, the which I thinke cannot be done, ‡

¶ The Temperature and Vertues.

A The temperature and faculties are referred vnto the garden Claries: yet *Paulus Aegineta* saith it is hot and moderately drie, and it also clenseth.

B The seed of wilde Clarie, as *Dioscorides* writeth, being drunke with wine, stirreth vp lust, it clenseth the eies from filmes and other imperfections, being mixed with honie.

C The seede put whole into the eies, clenseth and purgeth them exceedingly from waterish humours, rednesse, inflammation, and diuers other maladies, or all that happen vnto the eies, and takes away the paine and smarting thereof, especially being put into the eies one seed at one time, and

no more, which is a generall medicine in Cheshire and other Countries thereabout, knowne of all, and vsed with good successe.

The leaues are good to be put into pottage or brothes among other potherbes, for they scatter congealed bloud, warme the stomacke, and helpe the dimnesse of the eies.

† The figure that formerly was in the first place, was of that which you may here finde figured and described in the fourth.

CHAP. 269. Of Mullein.

¶ The Description.

1 The male Mullein or Higtaper hath broad leaues, very soft, whitish and downie, in the midst of which riseth vp a stalke, straight, single, and the same also whitish all ouer, with a hoarie downe, and covered with the like leaues, but lesser and lesser euen to the top: among which taperwise are set a multitude of yellow floures, consisting of five leaues apeece: in the places whereof come vp little round vessels, in which is contained very small seed. The root is long, a finger thicke, blacke without, and full of strings.

1 *Tapsus Barbatas.*

Mullein or Higtaper.

2 *Tapsus Barbatas flore albo.*

White floured Mullein.

2 The female Mullein hath likewise many white woolley leaues, set vpon an hoarie cottonie vpriht stalke, of the height of foure or five cubits: the top of the stalks resembleth a torch decked with infinite white floures, which is the speciall marke to know it from the male kinde, being like in euery other respect.

¶ The Place.

These plants do grow of themselves neere the borders of pastures, and plowed fields, or causies, and drie sandie ditch banks, and in other vttilled places. They grow in great plentie neere vnto a lyme kill vpon the end of black Heath next to London, as also about the Queens house at Eltham neere vnto Dartford in Kent: in the high waies about Highgate neere London, and in most countries of England that are of a sandie soile.

Ttt

¶ The

¶ The Time.

They are found with their floure from Iuly to September, and bring forth their seed the second yeare after the seed is sowne.

¶ The Names.

Mullein is called in Greeke *φλόκος* in shops, *Tapsus Barbatius*: of diuers, *Candela Regia*, *Candelaria*, and *Lanaria*: *Dioscorides*, *Pliny*, and *Galen*, do call it *Verbascum*: in Italian, *Verbascio*, and *Tasso Barbasso*: in Spanish, *Gordolebo*: in High Dutch, *Mullkraut*: in French, *Bouillon*: in English, *Mullein*, or rather *Woollen*, *Higtaper*, *Torches*, *Long-woort*, and *Bullockes Long-woort*; and of some *Hares-beard*.

¶ The Temperature.

Mullein is of temperature drie: the leaues haue also a digesting and clensing qualitie, as *Galen* affirmeth.

¶ The Vertues.

- A The leaues of Mullein being boiled in water, and laid vpon hard swellings and inflammations of the eies, cureth and ceaseth the paine.
- B The root boiled in red wine and drunke, stoppeth the laske and bloody flux.
- C The same boiled in water and drunke, is good for them that are broken and hurt inwardly, and preuaileth much against the old cough.
- D A little fine treacle spread vpon a leafe of Mullein, and laied to the piles or Hemorrhoides, cureth the same: an ointment also made with the leaues thereof and old hogs grease worketh the same effect.
- E The leaues worne vnder the feet day and night, in manner of a shooe sole or sock, bringeth down in yong maidens their desired sicknesse, being kept vnder their feet with some socks or other thing for falling away.
- F The Countrey people, especially the husbandmen in Kent, doe giue their cattell the leaues to drinke against the cough of the lungs, being an excellent approued medicine for the same, whereupon they doe call it *Bullocks Lung-woort*.
- G Frankensence and Masticke burned in a chafing dish of coles, and set within a close stoole, and the fume thereof taken vnderneath, doth perfectly cure the piles, hemorrhoids, and all diseases happening in those lower parts, if also there be at euery such fuming (which must bee twice euery day) a leafe of the herbe bound to the place, and there kept vntill the next dressing.
- H There be some who thinke that this herbe being but carried about one, doth helpe the falling sicknesse, especially the leaues of that plant which hath not as yet borne floures, and that is gathered when the Sun is in Virgo, and the Moone in Aries; which thing notwithstanding is vaine and superstitious.
- I The later Physitions commend the yellow floures, beeing steeped in Oile and set in warme dounge vntill they bee waisted into the Oile and consumed away, to bee a remedie against the piles.
- K The report goeth, saith *Pliny*, that figges do not putrifie at all that are wrapped in the leaues of Mullein: which thing *Dioscorides* also maketh mention of.

CHAP. 270. Of base Mullein.

¶ The Description.

1 The base white Mullein hath a thicke wooddie root, from which riseth vp a stiffe and hairie stalke, of the height of foure cubites, garnished with faire grayish leaues like those of Elecampane, but lesser: the floures grow round about the stalks taper or torch fashion, of a white colour, with certaine golden thrums in the middle: the seed followeth, smal, and of the colour of dust.

2 Blacke Mullein hath long leaues, not downie at all, large and sharp pointed, of an ouerworne blackish green colour, somewhat rough, and strongly smelling: the floures grow at the top of the stalks, of a golden yellow colour, with certaine threds in the middle thereof. The root differeth not from the precedent.

3 Candleweeke Mullein hath large, broad, and woollie leaues, like vnto those of the common Mullein: among which riseth vp a stalke couered with the like leaues, euen to the branches whereon the floures do grow, but lesser and lesser by degrees. The stalke diuideth it selfe toward the top into diuerse branches, whereon is set round about many yellow floures, which oftentimes doe change into white, varying according vnto the soile and clymate. The root is thick and wooddy.

4 The

1 *Verbascum album*.
Base white Mullein.

2 *Verbascum nigrum*.
Base blacke Mullein.

3 *Verbascum Lychnite Matthioli*.
Candle-weeke Mullein.

4 *Verbascum Lychnite minus*.
Small Candle-weeke Mullein.

4 The small Candle-weeke Mullein differeth little from the last rehearsed, sauing that the whole plant of this is of a better sauour, wherein especially consisteth the difference. ‡ The floure also is much larger, and of a straw, or pale yellow colour. ‡

¶ The Place.

These plants do grow where the other Mulleins do, and in the like soile.

¶ The Time.

The time likewise answereth their flouring and feeding.

¶ The Names.

Their capitall names expressed in the titles shal serue for these base Mulleins, considering they are all and euery of them kindes of Mulleins.

¶ The Temperature.

These Mulleins are drie without any manifest heat, yet doubtlesse hotter and drier than the common Mullein or Hygtaper.

¶ The Vertues.

A The blacke Mullein, with his pleasant yellow floures, boiled in water or wine and drunken, is good against the diseases of the brest and lungs, and against all spitting of corrupt rotten matter.

B The leaues boiled in water, stamped and applied pultis wise vpon cold swellings (called *Oedemata*) and also vpon the vlcers and inflammations of the eies, cureth the same.

C The floures of blacke Mullein are put into lie, which causeth the haire of the head to wax yellow, if it be washed and combed therewith:

D The leaues are put into cold ointments with good successe, against scaldings and burnings with fire or water.

E *Apuleius* reporteth a tale of *Vlysses*, *Mercurie*, and the inchantresse *Circe*, and their vse of these herbes in their incantations and witchcrafts.

CHAP. 271. Of Moth Mullein.

1 *Blattaria Plinij.*

Plinies Moth Mullein.

2 *Blattaria flore purpureo.*

Purple Moth Mullein.

¶ The

¶ The Description.

1 **P**Linie hath set forth a kinde of *Blattaria*, which hath long and smooth leaues, somewhat iagged or snipt about the edges: the stalke riseth vp to the height of three cubits, diuiding it selfe toward the top into sundry armes or branches, beset with yellow floures like vnto blacke Mullein.

2 *Blattaria* with purple floures hath broad blacke leaues, without any manifest snips or notches by the sides, growing flat vpon the ground: among which riseth vp a stalke two cubits high, garnished with floures like vnto the common *Blattaria*, but that they are of a purple colour, and those few threds or chiues in the middle of a golden colour: the root is as thick as a mans thumb, with some threds hanging thereat, and it indureth from yeare to yeare.

3 There is another kinde like vnto the blacke Mullein, in stalks, roots, and leaues, and other respects, sauing that his small floures are of a greene colour.

4 There is another like vnto the last before written, sauing that his leaues are not so deeply cut about the edges, and that the small floures haue some purple colour mixed with the greenesse.

† 3 *Blattaria flore viridi.*
Greene Moth Mullein.

† 4 *Blattaria flore ex viridi purpurascente.*
Moth Mullein with the greenish purple coloured floure.

† 5 This is somewhat like the first described in leaues and stalks, but much lesse, the floures also are of a whitish or grayish colour, and therein consists the chiefe difference.

6 There is also another varietie of this kinde, which hath very faire and large floures, and these either of a bright yellow, or else of a purple colour.

7 This hath long narrow leaues like those of the second, snipt about the edges, and of a darke greene colour: the stalkes grow some two cubits high, and seldome send forth any branches; the floures are large and yellow, with rough threddes in their middles tipt with red, and these grow in such an order that they somewhat resemble a flie: the seed is small, and contained in round buttons. This is an annuall, and periseth when the seed is ripe. †

‡ 5 *Blattaria flore albo.*
White floured Moth Mullen.

‡ 7 *Blattaria flore Luteo.*
Yellow Moth Mullen.

‡ 6 *Blattaria flore amplo.*
Moth Mullen with the great floure.

¶ The Place.

† The first and fift of these grow wilde in sundrie places, and the rest onely in gardens with vs.

¶ The Time.

They floure in Iuly and August.

¶ The Names.

The later Herbarists call Moth Mullen by the name of *Blattaria*, and doe truly take it to bee that which *Plinie* describeth in his 22. booke, cap. 9. in these words. [There is an herbe like Mullen, or *Verbascum nigrum*, which oftentimes deceiueth, being taken for the same, with leaues not so white, moe stalks, and with yellow floures (as wee haue written) which do agree with blacke Mullen, but we haue not as yet learned by obseruation that they do gather mothes and flies vnto them, as wee haue said.] *Valerius Cordus* names it *Verbascum Leptophyllum*, or narrow leaved Mullen: their seuerall titles sufficiently set forth their English names.

¶ The Nature and Vertues.

Concerning the plants comprehended vnder the titles of *Blattaria*, or Moth Mullens, I find nothing written of them, sauing that moths, butterflies, and all manner of small flies and bats do resort to the place where these herbs are laied or strewed.

† The decoctiō of the floures or leaues of the first described opens the obstructions of the bowels, as also of the Meseraicke veins, as *Camerar.* affirms. ‡

CHAP. 272. Of Mullein of Æthiopia.

Æthiopsis.

Æthiopian Mullein.

¶ The Description.

Mullein of Æthiopia hath many very broad hoary leaues spread vpon the ground, very soft and downy, or rather woolly, like to those of Hygtaper, but farre whiter, softer, thicker, and fuller of woollinesse; which wooll is so long, that one may with his fingers pull the same from the leaues, euen as wooll is pulled from a Sheeps skinne: among which leaues riseth vp a foure square downy stalke, set with the like leaues, but smaller, which stalke is diuided at the top into other branches, set about and orderly placed by certaine distances, hauing many floures like those of Archangell, of a white colour tending to blewnesse: which being past, there succeedeth a three square browne seed: the root is blacke, hard, and of a woody substance.

¶ The Place.

It groweth naturally in Ethiopia, and in Ida, a hill hard by Troy, and in Messenia a prouince of Morea, as *Pliny* sheweth in his twenty seuenth booke, chap. 4. it also groweth in Meroë, an Island in the riuer Nilus: it likewise groweth in my garden.

¶ The Time.

It floureth and flourisheth in Iune, and perfecteth his seed toward the end of August.

¶ The Names.

It is called in Greek *Αἰθίοπις*: and in Latine *Æthiopsis*, of the countrey, and for that cause it is likewise called *Meroides*, of Meroë, as *Pliny* writeth: of some because the Greeke word *Αἰθίοπις*, signifieth in Latine *Fauilla adusta*, or *Cinere aspersa*, or couered with ashes: in English we may call it Mullein of Æthiopia, or woolly Mullein.

¶ The Nature.

Æthiopsis is dry without any manifest heate.

¶ The Vertues.

Æthiopsis is good for those that haue the Pleurisie, and for those that haue their breasts charged with corrupt and rotten matter, and for such as are grieued with the asperitie and roughnesse in the throat, and against the Sciatica, if one drinke the decoction of the root thereof.

For the diseases of the brest and lungs it is good to licke oftentimes of a confection made with the root hereof and honey, and so are the roots condited with sugar, in such manner as they condite the roots of Eringos.

CHAP. 273. Of Cowslips.

¶ The Description.

THose herbes which at this day are called Primroses, Cowslips, and Oxlips, are reckoned among the kindes of Mulleins; notwithstanding for distinctions sake I haue marshalled them in a chapter, comming in the rereward as next neighbors to the Mullen, for that the Antients haue named them *Verbasculi*, that is to say, Small Mullen. The first, which is called in English the field Cowslip, is as common as the rest, therefore I shall not need to spend much time about the description.

2 The second is likewise well knowne by the name of Oxlip, and differeth not from the other, faue

saue that the floures are not so thicke thrust together as the former, and they are fairer, and fewer in number, and do not smell so pleasantly as the other: of which kinde wee haue one lately come into our gardens, whose floures are curled and wrinkled after a most strange manner, which our women haue named Iack-an-apes on horsebacke.

1 *Primula veris maior.*

Field Cowslips.

2 *Primula pratensis inodora lutea.*

Field Oxlips.

3 Double Paigle, called of *Pena*, *Primula hortensis Anglica omnium maxima*, & *serotina floribus plenis*; that is, The greatest English garden Cowslip with double yellow floures, is so commonly knowne that it needeth no description.

4 The fourth is likewise known by the name of double Cowslips, hauing but one floure within another, which maketh the same once double, where the other is many times double, called by *Pena*, *Geminata*, for the likenesse of the floures, which are brought forth as things against nature, or twinnes.

5 The fifth being the common white field Primrose, needeth no description.

6 The sixth, which is our garden double Primrose, of all the rest is of greatest beauty, the description whereof I refer vnto your owne consideration.

7 The seventh kinde is also very well knowne, being a Primrose with greenish floures somewhat welted about the edges: for which cause *Pena* hath called it *Siluarum primula, floribus obscure virentibus fimbriatis*.

8 There is a strange Primrose found in a wood in Yorkshire growing wilde, by the trauell and industrie of a learned gentleman of Lancashire called M^r. *Thomas Hesketh*, a diligent searcher of Simples, who hath not onely brought to light this amiable and pleasant kinde of Primrose, but many others likewise, neuer before his time remembred or found out. This kinde of Primrose hath leaues and roots like the wilde field Primrose in each respect: it bringeth forth amongst the leaues a naked stalke of a grayish or ouerworne greenish colour: at the top whereof doth grow in the Winter time one floure and no more, like vnto that single one of the field: but in the Sommer time it bringeth forth a soft russet huske or hose, wherein are contained many small floures, sometimes foure or fve, and oftentimes more, very thicke thrust together, which maketh one entire floure, seeming to be one of the common double Primroses, whereas indeed it is one double floure made of a number of small single floures, neuer ceasing to beare floures Winter nor Sommer, as before is specified.

‡ Besides

3 *Primula hortensis Anglica.*
Double Paigles.

4 *Primula veris flore geminato.*
Cowslips two in a hose:

6 *Primula veris flore pleno.*
Double white Primrose.

5 *Primula veris minor.*
Field Primrose.

‡ Besides these, there are kept in our gardens, and set forth by M^r. Parkinson (to whose Worke I referre the curious Reader) two or three more varieties; one a double Cowslip hose in hose, naked, without any huske: the other two beare many Greene leaues on the tops of the stalkes, the one of them hauing yellowish floures amongst the leaues, and the other onely longish narrow Greene leaues. The first of these he calls *Paralysis inodora flore geminato*, Double Oxlips hose in hose. The second, *Paralysis fatua*, The foolish Cowslip. And the last, *Paralysis flore viridi roseo calamistrato*, The double Greene feathered Cowslip. ‡

¶ The

7 *Primula flore viridi.*
Greene Primrose.

8 *Primula veris Heskethi.*
M^r. Heskeths Primrose.

¶ *The Place.*

Cowslips and Primroses ioy in moist and dankish places, but not altogether covered with water, they are found in woods and the borders of fields: the Primrose found by M^r. Hesketh growes in a wood called Clap-dale, three miles from a towne in Yorke-shire called Settle.

¶ *The Time.*

They flourish from Aprill to the end of May, and some one or other of them do floure all the Winter long.

¶ *The Names.*

They are commonly called *Primula veris*, because they are the first among those plants that doe floure in the Spring, or because they do floure with the first. They are also named *Arthritica*, and *Herba paralysis*, for they are thought to be good against the paines of the ioynts and sinewes. They are called in Italian, *Brache cuculi*: in English, Petty Mulleins, or Palsie-worts: of most, Cowslips.

The greater sort, called for the most part Oxlips or Paigles, are named of diuers *Herba S. Petri*. In English, Oxlip, and Paigle.

The common Primrose is vsually called *Primula veris*: most Herbarists do refer the Primroses to the *expusae*, called in Latine *Verbascula*, or Petty Mulleins; but seeing the leaues be neither woolly nor round, they are hardly drawnto them: for *Phlomidæ* are described by leaues, as *Pliny* hath interpreted it, *Hirsutis & Rotundis*, Hairy and round; which *Pliny*, lib. 25. cap. 10. translateth thus: *Sunt & Phlomidæ duæ Hirsutæ, rotundis folijs, humiles*: which is as much to say in English as, There be also two pretty Mulleins, hairy, round leaved, low, or short. ‡ *Fabius Columna* refers these to the *Alisma* of *Dioscor.* and calls the Cowslip *Alisma pratorum*: and the Primrose, *Alisma sylvarum*. ‡

¶ *The Temperature.*

The Cowslips and Primroses are in temperature dry, and a little hot.

¶ *The Vertues.*

A The Cowslips are commended against the paine of the ioynts called the Gout, and slackenesse of the sinewes, which is the palsie. The decoction of the roots is thought to be profitably giuen against the stone in the kidneyes and bladder; and the iuyce of the leaues for members that are loose and out of ioynt, or inward parts that are hurt, rent, or broken.

B A dramme and a halfe of the poudre of the dried roots of field Primrose gathered in Autumne, giuen

giuen to drinke in Ale or Wine purgeth by vomit very forcibly (but safely) waterish humours, choler, and flegme, in such manner as *Azaram* doth, experimented by a learned and skilfull Apothecarie of Colchester Mr. *Thomas Buckstone*, a man singular in the knowledge of Simples.

A conferue made with the floures of Cowslips and sugar preuaileth wonderfully against the C palse, convulsions, cramps, and all the diseases of the sinewes.

Cowslips or Paigles do greatly reſtraine or ſtop the belly in the time of a great laſke or bloody D flux, if the decoction thereof be drunke warme.

A practitioner in London, who was famous for curing the frenſie, after that hee had performed E his cure by the due obſeruation of phyſicke, accuſtomed euery yeare in the moneth of May to diet his patients after this manner: Take the leaues and floures of Primroſe, boyle them a little in fountaine water, and in ſome Roſe and Betony waters, adding thereto ſugar, pepper, ſalt, and butter, which being ſtrained, he gaue them to drinke thereof firſt and laſt.

The roots of Primroſe ſtamped and ſtrained, and the iuyce ſniffed into the noſe with a quill or F ſuch like, purgeth the braine, and qualiſieth the paine of the megrim.

An vnguent made with the iuyce of Cowſlips and oyle of Linſeed cureth all ſcaldings or bur- G nings with fire, water, or otherwiſe.

The floures of Primroſes ſodden in vineger and applied, do heale the Kings Euill, as alſo the H almonds of the throat and uvula, if you gargarize the part with the decoction thereof.

The leaues and floures of Primroſes boyled in wine and drunke, is good againſt all diſeaſes of I the breſt and lungs, and draweth forth of the fleſh any thorne or ſplinter, or bone fixed therein.

CHAP. 274. Of Birds-eyne.

1 *Primula veris flore rubro.*
Red Bird-eyne.

2 *Primula veris flore albo.*
White Bird-eyne.

The Description.

Some Herbariſts call this plant by the name of *Sanicula anguſtifolia*, making thereof two kinds, and diſtinguiſhing them by theſe termes, *maior* & *minor*, ſue *media*: others call them *Paralytica alpina*, which without controuerſie are kindes of Cowſlips, agreeing with them as well in ſhape, as in their nature and vertues, hauing leaues much like vnto Cowſlips, but ſmaller, growing

growing flat vpon the ground, of a faint greenish colour on the vpper side, & vnderneath of a white or mealy colour: among which rise vp small and tender stalkes of a foot high, hauing at the top of euery stalke a bush of small floures in shape like the common Oxlip, sauing that they are of a faire stammell colour tending to purple: in the middle of euery small floure appeareth a little yellow spot, resembling the eye of a bird; which hath moued the people of the North parts (where it aboundeth) to call it Birds eyne. The seed is small like dust, and the root white and threddy.

2 The second is like the first, sauing that the whole plant is greater in each respect, and that the floures are of a whitish colour.

¶ The Place.

These plants grow very plentifully in moist and squally grounds in the North parts of England, as in Harwood neere to Blackburne in Lancashire, and ten miles from Preston in Aundernesse; also at Crosby, Rauenswaith, and Crag-Close in Westmerland.

They likewise grow in the medowes belonging to a village in Lancashire neere Maudsley, called Harwood, and at Hesketh not far from thence, and in many other places of Lancashire, but not on this side Trent, that I could euer haue any certaine knowledge of. Lobel reporteth, That doctor Penny (a famous Physition of our London Colledge) did finde them in these Southerne parts.

¶ The Time.

They floure and flourish from Aprill to the end of May.

¶ The Names.

The first is called Primrose with the red floure: the second, Primrose with the white floure, and Birds eyne.

¶ The Nature and Vertues.

The nature and vertues of these red and white Primroses must be sought out amongst those aboue named.

CHAP. 275. Of Beares eares, or Mountaine Cowslips.

1 *Auricula vrsiflore luteo.*
Yellow Beares-eare.

2 *Auricula vrsiflore purpureo.*
Purple Beares-eare.

¶ The Kindes.

There be diuers sorts of Mountaine Cowslips, or Beares-eares, differing especially in the colour of their floures, as shall be declared, notwithstanding it may appeare to the curious, that there is great difference in the roots also, considering some of them haue knobby roots, and others threddy: notwithstanding there is no difference in the roots at all.

‡ There are diuers varieties of these floures, and the chiefe differences arise, either from the leaues or floures; from their leaues, which are either smooth and Greene, or else gray and hoary, againe they are smooth about the edges, or snipt more or lesse; The floures some are fairer then other some, and their colours are so various, that it is hard to finde words to expresse them, but they may be refer'd to whites, reds, yellowes, and purples; for of all the varieties and mixtures of these they chiefly consist. The gardens of M^r. Tradescant and M^r. Tuggie are at this present furnished with very great varieties of these floures. ‡

3 *Auricula Vrsi* ij. *Clusij*.
Red Beares eare.

4 *Auricula Vrsi* iij. *Clusij*.
Scarlet Beares eare.

¶ The Description.

1 *Auricula Vrsi* was called of *Matthiolus*, *Pena*, and other Herbarists, *Sanicula Alpina*, by reason of his singular facultie in healing of wounds, both inward and outward. They do all call it *Paralitica*, because of his vertues in curing the palsies, cramps, and convulsions, and is numbred among the Kindes of Cowslips, whereof no doubt they are kinds, as others are which do hereafter follow vnder the same title, although there be some difference in the colour of the floures. This beautifull and braue plant hath thicke, Greene, and fat leaues, somewhat finely snipt about the edges, not altogether vnlike those of Cowslips, but smoother, greener, and nothing rough or crumpled: among which riseth vp a slender round stem a handfull high, bearing a tuft of floures at the top, of a faire yellow colour, not much vnlike to the floures of Oxe-lips, but more open and consisting of one only leafe like *Cotyledon*: the root is very threddy, and like vnto the Oxe-lip.

2 The leaues of this kinde which beareth the purple floures are not so much snipt about the edges: these said purple floures haue also some yellownesse in the middle, but the floures are not so much laid open as the former, otherwise in all respects they are like.

3 *Carolus Clusius* setteth forth in the booke of his Pannonicke trauels two kindes more, which he hath found in his trauell ouer the Alpes and other mountaines of Germanie and Heluetia, being the third in number, according to my computation: it hath leaues like the former, but longer, smaller, and narrower toward the bottome, Greene aboue, and of a pale colour vnderneath. The floures are in fashion like to the former, but of a most shining red colour within, and on the outside of the colour of a mulberry: the middle or eye of the floure is of a whitish pale colour: the root is like the former.

4 The fourth is a smaller plant than any of the foresaid, whose leaues are thicke and fat, nothing at all snipt about the edges, Greene aboue, and grayish vnderneath. The floures are like the former, shining about the edges, of an ouerworne colour toward the middle, and in the middle commeth a forke couered with an hairinesse: the root is blacke and threddy.

5 *Auricula Vrsi erubescens.*
Blush coloured Beares eare.

6 *Auricula Vrsi suauis rubens.*
Bright red Beares eare.

7 *Auricula Vrsi minima.*
Stamell Beares eare.

5 The blush-coloured Beares eare hath diuers thicke fat leaues spred vpon the ground, of a whitish green colour, sleightly or not at all indented in the edges: among which riseth vp a naked stalke likewise hairy or whitish, on the top whereof stand very faire floures, in shape like those of the common Cowslip, but of a whitish colour tending to purple, which wee terme blush-colour. The root is tough and threddy, as are all the rest.

6 The bright shining red Beares eare of *Matthiolus* description seemes to late Herbarists to be rather a figure made by conceit or imagination, than by the sight of the plant it self, for doubtlesse we are perswaded that there is no such plant, but onely a figure foisted for ostentations sake, the description whereof we leaue to a further consideration, because we haue not seene any such plant, neither do we beleue there is any such. ‡ Our Author is here without cause iniurious to *Matthiolus*, for he figures and describes onely the common first described yellow Beares eare: yet if he had said the floures were of a light shining red, he had not erred, for I haue seen these floures of all the reds both bright and darke that one may imagine. ‡

7 *Pena* setteth forth a kinde of Beares eare vnder the name of *Sanicula Alpina*, hauing his vppermost leaues an inch long, somewhat iagged and hem'd at the ends, and broad before like a shouel; the lower leaues next the ground are somewhat shorter, but of the same forme, among which riseth a small slender foot-stalke of an inch long, whereon doth stand a small floure, consisting of five little leaues of a bright red or stammell colour.

8 The snow white Beares eare differeth not from the last described but in the colour of the floure, for as the others are red, contrarie these are very white, and the whole plant is lesser, wherein consisteth the difference. The root is long, tough, with some fibres thereto belonging. Neither of these two last described will be content to grow in gardens.

¶ The Place.

They grow naturally vpon the Alpish and Heluetian mountaines: most of them do grow in our London gardens.

¶ The Time.

These herbes do floure in Aprill and May.

¶ The Names.

Either the antient writers knew not these plants, or else the names of them were not by them or their successors diligently committed vnto posteritie. *Matthiolus* and other later writers haue giuen names according to the similitude, or of the shape that they beare vnto other plants, according to the likenesse of the qualities and operations: you may call it in English, Beares eare: they that dwell about the Alps doe call it *Drastkravot*, and *Schwindlekravot*, by reason of the effects thereof; for the root is amongst them in great request for the strengthening of the head, that when they are on the tops of places that are high, giddinesse and the swimming of the braine may not afflict them: it is there called the Rocke-rose, for that it groweth vpon the rockes, and resemblance the braue colour of the Rose. † *Fabius Columna* proues this to be the *Alisma* or *Damasonium* of *Dioscorides* and the Antients.

¶ The Nature.

These herbes are dry and very astringent.

¶ The Vertues.

It healeth all outward and inward wounds of the brest, and the enterocoele also, if for some reasonable space of time it be put in drinckes, or boyled by it selfe. A

These plants are of the nature and temperature of *Primula veris*, and are reckoned amongst the *Sanicles* by reason of their vertue. B

Those that hunt in the Alps and high mountaines after Goats and Bucks, do as highly esteeme hereof as of *Doronicum*, by reason of the singular effects that it hath, but (as I said before) one especially, euen in that it preuenteth the losse of their best ioynts (I meane their neckes) if they take the roots hereof before they ascend the rocks or other high places. C

† The root of *Damasonium* (according to *Dioscorides*) taken in the weight of one or two drams, helpeth such as haue deuoured the *Lepus marinus* or sea Hare, or haue been bitten by a Toad, or taken too great a quantitie of *Opium*. D

It is also profitably drunke, either by it selfe, or with the like quantitie of *Daucus* seeds, against gripings in the belly, and the bloody flux. E

Also it is good against convulsions and the affects of the wombe. F

The herbe stayes the fluxes of the belly, moues the courses, and applied in forme of a pultis aswageth oedematous tumors. † G

CHAP. 276. Of Mountaine Sanicle.

¶ The Kindes.

There be sundry sorts of herbes contained vnder the name of Sanicle, and yet not one of them agreeing with our common Sanicle, called *Diapensia*, in any one respect, except in the vertues, whereof no doubt they tooke that name; which number doth dayly increase, by reason that the later writers haue put downe more new plants, not written of before by the Antients, which shall be distinguished in this chapter by seuerall titles.

¶ The Description.

1 Spotted Sanicle of the mountaine hath small fat & round leaues, bluntly indented about the edges, and fashioned like vnto the leaues of *Saxifraga aurea*, or rather *Cyclamen folio hedera*, of a darke greene colour, and somewhat hairy vnderneath: amongst which rise

1 *Sanicula guttata*.
Spotted Sanicle.

2 *Pinguicula sine Sanicula Eboracensis*.
Butterwort, or Yorkshire Sanicle.

3 *Sanicula Aloina Clusij, sine Cortusa Matthioli*.
Beares eare Sanicle.
